Index of the components 168
1 Introduction

Lorenzo and Mirella, 57 years ago, started a trip that eventually lead to a lot of things — among them, CircuiTi\textup{K} v1.0.

In loving memory — R.G., 2020-02-04

1.1 About

CircuiTi\textup{K} was initiated by Massimo Redaelli in 2007, who was working as a research assistant at the Polytechnic University of Milan, Italy, and needed a tool for creating exercises and exams. After he left University in 2010 the development of CircuiTi\textup{K} slowed down, since \LaTeX{} is mainly established in the academic world. In 2015 Stefan Lindner and Stefan Erhardt, both working as research assistants at the University of Erlangen-Nürnberg, Germany, joined the team and now maintain the project together with the initial author. In 2018 Romano Giannetti, full professor of Electronics at Comillas Pontifical University of Madrid, joined the team.

The use of CircuiTi\textup{K} is, of course, not limited to academic teaching. The package gets widely used by engineers for typesetting electronic circuits for articles and publications all over the world.

1.2 License

Copyright © 2007–2020 by Massimo Redaelli, 2013–2020 by Stefan Erhardt, 2015–2020 by Stefan Lindner, and 2018–2020 by Romano Giannetti. This package is author-maintained. Permission is granted to copy, distribute and/or modify this software under the terms of the \LaTeX{} Project Public License, version 1.3.1, or the GNU Public License. This software is provided ‘as is’, without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

1.3 Loading the package

\begin{tabular}{ll}
\LaTeX{} & Con\LaTeX{}t\footnote{Con\LaTeX{}t support was added mostly thanks to Mojca Miklavec and Aditya Mahajan.}\\
\usepackage{circuitikz} & \usemodule[circuitikz]
\end{tabular}

TikZ will be automatically loaded.

CircuiTi\textup{K} commands are just TikZ commands, so a minimum usage example would be:

\begin{tikzpicture}
\node (R) {$R_1$};
\draw (R) to (2,0);
\end{tikzpicture}
\begin{Verbatim}
\tikz \draw (0,0) to[R=\$R\_1\$] (2,0);
\end{Verbatim}
1.4 Installing a new version of the package.

The stable version of the package should come with your \LaTeX\ distribution. Downloading the files from CTAN and installing them locally is, unfortunately, a distribution-dependent task and sometime not so trivial. If you search for local texmf tree and the name of your distribution on https://tex.stackexchange.com/ you will find a lot of hints.

Anyway, the easiest way of using whichever version of CircuiTiKZ is to point to the github page https://circuitikz.github.io/circuitikz/ of the project, and download the version you want. You will download a simple (bighish) file, called circuitikz.sty.

Now you can just put this file in your local texmf tree, if you have one, or simply adding it into the same directory where your main file resides, and then use

\usepackage[...options...]{circuitikzgit}

instead of \texttt{circuitikz}. This is also advantageous for “future resilience”; the authors try hard not to break backward compatibility with new versions, but sometime things happen.

1.5 Requirements

- \texttt{tikz}, version $\geq 3$;
- \texttt{xstring}, not older than 2009/03/13;
- \texttt{siunitx}, if using \texttt{siunitx} option.

1.6 Incompatible packages

\texttt{TikZ}'s own \texttt{circuit} library, which is based on CircuiTi\texttt{K}, (re?)defines several styles used by this library. In order to have them work together you can use the \texttt{compatibility} package option, which basically prefixes the names of all CircuiTi\texttt{K} to[] styles with an asterisk.

So, if loaded with said option, one must write (0,0) to[*R] (2,0) and, for transistors on a path, (0,0) to[*Tnmos] (2,0), and so on (but (0,0) node[nmos] {}). See example at page 159.

Another thing to take into account is that any \texttt{TikZ} figure (and CircuiTi\texttt{K} ones qualify) \textbf{will} have problems if you use the \texttt{babel} package with a language that changes active characters (most of them). The solution is normally to add the line \texttt{\usetikzlibrary{babel}} in your preamble, after loading \texttt{TikZ} or CircuiTi\texttt{K}. This will normally solve the problem; some language also requires using \texttt{\deactivatequoting} or the option \texttt{shorthands=off} for \texttt{babel}. Please check the documentation of \texttt{TikZ} or this question on \TeX\ stackexchange site.

1.7 Known bugs and limitation

CircuiTi\texttt{K} will \textbf{not work} correctly with global (in the main \texttt{circuitikz} environment, or in \texttt{scope} environments) \texttt{negative} scale parameters (\texttt{scale}, \texttt{xscale} or \texttt{yscale}), unless \texttt{transform shape} is also used, and even in this cases the behavior is not guaranteed. Neither it will work with angle-changing scaling (when \texttt{xscale} is different form \texttt{yscale}) and with the global \texttt{rotate} parameter.

Correcting this will need a big rewrite of the path routines, and although the authors are thinking about solving it, don’t hold your breath; it will need changing a lot of interwoven code (labels, voltages, currents and so on). Contributions and help would be highly appreciated.

This same issue create a lot of problem of compatibility between CircuiTi\texttt{K} and the new \texttt{pic} \texttt{TikZ} feature, so basically don’t put components into \texttt{pics}. 

7
1.8 Scale factors inaccuracies

Sometimes, when using fractional scaling factors and big values for the coordinates, the basic layer inaccuracies from \LaTeX can bite you, producing results like the following one:

```latex
\begin{circuitikz}[scale=1.2, transform shape,]
  \draw (60,1) to [battery2, v_=$V_{cc}$, name=B] ++(0,2);
  \node[draw,red,circle,inner sep=4pt] at(B.left) {};
  \node[draw,red,circle,inner sep=4pt] at(B.right) {};
\end{circuitikz}
```

A general solution for this problem is difficult to find; probably the best approach is to use a `scalebox` command to scale the circuit instead of relying on internal scaling.

Nevertheless, Schrödinger’s cat found a solution which has been ported to CircuiTiKZ: you can use the key `use fpu reciprocal` which will patch a standard low-level math routine with a more precise one.

```latex
\begin{circuitikz}[scale=1.2, transform shape, use fpu reciprocal,]
  \draw (60,1) to [battery2, v_=$V_{cc}$] ++(0,2);
\end{circuitikz}
```

They `use fpu reciprocal` key seems to have no side effects, but given that it is patching an internal interface of TiKZ it can break any time, so it is advisable to use it only if and when needed.

1.9 Incompatibilities between version

Here, we will provide a list of incompatibilities between different version of circuitikz. We will try to hold this list short, but sometimes it is easier to break with old syntax than including a lot of switches and compatibility layers. You can check the used version at your local installation using the macro `\pgfcircversion{}`.

- After v0.9.7: the position of the text of transistor nodes has changed; see section 3.17.4.
- After v0.9.4: added the concept of styling of circuits. It should be backward compatible, but it’s a big change, so be ready to use the 0.9.3 snapshot (see below for details).
- After v0.9.0: the parameters `tripoles/american` or `port/saa`, `...bbb`, `...ccc` and `...ddd` are no longer used and are silently ignored; the same stands for `nor`, `xor`, and `xnor` ports.
- After v0.9.0: voltage and current directions/sign (plus and minus signs in case of `american voltages` and arrows in case of `european voltages` have been rationalized with a couple of new options (see details in section 4.2. The default case is still the same as v0.8.3.
- Since v0.8.2: voltage and current label directions (\`v\` and \`i\`) do NOT change the orientation of the drawn source shape anymore. Use the `invert` option to rotate the shape of the source. Furthermore, from this version on, the current label (\`i\`) at current sources can be used independent of the regular label (\`l\`).
• Since v0.7?: The label behaviour at mirrored bipoles has changes, this fixes the voltage
drawing, but perhaps you have to adjust your label positions.

• Since v0.5.1: The parts pfet, pigfete, pigfetebulk and pigfetd are now mirrored by default.
Please adjust your yscale-option to correct this.

• Since v0.5: New voltage counting direction, here exists an option to use the old behaviour

If you have older projects that show compatibility problems, you have two options:

• you can use an older version locally using the git-version and picking the correct commit
from the repository (branch gh-pages) or the main GitHub site directly;

• if you are using \LaTeX, the distribution has embedded several important old versions: 0.4,
0.6, 0.7, 0.8.3, 0.9.3, 0.9.6 and 1.0. To switch to use them, you simply change your
\usepackage invocation like:

\usepackage[]{circuitikz-0.8.3} % or circuitikz-0.4, 0.6...

You have to take care of the options that may have changed between versions;

• if you are using Con\TeXt, only versions 0.8.3, 0.9.3, 0.9.6 and 1.0 are packaged for now;
if can use it with

\usemodule[circuitikz-0.8.3]

1.10 Feedback

The easiest way to contact the authors is via the official Github repository: https://github.com/
circuitikz/circuitikz/issues. For general help question, a lot of nice people is quite active on
https://tex.stackexchange.com/questions/tagged/circuitikz — be sure to read the help
pages for the site and ask!

1.11 Package options

Circuit people are very opinionated about their symbols. In order to meet the individual gusto you
can set a bunch of package options. The standard options are what the authors like, for example
you get this:

\begin{circuitikz}
\draw (0,0) to[R=2<\ohm>, i=?, v=84<\volt>] (2,0) --
(2,2) to[V<=84<\volt>] (0,2)
-- (0,0);
\end{circuitikz}

Feel free to load the package with your own cultural options:

<table>
<thead>
<tr>
<th>\LaTeX</th>
<th>Con\TeXt</th>
</tr>
</thead>
<tbody>
<tr>
<td>\usepackage[american]{circuitikz}</td>
<td>\usemodule[circuitikz][american]</td>
</tr>
</tbody>
</table>
However, most of the global package options are not available in ConTExt; in that case you can always use the appropriate \tikzset{} or \ctikzset{} command after loading the package.

Here is the list of all the options:

- **europeanvoltages**: uses arrows to define voltages, and uses europe-style voltage sources;
- **straightvoltages**: uses arrows to define voltages, and uses straight voltage arrows;
- **americanvoltages**: uses – and + to define voltages, and uses american-style voltage sources;
- **european currents**: uses european-style current sources;
- **americancurrents**: uses american-style current sources;
- **europeanresistors**: uses rectangular empty shape for resistors, as per european standards;
- **americanresistors**: uses zig-zag shape for resistors, as per american standards;
- **europeaninductors**: uses rectangular filled shape for inductors, as per european standards;
- **americaninductors**: uses “4-bumps” shape for inductors, as per american standards;
- **cuteinductors**: uses my personal favorite, “pig-tailed” shape for inductors;
- **americanports**: uses triangular logic ports, as per american standards;
- **europeanports**: uses rectangular logic ports, as per european standards;
- **americangfsurgearrester**: uses round gas filled surge arresters, as per american standards;
- **europeangfsurgearrester**: uses rectangular gas filled surge arresters, as per european standards;
- **european**: equivalent to **europeanvoltages**, **european currents**, **europeanresistors**, **europeaninductors**;
- **american**: equivalent to **americancurrents**, **americanvoltages**, **americanresistors**, **americaninductors**;
- **siunitx**: integrates with SIunitx package. If labels, currents or voltages are of the form \SI{#1}{#2} then what is shown is actually \SI{#1}{#2};
- **nosiunitx**: labels are not interpreted as above;
- **fulldiode**: the various diodes are drawn and filled by default, i.e. when using styles such as diode, D, sD, ... Other diode styles can always be forced with e.g. Do, D–, ... 
- **strokediode**: the various diodes are drawn and stroke by default, i.e. when using styles such as diode, D, sD, ... Other diode styles can always be forced with e.g. Do, D*, ...
• **emptydiode**: the various diodes are drawn *but not* filled by default, i.e. when using styles such as \( D \), \( sD \), ... Other diode styles can always be forced with e.g. \( D_0 \), \( D^- \), ...

• **arrowmos**: pmos and nmos have arrows analogous to those of pnp and npn transistors;

• **noarrowmos**: pmos and nmos do not have arrows analogous to those of pnp and npn transistors;

• **fetbodydiode**: draw the body diode of a FET;

• **nofetbodydiode**: do not draw the body diode of a FET;

• **fetsolderdot**: draw solderdot at bulk-source junction of some transistors;

• **nofetsolderdot**: do not draw solderdot at bulk-source junction of some transistors;

• **emptypmoscircle**: the circle at the gate of a pmos transistor gets not filled;

• **lazymos**: draws lazy nmos and pmos transistors. Chip designers with huge circuits prefer this notation;

• **legacytransistorstext**: the text of transistor nodes is typeset near the collector;

• **nolegacytransistorstext** or **centertransistorstext**: the text of transistor nodes is typeset near the center of the component;

• **straightlabels**: labels on bipoles are always printed straight up, i.e. with horizontal baseline;

• **rotatelabels**: labels on bipoles are always printed aligned along the bipoles;

• **smartlabels**: labels on bipoles are rotated along the bipoles, unless the rotation is very close to multiples of 90°;

• **compatibility**: makes it possible to load CircuiTiKZ and TiKZ circuit library together.

• Voltage directions: until v0.8.3, there was an error in the coherence between american and european voltages styles (see section 4.2) for the batteries. This has been fixed, but to guarantee backward compatibility and to avoid nasty surprises, the fix is available with new options:
  
  – **oldvoltagedirection**: Use old way of voltage direction having a difference between european and american direction, with wrong default labelling for batteries;

  – **nooldvoltagedirection**: The standard from 0.5 onward, utilize the (German?) standard of voltage arrows in the direction of electric fields (without fixing batteries);

  – **RPvoltages** (meaning Rising Potential voltages): the arrow is in direction of rising potential, like in **oldvoltagedirection**, but batteries and current sources are fixed to follow the passive/active standard;

  – **EFvoltages** (meaning Electric Field voltages): the arrow is in direction of the electric field, like in **nooldvoltagedirection**, but batteries are fixed;

If none of these option are given, the package will default to **nooldvoltagedirection**, but will give a warning. The behavior is also selectable circuit by circuit with the **voltage dir** style.

• **betterproportions**: nicer proportions of transistors in comparision to resistors;

\(^2\text{May change in the future!}\)
The old options in the singular (like \texttt{american voltage}) are still available for compatibility, but are discouraged.

Loading the package with no options is equivalent to the following options: \texttt{[nofetsolderdot, europeancurrents, europeanvoltages, americanports, americanresistors, cuteinductors, europeangfsurgearrester, nosiunitx, noarrowmos, smartlabels, nocompatibility, centertransistorstext]}.

In ConT\TeX t the options are similarly specified: \texttt{current= european|american, voltage= european|american, resistor= american|european, inductor= cute|american|european, logic= american|european, siunitx= true|false, arrowmos= false|true}. 
2 Tutorials

To draw a circuit, you have to load the \texttt{circuitikz} package; this can be done with

\begin{verbatim}
\usepackage[siunitx, RPvoltages]{circuitikz}
\end{verbatim}

somewhere in your document preamble. It will load automatically the needed packages if not already done before.

2.1 Getting started with CircuiTi\textsc{kZ}: a current shunt

Let’s say we want to prepare a circuit to teach how a current shunt works; the idea is to draw a current generator, a couple of resistors in parallel, and the indication of currents and voltages for the discussion.

A circuit in CircuiTi\textsc{kZ} is drawn into a \texttt{circuitikz} environment (which is really an alias for \texttt{tikzpicture}). In this first example we will use absolute coordinates. The electrical components can be divided in two main categories: the one that are bipoles and are placed along a path (also known as \texttt{to}-style component, for their usage), and components that are nodes and can have any number of poles or connections.

Let’s start with the first type of component, and build a basic mesh:

\begin{verbatim}
\begin{circuitikz}
\draw (0,0) to[isource] (0,3) -- (2,3) to[R] (2,0) -- (0,0);
\end{circuitikz}
\end{verbatim}

The symbol for the current source can surprise somebody; this is actually the european-style symbol, and the type of symbol chosen reflects the default options of the package (see section 1.11). Let’s change the style for now (the author of the tutorial, Romano, is European - but he has always used American-style circuits, so ...); and while we’re at it, let’s add the other branch and some labels.

\begin{verbatim}
\begin{circuitikz}[american]
\draw (0,0) to[isource, l=$I_0$] (0,3) -- (2,3) to[R=$R_1$] (2,0) -- (0,0);
\draw (2,3) -- (4,3) to[R=$R_2$] (4,0) -- (2,0);
\end{circuitikz}
\end{verbatim}

You can use a single path or multiple path when drawing your circuit, it’s just a question of style (but be aware that closing path could be non-trivial, see section 5.4), and you can use standard TikZ lines (-, |- or similar) for the wires. Nonetheless, sometime using the CircuiTi\textsc{kZ} specific \texttt{short} component for the wires can be useful, because then we can add labels and nodes at it, like for example in the following circuit, where we add a current (with the key \texttt{i=}..., see section 4.3) and a connection dot (with the special shortcut \texttt{-*} which adds a \texttt{circ} node at the end of the connection, see sections 3.15 and 5.1).
One of the problems with this circuit is that we would like to have the current in a different position, such as for example on the upper side of the resistors, so that Kirchoff’s Current Law at the node is better shown to students. No problem; as you can see in section 4.2 you can use the position specifier \texttt{<>^_} after the key \texttt{i}:

\begin{circuitikz}[american]
\draw (0,0) to[isource, l=$I_0$] (0,3)
\draw (0,3) to[short, -*, i=$I_0$] (2,3)
\draw[short, -*] (2,3) -- (0,3);
\end{circuitikz}

Finally, we would like to add voltages indication for carrying out the current formulas; as the default position of the voltage signs seems a bit cramped to me, I am adding the \texttt{voltage shift} parameter to make a bit more space for it:

\begin{circuitikz}[american, voltage shift=0.5]
\draw (0,0) to[isource, l=$I_0$, v=$V_0$] (0,3)
\draw (0,3) to[short, -*, f=$I_0$] (2,3)
\draw[short, -*] (2,3) -- (0,3);
\end{circuitikz}

\textit{Et voilà!} Remember that this is still \LaTeX, which means that you have done a description of your circuit, which is, in a lot of way, independent of the visualization of it. If you ever have to adapt the circuit to, say, a journal that force European style and flows instead of currents, you just change a couple of things and you have what seems a completely different diagram:

\begin{circuitikz}[european, voltage shift=0.5]
\draw (0,0) to[isourceC, l=$I_0$, v=$V_0$] (0,3)
\draw (0,3) to[short, -*, f=$I_0$] (2,3)
\draw[short, -*] (2,3) -- (0,3);
\end{circuitikz}
And finally, this is still Ti\textit{k}Z, so that you can freely mix other graphics element to the circuit.

\begin{circuitikz}[american, voltage shift =0.5]
\draw (0,0) to[i=I_0, v=V_0] (0,3)
to[short, -, f=I_0] (2,3)
to[R=R_1, f>_>=i_1] (2,0) -- (0,0);
\draw (2,3) -- (4,3)
to[R=R_2, f>_>=i_2] (4,0) to[short, -] (2,0);
\draw[red, thick] (1.5,2.5) rectangle (4.5,3.5)
ode[pos=0.5, above]{KCL};
\end{circuitikz}

\subsection{A more complex tutorial: circuits, Romano style.}

The idea is to draw a two-stage amplifier for a lesson, or exercise, on the different qualities of BJT and MOSFET transistors.

Please Notice that this section uses the “new” position for transistors labels, enabled since version 0.9.7. You should refer to older manuals to see how to do the same with older versions; basically the transistor’s names where put with a different \texttt{node{}} command.

Also notice that this is a more “personal” tutorial, showing a way to draw circuits that is, in the author’s opinion, highly reusable and easy to do. The idea is using relative coordinates and named nodes as much as possible, so that changes in the circuit are easily done by changing keys numbers of position, and crucially, each block is reusable in other diagrams.

First of all, let’s define a handy function to show the position of nodes:

\begin{verbatim}
def normalcoord(#1){coordinate(#1)}
def showcoord(#1){node[circle, red, draw, inner sep=1pt,
  pin={[red, overlay, inner sep=0.5pt, font=\tiny, pin distance=0.1cm,
  pin edge={red, overlay}]45:#1}(#1){}}
let\coord=normalcoord
let\coord=showcoord
\end{verbatim}

The idea is that you can use \texttt{\coord()} instead of \texttt{coordinate()} in paths, and that will draw sort of markers showing them. For example:

\begin{verbatim}
\begin{circuitikz}[american,]
\def
\draw (0,0) node[npn](Q){};
\path (Q.center) \coord(center)
(Q.B) \coord(B) (Q.C) \coord(C)
(Q.E) \coord(E);
\end{circuitikz}
\end{verbatim}

After the circuit is drawn, simply commenting out the second \texttt{let} command will hide all the markers.

So let’s start with the first stage transistor; given that my preferred way of drawing a MOSFET is with arrows, I’ll start with the command \texttt{\ctikzset{tripoles/mos style/arrows}}:
I had to do draw an invisible line to take into account the text for Q1 — the text is not taken into account in calculating the bounding box. This is because the “geographical” anchors (north, north west, ...) are defined for the symbol only. In a complex circuit, this is rarely a problem.

Another thing I like to modify with respect to the standard is the position of the arrows in transistors, which are normally in the middle the symbol. Using the following setting (see section 3.17.5) will move the arrows to the start or end of the corresponding pin.

\begin{circuitikz}{american,}
\ctikzset{transistors/arrow pos=end}
\end{circuitikz}

The tricky thing about \killdepth{} macro is finicky details. Without the \killdepth macro, the labels of different transistor will be adjusted so that the vertical center of the box is at the center anchor, and as an effect, labels with descenders (like Q) will have a different baseline than labels without. You can see this here (it's really subtle):

\begin{circuitikz}{american,}
\draw (0,0) node[nmos](Q1){q1} ++(2,0) node[nmos](M1){m1};
\draw [red] (Q1.center) ++(0,-0.7ex) -- ++(3,0);
\draw (0,-2)node[nmos](Q1){\killdepth{q1}} ++(2,0) node[nmos](M1){\killdepth{m1}};
\draw [red] (Q1.center) ++(0,-0.7ex) -- ++(3,0);
\end{circuitikz}

We will start connecting the first transistor with the power supply with a couple of resistors. Notice that I am naming the nodes GND, VCC and VEE, so that I can use the coordinates to have all the supply rails at the same vertical position (more on this later).
After that, let’s add the input part. I will use a named node here, to refer to it to add the input source. Notice how the ground node is positioned: the coordinate \((\text{in} \mid \text{GND})\) is the point with the horizontal coordinate of \((\text{in})\) and the vertical one of \((\text{GND})\), lining it up with the ground of the capacitor \(C_1\) (you can think it as “the point on the vertical of \(\text{in}\) and the horizontal of \(\text{GND}\)”).

Notice that the only absolute coordinate here is the first one, \((0,0)\); so the elements are connected with relative movements and can be moved by just changing one number (for example, changing \(\text{to}[C=C_1]\) \((0,-1.5)\) will move all the grounds down).

This is the final circuit, with the nodes still marked:

\begin{circuitikz}[american, scale=0.7, transform shape]
\draw (0,0) node[mmos,](Q1)\{\killdepth{Q1}\};
\draw (Q1.S) to[R, l2=\SI{5}{\k\ohm}] ++(0,-3) node[vee](VEE)\{\SI{-10}{V}\};
\draw (Q1.D) to[R, l2=\SI{10}{\k\ohm}] ++(0,3) node[vcc](VCC)\{\SI{10}{V}\};
\draw (Q1.S) to[short] ++(2,0) node[ground](GND)\{\};
\draw (Q1.G) to[short] ++(-1,0) node[ground](GND)\{\};
\draw (Q1.G) to[short] ++(-1,0) node[ground](GND)\{\};
\draw (VCC) \coord(VCC);
\draw (VEE) \coord(VEE);
\end{circuitikz}
\begin{circuitikz} [american] 
\draw (0,0) node[nmos,](Q1){Q1}; 
\draw (Q1.S) to[R, 12\text{\,$\Omega$}, \SI{5}{k\,$\Omega$}] ++(0,-3) node[vee](VEE){$V_{EE}=\SI{-10}{V}$}; 
%define VEE level 
\draw (Q1.S) to[short] ++(2,0) to[C=$C_1$] ++(0,-1.5) node[ground](GND){}; 
\draw (Q1.G) to[short] ++(-1,0) \coord (in) to[R, 12\text{\,$\Omega$}, \SI{1}{M\,$\Omega$}] (in | GND) node[ground]{}; 
\draw (in) to[C, \SI{1}{\mu F}] ++(-1.5,0) node[left]{$v_i=v_{i1}$}; 
\draw (Q1.D) to[R, 12\text{\,$\Omega$}, \SI{10}{k\,$\Omega$}] ++(0,3) node[vcc](VCC){$V_{CC}=\SI{10}{V}$}; 
\draw (Q1.D) to[short, -o] ++(1,0) node[right]{$v_{o1}$}; 
\draw (Q1) to[short] (Q1.C |- VCC) node[vcc]{}; 
\path (vo1) -- ++(2,0) \coord(bjt); 
% \draw (bjt) node[npn, anchor=B](Q2){Q2}; 
\draw (Q2.B) to[short, -o] ++(-0.5,0) node[left]{$v_{i2}$}; 
\draw (Q2.E) to[R, 12\text{\,$\Omega$}, \SI{9.3}{k\,$\Omega$}] (Q2.E |- VEE) node[vee]{}; 
\draw (Q2.E) to[short, -o] ++(1,0) node[right]{$v_{o2}$}; 
\draw (Q2.C) to[short] (Q2.C |- VCC) node[vcc]{}; 
\draw (Q1.D) to[short, -o] ++(1,0) node[right]{$v_{o1}$}; 
% \draw (vo2) ++(1.5,0) \coord(load); 
% \draw (load) to[C=$C_3$] ++(1,0) \coord(tmp) to[R=$R_L$] (tmp |- GND) node[ground]{}; 
\draw [densely dashed] (vo2) -- (load); 
\draw [densely dashed] (vo1) -- (vi2); 
\draw [blockdef](vi1|-VEE) ++(0,-2) \coord(tmp) 
-- node[midway, fill=white]{bloque 1} (vo1|- tmp); 
\draw [blockdef](vi2|-VEE) ++(0,-2) \coord(tmp) 
-- node[midway, fill=white]{bloque 2} (vo2|- tmp); 
\end{circuitikz}
You can see that after having found the place where we want to put the BJT transistor (line 18), we use the option \texttt{anchor=B} so that the base anchor will be put at the coordinate \texttt{bjt}.

Finally, if you like a more compact drawing, you can add the options (for example):

\begin{verbatim}
\begin{circuitikz}[american, scale=0.8] % this will scale only the coordinates
  \ctikzset{resistors/scale=0.7, capacitors/scale=0.6}
  ...
\end{circuitikz}
\end{verbatim}

and you will obtain the following diagram with the exact same code (I just removed the second \texttt{\coord} definition to hide the coordinates markings).
\[ V_{CC} = 10 \text{ V} \]

\[ V_{EE} = -10 \text{ V} \]

Diagram:

- \( Q1 \)
  - \( R_G \) 1 M\( \Omega \)
  - \( R_S \) 5 k\( \Omega \)
  - \( C_1 \)
  - \( v_i = v_{i1} \)
- \( Q2 \)
  - \( R_D \) 10 k\( \Omega \)
  - \( R_E \) 9.3 k\( \Omega \)
  - \( C_3 \)

- \( v_{o1} \) to \( v_{o2} \)
- \( v_{i2} \)
- \( R_L \)

---

bloque 1

bloque 2
3 The components

Components in CircuiTi\kZ come in two forms: path-style, to be used in to path specifications, and node-style, which will be instantiated by a node specification.

3.1 Path-style components

The path-style components are used as shown below:

\begin{circuitikz}
\draw (0,0) to[#1=#2, #options] (2,0);
\end{circuitikz}

where #1 is the name of the component, #2 is an (optional) label, and options are optional labels, annotations, style specifier that will be explained in the rest of the manual.

Transistors and some other node-style components can also be placed using the syntax for bipoles. See section 3.17.8.

Most path-style components can be used as a node-style components; to access them, you add a shape to the main name of component (for example, diodeshape). Such a “node name” is specified in the description of each component.

3.1.1 Anchors

Normally, path-style components do not need anchors, although they have them just in case you need them. You have the basic “geographical” anchors (bipoles are defined horizontally and then rotated as needed):

center
left
right
north west
north
north east
east
south east
south
south west
west
north west

In the case of bipoles, also shortened geographical anchors exists. In the description, it will be shown when a bipole has additional anchors. To use the anchors, just give a name to the bipole element.

\begin{circuitikz}
\draw (0,0) to[potentiometer, name=P, mirror] ++(0,2);
\draw (P.wiper) to[L] ++(2,0);
\end{circuitikz}

Alternatively, that you can use the shape form, and then use the left and right anchors to do your connections.

\begin{circuitikz}
\draw (0,0) node[potentiometershape, rotate=-90](P){};
\draw (P.wiper) to[L] ++(2,0);
\end{circuitikz}
3.1.2 Customization

Pretty much all CircuiTi\textregistered Z relies heavily on \texttt{pgfkeys} for value handling and configuration. Indeed, at the beginning of \texttt{circuitikz.sty} and in the file \texttt{pgfcirc.define.tex} a series of key definitions can be found that modify all the graphical characteristics of the package.

All can be varied using the \texttt{\ctikzset} command, anywhere in the code.

Note that the details of the parameters that are not described in the manual can change in the future, so be ready to use a fixed version of the package (the ones with the specific number, like \texttt{circuitikz-0.9.3}) if you dig into them.

3.1.2.1 Components size Perhaps the most important parameter is \texttt{bipoles/length} (default 1.4 cm), which can be interpreted as the length of a resistor (including reasonable connections): all other lengths are relative to this value. For instance:

```
\begin{circuitikz}[scale=1]
\draw
(0,0) node[anchor=east] {B} to[short, o-*] (1,0) to[R=20<\ohm>, *-*] (1,2) to[R=10<\ohm>, v=$v_x$] (3,2) -- (4,2) to[cI=$\frac{\si{\siemens}}{5} v_x$, *-*] (4,0) -- (3,0) to[R=5<\ohm>, *-*] (3,2) (3,0) -- (1,0) (1,2) to[short, -o] (0,2) node[anchor=east] {A};\end{circuitikz}
```

\begin{figure}
\centering
\includegraphics[width=0.5\textwidth]{circuit}
\caption{Example circuit diagram with variable bipoles/length.}
\end{figure}
\begin{circuitikz}[scale=1.2]
draw (0,0) node[anchor=east] {B} to[short, o-*] (1,0) to[R=20<\ohm>, *-*] (1,2) to[R=10<\ohm>, v=$v_x$] (3,2) -- (4,2) 
\draw (3,0) -- (1,0) 
to[v=$\frac{\siemens}{5} v_x$, *-*] (4,0) -- (3,0) 
\draw (3,0) -- (1,0) 
to[R=5<\ohm>, *-*] (3,2)
(1,2) to[short, -o] (0,2) node[anchor=east]{A}
\end{circuitikz}

The changes on \texttt{bipoles/length} should, however, be globally applied to every path, because they affect every element — including the poles. So you can have artifacts like these:

\begin{circuitikz}
\bigR/.style={R, bipoles/length=3cm}
\draw (0,3) to [\bigR, o-o] ++(4,0);
\draw (0,1.5) to [\bigR, o-o] ++(4,0) to[R, o-o] ++(2,0); % will fail here 
\draw (0,0) to [R, o-o] ++(4,0);
\end{circuitikz}

Several groups of components, on the other hand, have a special \texttt{scale} parameter that can be used safely in this case (starting with 0.9.4 — more groups of components will be added going forward); the key to use will be explained in the specific description of the components. For example, in the case of resistors you have \texttt{resistors/scale} available:

\begin{circuitikz}
\bigR/.style={R, resistors/scale=1.8}
\draw (0,3) to [\bigR, o-o] ++(4,0);
\draw (0,1.5) to [\bigR, o-o] ++(4,0) to[R, o-o] ++(2,0); % ok now 
\draw (0,0) to [R, o-o] ++(4,0);
\end{circuitikz}

\subsection{3.1.2.2 Thickness of the lines (globally)}

The best way to alter the thickness of components is using styling, see section 3.3.3. Alternatively, you can use “legacy” classes like \texttt{bipole}, \texttt{tripoles} and so on — for example changing the parameter \texttt{bipoles/thickness} (default 2). The number is relative to the thickness of the normal lines leading to the component.
3.1.2.3 Shape of the components  (on a per-component-class basis)
The shape of the components are adjustable with a lot of parameters; in this manual we will comment the main ones, but you can look into the source files specified above to find more.

It is recommended to use the styling parameters to change the shapes; they are not so fine grained (for example, you can change the width of resistor, not the height at the moment), but they are more stable and coherent across your circuit.

3.1.3 Descriptions
The typical entry in the component list will be like this:

where you have all the needed information about the bipole, with also no-standard anchors. If the component can be filled it will be specified in the description. In addition, as an example, the component shown will be filled with the option \texttt{fill=cyan!30!white}:

The \textit{Class} of the component (see section 3.3) is printed at the end of the description.
3.2 Node-style components

Node-style components (monopoles, multipole) can be drawn at a specified point with this syntax, where #1 is the name of the component:

\begin{circuitikz}
\draw (0,0) node[#1,#2] (#3) {#4};
\end{circuitikz}

Explanation of the parameters:
#1: component name\(^3\) (mandatory)
#2: list of comma separated options (optional)
#3: name of an anchor (optional)
#4: text written to the text anchor of the component (optional)

Most path-style components can be used as a node-style components; to access them, you add a shape to the main name of component (for example, diodeshape). Such a “node name” is specified in the description of each component.

Notice: Nodes must have curly brackets at the end, even when empty. An optional anchor (#3) can be defined within round brackets to be addressed again later on. And please don’t forget the semicolon to terminate the \draw command.

Also notice: If using the \tikzexternalize feature, as of Tikz 2.1 all pictures must end with \end{tikzpicture}. Thus you cannot use the circuitikz environment.
Which is ok: just use the environment tikzpicture: everything will work there just fine.

3.2.1 Mirroring and flipping

Mirroring and flipping of node components is obtained by using the Ti\kz\ keys xscale and yscale.
Notice that this parameters affect also text labels, so they need to be un-scaled by hand.

\begin{circuitikz}[scale=0.7, transform shape]
\draw (0,3) node[op amp]{OA1};
\draw (3,3) node[op amp, xscale=-1]{OA2};
\draw (0,0) node[op amp]{OA3};
\draw (3,0) node[op amp, xscale=-1]{OA4};
\end{circuitikz}

To simplify this task, Circui\kz\ when used in \La\TeX\ has three helper macros — \ctikzflipx{}, \ctikzflipy{}, and \ctikzflipxy{}, that can be used to “un-rotate” the text of nodes drawn with, respectively, xscale=-1, yscale=-1, and scale=-1 (which is equivalent to xscale=-1, yscale=-1). In other formats they are undefined; contributions to fill the gap are welcome.

\(^3\)For using bipoles as nodes, the name of the node is \#1shape.
3.2.2 Anchors

Node components anchors are variable across the various kind of components, so they will described better after each category is presented in the manual.

3.2.3 Descriptions

The typical entry in the component list will be like this:

Cute spdt down with arrow, type: node (node[cute spdt down arrow]{}). Class: switches.

NPN, TYPE: NODE (node[npn]{}). Class: transistors.

All the shapes defined by CircuiTiKZ. These are all pgf nodes, so they are usable in both pgf and TiKZ. If the component can be filled it will be specified in the description. In addition, as an example, the component shown will be filled with the option fill=cyan!30!white:

Plain amplifier, type: node, fillable (node[plain amp]{}). Class: amplifiers.

Sometime, components will expose internal (sub-)shapes that can be accessed with the syntax <node name>-<internal node name> (a dash is separating the node name and the internal node name); that will be shown in the description as a blue “anchor”:

Rotary switch, type: node (node[rotaryswitch](N){}). Class: switches.

The Class of the component (see section 3.3) is printed at the end of the description.
3.3 Styling circuits and components

You can change the visual appearance of a circuit by using a circuit style different from the default. For styling the circuit, the concept of class of a component is key: almost every component has a class, and a style change will affect all the components of that class.

Let’s see the effect over a simple circuit.¹

```latex
\begin{Verbatim}
1 \def\killdepth\#1{\{\raisebox{0pt}[height][0pt]{\#1}}
2 \newcommand{\bjtname}[1]{$(#1.C)!0.5!(#1.E)$ node[anchor=west]\{\killdepth\#1}}
3 \begin{circuitikz}[american, cute inductors]
4 \node [op amp](A1){texttt{OA1}};
5 \draw (A1.-) to[short] ++(0,1) coordinate(tmp) to[R, l_=$R$] (tmp -| A1.out) to[short] (A1.out);
6 \draw (A1.+ to[battery2, invert] ++(0,-2.5) to[ground] (A1.out);
7 \draw (A1.-) to[C=$C$] (tmp -| A1.out) to[short] (A1.out);
8 \draw (A1.+) to[vcc] ++(0,2.5) node[ground](GND){};
9 \draw (A1.+) to[L=$L$] ++(-2,0) coordinate(tmp) to[vcc, l=$v_s$, fill=yellow](tmp |-GND) node[ground]{};
10 \draw (A1.out) to[R=$R_s$] ++(2,0) coordinate(bb) to[I, l_=$I_B$, invert] ++(0,2) node[vee](VEE){};
11 \draw (bb) to[\bjtname{Q1}](Q1);
12 \draw (bb1) to[\bjtname{Q2}](Q2);
13 \draw (Q1.E) -- (Q2.E) ($Q1.E)+0.5*(Q2.E)$ to[short, +++, name=S] node[right]{$v_{o_Q}$};
14 \draw (S.s) to[european resistor, l=$Z_L$] (S.s |- GND) node[ground]{};
15 \draw (Q1.C) -- (Q1.C|-VCC) node[vcc]{\SI{5}{V}};
16 \draw (Q2.C) -- (Q2.C|-VEE) node[vee]{\SI{-5}{V}};
17 \end{circuitikz}
\end{Verbatim}

This code, with the default parameters, will render like the following image.

![Circuit Diagram](image)

3.3.1 Relative size

Component size can be changed globally (see section 3.1.2.1), or you can change their relative size by scaling a family of components by setting the key \texttt{class/scale}; for example, you can change the size of all the diodes in your circuit by setting \texttt{diodes/scale} to something different from the default 1.0.

Remember that if you use a global scale (be sure to read section 1.7!) you change the coordinate only, so using \texttt{scale=0.8} in the environment options you have:

¹This is a just an example, the circuit is not intended to be functional.
If you want to scale all the circuit, you have to use also transform shape:

Using relative sizes as described in section 3.1.2.1 enables your style for the circuit. For example, setting:

```latex
\ctikzset{resistors/scale=0.8, \% smaller R
  capacitors/scale=0.7, \% even smaller C
  diodes/scale=0.6, \% small diodes
  transistors/scale=1.3} \% bigger BJTs
```

Will result in a (much more readable in Romano's opinion) circuit:
Warning: relative scaling is meant to work for a reasonable range of stretching and shortening, so try to keep your scale parameter in the 0.5 to 2.0 range (more or less). Bigger or smaller value can result in awkward shapes.

3.3.2 Fill color

You can also set a default fill color for the components. You can use the keys \texttt{class/fill} (which defaults to \texttt{none}, no fill, i.e. transparent component) for all fillable components in the library.

If you add to the previous styles the following commands:

\begin{verbatim}
\ctikzset{
  amplifiers/fill=cyan,
  sources/fill=green,
  diodes/fill=red,
  resistors/fill=violet,
}
\end{verbatim}

you will have the following circuit (note that the first generator is explicitly set to be yellow, so if will not be colored green!):

Please use this option with caution. Although two-color circuits can be nice, using more than that can become rapidly unbearable. Old textbooks used the two-color style quite extensively, filling
with a kind of light blue like \texttt{blue!30!white} “closed” components, but that was largely to hinder black-and-white photocopying...

### 3.3.3 Line thickness

You can change the line thickness for any class of component in an independent way. The default standard thickness of components is defined on a loose “legacy” category (like \texttt{bipoles}, \texttt{tripoles} and so on, see section 3.1.2.2); to override that you set the key \texttt{class/thickness} to any number. The default is \texttt{none}, which means that the old way of selecting thickness is used.

For example, \textit{amplifiers} have the legacy class of \texttt{tripoles}, as well as transistors and tubes. By default they are drawn with thickness 2 (relative to the base linewidth). To change them to be thicker, you can for example add to the previous style

\begin{verbatim}
\ctikzset{amplifier/thickness=4}
\end{verbatim}

\textbf{Caveat:} not every component has a “class”, so you have to play with the available ones (it’s specified in the component description) and with the absolute values to have the circuit following your taste. A bit of experimentation will create a kind of \textit{style options} that you could use in all your documents.

### 3.3.4 Style files

When using styles, it is possible to use \textit{style files} (see section 3.3.5), that then you can load with the command \texttt{\ctikzloadstyle}. For example, in the distribution you have a number of style files: \texttt{legacy}, \texttt{romano}, \texttt{example}. When you load a style name \texttt{name}, you will have available a style called \texttt{name circuit style} that you can apply to your circuits. The last style loaded is not enacted — you have to explicitly do it if you want the style used by default, by putting for example in the preamble:

\begin{verbatim}
\ctikzloadstyle{romano}
\tikzset{romano circuit style}
\end{verbatim}

Please notice that the style is at \texttt{TikZ} level, not \texttt{CircuitiTikZ} — that let’s you use it in the top option of the circuit, like:

\begin{verbatim}
\begin{circuitikz}[legacy circuit style,
    ..., ]
    ...
\end{circuitikz}
\end{verbatim}
If you just want to use one style, you can load and activate it in one command with
\ctikzsetstyle{romano}

The example style file will simply make the amplifiers filled with light blue:

\begin{circuitikz}
\draw (0,0) node[op amp] {OA1};
\end{circuitikz}
\ctikzloadstyle{example}
\begin{circuitikz}[example circuit style]
\draw (0,0) node[op amp] {OA1};
\end{circuitikz}

The styles legacy is a style that set (most) of the style parameters to the default, and romano is a style used by one of the authors; you can use these styles as is or you can use them to learn to how to write new file style following the instructions in section 3.3.5. In the next diagrams, the left hand one is using the romano circuit style and the right hand one the legacy style.

\begin{circuitikz}
\draw (0,0) node[op amp] {OA1};
\end{circuitikz}
\ctikzset{example circuit style/.style={
\circuitikzbasekey/.cd,
amplifiers/fill=blue!20!white,
},% end .style
]% end \ctikzset
\endinput

This kind of style will add to the existing style. If you want to have a style that substitute the current style, you should do like this:
3.4 Grounds and supply voltages

3.4.1 Grounds

For the grounds, the \texttt{center} anchor is put on the connecting point of the symbol, so that you can use them directly in a \texttt{path} specification.

\begin{center}
\begin{tabular}{|l|}
\hline
\textbf{Ground, type: node (node[ground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Tailless ground, type: node (node[tlground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Reference ground, type: node (node[rground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Signal ground, type: node, fillable (node[sground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Thicker tailless reference ground, type: node (node[tground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Noiseless ground, type: node (node[nground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Protective ground, type: node, fillable (node[pground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{Chassis ground\textsuperscript{5}, type: node (node[cground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{European style ground, type: node (node[eground]{}). Class: \texttt{grounds}.} \\
\hline
\textbf{European style ground, version 2\textsuperscript{6}, type: node (node[eground2]{}). Class: \texttt{grounds}.} \\
\hline
\end{tabular}
\end{center}

\textsuperscript{5}These last three were contributed by Luigi «Liverpool»

\textsuperscript{6}These last two were contributed by @fotesan
3.4.1.1 Grounds anchors  Anchors for grounds are a bit strange, given that they have the center spot at the same location than north and all the ground will develop “going down”:

3.4.1.2 Grounds customization  You can change the scale of these components (all the ground symbols together) by setting the key grounds\/scale (default 1.0).

3.4.2 Power supplies

\begin{circuitikz}
\def\coord(#1){\showcoord(#1)<0:0.3>}
\draw (0,0)
node[vcc](vcc){VCC} \coord(vcc) ++(2,0)
node[vee](vee){VEE} \coord(vee);
\ctikzset{monopoles/vcc/arrow={Stealth[red, width=6pt, length=9pt]}}
\ctikzset{monopoles/vee/arrow={Latex[blue]}}
\draw (0,-2)
node[vcc](vcc){VCC} \coord(vcc) ++(2,0)
node[vee](vee){VEE} \coord(vee);
\end{circuitikz}

The power supplies are normally drawn with the arrows shown in the list above.

3.4.2.1 Power supply anchors  They are similar to grounds anchors, and the geographical anchors are correct only for the default arrow.

3.4.2.2 Power supplies customization  You can change the scale of the power supplies by setting the key power supplies\/scale (default 1.0).

Given that the power supply symbols are basically arrows, you can change them using all the options of the arrows.meta package (see the TikZ manual for details) by changing the keys monopoles/vcc/arrow and monopoles/vee/arrow (the default for both is legacy, which will use the old code for drawing them). Note that the anchors are at the start of the connecting lines, and that geographical anchors are just approximation if you change the arrow symbol!

\begin{circuitikz}
\def\coord(#1){\showcoord(#1)<0:0.3>}
\draw (0,0)
node[vcc](vcc){VCC} \coord(vcc) ++(2,0)
node[vee](vee){VEE} \coord(vee);
\ctikzset{monopoles/vcc/arrow={Stealth[red, width=6pt, length=9pt]}}
\ctikzset{monopoles/vee/arrow={Latex[blue]}}
\draw (0,-2)
node[vcc](vcc){VCC} \coord(vcc) ++(2,0)
node[vee](vee){VEE} \coord(vee);
\end{circuitikz}
However, arrows in Ti\textit{kZ} are in the same class with the line thickness, so they do not scale with neither the class \texttt{power supplies} scale nor the global scale parameter (you should use \texttt{transform canvas={scale...}} for this).

If you want that the arrows behave like the legacy symbols (which are shapes), \textit{only in the arrow definitions}, you can use the special length parameter \texttt{\textbackslash scaledwidth}\footnote{Thanks to @Schrödinger's cat on \texttt{\LaTeX} stackexchange site} in the arrow definition, which correspond to the width of the legacy \texttt{vcc} or \texttt{vee}. Compare the effects on the following circuit.

\begin{circuitikz}

\node [ocirc](TW) at (0,0) {};
\draw (TW.east) -- ++(1,0) node[midway, above]{$v_i$} node[op amp, anchor=-](A1){};
\draw (A1.up) -- ++(0, 0.3) node[vcc]{\SI{+10}{V}};
\draw (A1.down) -- ++(0,-0.3) node[vee]{\SI{-10}{V}};
\draw (A1.+) -- ++(-0.5,0) to[battery2, invert, l_={\SI{2}{V}}] ++(0,-1) node[ground]{};
\draw (A1.out) to[short, -o] ++(0.5,0) node[above](vo){$v_o$};
\end{circuitikz}

\begin{circuitikz}[baseline=(vo.center), scale=0.6, transform shape]

\node [ocirc](TW) at (0,0) {};
\draw (TW.east) -- ++(1,0) node[midway, above]{$v_i$} node[op amp, anchor=-](A1){};
\draw (A1.up) -- ++(0, 0.3) node[vcc]{\SI{+10}{V}};
\draw (A1.down) -- ++(0,-0.3) node[vee]{\SI{-10}{V}};
\draw (A1.+) -- ++(-0.5,0) to[battery2, invert, l_={\SI{2}{V}}] ++(0,-1) node[ground]{};
\draw (A1.out) to[short, -o] ++(0.5,0) node[above](vo){$v_o$};
\end{circuitikz}

\subsection{Resistive bipoles}

\begin{table}
\centering
\begin{tabular}{|c|}
\hline
\textbf{short:} Short circuit, type: path-style, nodename: shortshape. Class: default. \\
\hline
\textbf{open:} Open circuit, type: path-style, nodename: openshape. Class: default. \\
\hline
\textbf{generic:} Generic (symmetric) bipole, type: path-style, fillable, nodename: genericshape. Class: resistors. \\
\hline
\end{tabular}
\end{table}
xgeneric: Crossed generic (symmetric) bipole, type: path-style, fillable, nodename: xgenericshape. Class: resistors.

If americanresistors option is active (or the style [american resistors] is used; this is the default for the package), the resistors are displayed as follows:

If instead europeanresistors option is active (or the style [european resistors] is used), the resistors, variable resistors and potentiometers are displayed as follows:

Other miscellaneous resistor-like devices:
3.5.1 Potentiometers: wiper position

Since version 0.9.5, you can control the position of the wiper in potentiometers using the key `wiper pos`, which is a number in the range [0,1]. The default middle position is `wiper pos=0.5`.

```latex
\begin{circuitikz}[american]
\ctikzset{resistors/width=1.5, resistors/zigs=9}
\draw (0,0) to[pR, name=A] ++(0,-4);
\draw (1.5,0) to[pR, wiper pos=0.3, name=B] ++(0,-4);
\ctikzset{european resistors}
\draw (3,0) to[pR, wiper pos=0.8, name=C] ++(0,-4);
\foreach i in {A, B, C}
  \node[right] at (i.wiper) {i};
\end{circuitikz}
```

3.5.2 Generic sensors anchors

Generic sensors have an extra anchor named `label` to help position the type of dependence, if needed:

```latex
\begin{circuitikz}
 \draw (0,2) to[sR, l=$R$, name=mySR] ++(3,0);
 \node [font=\tiny, right] at(mySR.label) {-t\si{\degree}};
 \draw (0,0) to[sL, l=$L$, name=mySL] ++(3,0);
 \node [draw, circle, inner sep=2pt] at(mySL.label) {};
 \draw (0,-2) to[sC, l=$C$, name=mySC] ++(3,0);
 \node [font=\tiny, below right, inner sep=0pt] at(mySC.label) {+H\si{\%}};
\end{circuitikz}
```

The anchor is positioned just on the corner of the segmented line crossing the component.
3.5.3 Resistive components customization

You can change the scale of these components (all the resistive bipoles together) by setting the key \texttt{resistors/scale} (default 1.0). Similarly, you can change the widths by setting \texttt{resistors/width} (default 0.8).

You can change the width of these components (all the resistive bipoles together) by setting the key \texttt{resistors/width} to something different from the default 0.8.

For the american style resistors, you can change the number of “zig-zags” by setting the key \texttt{resistors/zigs} (default value 3).

```
\begin{circuitikz}
\longpot/.style = {pR, resistors/scale=0.75, resistors/width=1.6, resistors/zigs=6}]
\draw (0,1.5) to[R, l=$R$] ++(4,0);
\draw (0,0) to[longpot, l=$P$] ++(4,0);
\ctikzset{resistors/scale=1.5}
\draw (0,-1.5) to[R, l=$R$] ++(4,0);
\end{circuitikz}
```

3.6 Capacitors and inductors: dynamical bipoles

3.6.1 Capacitors

There is also the (deprecated\textsuperscript{8} — its polarity is not coherent with the rest of the components) \texttt{polar capacitor}:

\textsuperscript{8}Thanks to Anshul Singhv for noticing.

3.6.2 Capacitive sensors anchors

For capacitive sensors, see section 3.5.2.

3.6.3 Capacitors customizations

You can change the scale of the capacitors by setting the key capacitors/scale to something different from the default 1.0.

3.6.4 Inductors

If the cuteinductors option is active (default behaviour), or the style [cute inductors] is used, the inductors are displayed as follows:

midtap

label

If the americaninductors option is active (or the style [american inductors] is used), the inductors are displayed as follows:

midtap

label

Finally, if the europeaninductors option is active (or the style [european inductors] is used), the inductors are displayed as follows:
### 3.6.5 Inductors customizations

You can change the scale of the inductors by setting the key `inductors/scale` to something different from the default 1.0.

You can change the width of these components (all the inductors together, unless you use style or scoping) by setting the key `inductors/width` to something different from the default, which is 0.8 for American and European inductors, and 0.6 for cute inductors.

Moreover, you can change the number of “coils” drawn by setting the key `inductors/coils` (default value 5 for cute inductors and 4 for American ones). **Notice** that the minimum number of coils is 1 for American inductors, and 2 for cute ones.

Chokes (which comes only in the `cute` style) can have single and double lines, and can have the line thickness adjust (the value is relative to the thickness of the inductor).
3.6.6 Inductors anchors

For inductive sensors, see section 3.5.2.

Inductors have an additional anchor, called midtap, that connects to the center of the coil “wire”. Notice that this anchor could be on one side or the other of the component, depending on the number of loops of the element; if you need a fixed position, you can use the geographical anchors.

\begin{circuitikz}
\begin{scope}
\draw (0,2) to[L, loops=5, name=A] ++(2,0);
\draw (0,0) to[L, loops=6, name=B] ++(2,0);
\draw (0,2) to[L, loops=5, name=C] ++(2,0);
\draw (0,0) to[L, loops=6, name=D] ++(2,0);
\foreach \i in {A, B, C, D} \node[circle, fill=red, inner sep=1pt] at (\i.midtap){};
\end{scope}
\end{circuitikz}

3.7 Diodes and such

There are three basic styles for diodes: empty (fillable in color), full (completely filled with the draw color) and stroke (empty, but with a line across them).

You can switch between the styles setting the key diode (for example \ctikzset{diode=full} or empty or stroke, or with the styles full diodes, empty diodes and stroke diodes.

To use the default element, simply use the name shown for the empty diodes without the final “o” — that is D, sD, and so on. The names shown in the following tables will draw the specified diode independently on the style chosen (that is, leD* is always a full LED diode).

The package options fulldiode, strokediode, and emptydiode (and the styles [full diodes], [stroke diodes], and [empty diodes]) define which shape will be used by abbreviated commands such that D, sD, zD, tD, pD, leD, VC, Ty,Tr (no stroke symbol available!).

<table>

3.7.1 Tripole-like diodes

The following tripoles are entered with the usual command, of the form `to[Tr, ...].`
### 3.7.2 Triacs anchors

When inserting a thyristor, a triac or a potentiometer, one needs to refer to the third node-gate \( G \) for the former two; wiper \( W \) for the latter one. This is done by giving a name to the bipole:

\begin{verbatim}
\begin{circuitikz} 
\draw (0,0) to[Tr, n=TRI] (2,0) to[pR, n=POT] (4,0); \draw[dashed] (TRI.G) -| (POT.wiper); \end{circuitikz}
\end{verbatim}

### 3.7.3 Diode customizations

You can change the scale of the diodes by setting the key `diodes/scale` to something different from the default 1.0. In Romano’s opinion, diodes are somewhat big with the default style of the package, so a setting like `\ctikzset{diode/scale=0.6}` is recommended.

\begin{verbatim}
\begin{circuitikz}
\draw (0,1) to[D, l=$D$] ++(2,0) node[npn, anchor=B]{}; \ctikzset{diodes/scale=0.6}
\draw (0,-1) to[D, l=$D$] ++(2,0) node[npn, anchor=B]{}; \end{circuitikz}
\end{verbatim}

You can change the direction of the LEDs and photodiodes’ arrows by using the binary keys `led arrows from cathode` and `pd arrows to cathode` (the default are `led arrows from anode` and `pd arrows to anode`), as you can see in the following example.
\begin{circuitikz}
\ctikzset{led arrows from anode} % default
\ctikzset{pd arrows to anode} % default
\ctikzset{full diodes}
\draw (0,0) to[leD] ++(1.5,0) to[pD] ++(1.5,0);
\ctikzset{stroke diodes}
\draw (0,-1) to[leD] ++(1.5,0) to[pD] ++(1.5,0);
\ctikzset{empty diodes}
\draw (0,-2) to[leD] ++(1.5,0) to[pD] ++(1.5,0);
\ctikzset{led arrows from cathode}
\ctikzset{pd arrows to cathode}
\ctikzset{full diodes}
\draw (0,-4) to[leD] ++(1.5,0) to[pD] ++(1.5,0);
\ctikzset{stroke diodes}
\draw (0,-5) to[leD] ++(1.5,0) to[pD] ++(1.5,0);
\ctikzset{empty diodes}
\draw (0,-6) to[leD] ++(1.5,0) to[pD] ++(1.5,0);
\end{circuitikz}

3.8 Sources and generators

Notice that source and generators are divided in three classes that can be styled independently: traditional battery symbols (class \texttt{batteries}), independent generators (class \texttt{sources}) and dependent generators (class \texttt{csources}). This is because they are often treated differently, and so you can choose to, for example, fill the dependent sources but not the independent ones.

3.8.1 Batteries

\begin{center}
\begin{tabular}{|c|}
\hline
\textbf{battery}: Battery, type: path-style, nodename: batteryshape. Class: batteries. \\
\hline
\textbf{battery1}: Single battery cell, type: path-style, nodename: battery1shape. Class: batteries.
\hline
\textbf{battery2}: Single battery cell, type: path-style, nodename: battery2shape. Class: batteries.
\hline
\end{tabular}
\end{center}

3.8.2 Stationary sources

\begin{center}
\begin{tabular}{|c|}
\hline
\textbf{european voltage source}: Voltage source (european style), type: path-style, fillable, nodename: vsourceshape. Class: sources.
\hline
\textbf{cute european voltage source}: Voltage source (cute european style), type: path-style, fillable, nodename: vsourceCshape. Aliases: vsourceC, ceV. Class: sources.
\hline
\end{tabular}
\end{center}
3.8.3 Sinusoidal sources

These two are basically the same symbol; to distinguish among them, you have to add a label, which will be a voltage or a current.

\begin{circuitikz}[american]
\draw (0,0) to[sV=$V$] ++(3,0);
\draw (0,1) to[sI=$I$] ++(3,0);
\end{circuitikz}
### 3.8.4 Controlled sources

- **European controlled voltage source**: Controlled voltage source (European style), type: path-style, fillable, nodename: cvsource. Class: csources.

- **Cute European controlled voltage source**: Voltage source (cute European style), type: path-style, fillable, nodename: cvsourceCshape. Aliases: cvsourceC, cceV. Class: csources.

- **American controlled voltage source**: Controlled voltage source (American style), type: path-style, fillable, nodename: cvsourceAMshape. Class: csources.

- **European controlled current source**: Controlled current source (European style), type: path-style, fillable, nodename: cisource. Class: csources.

- **American controlled current source**: Controlled current source (American style), type: path-style, fillable, nodename: cisourceAMshape. Class: csources.

If (default behaviour) `european currents` option is active (or the style [European currents] is used), the shorthands `controlled current source`, `cisource`, and `cI` are equivalent to `European controlled current source`. Otherwise, if `american currents` option is active (or the style [American currents] is used) they are equivalent to `American controlled current source`.

Similarly, if (default behaviour) `european voltages` option is active (or the style [European voltages] is used), the shorthands `controlled voltage source`, `cvsource`, and `cV` are equivalent to `European controlled voltage source`. Otherwise, if `american voltages` option is active (or the style [American voltages] is used) they are equivalent to `American controlled voltage source`.

The following two behave like the corresponding independent sources, see section 3.8.3.
3.8.5 Noise sources

In this case, the “direction” of the source is undefined. Noise sources are filled in gray by default, but if you choose the dashed style, they become fillable.

You can change the fill color with the key `circuitikz/bipoles/noise sources/fillcolor`:

```plaintext
\begin{circuitikz}
\draw(0,0) to [nV, l=$e_n$] ++(2,0);
\draw(0,-2) to [nI, l=$i_n$] ++(2,0);
\begin{scope}[circuitikz/bipoles/noise sources/fillcolor=red!50]
\draw(3,0) to [nV, l=$e_n$] ++(2,0);
\draw(3,-2) to [nI, l=$i_n$] ++(2,0);
\end{scope}
\end{circuitikz}
```

If you prefer a patterned noise generator (similar to the one you draw by hand) you can use the fake color `dashed`:

```plaintext
\begin{circuitikz}
\draw(0,0) to [nV, l=$e_n$] ++(2,0);
\draw(0,-2) to [nI, l=$i_n$] ++(2,0);
\begin{scope}[circuitikz/bipoles/noise sources/fillcolor=dashed]
\draw(3,0) to [nV, l=$e_n$] ++(2,0);
\draw(3,-2) to [nI, l=$i_n$] ++(2,0);
\end{scope}
\end{circuitikz}
```

Notice that if you choose the dashed style, the noise sources are fillable:
\begin{circuitikz}
\ctikzset{bipoles/noise sources/fillcolor=dashed}
\draw(0,0) to [nV, l=$e_n$] ++(2,0);
\draw(0,-2) to [nI, l=$i_n$] ++(2,0);
\begin{scope}
\draw(3,0) to [nV, l=$e_n$, fill=yellow!50!red] ++(2,0);
\draw(3,-2) to [nI, l=$i_n$, fill=blue!50!white] ++(2,0);
\end{scope}
\end{circuitikz}

3.8.6 Special sources

3.8.7 DC sources

The size of the broken part of the DC current source is configurable by changing the value of bipoles/dcisource/angle (default 80); values must be between 0 (no circle at all, probably not useful) and 90 (full circle, again not useful).
3.8.8 Sources customizations

You can change the scale of the batteries by setting the key `batteries/scale`, for the controlled (dependent) sources with `csources/scale`, and for all the other independent sources and generators with `sources/scale`, to something different from the default 1.0.

The symbols drawn into the **American voltage source** can be changed by using the `\ctikzset` keys `bipoles/vsourceam/inner plus` and `bipoles/vsourceam/inner minus` (by default they are $+$ and $-$ respectively, in the current font), and move them nearer of farther away by twiddling `bipoles/vsourceam/margin` (default 0.7, less means nearer).

Moreover, you can move the two symbols nearer of farther away by twiddling `bipoles/vsourceam/margin` (default 0.7, less means nearer).

You can do the same with the **American controlled voltage sources**, substituting `cvsourceam` to `vsourceam` (notice the initial “c”).

3.9 Instruments
3.9.1 Instruments customizations

You can change the scale of all the instruments (including the current loops) by setting the key `instruments/scale` to something different from the default 1.0.

---

10Suggested by @nobrl on GitHub
3.9.2 Rotation-invariant elements

The \texttt{oscope} element will not rotate the “graph” shown with the component:

\begin{circuitikz}
\foreach a in {0,45,...,350} {
\draw (0,0) to[oscope] (a:3);
}
\end{circuitikz}

The \texttt{rmeter}, \texttt{rmeterwa}, and \texttt{smeter} have the same behavior.

However, if you prefer that the \texttt{oscope}, \texttt{rmeter}, \texttt{smeter} and \texttt{rmeterwa} instruments rotate the text or the diagram, you can use the key or style \texttt{rotated instruments} (the default style is \texttt{straight instruments}).

\begin{circuitikz}[scale=0.8, transform shape]
\ctikzset{rotated instruments}
% new default
\draw (0,0) to[oscope] ++(0:3);
\draw (0,0) to[oscope] ++(60:3);
\draw (0,0) to[rmeter, t=A] ++(120:3);
% local override
\draw (0,0) to[rmeterwa, t=A, straight instruments] ++(180:3);
\ctikzset{straight instruments}
% back to default
\draw (0,0) to[rmeterwa, t=A] ++(240:3);
% local override
\draw (0,0) to[smeter, t=A, rotated instruments] ++(300:3);
\end{circuitikz}

3.9.3 Instruments as node elements

The node-style usage of the \texttt{oscope} is also interesting, using the additional \texttt{in 1} and \texttt{in 2} anchors; notice that in this case you can use the text content of the node to put labels above it. Moreover, you can change the size of the oscilloscope by changing \texttt{bipoles/oscope/width} and \texttt{bipoles/oscope/height} keys (which both default to 0.6).

\begin{circuitikz}[scale=0.8, transform shape]
\ctikzset{rotated instruments}
% new default
\draw (0,0) to[oscope] ++(0:3);
\draw (0,0) to[oscope] ++(60:3);
\draw (0,0) to[rmeter, t=A] ++(120:3);
% local override
\draw (0,0) to[rmeterwa, t=A, straight instruments] ++(180:3);
\ctikzset{straight instruments}
% back to default
\draw (0,0) to[rmeterwa, t=A] ++(240:3);
% local override
\draw (0,0) to[smeter, t=A, rotated instruments] ++(300:3);
\end{circuitikz}
3.9.4 Measuring voltage and currents, multiple ways

This is the classical (legacy) option, with the voltmeter and ammeter. The problem is that elements are intrinsically horizontal, so they look funny if put in vertically.

So the solution is often changing the structure to keep the meters in horizontal position.

Since version 0.9.0 you have more options for the measuring instruments. You can use the generic \texttt{rmeterwa} (round meter with arrow), to which you can specify the internal symbol with the option \texttt{t=}... (and is fillable).

This kind of component will keep the symbol horizontal, whatever the orientation:
The plain `rmeter` is the same, without the measuring arrow:

```
\begin{circuitikz}[american]
\draw (0,0) -- ++(1,0) to[R] ++(2,0)
to [rmeter, t=A, i=$i$] ++(0,-2) node[ground]{};
\draw (1,0) to [rmeter, t=V, v=$v$] ++(0,-2) node[ground]{};
\end{circuitikz}
```

If you prefer it, you have the option to use square meters, in order to have more visual difference from generators:

```
\begin{circuitikz}[american]
\draw (0,0) -- ++(1,0) to[R] ++(2,0)
to [smeter, t=A, i=$i$] ++(0,-2) node[ground]{};
\draw (1,0) to [smeter, t=V, v=$v$] ++(0,-2) node[ground]{};
\end{circuitikz}
```

Another possibility is to use QUCS\textsuperscript{11}-style probes, which have the nice property of explicitly showing the type of connection (in series or parallel) of the meter:

```
\begin{circuitikz}[american]
\draw (0,0) to[qiprobe, l=$i$, a=$v$, name=P] ++(0,-2) node[ground]{};
\draw (P.v-) -| ++(-0.5,-1) coordinate(a) to[short, -*] (a-|ground);
\draw (P.v+) -| (b);
\end{circuitikz}
```

If you want to explicitly show a power measurement, you can use the power probe `qpprobe` and using the additional anchors `v+` and `v-`:

```
\begin{circuitikz}[american]
\draw (0,0) to[short, -*] ++(1,0) coordinate(b)
to[R] ++(2,0) to[qpprobe, l=$i$, a=$v$, name=P]
++(0,,-2.5) node[ground](GND){};
\draw (P.v-) -| ++(-0.5,-1) coordinate(a)
to[short, -*] (a-|GND);
\draw (P.v+) -| (b);
\end{circuitikz}
```

\textsuperscript{11}QUCS is an open source circuit simulator: \url{http://qucs.sourceforge.net/}
The final possibility is to use oscilloscopes. For example:

\begin{circuitikz}[american]
  \draw (0,0) -- ++(1,0) to[R] ++(3,0) to [iloop, mirror, name=I] ++(0,-2) node[ground] (GND){};
  \draw (1,0) to[oscope, v=$v$] ++(0,-2) node[ground]{};
  \draw (I.i) -- ++(-0.5,0) node[oscopeshape, anchor=right, name=O]{};
  \draw (O.south) -- (O.south |- GND) node[ground]{};
\end{circuitikz}

Or, if you want a more physical structure for the measurement setup:

\begin{circuitikz}[american]
  \draw (0,0) -- ++(1,0) to[R] ++(3,0) to [iloop2, name=I] ++(0,-2) node[ground] (GND){};
  \ctikzset{bipoles/oscope/width=1.6}\ctikzset{bipoles/oscope/height=1.2}
  \node [oscopeshape, fill=green!10](O) at (6,2){};
  \node [bnc, xscale=-1, anchor=zero](bnc1) at (O.in 1){};
  \node [bnc, , anchor=zero, rotate=-90](bnc2) at (O.in 2){};
  \draw [-latexslim] (bnc1.hot) -| (1,0);
  \draw (bnc2.hot) |- (I.i+);
  \draw (I.i-) node[ground, scale=0.5]{};
\end{circuitikz}

3.10 Mechanical Analogy

3.10.1 Mechanical elements customizations

You can change the scale of all the mechanical elements by setting the key `mechanicals/scale` to something different from the default 1.0.

3.11 Miscellaneous bipoles

Here you’ll find bipoles that are not easily grouped in the categories above.

You can tune how big is the gap in the `openbarrier` component by setting the key `bipoles/openbarrier/gap` (default value 0.5; 0 means no gap and 1 full gap).

---

12Suggested by @Alex in https://tex.stackexchange.com/q/484268/38080

If (default behaviour) europeangfsurgearrester option is active (or the style \textit{european gas filled surge arrester} is used), the shorthands gas filled surge arrester and gf surge arrester are equivalent to the european version of the component.

If otherwise americangfsurgearrester option is active (or the style \textit{american gas filled surge arrester} is used), the shorthands the shorthands gas filled surge arrester and gf surge arrester are equivalent to the american version of the component.

You can use microphones and loudspeakers with \textit{waves} (see section 3.19) too:

\begin{circuitikz}
\draw (0,0) to[mic, name=M] ++(0,2)
\draw (2,0) to[amp, t=$A$] ++(2,0)
\draw (0,-2) to[loudspeaker, name=L] ++(0,-2)
\draw (0,0) to[short, -*] (0,0) node[ground]{};
\node [waves, scale=0.7, left=5pt] at(M.north) {};
\node [waves, scale=0.7, right] at(L.north) {};
\end{circuitikz}

3.11.1 Miscellaneous element customization

You can change the scale of all the miscellaneous elements by setting the key \texttt{misc/scale} to something different from the default \texttt{1.0}.
3.12 Multiple wires (buses)

This are simple drawings to indicate multiple wires.

\begin{circuitikz}
\draw (0,0) to[\multiwire=4] ++(1,0);
\draw (0,-2) to[\bmultiwire=6] ++(1,0);
\end{circuitikz}

3.13 Crossings

Path style:

\begin{circuitikz}
\draw (0,0) to[\short] (2,0);
\draw (0,-2) to[\short] (2,-2);
\node[\circ] at (1,0) {};
\end{circuitikz}

Node style:

\begin{circuitikz}
\node[\jump\crossing] (A) at (0,0) {};
\node[\plain\crossing] (B) at (2,0) {};
\end{circuitikz}

All circuit-drawing standards agree that to show a crossing without electric contact, a simple crossing of the wires suffices; the electrical contact must be explicitly marked with a filled dot.

\begin{circuitikz}
\node[\circ] at (1,0) {};
\node[\circ] at (3,0) {};
\end{circuitikz}

However, sometime it is advisable to mark the non-contact situation more explicitly. To this end, you can use a path-style component called \texttt{crossing}:
\begin{circuitikz}
\draw[short] (1,-1) to (1,1) (0,0) to[crossing] (2,0);
\draw[short] (4,-1) to (4,1) (3,0) to[short] (5,0)
(4,0) node[circ]{};
\end{circuitikz}

That should suffice most of the time; the only problem is that the crossing jumper will be put in
the center of the subpath where the to[crossing] is issued, so sometime a bit of trial and error
is needed to position it.

For a more powerful (and elegant) way you can use the crossing nodes:

\begin{circuitikz}
\node at (1,1)[jump crossing](X){};
\draw (X.west) -- ++(-1,0);
\draw (X.east) to[R] ++(2,0);
\draw (X.north) node[vcc]{};
\draw (X.south) to[C] ++(0,-1.5);
\end{circuitikz}

Notice that the plain crossing and the jump crossing have a small gap in the straight wire,
to enhance the effect of crossing (as a kind of shadow).

The size of the crossing elements can be changed with the key `bipoles/crossing/size` (default
0.2).

### 3.14 Arrows

These are pseudo-arrows used in lot of places in the packages (for transistors, flows, currents, and
so on). The first three arrows are magnified by a factor 3 in the boxes below; for the trarrow, the
anchor tip is exactly on the tip and btip is slightly receded.

<table>
<thead>
<tr>
<th>Diagram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="example.png" alt="current voltage arrow" /></td>
<td>Arrow for current and voltage, type: node (node[currarrow]{}). No class.</td>
</tr>
<tr>
<td><img src="example.png" alt="input arrow" /></td>
<td>Arrow that is anchored at its tip, useful for block diagrams., type: node (node[inputarrow]{}). No class.</td>
</tr>
<tr>
<td><img src="example.png" alt="tip btip" /></td>
<td>Arrow the same size of currarrow but only filled., type: node (node[trarrow]{}). No class.</td>
</tr>
<tr>
<td><img src="example.png" alt="flow arrow" /></td>
<td>Arrow used for the flows, with a text anchor, type: node (node[flowarrow]{$I_p$}). No class.</td>
</tr>
</tbody>
</table>
3.14.1 Arrows size

You can use the parameter \texttt{current arrow scale} to change the size of the arrows in various components and indicators; the normal value is 16, higher numbers give smaller arrows and so on. You need to use \texttt{circuitikz/current arrow scale} if you use it into a node.

\begin{circuitikz}
\draw (0,0) to[R, i=f] ++(2,0) node[npn, anchor=B]{};
\draw (0,-2) to[R, f=f, current arrow scale=8] ++(2,0) node[pnp, anchor=B, circuitikz/current arrow scale =8]{};
\draw (0,-4) to[R, f=f, current arrow scale=24] ++(2,0) node[nigbt, anchor=B]{};
\end{circuitikz}

Moreover, you have the arrow tip \texttt{latexslim} which is an arrow similar to the old (in deprecated \texttt{arrows} library) \texttt{latex'} element:

\begin{circuitikz}[american,]
\draw [latexslim-latexslim] (0,0) -- (1,0);
\end{circuitikz}

3.15 Terminal shapes

These are the so-called “bipole nodes” shapes, or poles (see section 5.1). These nodes are always filled; the “open” versions (starting with an \texttt{o}) are by default filled white, but you can override it with the \texttt{fill} parameter.

<table>
<thead>
<tr>
<th></th>
<th>Connected terminal, type: node (node[circ]{}). No class.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Since version 0.9.0, “bipole nodes” shapes have all the standard geographical anchors, so you can do things like these:
The size of the poles is controlled by the key \texttt{nodes width} (default 0.04, relative to the basic length). Be sure to see section 5.1 for more usage and configurability.

3.15.1 BNC connector/terminal

The BNC connector is defined so that you can easily connect it as input or output (but remember that you need to flip the text if you flip the component):

\begin{circuitikz}
\draw (0,0) node[bnc]{$v_i$} to[R=$\SI{50}{\ohm}$] ++(3,0) node[bnc, xscale=-1]{$v_o$};
\node [ground] at (B1.shield) {};
\node [eground] at (B2.shield){};
\end{circuitikz}

It also has a \texttt{zero} anchor if you need to rotate it about its real center.

\begin{circuitikz}
\draw[thin, red] (0,0) -- ++(1,0) (0,-1) -- ++(1,0);
\path (0,0) node[bnc]{} ++(1,0) node[bnc, rotate=-90]{};
\path (0,-1) node[bnc, anchor=zero]{} ++(1,0) node[bnc, anchor=zero, rotate=-90]{};
\end{circuitikz}

3.16 Block diagram components

Contributed by Stefan Erhardt.

mixer, type: node, fillable \texttt{(node[mixer]{})}. Class: \texttt{blocks}.

adder, type: node, fillable \texttt{(node[adder]{})}. Class: \texttt{blocks}.
oscillator, type: node, fillable (node[oscillator]{}).
Class: blocks.

circulator, type: node, fillable (node[circulator]{}).
Class: blocks.

wilkinson divider, type: node, fillable (node[wilkinson]{}). Class: blocks.

twoport: generic two port\textsuperscript{13}, type: path-style, fillable, nodename: twoportshape. Class: blocks.

\textsuperscript{13}To specify text to be put in the component: twoport[t=text]:

---

Generic fourport, type: node, fillable (node[fourport]{}). Class: blocks.

Coupler, type: node, fillable (node[coupler]{}). Class: blocks.

Coupler with rounded arrows, type: node, fillable (node[coupler2]{}). Class: blocks.
3.16.1 Blocks anchors

The ports of the mixer and adder can be addressed with numbers or west/south/east/north:

```latex
\begin{circuitikz}
\draw
(0,0) node[mixer] (mix) {};
(mix.1) node[left] {1};
(mix.2) node[below] {2};
(mix.3) node[right] {3};
(mix.4) node[above] {4};
\end{circuitikz}
```

The Wilkinson divider has:

```latex
\begin{circuitikz}
\draw
(0,0) node[wilkinson] (w) {\SI{3}{dB}};
(w.in) to[short,-o] ++(-0.5,0);
(w.out1) to[short,-o] ++(0.5,0);
(w.out2) to[short,-o] ++(0.5,0);
(w.in) node[below left] {\texttt{in}};
(w.out1) node[below right] {\texttt{out1}};
(w.out2) node[above right] {\texttt{out2}};
\end{circuitikz}
```

The couplers have:

```latex
\begin{circuitikz}
\draw
(0,0) node[coupler] (c) {\SI{10}{dB}};
(c.1) to[short,-o] ++(-0.5,0);
(c.2) to[short,-o] ++(0.5,0);
(c.3) to[short,-o] ++(0.5,0);
(c.4) to[short,-o] ++(-0.5,0);
(c.1) node[below left] {\texttt{1}};
(c.2) node[below right] {\texttt{2}};
(c.3) node[above right] {\texttt{3}};
(c.4) node[above left] {\texttt{4}};
\end{circuitikz}
```

```latex
\begin{circuitikz}
\draw
(0,0) node[coupler2] (c) {\SI{3}{dB}};
(c.1) to[short,-o] ++(-0.5,0);
(c.2) to[short,-o] ++(0.5,0);
(c.3) to[short,-o] ++(0.5,0);
(c.4) to[short,-o] ++(-0.5,0);
(c.1) node[below left] {\texttt{1}};
(c.2) node[below right] {\texttt{2}};
(c.3) node[above right] {\texttt{3}};
(c.4) node[above left] {\texttt{4}};
\end{circuitikz}
```
3.16.2 Blocks customization

You can change the scale of all the block elements by setting the key `blocks/scale` to something different from the default 1.0.

With the option `>` you can draw an arrow to the input of the block diagram symbols.

```latex
\begin{circuitikz}
\draw (0,0) to[short,o-] ++(0.3,0)
  to[lowpass,>] ++(2,0)
  to[adc,>] ++(2,0)
  to[short,-o] ++(0.3,0);
\end{circuitikz}
```

3.16.2.1 Multi ports

Since inputs and outputs can vary, input arrows can be placed as nodes. Note that you have to rotate the arrow on your own:

```latex
\begin{circuitikz}
\draw (0,0) node[mixer] (m) {}
  (m.1) to[short,-o] ++(-1,0)
  (m.2) to[short,-o] ++(0,-1)
  (m.3) to[short,-o] ++(1,0)
  (m.1) node[inputarrow] {} 
  (m.2) node[inputarrow,rotate=90] {};
\end{circuitikz}
```

3.16.2.2 Labels and custom two-port boxes

Some two-ports have the option to place a normal label (`l=`) and an inner label (`t=`).

```latex
\begin{circuitikz}
\ctikzset{bipoles/amp/width=0.9}
\draw (0,0) to[amp,t=LNA,l_=$F{=}0.9\,$dB,o-o] ++(3,0);
\end{circuitikz}
```

3.16.2.3 Box option

Some devices have the possibility to add a box around them. The inner symbol scales down to fit inside the box.

```latex
\begin{circuitikz}
\draw (0,0) node[mixer,box,anchor=east] (m) {}
  to[amp,box,>,-o] ++(2.5,0)
  (m.west) node[inputarrow] {} to[short,-o] ++(-0.8,0)
  (m.south) node[inputarrow,rotate=90] {} --
  ++(0,-0.7) node[oscillator,box,anchor=north] {};
\end{circuitikz}
```

3.16.2.4 Dash optional parts

To show that a device is optional, you can dash it. The inner symbol will be kept with solid lines.

```latex
\begin{circuitikz}
\draw (0,0) to[amp,l=\SI{10}{dB}] ++(2.5,0);
\draw[dashed] (2.5,0) to[lowpass,l=opt.] ++(2.5,0);
\end{circuitikz}
```
3.17 Transistors

3.17.1 Standard bipolar transistors

- npn, type: node (node[npn]{Q}). Class: transistors.

- pnp, type: node (node[pnp]{}). Class: transistors.

- schottky npn, type: node (node[npn, schottky base]{}). Class: transistors.

- schottky pnp, type: node (node[pnp, schottky base]{}). Class: transistors.

- npn, type: node (node[npn, bodydiode]{}). Class: transistors.

- nobase

- photo npn, type: node (node[npn, photo]{}). Class: transistors.

- photo pnp, type: node (node[pnp, photo]{}). Class: transistors.

- night, type: node (node[night]{Q}). Class: transistors.

- pigbt, type: node (node[pigbt]{}). Class: transistors.

- Lnigbt, type: node (node[Lnight]{Q}). Class: transistors.
3.17.2 Multi-terminal bipolar transistors

In addition to the standard BJTs transistors, since version 0.9.6 the **bjtnpn** and **bjtpnp** are also available; these are devices where you can have more collectors and emitters (on the other hand, they have no **photo** nor **bodydiode** options — they are silently ignored).

Basically they are the same as the normal **npn** and **pnp**, and they (by default) have similar sizes; the options **collectors** and **emitters** will change the number of the relative terminals. The base terminal is connected midway from the collector and the emitter, **not** on the center of the base; a **cbase** anchor is available if you prefer to use it. The label of the component (the text) is set on the right side, vertically centered around the base terminal. They will accept the **schottky base** key.

3.17.3 Field-effect transistors

nmos, type: node (node[nmos]{Q}). Class: transistors.
NFETS and PFETS have been incorporated based on code provided by Clemens Helfmeier and Theodor Borsche. Use the package options \texttt{fetsolderdot/nofetsolderdot} to enable/disable solderdot at some fet-transistors. Additionally, the solderdot option can be enabled/disabled for single transistors with the option \texttt{solderdot} and \texttt{nosolderdot}, respectively.

\begin{itemize}
\item \texttt{pmos}, type: node (\texttt{pmos}). Class: \texttt{transistors}.
\item \texttt{hemt}, type: node (\texttt{hemt}). Class: \texttt{transistors}.
\item NFETS and PFETS have been incorporated based on code provided by Clemens Helfmeier and Theodor Borsche. Use the package options \texttt{fetsolderdot/nofetsolderdot} to enable/disable solderdot at some fet-transistors. Additionally, the solderdot option can be enabled/disabled for single transistors with the option \texttt{solderdot} and \texttt{nosolderdot}, respectively.
\item \texttt{nfet}, type: node (\texttt{nfet}). Class: \texttt{transistors}.
\item \texttt{nigfete}, type: node (\texttt{nigfete}). Class: \texttt{transistors}.
\item \texttt{nigfete}, type: node (\texttt{nigfete,solderdot}). Class: \texttt{transistors}.
\item \texttt{pigfete}, type: node (\texttt{pigfete}). Class: \texttt{transistors}.
\item \texttt{pigfetebulk}, type: node (\texttt{pigfetebulk}). Class: \texttt{transistors}.
\end{itemize}
pigfetd, type: node (node[pigfetd]{}). Class: transistors.

NjFET and PjFET have been incorporated based on code provided by Danilo Piazzalunga:

cpyet

Q

njfet, type: node (node[njfet]{Q}). Class: transistors.

pjfet, type: node (node[pjfet]{}). Class: transistors.

ISFET

isfet, type: node (node[isfet]{Q}). Class: transistors.

3.17.4 Transistor texts (labels)

In versions before 0.9.7, transistors text (the node text) was positioned near the collector terminal; since version 0.9.7 the default has been changed to a more natural position near the center of the device, similar to the multi-teminal transistors. You can revert to the old behavior locally with the key legacy transistors text, or globally by setting the package option legacytransistorstext.

Notice the use of the utility functions \ctikzflip{x,y,xy} as explained in section 3.2.1.

\begin{circuitikz}
\draw (0,0) node [npn]{T1}
++(1.2,0) node [npn, xscale=-1]{\ctikzflipx{T1}}
++(2,0) node [npn, yscale=-1]{\ctikzflipy{T1}}
++(1.2,0) node [npn, scale=-1]{\ctikzflipxy{T1}};
\ctikzset{legacy transistors text}
\draw (0,-2) node [npn]{T1}
++(1.2,0) node [npn, xscale=-1]{\ctikzflipx{T1}}
++(2,0) node [npn, yscale=-1]{\ctikzflipy{T1}}
++(1.2,0) node [npn, scale=-1]{\ctikzflipxy{T1}};
\end{circuitikz}

3.17.5 Transistors customization

3.17.5.1 Size. You can change the scale of all the transistors by setting the key transistors/scale (default 1.0). The size of the arrows (if any) is controlled by the same parameters as currarrow (see section 3.14.1) and the dots on P-type transistors (if any) are the same as the nodes/poles (see section 5.1).
3.17.5.2 Arrows. The default position of the arrows in transistors is somewhat in the middle of the terminal; if you prefer you can move them to the end with the style key `transistors/arrow pos=end` (the default value is `legacy`).

```latex
\begin{circuitikz}
\ctikzset{tripoles/mos style=arrows}
\ctikzset{transistors/arrow pos=end}
\draw (0,0) node[npn]{};
\draw (2,0) node[pnp]{};
\draw (0,-2) node[nmos]{};
\draw (2,-2) node[pmos]{};
\end{circuitikz}
```

If the option `arrowmos` is used (or after the command `\ctikzset{tripoles/mos style/arrows}` is given), this is the output:

```
nmos, type: node (node[nmos]{}). Class: transistors.
```

```
pmos, type: node (node[pmos]{}). Class: transistors.
```

You can go back to the no-arrows mos with `noarrowmos` locally or with `\ctikzset{tripoles/mos style/no arrows}`.

3.17.5.3 Body diodes and similar things. For all transistors (minus bjtnpn and bjtpnp) a body diode (or freewheeling or flyback diode) can automatically be drawn. Just use the global option `bodydiode`, or for single transistors, the tikz-option `bodydiode`. As you can see in the next example, the text for the diode is moved if a bodydiode is present (but beware, if you change a lot the relative dimension of components, it may become misplaced):

```latex
\begin{circuitikz}
\draw (0,0) node[npn, bodydiode](nppn){1} ++(2,0) node[pnp, bodydiode](nppn){};
\draw (0,-2) node[nigbt, bodydiode](nppn){2} ++(2,0) node[pigbt, bodydiode](nppn){};
\draw (0,-4) node[nfet, bodydiode](nppn){3} ++(2,0) node[pfet, bodydiode](nppn){};
\end{circuitikz}
```

You can use the `body ... anchors to add more or different things to the transistors in addition (or instead) of the flyback diode.
\def\snubb#1#2{% add a snubber to a transistor
\draw (#1.body C #2) to[short, -*, nodes width=0.02]
++(0.3,0) coordinate(tmp) to [R, resistors/scale=0.3]
% 2/3 space for R, 1/3 for C
($(tmp)!0.66!(tmp|-#1.body E #2)$)
to [C, capacitors/scale=0.3] (tmp|-#1.body E #2)
to [short, -*, nodes width=0.02] (#1.body E #2);
}
\begin{circuitikz}
\node[npn](Q1) at(0,0) {};\snubb{Q1}{in} \snubb{Q3}{out}
\node[pnp](Q2) at(2,0) {}; \snubb{Q2}{in} \snubb{Q4}{out}
\node[pnp, bodydiode](Q3) at(0,-3) {};\snubb{Q3}{out}
\node[npn, bodydiode](Q4) at(2,-3) {};
\end{circuitikz}

3.17.5.4 Schottky transistors. The Schottky transistors are generated by adding the \texttt{schottky base} key (there is also a \texttt{no schottky base} key that can be used if you use the other one as a default). You can change the size of the Schottky “hook” changing the parameter \texttt{tripoles/schottky base size} with \texttt{\ctikzset{}} (default 0.07; the unit is the standard resistor length, scaled if needed.)

\begin{circuitikz}
\draw (0,4) node[npn]{} ++(2,0) node[npn, schottky base]{};
\draw (1,2) node[bjtnpn, collectors=2, emitters=3, schottky base, rotate=90]{};
\tikzset{schottky base}
\ctikzset{tripoles/schottky base size=0.1}
\draw (0,0) node[pnp]{} ++(2,0) node[pnp, no schottky base]{};
\end{circuitikz}

3.17.5.5 IGBT outer base Normally, in bipolar IGBTs the outer base is the same size (height) of the inner one, and of the same thickness (which will depend on the class thickness value). You can change this by setting (via \texttt{\ctikzset{}}) the keys \texttt{tripoles/igbt/outer base height} (default 0.4, the same as \texttt{base height}), and \texttt{tripoles/igbt/outer base thickness} (default 1.0), which will be relative to the class thickness.
3.17.5.6 Base/Gate terminal. The Base/Gate connection of all transistors can be disabled by the options \texttt{nogate} or \texttt{nobase}, respectively. The Base/Gate anchors are floating, but there is an additional anchor \texttt{nogate/nobase}, which can be used to point to the unconnected base:

To draw the PMOS circle non-solid, use the option \texttt{emptycircle} or the command \texttt{\ctikzset{tripoles/pmos style/emptycircle}}. To remove the dot completely (only useful if you have \texttt{arrowmos} enabled, otherwise there will be no difference between P-MOS and N-MOS), you can use the option \texttt{nocircle} or \texttt{\ctikzset{tripoles/pmos style/nocircle}}.

pmos, type: node (node[pmos,emptycircle]{}). Class: transistors.

pmos, type: node (node[pmos,nocircle,arrowmos]{}). Class: transistors.
3.17.5.7 Bulk terminals. You can add a bulk terminal\(^\d\) to \text{nmos} and \text{pmos} using the key \text{bulk} in the node (and \text{nobulk} if you set the bulk terminal by default); additional anchors \text{bulk} and \text{nobulk} are added (in the next example, \text{tripoles/mos style/arrows} is enacted, too):

\begin{circuitikz}
  \draw (0,1) node{pmos} (2,1) node{nmos};
  \draw (0,0) node[info]{default} node[pmos]{} (2,0) node[nmos]{};
  \ctikzset{tripoles/mos style/arrows}
  \draw (0,-2) node[info]{arrows} node[pmos]{} (2,-2) node[nmos]{};
  \ctikzset{tripoles/pmos style/emptycircle}
  \draw (0,-4) node[info]{emptycircle} node[pmos]{} (2,-4) node[nmos]{};
  \ctikzset{tripoles/pmos style/nocircle}
  \draw (0,-6) node[info]{nocircle} node[pmos]{} (2,-6) node[nmos]{};
  \ctikzset{tripoles/mos style/no arrows}
  \draw (0,-8) node[info, red]{no circle, no arrows, DON’T do it} node[pmos]{} (2,-8) node[nmos]{};
\end{circuitikz}

3.17.6 Multiple terminal transistors customization

You can create completely “bare” transistors (without the connection leads to the B, C y E terminals), by changing the parameter \text{tripoles/bjt/pins width} (default 0.3; it is expressed as a fraction of the basic (scaled) length) or using the style \text{bjt pins width}; and you can change the distance between multiple collectors/emitters setting with \text{\ctikzset{}} the parameter \text{tripoles/bjt/multi height} (default 0.5) or the style \text{bjt multi height}.

\(^{14}\)Thanks to Burak Kelleci <kelleci@hotmail.com>.

72
3.17.7 Transistors anchors

For NMOS, PMOS, NFET, NFETD, PFET, PIGFETE, and PIGFETD transistors one has base, gate, source and drain anchors (which can be abbreviated with B, G, S and D):

```latex
\begin{circuitikz}
\draw
(0,0) node[nmos] (mos) {};
\end{circuitikz}
```

Similarly NFET and PFET have gate, source and drain anchors (which can be abbreviated with G, S and D):

```latex
\begin{circuitikz}
\draw
(0,0) node[pfet] (pfet) {};
\end{circuitikz}
```

For NPN, PNP, NIGBT and PIGBT transistors, the anchors are base, emitter and collector anchors (which can be abbreviated with B, E and C):

```latex
\begin{circuitikz}
\draw
(0,0) node[npn] (npn) {};
\end{circuitikz}
```
Finally, all transistors, except the multi-terminal \texttt{bjtpnp} and \texttt{bjtnpn}, (since 0.9.6) have internal nodes on the terminal corners, called \texttt{inner up} and \texttt{inner down}; you do not normally need them, but they are here for special applications:

```
\begin{circuitikz}
\node [npn](A) at(0,2) {};
\node [pmos](B) at(0,0) {};\foreach \e in {A, B}
\foreach \a in {inner up, inner down} {
\node[red, circle, inner sep=1pt, draw] at (\e.\a) {};
\node [right, font=tiny, blue] at (\e.\a) {\a};
}\end{circuitikz}
```

Additionally, you can access the position for the flyback diodes and possibly snubbers as shown in 3.17.5.3.

The multi-terminal transistors have all the geographical anchors; note though that the \texttt{center} anchor is not the geometrical center of the component, but the logical one (at the same height than the base). The additional anchors \texttt{vcenter} (vertical geometric center of the collector–emitter zone) and \texttt{gcenter} (graphical center) are provided, as shown in the following picture. They have no bodydiode anchors nor \texttt{inner up/down} ones.

A complete example of multiple terminal transistor application is the following PNP double current mirror circuit.
Here is one composite example (please notice that the xscale=-1 style would also reflect the label of the transistors, so here a new node is added and its text is used, instead of that of pnp1):

\begin{circuitikz}
\ctikzset{transistors/arrow pos=end}
\draw (0,0) node[pnp, xscale=-1] (Q1) {% 
\scalebox{-1}[1]{Q1}};
\draw (Q1.B) node[pnp, anchor=B, collectors=2] (Q2) {Q2} (Q1.B) node[circ]{};
\draw (Q1.E) node[circ] (Q1.E) -- (Q1.B);
\draw (Q1.C) to[R, l_=$R_0$, f=$I_0$] ++(0,-3.5)
\node[ground](GND){};
\draw (Q2.C) -- ++(0,-0.5) coordinate(a);
\draw (Q2.C1) -- ++(1,0) coordinate(b) -- (b|-a);
\draw (a) ++(0,-0.1) node[flowarrow, rotate=-90, anchor=west]{\rotatebox{90}{$I_0$}};
\draw (b|-a) ++(0,-0.1) node[flowarrow, rotate=-90, anchor=west]{\rotatebox{90}{$I_0$}};
\path (b) ++(0.5,0);
\end{circuitikz}

Notice that the text labels of transistors are somewhat buggy. It is better to set explicit anchors to set transistor names.

Similarly, transistors like other components can be reflected vertically:

\begin{circuitikz}
\draw (0,0) node[pigfete, yscale=-1] (pigfete) {};
\draw (pigfete.bulk) node[anchor=west] {Bulk}
\draw (pigfete.G) node[anchor=east] {G}
\draw (pigfete.D) node[anchor=south] {D}
\draw (pigfete.S) node[anchor=north] {S};
\end{circuitikz}

3.17.8 Transistor paths

For syntactical convenience standard transistors (not multi-terminal ones) can be placed using the normal path notation used for bipoles. The transistor type can be specified by simply adding a “T” (for transistor) in front of the node name of the transistor. It will be placed with the base/gate orthogonal to the direction of the path:
Access to the gate and/or base nodes can be gained by naming the transistors with the `n` or `name` path style:

Transistor paths have the possibility to use the poles syntax (see section 5.1) but they have no voltage, current, flow, annotation options. Also, the positioning of the labels is very simple and is not foolproof for all rotations; if you need to control them more please name the node and position them by hand, or use the more natural node style for transistors.

The `name` property is available also for bipoles; this is useful mostly for triac, potentiometer and thyristor (see 3.7.1).

### 3.18 Electronic Tubes

Electronic tubes, also known as vacuum tubes, control current flow between electrodes. They come in many different flavours. Contributed by J. op den Brouw (J.E.J.opdenBrouw@hhs.nl).
Anode

Cathode

Control

Triode, type: node, fillable (node[triode]{}) class: tubes.

Anode

Screen

Control

Cathode

Tetrode, type: node, fillable (node[tetrode]{}) class: tubes.

Anode

Suppressor

Screen

Control

Cathode

Pentode, type: node, fillable (node[pentode]{}). class: tubes.

Some pentodes have the suppressor grid internally connected to the control grid, which saves a pin on the tube’s housing.

Anode

Screen

Control

Cathode

Pentode with suppressor grid connected to cathode, type: node, fillable (node[pentode suppressor to cathode]{}). class: tubes.

Note that the diodetube is used as component name to avoid clashes with the semiconductor diode. Normally, the filament is not drawn. If you want a filament, put the filament option in the node description:

Anode

Filament 1

Filament 2

Tube Diode, type: node, fillable (node[diodetube, filament]{}). class: tubes.
Sometimes, you don’t want the cathode to be drawn (but you do want the filament). Use the \texttt{nocathode} option in the node description:

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{example.png}
\caption{Tube Diode, type: node, fillable \texttt{(node[diodetube,filament,nocathode]{}). Class: tubes.}}
\end{figure}

If you want a full cathode to be drawn, use the \texttt{fullcathode} option in the node description. You can then use the anchors \texttt{cathode 1} and \texttt{cathode 2}.

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{example.png}
\caption{Tube Diode, type: node, fillable \texttt{(node[diodetube,fullcathode]{}). Class: tubes.}}
\end{figure}

### 3.18.1 Tubes customization

The tubes can be scaled using the key \texttt{tubes/scale}, default 1.0. In addition, they are fully configurable, and the attributes are described below:

<table>
<thead>
<tr>
<th>Key</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tubes/scale</td>
<td>1</td>
<td>scale factor</td>
</tr>
<tr>
<td>tubes/width</td>
<td>1</td>
<td>relative width</td>
</tr>
<tr>
<td>tubes/height</td>
<td>1.4</td>
<td>relative height</td>
</tr>
<tr>
<td>tubes/tube radius</td>
<td>0.40</td>
<td>radius of tube circle</td>
</tr>
<tr>
<td>tubes/anode distance</td>
<td>0.40</td>
<td>distance from center</td>
</tr>
<tr>
<td>tubes/anode width</td>
<td>0.40</td>
<td>width of an anode/plate</td>
</tr>
<tr>
<td>tubes/grid protrusion</td>
<td>0.25</td>
<td>distance from center</td>
</tr>
<tr>
<td>tubes/grid dashes</td>
<td>5</td>
<td>number of grid dashes</td>
</tr>
<tr>
<td>tubes/grid separation</td>
<td>0.2</td>
<td>separation between grids</td>
</tr>
<tr>
<td>tubes/grid shift</td>
<td>0.0</td>
<td>y shift of grids from center</td>
</tr>
<tr>
<td>tubes/cathode distance</td>
<td>0.40</td>
<td>distance from grid</td>
</tr>
<tr>
<td>tubes/cathode width</td>
<td>0.40</td>
<td>width of a cathode</td>
</tr>
<tr>
<td>tubes/cathode corners</td>
<td>0.06</td>
<td>corners of the cathode wire</td>
</tr>
<tr>
<td>tubes/cathode right extend</td>
<td>0.075</td>
<td>extension at the right side</td>
</tr>
<tr>
<td>tubes/filament distance</td>
<td>0.1</td>
<td>distance from cathode</td>
</tr>
<tr>
<td>tubes/filament angle</td>
<td>15</td>
<td>angle from the centerpoint</td>
</tr>
</tbody>
</table>

Conventionally, the model of the tube is indicated at the \texttt{east} anchor:
Example triode amplifier:

\begin{circuitikz}
\draw (0,0) node (start) {} to[sV=$V_i$] ++(0,2+\ctikzvalof{tubes/height}) to[C=$C_i$] ++(2,0) node (Rg) {} to[R=$R_g$] (Rg |- start) to[short,-*] ++(1,0) node[triode,anchor=control] (Tri) {} ++(2,0) (Tri.cathode) to[R=$R_c$,-*] (Tri.cathode |- start) (Tri.anode) to [R=$R_a$] ++(0,2) to [short] ++(3.5,0) node(Vatop) {} to [V<=$V_a$] (Vatop |- start) to [short] (start) (Tri.anode) ++(0,0.2) to[C=$C_o$,-*o] ++(2,0) (Tri.cathode) ++(0,-0.2) to[short,*-] ++(1.5,0) node(Cctop) {} to[C=$C_c$,-*] (start -| Cctop)
\draw[red,thin,dashed] (Tri.north west) rectangle (Tri.south east);
\draw (Tri.east) node[right] {12AX7};
\end{circuitikz}

The magnetron shape will also scale with tubes(scale).
3.19 RF components

For the RF components, similarly to the grounds and supply rails, the center anchor is put on the connecting point of the symbol, so that you can use them directly in a path specification.

Notes that in the transmission and receiving antennas, the “waves” are outside the geographical anchors.
3.19.1 RF elements customization

The RF elements can be scaled using the key `RF/scale`, default 1.0.

\footnote{This four components were suggested by \texttt{@tcpluess} on GitHub}
3.19.2 Microstrip customization

The microstrip linear components' (\texttt{mstline}, \texttt{mslstub}, \texttt{msport}) heights can be changed by setting the parameter \texttt{bipoles/mstline/height} (for the three of them, default 0.3). The widths are specified in \texttt{bipoles/mstline/width} for the first two and by \texttt{monopoles/msport/width} for the port (defaults: 1.2, 0.5).

For the length parameter of the transmission line there is a shortcut in the form of the direct parameter \texttt{mstlinelen}.

![Circuitikz Diagram](image)

\begin{circuitikz}
\draw (0,0) node[msport, right, xscale=-1]{}
   to[mstline, -o] ++(3,0) coordinate(there)
   to[mstline, mstlinelen=2, l=longer, o-*] ++(4,0)
   coordinate(here) -- ++(0.5,0) node[mslstub, fill=yellow]{stub}
   (here) -- ++(0,0.5) node[mslstub, rotate=90, mstlinelen=0.5]{short};
\draw (there) to[short, o-] ++(0, 0.5) node[msrstub]{};
\draw (here) -- ++(0, -0.5) node[msrstub, yscale=-1]{};
\end{circuitikz}

3.20 Electro-Mechanical Devices

The internal part of the motor and generator are, by default, filled white (to avoid compatibility problems with older versions of the package).

![Motor and Generator](image)

Motor, type: node, fillable (\texttt{node[elmech]{}{M}}). Class: \texttt{electromechanicals}.

Generator, type: node, fillable (\texttt{node[elmech]{}{G}}). Class: \texttt{electromechanicals}.

3.20.1 Electro-Mechanical Devices anchors

Apart from the standard geographical anchors, \texttt{elmech} has the border anchors (situated on the inner circle) and the following anchors on the “block”: 
The symbols can also be used along a path, using the transistor-path-syntax (\texttt{T} in front of the shape name, see section 3.17.8). Don’t forget to use parameter \texttt{n} to name the node and get access to the anchors:

```latex
\begin{circuitikz}
\draw (2,0) node[elmech](motor){M};
\draw (motor.north) -|(0,2) to [R] ++(0,-2) to [dcvsourse]++(0,-2) -| (motor.bottom);
\draw[thick,->>](motor.right)--++(1,0)node[midway, above]{$\omega$};
\end{circuitikz}
```

```latex
\begin{circuitikz}
\draw (2,0) node[elmech](motor){};
\draw (motor.north) -|(0,2) to [R] ++(0,-2) to [dcvsourse]++(0,-2) -| (motor.center);
\draw[thick,->>](motor.center)--++(1.5,0)node[midway, above]{$\omega$};
\end{circuitikz}
```

```latex
\begin{circuitikz}
\draw (0,0) to [Telmech=M,n=motor] ++(0,-3) to [Telmech=M] ++(3,0) to [Telmech=G,n=generator] ++(0,3) to [R] (0,0);
\draw[thick,->>](motor.left)--(generator.left)node[midway, above]{$\omega$};
\end{circuitikz}
```

### 3.21 Double bipoles (transformers)

Transformers automatically use the inductor shape currently selected. These are the three possibilities:

Transformer (cute inductor), type: node (node[transformer]{}). Class: inductors.
3.21.1 Double dipoles anchors

All the double bipoles/quadrupoles have the four anchors, two for each port. The first port, to the left, is port A, having the anchors A1 (up) and A2 (down); same for port B.

They also expose the base anchor, for labelling, and anchors for setting dots or signs to specify polarity. The set of anchors, to which the standard “geographical” north, north east, etc. is here:
Also, the standard “geographical” \texttt{north}, \texttt{north east}, etc. are defined. A couple of examples follow:

\begin{circuitikz}
  \draw (0,0) node[transformer] (T) {};
  (T.A1) node[anchor=east] (A1)
  (T.A2) node[anchor=east] (A2)
  (T.B1) node[anchor=west] (B1)
  (T.B2) node[anchor=west] (B2)
  (T.base) node[K]
  (T.inner dot A1) node[circ]
  (T.inner dot B2) node[circ];
\end{circuitikz}

Moreover, you can access the two internal coils (inductances); if your transformer node is called \texttt{T}, they are named \texttt{T-L1} and \texttt{T-L2}. Notice that the two inductors are rotated (by -90 degrees the first, +90 degrees the second) so you have to be careful with the anchors. Also, the \texttt{midtap} anchor of the inductors can be on the external or internal side depending on the numbers of coils. Finally, the anchors \texttt{L1.a} and \texttt{L1.b} are marking the start and end of the coils.

\begin{circuitikz}
  \draw (0,0) node[ground](GND) to [sV] ++(0,2) -- ++(1,0)
  node[transformer, inductors/coils=6, anchor=A1](T){};
  \draw (T.A2) to[short, -*] (T.A2-|GND);
  \draw (T-L2.midtap) to[short, *-o] (T.B1 |- T-L2.midtap);
  \node (ocirc) at (T.B1){}; \node (ocirc) at (T.B2){};
\end{circuitikz}

\subsection{2.1.2 Double dipoles customization}

Transformers are in the \texttt{inductors} class (also the gyrator…), so they scale with the key \texttt{inductors/scale}. You can change the aspect of a quadpole using the corresponding parameters \texttt{quadpoles/*/width} and \texttt{quadpoles/*/heigth} (substitute the star for \texttt{transformer}, \texttt{transformer core} or \texttt{gyrator}; default value is 1.5 for all). You have to be careful to not choose value that overlaps the components!

85
Transformers also inherit the `inductors/scale` (see 3.6.5) and similar parameters. It’s your responsibility to set the aforementioned parameters if you change the scale or width of inductors.

Transformers core line distance is specified by the parameter `quadpoles/transformer core/core width` (default 0.05) and the thickness of the lines follows the choke one; in other words, you can set it changing `bipoles/cutechoke/cthick`.

Another very useful parameter is `quadpoles/*/inner` (default 0.4) that determines which part of the component is the “vertical” one. So, setting that parameter to 1 will eliminate the horizontal part of the component (obviously, to maintain the general aspect ratio you need to change the width also):

This can be useful if you want to put seamlessly something in series with either side of the component; for simplicity, you have a style setting `quadpoles style` to toggle between the standard shape of double bipoles (called `inward`, default) and the one without horizontal leads (called `inline`):
3.21.3 Styling transformer’s coils independently

Since 0.9.6, you can tweak the style of each of the coils of the transformers by changing the value of the two styles `transformer L1` and `transformer L2`; the default for both are `{}`, that means inherit the inductors style in force.

\begin{circuitikz}[american]
\begin{scope}
\ctikzset{transformer L1/.style={inductors/coils=1, inductors/width=0.2}}
\draw (0,0) node[transformer core](T1){};
\end{scope}
\draw (3,0) node[transformer](T2){};
\ctikzset{cute inductors, quadpoles style=inline}
\ctikzset{transformer L1/.style={inductors/coils=2, inductors/width=0.2}}
\draw (6,0) node[transformer core](T3){};
\ctikzset{transformer L1/.style={american inductors, inductors/coils=1, inductors/width=0.2}}
\ctikzset{transformer L2/.style={inductors/coils=7, inductors/width=1.0}}
\draw (9,0) node[transformer](T4){};
\foreach \t in {T1, T2, T3, T4} {
\foreach \l in {L1, L2} {
\foreach \a in {a/blue, b/red}
\node [circle, fill=\a, inner sep=1pt] at (\t-\l.\a) {};
}
}
\end{circuitikz}

Caveat: the size of the transformer is independent from the styles for L1 and L2, so they follow whatever the parameters for the inductances were before applying them. In other words, the size of the transformer could result too small if you are not careful.

\begin{circuitikz}
\ctikzset{transformer L1/.style={inductors/width=1.8, inductors/coils=13}}
\draw (0,0) node[transformer core](T1){};
\ctikzset{quadpoles/transformer core/height=2.4}
\draw (2.5,0) node[transformer core](T1){};
\end{circuitikz}

You can obviously define a style for a “non-standard” transformer. For example, you can have a current transformer\footnote{Suggested by Alex Pacini on GitHub} defined like this:

\begin{circuitikz}
\ctikzset{transformer L1/.style={inductors/width=1.8, inductors/coils=13}}
\draw (0,0) node[transformer core](T1){};
\ctikzset{quadpoles/transformer core/height=2.4}
\draw (2.5,0) node[transformer core](T1){};
\end{circuitikz}
\begin{circuitikz}
\draw (0,0) node[TA core](T1){};
\draw (0,-3) node[transformer]{};
\end{circuitikz}

Remember that the default \texttt{pgfkeys} directory is /tikz for nodes and for the options of the environment, so you \textit{have} to use the full path (with \texttt{circuitikz/}) there.

### 3.22 Amplifiers

Plain instrumentation amplifier, type: node, fillable (\texttt{node[inst amp]{}}). Class: \texttt{amplifiers}.

\(^{17}\)Contributed by Kristofer M. Monisit.
3.22.1 Amplifiers anchors

The op amp defines the inverting input (\textasciitilde{}), the non-inverting input (+) and the output (out) anchors:

```plaintext
\begin{circuitikz}
\draw
(0,0) node[op amp] (opamp) {} 
(opamp.+ node[left] \{$v_+$\}) 
(opamp.- node[left] \{$v_-$\}) 
(opamp.out node[right] \{$v_o$\}) 
((opamp.up) ++(0,0.5) node[vcc]{5\textnormal{\textnormal{V}}}) 
((opamp.down) ++(0,-0.5) node[vee]{-5\textnormal{\textnormal{V}}})
\end{circuitikz}
```

There are also two more anchors defined, \textit{up} and \textit{down}, for the power supplies:
The fully differential op amp defines two outputs:

\begin{circuitikz}
\draw
(0,0) node[op amp] (opamp) {};
(opamp.+ node[left] {$v_+$});
(opamp.- node[left] {$v_-$});
(opamp.out node[right] {$v_o$});
(opamp.down node[ground] {});
(opamp.up) ++ (0,.5) node[above] {$\SI{12}{\volt}$};
\end{circuitikz}

The instrumentation amplifier defines also references (normally you use the down, unless you are flipping the component):

\begin{circuitikz}
\draw
(0,0) node[fd inst amp] (opamp) {};
(opamp.+ node[left] {$v_+$});
(opamp.- node[left] {$v_-$});
(opamp.out node[right] {out +});
(opamp.out node[right] {out -});
(opamp.down node[ground] {});
(opamp.up) to[short, -o] ++(0,0.3);
\end{circuitikz}

The fully differential instrumentation amplifier defines two outputs:

\begin{circuitikz}
\draw
(0,0) node[fd inst amp] (opamp) {};
(opamp.+ node[left] {$v_+$});
(opamp.- node[left] {$v_-$});
(opamp.out node[right] {out +});
(opamp.out node[right] {out -});
(opamp.up node[vcc] {});
(opamp.down node[vee] {});
(opamp.refv up) to[short, -o] ++(0,0.3);
\end{circuitikz}

The instrumentation amplifier with resistance terminals defines also terminals to add an amplification resistor:

\begin{circuitikz}
\draw
(0,0) node[inst amp ra] (opamp) {};
(opamp.+ node[left] {$v_+$});
(opamp.- node[left] {$v_-$});
(opamp.out node[right] {out +});
(opamp.out node[right] {out -});
(opamp.up node[vcc] {});
(opamp.down node[vee] {});
(opamp.refv up) to[short, -o] ++(0,0.3);
\end{circuitikz}
Amplifiers have also “border” anchors (just add b, without space, to the anchor, like b+ or bin up and so on). These can be useful to add “internal components” or to modify the component. Also the leftedge anchors (on the border midway between input) is available.

### 3.22.2 Amplifiers customization

You can scale the amplifiers using the key `amplifiers/scale` and setting it to something different from 1.0. The font used for symbols will not scale, so it’s your responsibility to change it if the need arises.

All these amplifier have the possibility to flip input and output (if needed) polarity. You can change polarity of the input with the `noinv input down` (default) or `noinv input up` key; and the output with `noinv output up` (default) or `noinv output down` key:

When you use the `noinv input/output ...` keys the anchors (+, −, out +, out −) will change with the effective position of the terminals. You have also the anchors in up, in down, out up, out down that will not change with the positive or negative sign.

You can change the symbols “+” or “−” appearing in the amplifiers if you want, both globally and on component-by-component basis. The plus and minus symbols can be changed with \ctikzset of the keys.
amplifiers/plus and amplifiers/minus (which defaults to the math mode plus or minus cited before), or using the styles amp plus and amp minus.

The font used is set in several keys, but you can change it globally with \tikzset{amp symbol font}, which has a default of 10-point (in \LaTeX, and the corresponding one in Con\TeXt). You can change it for example with

\begin{verbatim}
\tikzset{amp symbol font={\color{blue}\fontsize{12}{12}\selectfont\boldmath}}
\end{verbatim}

to have plus and minus symbols that are bigger and blue.

\begin{verbatim}
\begin{circuitikz}
% change in this circuit only
\tikzset{amp symbol font={\color{blue}\fontsize{12}{12}\selectfont\boldmath}}
% local change
\draw (0,2.2) node[op amp, amp plus=$\oplus$]{};
\draw (0,0) node[op amp]{};
% from now on...
\ctikzset{amplifiers/plus={$\oplus$}}
\ctikzset{amplifiers/minus={$\ominus$}}
\draw (0,-2.2) node[fd op amp]{};
\end{circuitikz}
\end{verbatim}

If you want different symbols for input and output you can use a null symbol and put them manually using the border anchors.

\begin{verbatim}
\begin{circuitikz}
\ctikzset{amplifiers/plus={}}
\ctikzset{amplifiers/minus={}}
\draw (0,0) node[fd op amp](A){};
\node [font=\small\bfseries, right] at(A.bin up) {1};
\node [font=\small\bfseries, right] at(A.bin down) {2};
\node [font=\small\bfseries, below] at(A.bout up) {3};
\node [font=\small\bfseries, above] at(A.bout down) {4};
\end{circuitikz}
\end{verbatim}

The amplifier label (given as the text of the node) is normally more or less centered in the shape (in the case of the triangular shape, it is shifted a bit to the left to seem visually centered); since version 1.1.0 you can move it at the left side plus a fixed offset setting the key component text or the style with the same name to left; by default the key is center. You can change the offset with the key left text distance (default 0.3em; you must use a length here).

\begin{verbatim}
\begin{circuitikz}
\draw (0,2.5) node[plain amp]{\texttt{741}};
\draw (3,2.5) node[plain amp, component text=left] {\texttt{741}};
\tikzset{component text=left}
\draw (0,0) node[op amp]{\texttt{741}};
\ctikzset{left text distance=0.6em}
\draw (3,0) node[op amp]{\texttt{741}};
\end{circuitikz}
\end{verbatim}
These keys are also used for the positioning of the labels in the label positioning of IEEE logic gates (see 3.24.2).

### 3.22.2.1 European-style amplifier customization

Thanks to the suggestions from David Rouvel (david.rouvel@iphc.cnrs.fr) there are several possible customization for the European-style amplifiers.

Since 0.9.0, the default appearance of the symbol has changed to be more in line with the standard; notice that to have a bigger triangle by default we should require more packages, and I fear ConTéXt compatibility; but see later on how to change it. Notice that the font used for the symbol is defined in `tripoles/en amp/font2` and that the font used for the + and - symbols is `tripoles/en amp/font`.

You can change the distances of the inputs, using `tripoles/en amp/input height` (default 0.3):

```circuitikz
\begin{circuitikz}
\ctikzset{tripoles/en amp/input height=0.45}
\draw (0,0)node[en amp](E){}
(E.out) node[right] \{$v_\cdot\text{mathrm(out)}\}$
(E.-) node[left] \{$v_\cdot\text{mathrm(in)}\}$
(E.+ node[left] \{$v_\cdot\text{mathrm(in)}\}$
\end{circuitikz}
```

and of course the key `noinv input up` is fully functional:

```circuitikz
\begin{circuitikz}
\ctikzset{tripoles/en amp/input height=0.45}
\draw (0,0)node[en amp, noinv input up](E){}
(E.out) node[right] \{$v_\cdot\text{mathrm(out)}\}$
(E.-) node[left] \{$v_\cdot\text{mathrm(in)}\}$
(E.+ node[left] \{$v_\cdot\text{mathrm(in)}\}$
\end{circuitikz}
```

To flip the amplifier in the horizontal direction, you can use `xscale=-1` as usual:

```circuitikz
\begin{circuitikz}
\ctikzset{tripoles/en amp/input height=0.45}
\draw (0,0)node[en amp, xscale=-1, noinv input up ](E){}
(E.out) node[right] \{$v_\cdot\text{mathrm(out)}\}$
(E.-) node[right] \{$v_\cdot\text{mathrm(in)}\}$
(E.+ node[right] \{$v_\cdot\text{mathrm(in)}\}$
\end{circuitikz}
```

Notice that the label is fully mirrored, so check below for the generic way to change this.

You can use the new key `en amp text A` to change the infinity symbol with an A:

```circuitikz
\begin{circuitikz}
\draw (0,0)node[en amp, en amp text A](E){}
(E.out) node[right] \{$v_\cdot\text{mathrm(out)}\}$
(E.-) node[left] \{$v_\cdot\text{mathrm(in)}\}$
(E.+ node[left] \{$v_\cdot\text{mathrm(in)}\}$
\end{circuitikz}
```

And if you want, you can completely change the text using the key `en amp text=`, which by default is `\mathstrut{\triangleright}\,{\infty}`:

```circuitikz
\begin{circuitikz}
\draw (0,0)node[en amp, en amp text=](E){}
(E.out) node[right] \{$v_\cdot\text{mathrm(out)}\}$
(E.-) node[left] \{$v_\cdot\text{mathrm(in)}\}$
(E.+ node[left] \{$v_\cdot\text{mathrm(in)}\}$
\end{circuitikz}
```
\begin{circuitikz}
\draw (0,0)node[en amp, en amp text={$\triangleright$ \\ small 200}\](E){}
(E.out) node[right] {$v_{\text{out}}$}
(E.-) node[left] {$v_{\text{in}-}$}
(E.+ node[left] {$v_{\text{in}+}$} ;
\end{circuitikz}

Notice two things here: the first, that \texttt{\triangleright} is enclosed in braces to remove the default spacing it has as a binary operator, and that \texttt{en amp text A} is simply a shortcut for
\begin{verbatim}
\texttt{en amp text={$\mathstrut \mathbf{\triangleright} \; \text{mathrm{A}}$}}
\end{verbatim}

To combine flipping with a generic label you just do:
\begin{circuitikz}
\draw (0,0)node[en amp, xscale=-1, en amp text A](E){}
(E.out) node[left] {$v_{\text{out}}$}
(E.-) node[right] {$v_{\text{in}-}$}
(E.+ node[right] {$v_{\text{in}+}$} ;
\end{circuitikz}

But notice that the “A” is also flipped by the \texttt{xscale} parameter. So the solution in this case is to use \texttt{scalebox}, like this:
\begin{circuitikz}
\draw (0,0)node[en amp, xscale=-1, en amp text={$\triangleright$ \scalebox{-1}[1]{small 200}}](E){}
(E.out) node[left] {$v_{\text{out}}$}
(E.-) node[right] {$v_{\text{in}-}$}
(E.+ node[right] {$v_{\text{in}+}$} ;
\end{circuitikz}

3.22.3 Designing your own amplifier

If you need a different kind of amplifier, you can use the \texttt{muxdemux} (see section 3.26) shape for defining one that suits your needs (you need version 1.0.0 for this to work).

\begin{tikzset}
tdax/.style={muxdemux,
        muxdemux def={NL=2, Lh=3, NR=1, Rh=0,
                      NB=4, NT=5}, font=\scriptsize\ttfamily}
\end{tikzset}
\begin{circuitikz}
\draw (0,0)node[tdax](A){TDA1};
\draw (2.5,0) node[tdax, muxdemux def={Rh=0.5}](TDA2);
\end{circuitikz}

3.23 Switches and buttons

Switches and button come in to-style (the simple ones and the pushbuttons), and as nodes. The switches can be scaled with the key \texttt{switches/scale} (default 1.0). Notice that scaling the switches will not scale the poles, which are controlled with their own parameters (see section 3.15).
3.23.1 Traditional switches

These are all of the to-style type:

- **toggle switch**: Toggle switch, type: path-style, nodename: toggleswitchshape. Class: default.
- **reed**: Reed switch, type: path-style, fillable, nodename: reedshape. Class: switches.

while this is a node-style component:

```
\begin{circuitikz} \draw
  \node[spdt] (Sw) {};
  \node[left] at (Sw.in) {in};
  \node[right] at (Sw.out 1) {out 1};
  \node[right] at (Sw.out 2) {out 2};
\end{circuitikz}
```
3.23.2 Cute switches

These switches have been introduced after version 0.9.0, and they come in also in to-style and in node-style, but they are size-matched so that they can be used together in a seamless way.

The path element (to-style) are:

while the node-style components are the single-pole, double-throw (spdt) ones:

- **Cute spdt up**: node[cute spdt up]. Class: switches.
- **Cute spdt mid**: node[cute spdt mid]. Class: switches.
- **Cute spdt down**: node[cute spdt down]. Class: switches.
- **Cute spdt up with arrow**: node[cute spdt up arrow]. Class: switches.
- **Cute spdt mid with arrow**: node[cute spdt mid arrow]. Class: switches.
- **Cute spdt down with arrow**: node[cute spdt down arrow]. Class: switches.
3.23.2.1 Cute switches anchors  The nodes-style switches have the following anchors:

Please notice the position of the normal anchors at the border of the ocirc shape for the cute switches; they are thought to be compatible with an horizontal wire going out. Additionally, you have the cin, cout 1 y cout 2 which are anchors on the center of the contacts.

For more complex situations, the contact nodes are available using the syntax name of the node-in, ...-out 1 and ...-out 2, with all their anchors.

\begin{circuitikz}
\draw (0,0) node[cute spdt up] (S1) {};
\draw (0,-2) node[cute spdt up, /tikz/circuitikz/bipoles/cuteswitch/height=0.8] (S2) {};
\draw [red] (S1-in.s) -- (S2-in.n);
\draw [blue] (S1-out 2.s) -- (S2-out 1.n);
\end{circuitikz}

The mid anchor in the cute switches (both path- and node-style) can be used to combine switches to get more complex configurations:

\begin{circuitikz}
\draw (0,1.4) node[cute spdt up](S1){};
\draw (0,0) node[cute spdt up](S2){};
\draw (0,-1) node[cuteclosedswitchshape, yscale=-1](S3){};
\draw [densely dashed] (S1.mid)--(S2.mid)--(S3.mid);
\end{circuitikz}

3.23.2.2 Cute switches customization  You can use the key bipoles/cuteswitch/thickness to decide the thickness of the switch lever. The units are the diameter of the ocirc connector, and the default is 1.

\begin{circuitikz}
\ctikzset{bipoles/cuteswitch/thickness=0.5}
\draw (0,1.4) node[cute spdt up](S1){};
\draw (0,0) node[cute spdt up](S2){};
\draw (0,-1) node[cuteclosedswitchshape, yscale=-1](S3){};
\draw [densely dashed] (S1.mid)--(S2.mid)--(S3.mid);
\end{circuitikz}

Finally, the switches are normally drawn using the ocirc shape, but you can change it, as in the following example, with the key bipoles/cuteswitch/shape. Be careful that the shape is used with its defaults (which can lead to strange results), and that the standard anchors will be correct only for circ and ocirc shapes, so you have to use the internal node syntax to connect it.

\footnotesize{\textsuperscript{18}}Thanks to @marmot on tex.stackexchange.com.
3.23.3 Rotary switches

Rotary switches are a kind of generic multipole switches; they are implemented as a strongly customizable element (and a couple of styles to simplify its usage). The basic element is the following one, and it has the same basic anchors of the cute switches, included the access to internal nodes (shown in blue here).

Notice that the name of the shape is \texttt{rotaryswitch}, no spaces. The default rotary switch component has 5 channels (this is set in the parameter \texttt{multipoles/rotary/channels}), spanning from \(-60\)° to \(60\)° (parameter \texttt{multipoles/rotary/angle}) and with the wiper at \(20\)° (parameter \texttt{multipoles/rotary/wiper}). Moreover, there are by default no arrows on the wiper; if needed, you can change this default setting the parameter \texttt{multipoles/rotary/arrow} which can assume the values \texttt{none}, \texttt{cw} (clockwise), \texttt{ccw} (counterclockwise) or \texttt{both}.

To simplify the usage of the component, a series of styles are defined: \texttt{rotary switch =} <channels> in <angle> wiper <wiper angle> (notice the space in the name of the style!). Using \texttt{rotary switch} without parameters will generate a default switch.

To add arrows, you can use the styles \texttt{rotary switch -} (no arrow, whatever the default), \texttt{rotary switch <->} (counterclockwise arrow), \texttt{rotary switch ->} (clockwise) and \texttt{rotary switch <->} (both).

Notice that the defaults of the styles are the same as the default values of the parameters, but that if you change globally the defaults using the keys mentioned above, you only change the defaults for the “bare” component \texttt{rotaryswitch}, not for the styles.
3.23.3.1 Rotary switch anchors

Rotary switches anchors are basically the same as the cute switches, including access (with the `<node name>-<anchor name>` notation) to the internal connection nodes. The geographical anchors work as expected, marking the limits of the component.

In addition to the anchors they have in common with the cute switches, the rotary switch has the so called “angled” anchors and the “external square anchors”. *Angled anchors*, called `aout 1`, `aout 2` and so forth, are anchors placed on the output poles at the same angle as the imaginary lines coming from the input pole; *square anchors*, called `sqout 1`..., are located on an imaginary square surrounding the rotary switch on the same line.

The code for the diagram at the left, above, without the markings for the anchors, is:

```latex
\begin{circuitikz}
\ctikzset{multipoles/rotary/arrow=both}
\draw (0,0) node[rotary switch <-=8 in 120 wiper 40, anchor=in](A){};
\draw (3,0) -- ++(1,0) node[rotary switch, anchor=in](B){};% default values
\draw[red] (A.out 4) -| (3,0);
\draw[blue] (A-out 2.n) -- ++(0,0.5) -| (B-out 1.n);
\draw (B.out 3) -- ++(1,0) node[rotary switch -=5 in 90 wiper 15, anchor=in](C){};
\draw (C.out 3) -- ++(1,0) node[rotary switch ->, xscale=-1, anchor=out 3](D){};
\draw[green, dashed] (B.mid) -- ++(-.5,-1) -| (C.mid);
\end{circuitikz}
```

One possible application for the angled and the “on square” anchors is that you can use them to move radially from the output poles, for example for adding numbers:
Finally, notice that the value of width for the rotary switches is taken from the one for the “cute switches” which in turn is taken from the width of traditional spdt switch, so that they match (notice that the “center” anchor is better centered in the rotary switch, so you have to explicitly align them).

3.23.3.2 Rotary switch customization  
Apart from the basic customization seen above (number of channels, etc.) you can change, as in the cute switches, the shape used by the connection points with the parameter multipoles/rotary/shape, and the thickness of the wiper with multipoles/rotary/thickness. The optional arrow has thickness equal to the standard bipole thickness bipoles/thickness (default 2).

Finally, the size can be changed using the parameter tripoles/spdt/width (default 0.85).

3.24 Logic gates  
Logic gates, with two or more input, are supported. Albeit in principle these components are multipoles, the are considered tripoles here, for historical reasons (when they just had two inputs).
3.24.1 American Logic gates

![American AND port](image1)

American AND port, type: node, fillable (node[american and port]{}). Class: logic ports.

![American OR port](image2)

American OR port, type: node, fillable (node[american or port]{}). Class: logic ports.

![American NAND port](image3)

American NAND port, type: node, fillable (node[american nand port]{}). Class: logic ports.

![American NOR port](image4)

American NOR port, type: node, fillable (node[american nor port]{}). Class: logic ports.

![American XOR port](image5)

American XOR port, type: node, fillable (node[american xor port]{}). Class: logic ports.

![American XNOR port](image6)

American XNOR port, type: node, fillable (node[american xnor port]{}). Class: logic ports.

![American BUFFER port](image7)

American BUFFER port, type: node, fillable (node[american buffer port]{}). Class: logic ports.

![American NOT port](image8)

American NOT port, type: node, fillable (node[american not port]{}). Class: logic ports.

There is no “European” version of the following symbols (but you can probably use the Schmitt symbol of the IEEE standard ports.

![Non-Inverting Schmitt trigger](image9)

Non-Inverting Schmitt trigger, type: node, fillable (node[schmitt]{}). Class: logic ports.

![Inverting Schmitt trigger](image10)

Inverting Schmitt trigger, type: node, fillable (node[invschmitt]{}). Class: logic ports.
3.24.2 IEEE logic gates

In addition to the legacy ports, since release 1.1.0, logic ports following the recommended geometry of distinctive-shape symbols in IEEE Std 91a-1991 Annex A (Recommended symbol proportions) are also available\(^\text{19}\).

These ports are completely independent from the legacy set (either **american** or **european**); they are not enabled by default because the relative size of the ports is very different from the legacy ones, and that will disrupt every schematic (especially if drawn with absolute coordinate). If you want to use them as default, you can use the command \texttt{\textbackslash ctikzset{logic ports=ieee}} and by default the shapes **and** port, **or** port and so on will be the IEEE standard ones.

---

\(^{19}\)Thanks to Jason for proposing it and digging out the info, see this GitHub issue.

Schmitt symbol to add to input pins if needed, type: node, fillable (`node[schmitt symbol]`). Class: logic ports.

### 3.24.3 European Logic gates

- **European OR port**, type: node, fillable (`node[european or port]`). Class: logic ports.

If (default behaviour) `americanports` option is active (or the style `[american ports]` is used), the shorthands `and`, `or`, `not`, `nand`, `nor`, `xor`, and `xnor` are equivalent to the American version of the respective logic port.

If otherwise `europeanports` option is active (or the style `[european ports]` is used), the shorthands `and`, `or`, `not`, `nand`, `nor`, `xor`, and `xnor` are equivalent to the European version of the respective logic port.

Finally, for version 1.1.0 and up, you can use the style `ieee ports` to set the shorthands to the set of `ieeestd` ports. (There is no global option for this).
3.24.4 American port usage

Since version 1.0.0, the default shape of the family of american “or” ports has changed to a more “pointy” one, for better distinguish them from the “and”-type ports. You can still going back to the previous aspect with the key american or shape that can be set to pointy or roundy. The legacy style will enact the old, roundy style also.

```circuitikz
\begin{circuitikz}
\american
\% legacy shapes
\ctikzset{american or shape=roundy}
\ctikzset{logic ports/fill=yellow}
\node [or port](O1) at (0,0) { }
\node [nor port](O2) at (0,-1.5) { }
\node [xor port](O3) at (0,-3) { }
\node [xnor port](O4) at (0,-4.5) { }
\begin{scope}[xshift=3cm]
\% new shapes
\ctikzset{american or shape=pointy}
\node [or port](O1) at (0,0) { }
\node [nor port](O2) at (0,-1.5) { }
\node [xor port](O3) at (0,-3) { }
\node [xnor port](O4) at (0,-4.5) { }
\end{scope}
\end{circuitikz}
```

3.24.4.1 American logic port customization  Logic port class is called logic ports, so you can scale them all with logic ports/scale (default 1.0).
As for most components, you can change the width and height of the ports; the thickness is given by the parameter tripoles/thickness (default 2).

It is possible to change height and width of the logic ports using the parameters tripoles/american type port/ plus width or height:

```circuitikz
\tikz \draw (0,0) node[nand port] {}; \par\ctikzset{tripoles/american nand port/input height=.2}\ctikzset{tripoles/american nand port/port width=.4}\ctikzset{tripoles/thickness=4}\tikz \draw (0,0) node[nand port] {};
```

This is especially useful if you have ports with more than two inputs, which are instantiated with the parameter number inputs:

```circuitikz
\begin{circuitikz}
\draw (0,3) node[american and port] (A) {P1}; \begin{scope}\ctikzset{tripoles/american or port/height=1.6}\draw (A.out) -- ++(0.5,0)\node[american or port, number inputs=5, anchor=in 1] (B) {P2};\end{scope}\draw (0,1.5) node[american or port] (C) {P3};\draw (C.out) |- (B.in 2);\end{circuitikz}
```
You can suppress the drawing of the logic ports input leads by using the boolean key `logic ports draw input leads` (default `true`) or, locally, with the style `no inputs leads` (that can be reverted with `input leads`), like in the following example. The anchors do not change and you have to take responsibility do do the connection to the "border"-anchors.

```
\begin{circuitikz}
\node [or port](O1) at (0,2) {};
\node [or port, no input leads](O1) at (2,2) {};
\ctikzset{logic ports draw input leads=false}
\node [and port](O1) at (0,0) {};
\node [nand port, input leads](O1) at (2,0) {};
\end{circuitikz}
```

This is useful if you need to draw a generic port, like the one following here:

```
\begin{circuitikz}
\ctikzset{tripoles/american nand port/height=1.6}
draw (0,0)
node[american nand port, circuitikz/tripoles/american nand port/height=1.1,
number inputs=5, no input leads,
] (B) {Pn};
draw (B.in 1) -- (B.bin 1) (B.in 5) -- (B.bin 5);
node[rotate=90] at (B.in 3) {\dots};
\end{circuitikz}
```

The flag works also for the european-style ports, and it suppress only the input leads because the negated ports in european style are ill-specified if you do not draw the output leads (and moreover, it seems really less useful).

You can tweak the appearance of american "or" family (or, nor, xor and xnor) ports, too, with the parameters `inner` (how much the base circle go “into” the shape, default 0.3) and `angle` (the angle at which the base starts, default 70).

```
\tikz \draw (0,0) node[xnor port] {};
\ctikzset{tripoles/american xnor port/inner=.7}
\ctikzset{tripoles/american xnor port/angle=40}
\tikz \draw (0,0) node[xnor port] {};
```

### 3.24.4.2 American logic port anchors

These are the anchors for logic ports:

```
in 1
in 2
in 3
left
right
out
```

```
left
right
```

You have also “border pin anchors”:

```
bout
bin 1
bin 2
bin 3
```

```
bout
bin 1
bin 2
```

These anchors are especially useful if you want to negate inputs:
As you can see, the `center` anchor is (for historic reasons) not in the center at all. You can fix this with the command `\ctikzset{logic ports origin=center}`:

```
\begin{circuitikz}
\ctikzset{logic ports origin=center}
\draw (0,0) node[and port] (myand) {};
\node at (myand.east) {1};
\node at (myand.east) {2};
\node at (myand.west) {3};
\draw[-] (myand.center) -- ++(1,-1) node{center};
\end{circuitikz}
```

In the case of `NOT`, there are only `in` and `out` (although for compatibility reasons `in` 1 is still defined and equal to `in`):

```
\begin{circuitikz}
\draw
(1,0) node[not port] (not1) {};
(3,0) node[not port] (not2) {};
(0,0) -- (not1.in)
(not2.in) -- (not1.out)
++(0,-1) node[ground] {} to[C] (not1.out)
(not2.out) -| (4,1) -| (0,0)
\end{circuitikz}
```

### 3.24.5 IEEE logic gates usage.

The rest of this section will assume you have issued the command `\ctikzset{logic ports=ieee}`, so that the short form of the names is used.

IEEE standard logic gates have a basic difference with the legacy ones: the proportions of their shapes does not change when you change the size, so you can’t have a “tall” port or a “squatty” ones. The two-inputs gates, by default, have their default size designed so that they match the chips component (see 3.27).
If you need, say, a 4-inputs port, the port will look like this:

```latex
\begin{circuitikz}
\draw (0,0) node [dipchip] (C) {IC} (C.pin 8) node [or port, anchor=in 1, number inputs=4, color=red] (A) {IC2A};
\end{circuitikz}
```

...and in this case it is clear that it does not match. With standard ports, there are two possibilities. The first one is to scale the port; if you set the port height so that it has the same size (see “IEEE logic gates customization” below for details) as the number of ports, they will match again.

```latex
\begin{circuitikz}
\draw (0,0) node [dipchip] (C) {IC} (C.pin 8) node [or port, anchor=in 1, number inputs=4, circuitikz/ieee std ports/height=4, color=red] (A) {IC2A};
\end{circuitikz}
```

But then the size of the port is quite “unusual”. The solution is technical literature is to use what we can call a “rack” for the inputs; basically, only a certain number of pins are kept on the port, and the other are put on an extended input line.

```latex
\begin{circuitikz}
\draw (0,0) node [dipchip] (C) {IC} (C.pin 8) node [or port, anchor=in 1, number inputs=5, inner inputs=2, color=red] (A) {IC2A};
\end{circuitikz}
```

When using the `inner inputs` key, keep in mind the rule of thumbs:

- the distance between the pins is matched with the chip ones when the `inner inputs` match the `/ieee std ports/height` key;
- when the number of pins in the rack is odd, the result is often quite ugly, so try to avoid it.

For example, look at the following example; given that we are asking an odd number of pins on the rack, some of the inputs are drawn on the port’s border, resulting in a less-than-ideal diagram.

```latex
\begin{circuitikz}
\draw (0,0) node [dipchip] (C) {IC} (C.pin 8) node [or port, anchor=in 1, number inputs=5, inner inputs=2, color=red] (A) {IC2A};
\end{circuitikz}
```
In this case, if you don’t like the solution, the better approach is to let the gate grow a bit.

The good thing about the rack mechanism is that you can have quite big ports without problems.

You can use the additional elements (the notcirc and the schmitt symbol) to obtain circuits like the following ones (well, a bit of a mix of conventions, but...):

Notice the key component text=left that moves the label near to the left border of the component. There is also a \ctikzset{component text=left} if you prefer to have it as a default for all the IEEE ports.\footnote{There is a plan to extend this to other components, too.}

3.24.5.1 Stacking and aligning IEEE standard gates. The standard gates are designed so that they stacks up nicely when positioned using the external leads as anchors. Notice that the ports do have different sizes, but the leads lengths are designed to counter the differences.
The length of the external leads can be changed by the user, but notice that if you use a too small value you can jeopardize that property.

The single input ports (not port, buffer port and their Schmitt equivalent) are smaller that the six standard ports, so they are not kept aligned by default; the just have the same distance at the input side. For the not ports, the left position of the text results often in a better look (the centered text in the triangle seems to be much more at the right).

```
\begin{circuitikz}
\ctikzset{component text=left}
\draw (0,0) node[nand port, anchor=in 1]{A1}
(0,-1.8) node[buffer port, anchor=in 1]{A2}
(0,-3.2) node[not port, anchor=in 1]{A3};
\draw (3,0) node[nand port, anchor=in 1](A1){A1}
(3,-1.8) node[buffer port, anchor=in 1]{A2}
(3,-3.2) node[not port, anchor=in 1](A3){A3};
\draw[red, dashed]([yshift=0.8cm]A1.body left)
-- ([yshift=-0.8cm]A3.body left);
\end{circuitikz}
```

### 3.24.5.2 IEEE standard ports customization

There are several parameters that can be used to customize the IEEE standard ports, although less than the ones in the legacy american ones — the basic shape is set to follow the IEEE recommendation. The basic parameters are shown in the following table, and they can be set via \ctikzset{ieeestd ports/...}

<table>
<thead>
<tr>
<th>key</th>
<th>default</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baselen</td>
<td>0.4</td>
<td>the basic length for every dimension, as a fraction of the (scaled) resistor length</td>
</tr>
<tr>
<td>height</td>
<td>2</td>
<td>the height of the port, in term of baselen. Pin distance is given by this parameter divided by the inner pins.</td>
</tr>
<tr>
<td>pin length</td>
<td>0.7</td>
<td>length of the external pin leads that are drawn with the port. This length is always calculated starting from the inner body of the shape.</td>
</tr>
<tr>
<td>not radius</td>
<td>0.154</td>
<td>radius of the “not circle” added to the negated-output ports. The default value is the IEEE recommended one.</td>
</tr>
<tr>
<td>xor bar distance</td>
<td>0.192</td>
<td>distance of the detached input shape in xor and xnor ports. The default value is the IEEE recommended one.</td>
</tr>
<tr>
<td>xor leads in</td>
<td>1</td>
<td>If set to 0, there will be no leads drawn between the detached input line and the body in the xor and xnor ports. IEEE recommends 1 here.</td>
</tr>
<tr>
<td>schmitt symbol size</td>
<td>0.3</td>
<td>Size of the small Schmitt symbol to use near input leads.</td>
</tr>
</tbody>
</table>

For example, using a not radius of 0.1 will give a “not ball” of the same size of a connecting pole, as it is in the legacy ports.

```
\begin{circuitikz}
\draw (0,2) node[xnor port](P){}
(P.out) to[short, -o] ++(1,0);
\ctikzset{ieeestd ports/.cd, not radius=0.1,
xor bar distance=0.3, xor leads in=0}
\draw (0,0) node[xnor port](P){}
(P.out) to[short, -o] ++(1,0);
\end{circuitikz}
```
In addition to the specific parameters, you can also apply to these ports the boolean style \textbf{no input leads} as in legacy ones (this simply \textit{does not draw} the input leads, but the anchors stays where they should):

```latex
\begin{circuitikz}
\draw (0,0) node[nand port, number inputs=5, no input leads,](B){Pn};
\draw (B.in 1) -- (B.bin 1) (B.in 5) -- (B.bin 5);
\node[rotate=90] at (B.in 3) {\textit{dots}};
\end{circuitikz}
```

Changing the leads length must be done with a bit of care, because if the length is shorter than the port left or right extrusions strange things can happen (yes, a 4-inputs xnor gates is not so well defined...but it’s a nice example to show):

```latex
\begin{circuitikz}
\ctikzset{ieeestd ports/pin length=0.2}
\draw (0,0) node[xnor port, number inputs=4, inner inputs=2](B){};
\end{circuitikz}
```

\section{IEEE standard ports anchors}

Geographical anchors define the rectangular space that the port is using, included the leads if presents.

Most of the anchors can be seen in the following diagram:

The inputs anchor are \textit{in number} (on the tip of the lead) and \textit{bin number} (border inputs) on the component’s border (useful if you draw the ports with \textbf{no input leads}. Additionally, you have \textit{ibin number} (inner border inputs) for the \textit{x}-type ports. The anchor named \textit{left} is where a central border input would be.

In one-input ports (\textit{not port}, the buffer, and Schmitt-type ports) you can use plain \textit{in} or \textit{in 1} indifferently.

On the output, \textit{out} is on the tip of the lead, and \textit{bout} on the rightmost border (so, if there is a negation circle, it is on it); \textit{right} is the same as \textit{bout}.

The main body of the port is marked with \textit{body left} and \textit{body right} anchors (as seen in the middle port in the diagram above); you have also an \textit{up} and \textit{down} anchors centered on the body (you can use them as enable signals or similar things).

Finally, the internal \texttt{notcirc} node used for the output negation is accessible with the name \texttt{nodename-not}, where \texttt{nodename} is the name given to the logic port node.
3.24.6 European logic port usage

European logic port are the same class as american and IEEE-style ones, and they obey the same class modifier. Moreover, you can use the no inputs pin as in the other logic ports to suppress input pins.

3.24.6.1 European logic port customization Normally the European-style logic port with inverted output are marked with a small triangle; if you want you can change it with the key tripoles/european not symbol; its default is triangle but you can set it to circle like in the following example. As you can see, the circle size is the same as the circuit poles; if you prefer the size used in the IEEE standard ports, you can use set it to ieee circle.

```latex
\begin{circuitikz}[european]
\node[nand port](A){};
(A.out) to[short, *-o] ++(0.5,0);
\ctikzset{tripoles/european not symbol=circle}
\node[nand port](A){};
(A.out) to[short, *-o] ++(0.5,0);
\ctikzset{tripoles/european not symbol=ieee circle}
\node[european nand port](A){};
(A.out) to[short, *-o] ++(0.5,0);
\end{circuitikz}
```

3.24.6.2 European logic port anchors The anchors are basically the same as in the american-style ports.

3.25 Flip-flops

Flip-flops (available since version 1.0.0) are an hybrid between the logic ports and the chips. They have a class by themselves (flipflops) but the default parameters are set at the same values as the logic gates one.

The default flip flop is empty: it is just a rectangular box like a blank dipchip with 6 pins.

As you can see, in a void flip flop no external pins are drawn: you have to define the meaning of each of them to see them. To define a specific flip-flop, you have to set a series of keys under the \ctikzset directory multiples/flipflop/, corresponding to pins 1...6, u for “up” and d for “down”:

- a text value t0, t1, ..., t6, and tu and td (the last ones for up and down) which will set a label on the pin:
• a clock wedge flag \((c0, \ldots, c6, cu, cd)\), with value 0 or 1, which will draw a triangle shape on the border of the correspondig pin;

• a negation flag \((n0, \ldots, n6, nu, nd)\), with value 0 or 1, which will put and \textcirc shape on the outer border of the correspondig pin.

To set all this keys, an auxiliary style \texttt{flipflop def} is defined, so that you can do the following thing:

\begin{verbatim}
\tikzset{flipflop AB/.style={flipflop,
   flipflop def={t1=A, t3=B, t6=Q, t4={\ctikztextnot{Q}},
   td=rst, nd=1, c2=1, n2=1, t2={\texttt{CLK}}},
}}
\end{verbatim}

...to obtain:

\begin{figure}
\centering
\includegraphics[width=\textwidth]{example_custom_flip_flop}
\caption{Example custom flip flop, type: node, fillable (node[flipflop AB]{}). Class: flipflops.}
\end{figure}

\texttt{\ctikztextnot{}} is a small utility macro to set a overbar to a text, like \texttt{RST} (created by \texttt{\ctikztextnot{RST}}).

By default, the following flip-flops are defined:

\begin{figure}
\centering
\begin{tabular}{c}
 D \quad \bar{Q} \\
 \hline
 CLK \quad \bar{Q} \\
\end{tabular}
\caption{D-type latch, type: node, fillable (node[latch]{}). Class: flipflops.}
\end{figure}

\begin{figure}
\centering
\begin{tabular}{c}
 S \quad Q \\
 \hline
 R \quad \bar{Q} \\
\end{tabular}
\caption{flip-flop SR, type: node, fillable (node[flipflop SR]{}). Class: flipflops.}
\end{figure}

\begin{figure}
\centering
\begin{tabular}{c}
 D \quad Q \\
 \hline
 \quad \bar{Q} \\
\end{tabular}
\caption{Edge-triggered synchronous flip-flop D, type: node, fillable (node[flipflop D]{}). Class: flipflops.}
\end{figure}

\begin{figure}
\centering
\begin{tabular}{c}
 T \quad Q \\
 \hline
 \quad \bar{Q} \\
\end{tabular}
\caption{Edge-triggered synchronous flip-flop T, type: node, fillable (node[flipflop T]{}). Class: flipflops.}
\end{figure}
Edge-triggered synchronous flip-flop JK, type: node, fillable (node[flipflop JK]{}). Class: flipflops.

If you prefer that the negated output is labelled \(Q\) and a dot indicating negation is shown, you can add the \texttt{dot on notQ} key:

Synchronous flip-flop JK with asynchronous set and reset, type: node, fillable (node[flipflop JK, dot on notQ]{}). Class: flipflops.

You can also add “vertical” asynchronous set and reset (active low) adding the style \texttt{add async SR} to all of them:

Synchronous flip-flop JK with asynchronous set and reset, type: node, fillable (node[flipflop JK, add async SR]{}). Class: flipflops.

### 3.25.1 Custom flip-flops

If you like different pin distributions, you can easily define different flip-flops to your taste. For example, somebody likes the clock pin on the bottom pin:

```latex
\begin{tikzpicture}
\node[flipflop JK/.style={flipflop,
  flipflop def={t1=J, t2=K, t6=Q, t4=\texttt{\textbackslash \textbf{ctikztextnot}(Q), c3=1}}}]{}
\end{tikzpicture}
```

Example custom flip flop, type: node, fillable (node[flipflop myJK]{}). Class: flipflops.

The standard definition of the default flip-flops are the following (in the file \texttt{pgfcircmultipoles.tex}):
3.25.2 Flip-flops anchors

Flip-flops have all the standard geometrical anchors, although it should be noticed that the external pin are outside them. The pins are accessed by the number 1 to 6 for the lateral ones (like in DIP chips), and with the up and down anchors for the top and bottom one. All the pins have the “border” variant (add a b in front of them, no spaces).

If you have negated pins, you can access the \textcircled{c}irc shapes with the name as <nodename>-N<pin number>, and all the respective anchors (for example — myFFnode-N4.west).

3.25.3 Flip-flops customization

Flip-flop’s size is controlled by the class parameters (like \texttt{flipflops/scale} and the specific \texttt{\ctikzset} keys \texttt{multipoles/flipflop/width} and \texttt{multipoles/flipflop/pin spacing}. Class parameters are also used for line thickness and fill color. The default values are matched with the logic ports ones.

The fonts used for the pins 1..6 is set by the key \texttt{multipoles/flipflop/font} (by default \texttt{\small} in \LaTeX and the equivalent in other formats) and the font used for pins u and d is \texttt{multipoles/flipflop/fontud} (\texttt{\tiny} by default). You can change it globally or specifically for each flip flop.

As in chips, you can change the length of the external pin with the key \texttt{external pins width}; you can for example have a pinless flip-flop like this:
Notice however that negated pins when the pins width is zero has to be handled with care. As explained in the poles section, the \( \textcircled{c} \) shape is drawn at the end of the shape to cancel out the wires below; so if you use a pinless flipflop when you do the connection you should take care of connecting the symbol correctly. To this end, the shapes of the negation circles are made available as \(<\text{nodename}>-N<\text{pin number}>\), as you can see in the next (contrived) example.

```
\begin{circuitikz}
\clip (0.2,0.5) rectangle (1.2,-1.3);
\node [flipflop JK, flipflop def={n5=1,n4=1,t5={/c},c5=1},
external pins width=0,
](A){};
\draw (A-N5.east) -- ++(1,0); % correct
\draw (A.pin 4) -- ++(1,0); % wrong
\end{circuitikz}
```

Normally the symbols on the flip-flop are un-rotated when you rotate the symbol, but as in case of chips, you can avoid it.

```
\begin{tikzpicture}
\draw (0,0) node[flipflop JK, add async SR]{};
\draw (3,0) node[flipflop JK, add async SR, rotate=90]{};
\draw (7,0) node[flipflop JK, add async SR, rotate=90, rotated numbers]{};
\end{tikzpicture}
```

### 3.26 Multiplexer and de-multiplexer

The shape used for muxes and de-muxes is probably the most configurable shape of the package; it has been added by Romano in v1.0.0. The basic shape is a multiplexer with 8 input pin, one output pin, and three control pins (\( 2^3 \rightarrow 1 \) multiplexer). The pins are not named as input or output pins (see below for a full description for anchors) for reasons that will be clear later.
You can define a custom shape for the \texttt{muxdemuxes} using an interface similar to the one used in flip-flops; for example:

\begin{verbatim}
\tikzset{demux/.style={muxdemux, muxdemux def={Lh=4, Rh=8, NL=1, NB=3, NR=8}}}
\end{verbatim}

will generate the following shape (the definition above is already defined in the package):

The shape can be also defined with an inset. For example it can be used like this to define a 1-bit adder (also already available):

\begin{verbatim}
\tikzset{one bit adder/.style={muxdemux, \texttt{muxdemux def}={Lh=4, NL=2, Rh=2, NR=1, NB=1, w=1.5, inset w=0.5, inset Lh=2, inset Rh=1.5}}}
\end{verbatim}

Or a Arithmetic Logic Unit (again, already defined by default):

\begin{verbatim}
\tikzset{ALU/.style={muxdemux, \texttt{muxdemux def}={Lh=5, NL=2, Rh=2, NR=1, NB=2, NT=1, w=2, inset w=1, inset Lh=2, inset Rh=0, square pins=1}}}
\end{verbatim}
3.26.1 Mux-Demux: design your own shape

In designing the shape there are several parameters to be taken into account. In the diagram on the right they are shown in a (hopefully) practical way. The parameter can be set in a node or in a style using the `muxdemux def` key as shown above, or set with `\ctikzset` as `multipoles/muxdemux/Lh` keys and so on.

The default values are \( L_h = 8 \), \( R_h = 6 \), \( w = 3 \) and no inset: \( \text{inset } L_h = \text{inset } R_h = \text{inset } w = 0 \). In addition, you can set the following parameters:

**NL, NR, NB, NT**: number of pins relatively on the left, right, bottom and top side (default 8, 1, 3, 0). When an inset is active (in other words, when \( L_h > 0 \)) the pins are positioned on the top and bottom part, not in the inset; the exception is when the number of left pins is odd, in which case you have one pin set on the center of the inset. If you do not want a pin in one side, use 0 as number of pins.

**square pins**: set to 0 (default) if you want the square pins to stick out following the slope of the bottom or top side, 1 if you want them to stick out in a square way (see the example above for the ALU).

All the distances are multiple of `multipoles/muxdemux/base len` (default 0.4, to be set with `\ctikzset`), which is relative to the basic length. That value has been chosen so that, if you have a numbers of pins which is equal to the effective distance where they are spread (which is \( L_h \) without inset, \( L_h - (\text{inset } L_h) \) with an inset), then the distance is the same as the default pin distance in chips, as shown in the next circuit. In the same drawing you can see the effect of `square pins` parameters (without it, the rightmost bottom lead of the mux 4by2 shape will not connect with the below one).
3.26.2 Mux-Demux customization

Mux-demuxes have the normal parameters of their class (muxdemuxes): you can scale them with the `\ctikzset` key `muxdemuxes/scale`, control the border thickness with `muxdemuxes/thickness` and the default fill color with `muxdemuxes/fill` — they are set, by default, at the same values than logic ports. External pins’ length is controlled by the key `multipoles/external pins width` (default 0.2) or by the style `external pins width`. The parameter `multipoles/external pins thickness` is also respected, like in chips. In addition, like in logic ports, you can suppress the drawing of the leads by using the boolean key `logic ports draw input leads` (default `true`) or, locally, with the style `no inputs leads` (that can be reverted with `input leads`).

The main difference between setting `external pins width` to 0 or using `no inputs lead` is that in the first case the normal pin anchors and the border anchors will coincide, and in the second case they will not move and stay where they should have been if the leads were drawn.

3.26.3 Mux-Demux anchors

Mux-demuxes have a plethora of anchors. As in the case of chips, the geographic anchors mark the rectangle occupied by the component, without taking into account the pin leads.

The pins anchors are named `lpin`, `rpin`, `bpin` and `tpin` for the left, right, bottom and top pin respectively, and points to the “external” pin. The border pins are named the same, with a `b` added in front: `blpin`, `brpin`, `bbpin` and `btpin`. The following graph will show the numbering and position of the pin anchors.

The code that implemented the printing of the numbers (which in `muxdemuxes`, differently from chips, are never printed automatically) in the last graph is the following one.
\begin{circuitikz}
\node [muxdemux, muxdemux def={NL=4, NR=3, NT=3, NB=3, w=2, inset w=0.5, Lh=4, inset Lh=2.0, inset Rh=1.0, square pins=1}] (C) at (0,0) {X};
\node [muxdemux, muxdemux def={NL=7, NR=8, NT=4, inset w=1.0, inset Lh=4.0, inset Rh=0.0}] (D) at (4,0) {X};
\foreach \myn/NL/NR/NB/NT in {C/4/3/3/3, D/7/8/3/4} {
  \foreach \myp in {1,...,\NL} \node[right, font=\tiny] at (\myn.blpin \myp) {\myp};
  \foreach \myp in {1,...,\NR} \node[left, font=\tiny] at (\myn.brpin \myp) {\myp};
  \foreach \myp in {1,...,\NB} \node[above, font=\tiny] at (\myn.bbpin \myp) {\myp};
  \foreach \myp in {1,...,\NT} \node[below, font=\tiny] at (\myn.btpin \myp) {\myp};
}\end{circuitikz}

You can use these shapes to draw a lot of symbols that are unavailable; using a bit of\LaTeX command trickery you can use them quite naturally too...

\def\tgate#1{
  \node[simple triangle, anchor=left, no input leads](#1-LR){}
  (#1-LR.right) node[simple triangle, xscale=-1, anchor=left](#1-RL){}
  ([yshift=.5ex]#1-RL.btpin 1) node[ocirc]{}
}\begin{circuitikz}[
  simple triangle/.style={muxdemux, muxdemux def={NL=1, NR=1, NB=1, NT=1, w=2, Lh=2, Rh=0,}}]
\draw (0,0) \tgate{A} (0,-2) \tgate{B};
\draw (A-RL.bpin 1) -- (B-RL.tpin 1);
\end{circuitikz}

### 3.27 Chips (integrated circuits)

\textbf{CircuiTikZ} supports two types of variable-pin chips: DIP (Dual-in-Line Package) and QFP (Quad-Flat Package).

Dual-in-Line Package chip, type: node, fillable (node[dipchip]{}). Class: chips.

Quad-Flat Package chip, type: node, fillable (node[qfpchip]{}). Class: chips.

### 3.27.1 DIP and QFP chips customization

You can scale chips with the key \texttt{chips/scale}. As ever, that will \textbf{not} scale text size of the labels, when they are printed.

You can customize the DIP chip with the key \texttt{multipoles/dipchip/width} (with a default of 1.2) and the key \texttt{multipoles/dipchip/pin spacing} (default 0.4) that are expressed in fraction of basic lengths (see section 3.1.3). The height of the chip will be equal to half the numbers of pins multiplied by the spacing, plus one spacing for the borders.
For the QFP chips, you can only choose the pin spacing with `multipoles/qfpchip/pin spacing` key.

The pins of the chip can be "hidden" (that is, just a spot in the border, optionally marked with a number) or "stick out" with a thin lead by setting `multipoles/external pins width` greater than 0 (default value is 0.2, so you’ll have leads as shown above). Moreover, you can transform the thin lead into a pad by setting the key `multipoles/external pad fraction` to something different from 0 (default is 0); the value expresses the fraction of the pin spacing space that the pad will use on both sides of the pin.

The number of pins is settable with the key `num pins`. **Please notice** that the number of pins must be **even** for `dipchip` and **multiple of 4** for `qfpchip`, otherwise havoc will ensue.

You can, if you want, avoid printing the numbers of the pin with `hide numbers` (default `show numbers`) if you prefer positioning them yourself (see the next section for the anchors you can use). The font used for the pins is adjustable with the key `multipoles/font` (default `\tiny`). For special use you can suppress the orientation mark with the key `no topmark` (default `topmark`).

The line thickness of the main shape is controlled by `multipoles/thickness` (default 2) and the one of the external pins/pads with `multipoles/external pins thickness` (default 1).

3.27.2 Chips anchors

Chips have anchors on pins and global anchors for the main shape. The pin anchors to be used to connect wires to the chip are called `pin 1`, `pin 2`, …, with just one space between `pin` and the number. Border pin anchors (`bpin 1`…) are always on the box border, and can be used to add numbers or whatever markings are needed. Obviously, in case of `multipoles/external pins width` equal to zero, border and normal pin anchors will coincide.
Additionally, you have geometrical anchors on the chip “box”, see the following figure. The nodes are available with the full name (like \texttt{north}) and with the short abbreviations \texttt{n}, \texttt{nw}, \texttt{w}... The \texttt{dot} anchor is useful to add a personalized marker if you use the \texttt{no topmark} key.

3.27.3 Chips rotation

You can rotate chips, and normally the pin numbers are kept straight (option \texttt{straight numbers}, which is the default), but you can rotate them if you like with \texttt{rotated numbers}. Notice that the main label has to be (counter-) rotated manually in this case.

\begin{circuitikz}
\draw (0,0) node[dipchip, rotate=90]{\rotatebox{-90}{IC2}};
\draw (3,0) node[qfpchip, rotated numbers, rotate=45]{IC3};
\end{circuitikz}

3.27.4 Chip special usage

You can use chips to have special, personalized blocks. Look at the following example, which is easily put into a macro.

\begin{circuitikz}
\ctikzset{multipoles/thickness=3}
\ctikzset{multipoles/dipchip/width=2}
\draw (0,0) node[dipchip, num pins=10, hide numbers, no topmark, external pins width=0](C){Block};
\node [right, font=\tiny] at (C.bpin 1) {RST};
\node [right, font=\tiny] at (C.bpin 2) {IN1};
\node [right, font=\tiny] at (C.bpin 4) {/IN2};
\node [left, font=\tiny] at (C.bpin 8) {OUT};
\draw (C.bpin 2) -- ++(-0.5,0) coordinate(extpin);
\draw (C.bpin 4) -- ++(0.5,0);
\draw (C.bpin 8) ++(0,0.1) -- ++(0,1,-0.1);
\draw (C.bpin 8) to[short,-o] ++(0.5,0);
\draw (C.bpin 5) ++(0,0.1) -- ++(0.1,-0.1);
\node[right, font=\tiny](CLK) -- ++(-0.1,-0.1);
\draw (C.n) -- ++(0,1) node[vcc]{};
\draw (C.s) -- ++(0,-1) node[ground]{};
\end{circuitikz}
3.28 Seven segment displays

The seven segment display lets you show values as if they were displayed in a classical seven segment display.\textsuperscript{21}

The main “bare” component is the one shown above, but for simplicity a couple of style interfaces are defined:

\begin{circuitikz}
\draw (0,0) node[seven segment val=A dot off box on]{};
\draw (1,0) node[seven segment val=- dot none box on]{};
\draw (0,-2) node[seven segment bits=1001001 dot empty box on]{};
\draw (1,-2) node[seven segment bits=0011101 dot none box off]{};
\end{circuitikz}

There are two main configuration methods. The first one is \texttt{seven segment val}, which will take an hexadecimal number or value and display it: the possible values are 0,...,15, plus A, B, C, D, E, F (or lowercase) and the symbol - (minus).

The other interface is \texttt{seven segment bits}, where you specify seven bits saying which segment must be on (please never specify a different number of bits, it will throw a very obscure error); you can see in the anchors the name of each segment.

The option \texttt{dot} specifies if you want a decimal dot or not. The key \texttt{none} will remove the dot and the space it would take; \texttt{empty} will not show the dot at all but reserve the space, and \texttt{on} or \texttt{off} will show the dot in the corresponding state.

The option \texttt{box} (can be \texttt{on} or \texttt{off}) simply toggles the drawing of the external box. You can separate it from the display with the key \texttt{seven seg/box sep} (default \texttt{ipt}), and it will use the thickness specified in \texttt{multipoles/thickness} (The same as the chips).

You can use these option with the “bare” object \texttt{bare7seg} and the keys \texttt{seven seg/bits} (default \texttt{0000000}), \texttt{seven seg/dot} (default \texttt{none}) and \texttt{seven seg/box} (default \texttt{off}); there is no option equivalent to the \texttt{val} interface.

3.28.1 Seven segments anchors

These are the anchors for the seven segment displays; notice that when the \texttt{dot} parameter is not \texttt{none}, the cell is a bit wider at the right side.

\[\text{Te\TeXexample.net}\]
3.28.2 Seven segments customization

You can scale the seven segment display with the key `displays/scale`. This will scale the size of the digit, but not the absolute sizes shown below — if you want them to scale, you have to do it manually.

You can change several parameters to adjust the displays:

```latex
\begin{itemize}
  \item \ctikzset{seven seg/width/.initial=0.4} % relative to \pgf@circ@Rlen (scalable)
  \item \ctikzset{seven seg/thickness/.initial=4pt} % segment thickness (not scaled)
  \item \ctikzset{seven seg/segment sep/.initial=0.2pt} % gap between segments (not scaled)
  \item \ctikzset{seven seg/box sep/.initial=1pt} % external box gap (not scaled)
  \item \ctikzset{seven seg/color on/.initial=red} % color for segment "on"
  \item \ctikzset{seven seg/color off/.initial=gray!20!white} % ...and "off"
\end{itemize}

A couple of examples are shown below.

```latex
\begin{circuitikz}[scale=0.5]
\ctikzset{seven seg/width=0.2, seven seg/thickness=2pt}
\foreach i in {0,...,15} \path (i,0) node[seven segment val=i dot on box off]{};
\ctikzset{seven seg/color on=black}
\foreach i in {0,...,15} \path (i,-1.5) node[seven segment val=i dot off box off, fill=gray!30!white]{};
\ctikzset{seven seg/color on=green, seven seg/color off=yellow!30}
\foreach i in {0,...,15} \path[color=red] (i,-3) node[seven segment val=i dot none box on, xslant=0.2]{};
\end{circuitikz}
```

![Diagram of seven segment displays with various customizations.](image)
4 Labels and similar annotations

Long names/styles for the bipoles can be used:

4.1 Labels and Annotations

Since Version 0.7, beside the original label (l) option, there is a new option to place a second label, called annotation (a) at each bipole. Up to now this is a beta-test and there can be problems. For example, up to now this option is not compatible with the concurrent use of voltage labels.

The position of (a) and (l) labels can be adjusted with _ and ^, respectively.
Caveat: notice that the way in which `circuitikz` processes the options, there will be problems if the label (or annotation, voltage, or current) contains one of the characters = (equal) or , (comma), giving unexpected errors and wrong output. These two characters must be protected to the option parser using an `\mbox` command, or redefining the characters with a TeX `\def`:

```
\def\eq{=}
\begin{circuitikz}
% the following will fail:
\draw (0,0) to[R, l={$R=3$}] (3,0);
\draw (0,0) to[R, l=\mbox{$R=3$}] (3,0);
\draw (0,0) to[R, l=$R\eq3$] (3,0);
\draw (3,3) to[R, l=\mbox{$R,3$}] (3,0);
% this works, but it has wrong spacing
\draw (0,3) to[R, l=$R{=}3$] (3,3);
\end{circuitikz}
```

The default orientation of labels is controlled by the options `smartlabels`, `rotatelabels` and `straightlabels` (or the corresponding `label/align` keys). Here are examples to see the differences:

```
\begin{circuitikz}
\ctikzset{label/align = straight}
\def\DIR{0,45,90,135,180,-90,-45,-135}
\foreach \i in \DIR {
    \draw (0,0) to[R=\i, *-o] (\i:2.5);
}
\end{circuitikz}
```

```
\begin{circuitikz}
\ctikzset{label/align = rotate}
\def\DIR{0,45,90,135,180,-90,-45,-135}
\foreach \i in \DIR {
    \draw (0,0) to[R=\i, *-o] (\i:2.5);
}
\end{circuitikz}
```
\begin{circuitikz}
\ctikzset{label/align = smart}
\def\DIR{0,45,90,135,180,-90,-45,-135}
\foreach \i in \DIR {
  \draw (0,0) to[R=\i, *-o] (\i:2.5);
}
\end{circuitikz}

You also can use stacked (two lines) labels. The example should be self-explanatory: the two lines are specified as 12=\textit{line1 and line2}. You can use the keys \texttt{l2 halign} to control horizontal position (left, center, right) and \texttt{l2 valign} to control the vertical one (bottom, center, top).

\begin{circuitikz}[ american, ]
\draw (0,0) to[R, l2^=$R_{CC}$ and \SI{4.7}{k\ohm}, l2 halign=c, l2 valign=b] (2,0);
\draw (0,0) to[R, l2^=$R_{CC}$ and \SI{4.7}{k\ohm}, l2 halign=c, ] (0,2);
\draw (0,0) to[R, l2^=$R_{CC}$ and \SI{4.7}{k\ohm}, , l2 valign=t] (-2,0);
\draw (0,0) to[R, l2^=$R_{CC}$ and \SI{4.7}{k\ohm}, l2 halign=c, l2 valign=t](0, -3);
\end{circuitikz}

4.2 Currents and voltages

The default direction/sign for currents and voltages in the components is, unfortunately, not standard, and can change across country and sometime across different authors. This unfortunate situation created a bit of confusion in circuitikz across the versions, with several incompatible changes starting from version 0.5. From version 0.9.0 onward, the maintainers agreed a new policy for the directions of bipoles' voltages and currents, depending on 4 different possible options:
• **oldvoltagedirection**, or the key style `voltage dir=old`: Use old way of voltage direction having a difference between European and American direction, with wrong default labelling for batteries (it was the default before version 0.5);

• **nooldvoltagedirection**, or the key style `voltage dir=noold`: The standard from version 0.5 onward, utilize the (German?) standard of voltage arrows in the direction of electric fields (without fixing batteries);

• **RPvoltages** (meaning Rising Potential voltages), or the key style `voltage dir=RP`: the arrow is in direction of rising potential, like in `oldvoltagedirection`, but batteries and current sources are fixed so that they follow the passive/active standard: the default direction of \(v\) and \(i\) are chosen so that, when both values are positive:
  
  – in passive component, the element is *dissipating power*;
  
  – in active components (generators), the element is *generating power*.

• **EFvoltages** (meaning Electric Field voltages), or the key style `voltage dir=EF`: the arrow is in direction of the electric field, like in `nooldvoltagedirection`, but batteries are fixed;

Notice that the four styles are designed to be used at the environment level: that is, you should use them at the start of your environment as in \begin{circuitikz}[voltage dir=old] ... and not as a key for single components, in which case the behaviour is not guaranteed.

The standard direction of currents, flows and voltages are changed by these options; notice that the default drops in case of passive and active elements is normally different. Take care that in the case of `noold` and `EFvoltages` also the currents can switch directions. It is much easier to understand the several behaviors by looking at the following examples, that have been generated by the code:

```latex
\foreach\element in {R, C, D, battery2, V, I, sV, cV, cI}{%
\noindent ttfamily
\begin{tabular}{p{2cm}}
\element \ \ american \\
\element \ \ european \\
\end{tabular}
\begin{tabular}{@{}l@{}}
\multicolumn{1}{c}{voltage dir} \\
\multicolumn{1}{c}{dir=\element} \\
\begin{tikzpicture}[
american, voltage dir=\element, 
]
\draw (0,0) to[\element, *-o, v=$v_1$, i=$i_1$, ] (2.5,0);
\end{tikzpicture}\%
\begin{tikzpicture}[
european, voltage dir=\element, 
]
\draw (0,0) to[\element, *-o, v=$v_1$, i=$i_1$, ] (2.5,0);
\end{tikzpicture}\ 
\medskip
\par%
}
R
american

R
european

C
american

C
european

D
american

D
european

battery2
american

battery2
european

V
american

V
european
Obviously, you normally use just one between current and flows, but anyway you can change direction of the voltages, currents and flows using the complete keys $i_>, i^<, i>_>, i^>$, as shown in the following examples.

This manual has been typeset with the option RPvoltages.
4.3 Currents

Inline (along the wire) currents are selected with $i_\triangleright$, $i_\triangleleft$, $i_{\triangleright}^\prime$, and various simplification; the default position and direction is obtained with the key $i=$.

```
\begin{circuitikz}
  \draw (0,0) to [R, i_\triangleright =$i_1$] (2,0);
\end{circuitikz}
```

```
\begin{circuitikz}
  \draw (0,0) to [R, i_\triangleright =$i_1$] (2,0);
\end{circuitikz}
```

```
\begin{circuitikz}
  \draw (0,0) to [R, i_\triangleleft =$i_1$] (2,0);
\end{circuitikz}
```

Also:

```
\begin{circuitikz}
  \draw (0,0) to [R, i_\triangleright =$i_1$] (2,0);
\end{circuitikz}
```

```
\begin{circuitikz}
  \draw (0,0) to [R, i_\triangleleft =$i_1$] (2,0);
\end{circuitikz}
```
4.4 Flows

As an alternative for the current arrows, you can also use the following flows. They can also be used to indicate thermal or power flows. The syntax is pretty the same as for currents.

This is a new beta feature since version 0.8.3; therefore, please provide bug reports or hints to optimize this feature regarding placement and appearance! This means that the appearance may change in the future!
4.5 Voltages

See introduction note at Currents (chapter 4.2, page 126)!

4.5.1 European style

The default, with arrows. Use option \texttt{europeanvoltage} or style \texttt{[european voltages]}.

\begin{circuitikz}[european voltages]
\draw (0,0) to[R, v^>=$v_1$] (2,0);
\end{circuitikz}

\begin{circuitikz}[european voltages]
\draw (0,0) to[R, v^<=$v_1$] (2,0);
\end{circuitikz}

\begin{circuitikz}[european voltages]
\draw (0,0) to[R, v^<_=$v_1$] (2,0);
\end{circuitikz}

\begin{circuitikz}[european voltages]
\draw (0,0) to[R, v^>_=$v_1$] (2,0);
\end{circuitikz}
\begin{circuitikz}
\draw (0,0) to[\text{I} = 1\text{A}, \text{v} = u_1] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[\text{I} \leq 1\text{A}, \text{v} = u_1] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[\text{I} \geq 1\text{A}, \text{v} = u_1] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[\text{I} = 1\text{A}, \text{v} = u_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american voltages}]
\draw (0,0) to[\text{R}, \text{v}^> = v_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american voltages}]
\draw (0,0) to[\text{R}, \text{v}^<= v_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american voltages}]
\draw (0,0) to[\text{R}, \text{v}^>= v_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american voltages}]
\draw (0,0) to[\text{R}, \text{v}^<= v_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{I} = 1\text{A}, \text{v} = u_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{I} \leq 1\text{A}, \text{v} = i_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{I} \geq 1\text{A}, \text{v} = i_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{I} \leq 1\text{A}, \text{v} = i_1] (2,0);
\end{circuitikz}

4.5.2 American style

Use option \text{american voltage} or set \text{[american voltages]}. 

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{R}, \text{v}^> = v_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{R}, \text{v}^<= v_1] (2,0);
\end{circuitikz}

\begin{circuitikz}[\text{american}]
\draw (0,0) to[\text{R}, \text{v}^>= v_1] (2,0);
\end{circuitikz}
4.5.3 Voltage position

It is possible to move away the arrows and the plus or minus signs with the key `voltages shift` (default value is 0, which gives the standard position):

```latex
\begin{circuitikz}
\begin{scope}
\ctikzset{voltage/american font=\tiny\boldmath}
\draw (0,0) to[R,v=$V_S$, i=$i_1$] ++(2,0);
\end{scope}
\end{circuitikz}
```

Notes that `american voltage` also affects batteries.

4.5.4 American voltages customization

Since 0.9.0, you can change the font\footnote{There where a bug before, noticed by the user dzereb on tex.stackexchange.com which made the symbols using different fonts in a basically random way. In the same page, user campa found the problem. Thanks!} used by the `american voltages` style, by setting to something different from nothing the key `voltage/american font` (default: nothing, using the current font) style:

```latex
\begin{circuitikz}[american]
\begin{scope}
\ctikzset{voltage/american font=\tiny\boldmath}
\draw (0,0) to[R,v=$V_S$, i=$i_1$] ++(2,0);
\end{scope}
\end{circuitikz}
```

Also, if you want to change the symbols (sometime just the + sign is drawn, for example, or for highlighting something), using the keys `voltage/american plus` and `voltage/american minus` (default $+$ and $-$).

\begin{circuitikz}[american]
\ctikzset{voltage/american font=\scriptsize\boldmath}
\ctikzset{voltage/american plus=\textcolor{red}{$\oplus$}}
\ctikzset{voltage/american minus=\textcolor{blue}{$\ominus$}}
\draw (0,0) to[R,v_=$V_S$] ++(2,0);
\draw (0,-2) to[R,v_<=$V_S$] ++(2,0);
\end{circuitikz}

This could be especially useful if you define a style, to use like this:

\begin{circuitikz}[american]
\tikzset{red plus/.style={
\ctikzset{voltage/american plus=\textcolor{red}{$+$},
}}}
\begin{circuitikz}[american]
\draw (0,0) to[R,v_=$V_S$, red plus] ++(2,0);
\draw (0,-2) to[R,v_<=$V_S$] ++(2,0);
\end{circuitikz}

4.6 Global properties of voltages and currents

\begin{circuitikz}
\draw (0,0) to[R, v=1<\volt>] (2,0); \par
\ctikzset{voltage/distance from node=.1}
\draw (0,0) to[R, v=1<\volt>] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[C, i=$\imath$] (2,0); \par
\ctikzset{current/distance = .2}
\draw (0,0) to[C, i=$\imath$] (2,0);
\end{circuitikz}

However, you can override the properties \texttt{voltage/distance from node} (how distant from the initial and final points of the path the arrow starts and ends) and \texttt{voltage/bump} \texttt{b} (how high the bump of the arrow is — how curved it is)\footnote{Prior to 0.9.4 you had also \texttt{voltage/european label distance} (how distant from the bipole the voltage label will be) but this is deprecated, and the european-style label is printed near the bump)} on a per-component basis, in order to fine-tune the voltages:

\begin{circuitikz}
\draw (0,0) to[R, v=1<\volt>] (1.5,0) to[C, v=2<\volt>] (3,0); \par
\ctikzset{bipoles/capacitor/voltage/distance from node/.initial=.7}
\draw (0,0) to[R, v=1<\volt>] (1.5,0) to[C, v=2<\volt>] (3,0); \par
\end{circuitikz}

Note the \texttt{.initial}; you have to create such key the first time you use it.
4.7 Changing the style of labels and text ornaments

Since version 0.9.5, it is possible to change the style of bipole text ornaments (labels, annotations, voltages etc) by using the appropriate styles or keys. The basic style applied to the text are defined in the \texttt{/tikz/circuitikz} key directory and applied to every node that contains the text; you can also change them locally by using the \texttt{tikz} direct keys in local scopes.

For example, you can make all annotations small by using:

\begin{verbatim}
\ctikzset{bipole annotation style/.style={font=\small}}
\end{verbatim}

And the change (override) the setting in one specific bipole using:

\begin{verbatim}
...to[bipole annotation style={color=red}, R, a={Red note}]...
\end{verbatim}

where the annotation will be in normal font (it has been reset!) and red, or append to the style:

\begin{verbatim}
...to[bipole annotation append style={color=red}, R, a={Red small note}]...
\end{verbatim}

\textbf{Caveat:} you have to put the style changing key at the start of the \texttt{to} arguments to have any effect\textsuperscript{24}.

The available styles and commands are \texttt{bipole label style}, \texttt{bipole annotation style}, \texttt{bipole voltage style}, \texttt{bipole current style}, and \texttt{bipole flow style}. The following example shows a bit of everything.

\begin{verbatim}
\begin{circuitikz}[american]
\ctikzset{bipole annotation style/.style={font=\tiny}}
\ctikzset{bipole current style/.style={font=\small sffamily}}
\draw (0,0) to [bipole annotation append style={fill=yellow}, R=L1, a=A1] ++(3,0) to [bipole label style={fill=cyan}, R, l2_=L2 and 2L, a^=A2] ++(3,0);
\draw (7,0) to [bipole voltage style={color=blue}, bipole flow style={fill=green, outer sep=5pt}, R=R1, v=V1, i=I1, f>^=F1] ++(3,0) to [bipole current append style={color=red}, R, v<=V2, i^=I2, f>^=F2] ++(3,0);
\end{circuitikz}
\end{verbatim}

4.8 Labels in special components

For some components label, current and voltage behave as one would expect:

\begin{verbatim}
\begin{circuitikz}
\draw (0,0) to[I=$a_1$] (2,0);
\end{circuitikz}
\end{verbatim}

\begin{verbatim}
\begin{circuitikz}
\draw (0,0) to[I, i=$a_1$] (2,0);
\end{circuitikz}
\end{verbatim}

\begin{verbatim}
\begin{circuitikz}
\draw (0,0) to[cI=$k\cdot a_1$] (2,0);
\end{circuitikz}
\end{verbatim}

\textsuperscript{24}No, I do not know why. Hints and fixes are welcome.
The following results from using the option \texttt{americancurrent} or using the style \texttt{[americancurrents]}.

The same holds for voltage sources:
The following results from using the option `americanvoltage` or the style `[american voltages]`.

4.9 Integration with `siunitx`

If the option `siunitx` is active (and not in ConTeXt), then the following are equivalent:
4.10 Accessing labels text nodes

Since 0.9.5, you can access all the labels nodes using special node names. So, if you use `name` to give a name to the bipole node, you can access also the following nodes: `namelabel` (notice: no space nor any other symbol between `name` and `label`!), `nameannotation`, `namevoltage`, `namecurrent` and `nameflow`.

\begin{circuitikz}
\draw (0,0) to [R=L1, a=A1, name=L1] ++(3,0) to [R, l2_=L2 and 2L, a^=A2, name=L2] ++(3,0);
\marknode{L1} \marknode{L1label} \marknode[0]{L1annotation}
\marknode{L2} \marknode[0]{L2label} \marknode{L2annotation}
\draw[blue] (L2label.south west) rectangle (L2label.north east);
\draw (6.1,0) to [R=R1, v=V1, i=I1, f>^=F1, name=R1] ++(3,0) to [R, v<=V2, i^=I2, f>^=F2, name=R2] ++(3,0);
\marknode[0]{R1voltage} \marknode[0]{R2voltage} \marknode[0]{R1current} \marknode[0]{R2current} \marknode[R1flow] \marknode[R2flow]
\end{circuitikz}

\newcommand{\marknode}{2}[45]{%
\node[circle, draw, red, inner sep=1pt, pin={[red, font=\tiny]#1:#2}] at (#2.center) {#3};
}
\begin{circuitikz}[ american]
\draw (0,0) to [R=L1, a=A1, name=L1] ++(3,0)
to [R, l2_=L2 and 2L, a^=A2, name=L2] ++(3,0);
\marknode{L1} \marknode[L1label] \marknode[0]{L1annotation}
\marknode{L2} \marknode[0]{L2label} \marknode{L2annotation}
\draw[blue] (L2label.south west) rectangle (L2label.north east);
\draw (6.1,0) to [R=R1, v=V1, i=I1, f>^=F1, name=R1] ++(3,0)
to [R, v<=V2, i^=I2, f>^=F2, name=R2] ++(3,0);
\marknode[0]{R1voltage} \marknode[0]{R2voltage} \marknode[0]{R1current} \marknode[0]{R2current} \marknode[R1flow] \marknode[R2flow]
\end{circuitikz}

The access to labels and annotations was present before, but not documented.
5 Using bipoles in circuits

5.1 Nodes (also called poles)

You can add nodes to the bipoles, positioned at the coordinates surrounding the component. The general style to use is `bipole nodes={start}{stop}`, where `start` and `stop` are the nodes — to be chosen between `none`, `circ`, `ocirc`, `squarepole`, `osquarepole`, `diamondpole`, `odiamondpole` and `rectfill`\(^{26}\) (see section 3.15).

These bipole nodes are added after the path is drawn, as every node in Ti\(\LaTeX\) — this is the reason why they are always filled (with the main color the normal nodes, with white the open ones), in order to “hide” the wire below. You can override the fill color if you want; but notice that if you draw things in two different paths, you will have “strange” results; notice that in the second line of resistors the second wire is starting from the center of the white `ocirc` of the previous path.

You can define shortcuts for the bipole nodes you use most; for example if you want a shortcut for a bipole with open square node in red in the right side you can:

\begin{circuitikz}
\ctikzset{-s/.style = {bipole nodes={none}{osquarepole, fill=red}}}
\draw (0,0) to[R, -s] (2,0);
\end{circuitikz}

There are several predefined shorthand as the above; in the following pages you can see all of them.

\begin{circuitikz}
\draw (0,0) to[R, o-o] (2,0);
\end{circuitikz}

\(^{26}\)You can use other shapes too, but at your own risk...Moreover, notice that `none` is not really a node, just a special word used to say “do not put any node here”.

140
\begin{circuitikz}
  \draw (0,0) to [R, -o] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, o-] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, *-*] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, -*] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, *-] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, d-d] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, -d] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, d-] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, o-*] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, *-o] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, o-d] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, d-o] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, o-*] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, *-d] (2,0);
\end{circuitikz}

\begin{circuitikz}
  \draw (0,0) to [R, d-] (2,0);
\end{circuitikz}
5.1.1 Transparent poles

“Open- poles” terminals (ocirc, odiamondpole, and osquarepole) are normally filled with the background color at full opacity. This is because, for simplicity of operation, the nodes are placed after the wires are drawn and have to “white-out” the underlying lines. Anyway, if you know what you are doing, you can change it with the key poles/open fill opacity (with \ctikzset) or the style open poles opacity. Notice that you will have artifacts if you don’t use the border anchors of the poles to connect wires, and you need to do that by hand.

\begin{circuitikz}[scale=3, transform shape]
\fill[cyan] (0,0) rectangle (4.1,-0.6);
\tikzset{halfwhite/.style={fill opacity=0.5, fill=white, open poles opacity=0.5}}
% automatic positioning when opacity is not 1.0 creates artifacts
\draw[halfwhite] (0,0) to[generic, -o] ++(2,0) --++(0,-0.5);
% you have to use manual positioning
\draw[halfwhite] (2.2,0) -- ++(0.5,0) node[ocirc, anchor=180]{};
\draw[halfwhite] (3,0) node[ocirc](B){} (B.0) --++(0.5,0) (B.-90) --++(0,-0.5);
% maybe really useful only for terminals going out of the circuit...
\draw (3.6,0) -- ++(0.2,0) node[ocirc, halfwhite, anchor=180]{};
\end{circuitikz}

You also have the similar keys for the “full” poles (albeit they are probably not useful at all).

5.2 Mirroring and Inverting

Bipole paths can also mirrored and inverted (or reverted) to change the drawing direction.

\begin{circuitikz}
\draw (0,0) to[pD] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[pD, mirror] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[pD, invert] (2,0);
\end{circuitikz}

Placing labels, currents and voltages works also, please note, that mirroring and inverting does not influence the positioning of labels and voltages. Labels are by default above/right of the bipole and voltages below/left, respectively.

\begin{circuitikz}
\draw (0,0) to[ospst=T, i=$i_1$, v=$v$] (2,0);
\end{circuitikz}
5.3 Putting them together

\begin{circuitikz}
\draw (0,0) to[ospst=T, mirror, i=$i_1$, v=$v$] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[ospst=T, invert, i=$i_1$, v=$v$] (2,0);
\end{circuitikz}

\begin{circuitikz}
\draw (0,0) to[ospst=T, mirror, invert, i=$i_1$, v=$v$] (2,0);
\end{circuitikz}

5.4 Line joins between Path Components

Line joins should be calculated correctly - if they are on the same path, and the path is not closed. For example, the following path is not closed correctly (\texttt{–cycle} does not work here!):

\begin{tikzpicture}[line width=3pt,european]
\draw (0,0) to[R]++(2,0)to[R]++(0,2) --++(-2,0)to[R]++(0,-2);
\draw[red,line width=1pt] circle(2mm);
\end{tikzpicture}

To correct the line ending, there are support shapes to fill the missing rectangle. They can be used like the support shapes (*,o,d) using a dot (.) on one or both ends of a component (have a look at the last resistor in this example):

\begin{tikzpicture}[line width=3pt,european]
\draw (0,0) to[R]++(2,0)to[R]++(0,2) --++(-2,0)to[R,-.]+(0,-2);
\draw[red,line width=1pt] circle(2mm);
\end{tikzpicture}
6 Colors

6.1 Shape colors

The color of the components is stored in the key `\circuitikzbasekey/color`. CircuiTiKZ tries to follow the color set in TiKZ, although sometimes it fails. If you change color in the picture, please do not use just the color name as a style, like `[red]`, but rather assign the style `[color=red]`.

Compare for instance

\begin{circuitikz} 
\draw[red] 
(0,2) node[and port] (myand1) {} 
(0,0) node[and port] (myand2) {} 
(2,1) node[xnor port] (myxnor) {} 
(myand1.out) -| (myxnor.in 1) 
(myand2.out) -| (myxnor.in 2) 
;\end{circuitikz}

and

\begin{circuitikz} 
\draw[color=red] 
(0,2) node[and port] (myand1) {} 
(0,0) node[and port] (myand2) {} 
(2,1) node[xnor port] (myxnor) {} 
(myand1.out) -| (myxnor.in 1) 
(myand2.out) -| (myxnor.in 2) 
;\end{circuitikz}

One can of course change the color in medias res:

\begin{circuitikz} 
\draw[blue] 
(0,0) node[pnp, color=blue] (pnp2) {} 
(pnp2.B) node[pnp, xscale=-1, anchor=B, color=brown] (pnp1) {} 
(pnp1.C) node[npn, anchor=C, color=green] (npn1) {} 
(pnp2.C) node[npn, xscale=-1, anchor=C, color=magenta] (npn2) {} 
(pnp1.E) -- (pnp2.E) (npn1.E) -- (npn2.E) 
(pnp1.B) node[circ] {} |- (pnp2.C) node[circ] {} 
;\end{circuitikz}

The all-in-one stream of bipoles poses some challenges, as only the actual body of the bipole, and not the connecting lines, will be rendered in the specified color. Also, please notice the curly braces around the `to`:
Which, for some bipoles, can be frustrating:

The only way out is to specify different paths:

And yes: this is a bug and not a feature...

6.2 Fill colors

Since version 0.9.0, you can also fill most shapes with a color (the manual specifies which ones are fillable or not). The syntax is quite intuitive:

This fill color will override any color defined by the style (see section 3.3.2). If you want to override a style fill color with no-fill for a specific component, you need to override the style — it’s a bit unfortunate but it should be an exceptional thing anyway:
You can combine shape colors with fill colors, too, but you should use the `draw` color option style for this:

\begin{circuitikz} \draw[color=red] (0,2) node[and port, fill=yellow] (myand1) {1} (0,0) node[and port, fill=cyan] (myand2) {2} (2,1) node[xnor port,fill=red!30!white] (myxnor) {3} (myand1.out) -| (myxnor.in 1) (myand2.out) -| (myxnor.in 2) \end{circuitikz}

This is because, as you can see from the following example in port 2, you can’t specify both a fill and a color in the node (yes, it’s a bug too, but it’s quite complex to solve given the current circuitTi\textsc{k} architecture). A workaround is shown in port 3:

\begin{circuitikz} \draw (0,2) node[and port, color=black] (myand1) {1} (0,0) node[and port, color=blue, fill=cyan] (myand2) {2} (2,1) {[[color=blue] node[xnor port, fill=cyan] (myxnor ) {3}]} (myand1.out) -| (myxnor.in 1) (myand2.out) -| (myxnor.in 2) \end{circuitikz}

Notice also that the connection point are always filled, although the color tries to follow the color of the filling of the component:

\begin{circuitikz}
\fill[cyan] (0,3.0) rectangle (7,7);
\draw [fill=yellow, ] (4,4) to [D,o-o] ++(0,2) to[D*, fill=yellow] ++(2,0) to[D*] ++(0,-2) to[D, fill=red, o-o] ++(-2,0);
\draw (1,4) node[ocirc]{} -- ++(1,0) node[ocirc]{},
\draw (1,4.5) to[short, o-o] ++(1,0) to[short, -o] ++(1,0);
\draw[fill=yellow] (1,5) to[short, o-o] ++(1,0) to[short, -o] ++(1,0);
\draw (1,5.5) to[short, fill=red, o-o] ++(1,0) to[short, -o] ++(1,0);
\end{circuitikz}
7 FAQ

Q: When using `\tikzexternalize` I get the following error:

! Emergency stop.

A: The TikZ manual states:

Furthermore, the library assumes that all \LaTeX pictures are ended with `\end{tikzpicture}`.

Just substitute every occurrence of the environment `circuitikz` with `tikzpicture`. They are actually pretty much the same.

Q: How do I draw the voltage between two nodes?
A: Between any two nodes there is an open circuit!

\begin{circuitikz}
\begin{circuitikz}
\draw
node[ocirc] (A) at (0,0) {};
node[ocirc] (B) at (2,1) {};
(A) to[open, v=$v$] (B);
\end{circuitikz}
\end{circuitikz}

Q: I cannot write `to[R = $R_1=12V$]` nor `to[ospst = open, 3s]`: I get errors.
A: It is a limitation of the parser.

Use `\def{\eq}{=} to[R = $R_1\eq 12V$]` and `to[ospst = open{,} 3s]` instead; see caveat in section 4.1.

Q: I tried to change the direction of the y axis with `yscale=-1`, but the circuit is completely messed up.
A: Yes, it’s a known bug (or misfeature, or limitation). See section 1.7. Don’t do that.

Q: I tried to put a diode in a `pic`, but it’s coming out badly rotated.
A: Yes, it’s a known bug (or misfeature, or limitation). See section 1.7. CircuiTiKZ is not compatible with `pics` at this point.
8 Defining new components

Per me si va ne la città dolente,
per me si va ne l’eterno dolore,
per me si va tra la perduta gente.

... Lasciate ogne speranza, voi ch’intrate.\footnote{https://classicsincontext.wordpress.com/2010/02/28/canto-iii-per-me-si-va-ne-la-citta-dolente/}

**Big fat warning**: this material is reserved to \TeX -hackers; do not delve into this if you have no familiarity with (at least) a bit of core \TeX programming and to the basic Ti\LaTeX layer. You have been warned.

8.1 Suggested setup

The suggested way to start working on a new component is to use the utilities of the CircuiTi\LaTeX manual for checking and testing your device. Basically, find (or download) the source code of the last version of CircuiTi\LaTeX and find the file `ctikzmanutils.sty`; copy it in your directory and prepare a file like this:

```latex
\documentclass[a4paper, titlepage]{article}
\usepackage[a4wide]{a4wide} % smaller borders
\usepackage[utf8]{inputenc}
\usepackage[T1]{fontenc}
\parindent=0pt
\parskip=4pt plus 6pt minus 2pt
\usepackage[siunitx, RPvoltages]{circuitikz}
\usepackage{ctikzmanutils}
\makeatletter
%% Test things here
\makeatother
\begin{document}
\circuitdescbip*{damper}{Mechanical damping}{}(left/135/0.2, right/45/0.2, center/-90/0.3)
\geolrcoord{dampershape, fill=yellow}
\begin{LTXexample}[varwidth]
\begin{circuitikz}
\draw (0,0) to[R] ++(2,0) to[damper] ++(2,0);
\end{circuitikz}
\end{LTXexample}
\end{document}
```

This will compile to something like this (in this case, we are using a couple of existing components to check everything is ok):
The command \texttt{circuitdescbip*} is used to show the component description (you can check the definition and the usage looking at \texttt{ctikzmanutils.sty} file, and the \texttt{\geolrcoord} is used to show the main anchors (geographical plus \texttt{left} and \texttt{right}) of the component.

From now on, you can add the new commands for the component between the \texttt{\makeatletter} and \texttt{\makeatother} commands and, modifying the example, check the results.

### 8.2 Path-style component

Let’s define for example a path style component, like the one suggested by the user \texttt{alex} on \LaTeX{} stackexchange site. The component will be a mix of the \texttt{damper} and the \texttt{spring} components already present.

The first step is to check if we can use the definition already existing for similar elements (for coherence of size) or if we need to define new ones; for this you have to check the file \texttt{pgfcirc.defines.tex}: we find

\begin{verbatim}
\ctikzset{bipoles/spring/height/.initial=.5}
\ctikzset{bipoles/spring/width/.initial=.5}
\ctikzset{bipoles/damper/height/.initial=.35}
\ctikzset{bipoles/damper/length/.initial=.3}
\ctikzset{bipoles/damper/width/.initial=.4}
\end{verbatim}

We will use them; at this stage you can decide to add other parameters if you need them. (Notice, however, than although flexibility is good, these parameters should be described in the manual, otherwise they’re as good as a fixed number in the code).

To define the new component we will look into \texttt{pgfcircbipoles.tex} and we will copy, for example, the definition of the damper into our code, just changing the name:

\begin{verbatim}
%% mechanical resistor - damper
\pgfcircdeclarebipolescaled{mechanicals}{
\ctikzvalof{bipoles/damper/height}} % depth (under the path line)
\ctikzvalof{bipoles/damper/height}} % name
\ctikzvalof{bipoles/damper/height}} % height (above the path line)
\ctikzvalof{bipoles/damper/width}} % width
\pgfpathrectanglecorners{{\pgfpoint{\ctikzvalof{bipoles/damper/length}}\pgf@circ@res@right}{\pgf@circ@res@down}}{{\pgfpoint{\pgf@circ@res@right}{\pgf@circ@res@up}}}
\pgf@circ@maybefill
\end{verbatim}

\% line into the damper
This command will define a shape that is named \texttt{viscoeshape}, with all the correct geographical anchors based on the depth, height and width defined in the parameters of \texttt{\pgfcircdeclarebipolescaled}. Moreover, the element is assigned to the class \texttt{mechanicals} for styling.

To be coherent with the styling, you should use (when needed) the length \texttt{\pgf@circ@scaled@Rlen} as the “basic” length for drawing, using the fill functions defined at the start of \texttt{pgfcirc.defines.tex} to fill and stroke — so that the operation will follow the style parameters and, finally, use the macro \texttt{\pgf@circ@setlinewidth} to set the line thickness /the first argument is the “legacy” class, if you do not want to assign one you can use the pseudo-legacy class \texttt{none}.

The anchors for the bipole (which then set the lengths \texttt{\pgf@circ@res@left}) are already scaled for your use. You can use these lengths (which defines, normally, the geographical anchors of the element) to draw your shapes.

This is not sufficient for using the element in a \texttt{to[]} path command; you need to “activate” it with (this commands are normally in \texttt{pgfcircpath.tex}):

\begin{verbatim}
\def\pgf@circ@viscoe@path#1{\pgf@circ@bipole@path{viscoe}{#1}}
\compattikzset{viscoe/.style = {\circuitikzbasekey, /tikz/to path=\pgf@circ@dviscoe@path, l=#1}}
\end{verbatim}

And now you can show it with:

\begin{verbatim}
\circuitdescbip*{viscoe}{Mechanical viscoelastic element}{}(left/135/0.2, right/45/0.2, center/-90/0.3)
\geolrcoord{viscoeshape, fill=yellow}
\end{verbatim}
\begin{circuitikz}
\draw (0,0) to[spring] ++(2,0)
to[viscoe] ++(2,0);
\end{circuitikz}
\end{LTExample}

Obviously, at first you just have a component that is the same as the one you copied with another name. It is now just a matter of modifying it so that it has the desired shape; in the example above you can already see the new symbol after the changes.

When doing the drawing, the \texttt{\pgfcircdeclarebipole} will setup the lengths \texttt{\pgf@circ@res@right} and \texttt{\pgf@circ@res@up} as the \texttt{x-y} coordinates of the upper right corner, and \texttt{\pgf@circ@res@left} and \texttt{\pgf@circ@res@down} as the \texttt{x-y} coordinates of the lower left corner of your shape. The \texttt{center} coordinate is usually at \texttt{(0pt,0pt)}.

Looking at the implementation of the \texttt{spring} element, a possible implementation is changing the lines between lines 12 and 16 with:

\begin{verbatim}
\pgfscope
\pgfpathmoveto{\pgfpoint{\pgf@circ@res@left}{\pgf@circ@res@zero}}
\pgf@circ@setlinewidth{bipoles}{\pgfstartlinewidth}
\pgfsetcornersarced{\pgfpoint{.25\pgf@circ@res@up}{.25\pgf@circ@res@up}}
\pgfpathlineto{\pgfpoint{.75\pgf@circ@res@left}{.75\pgf@circ@res@up}}
\pgfpathlineto{\pgfpoint{.5\pgf@circ@res@left}{-.75\pgf@circ@res@up}}
\pgfpathlineto{\pgfpoint{.25\pgf@circ@res@left}{.75\pgf@circ@res@up}}
\pgfpathlineto{\pgfpoint{0pt}{-.75\pgf@circ@res@up}}
\pgfpathlineto{\ctikzvalof{bipoles/damper/length}\pgf@circ@res@right}{.75\pgf@circ@res@up}}
\pgfusepath{stroke}
\endpgfscope
\end{verbatim}

which leads to:

\begin{center}
\begin{tikzpicture}
  \node [spring] (spring) at (0,0) {\pgfnodealias{spring}{spring}};
  \draw[viscoe] (spring.west) -- (spring.east);
\end{tikzpicture}
\end{center}

viscoe: Mechanical viscoelastic element, type: \texttt{path-style}, fillable, nodename: \texttt{viscoeshape}. Class: \texttt{mechanicals}.

\begin{center}
\begin{tikzpicture}
  \node [spring] (spring) at (0,0) {\pgfnodealias{spring}{spring}};
  \node [viscoe, v=V] (viscoe) at (spring.east) {\pgfnodealias{viscoe}{viscoe}};
  \draw (spring.west) to [viscoe] (viscoe.east);
\end{tikzpicture}
\end{center}

Now you can check if the voltage labels are correct for your new component:

\begin{center}
\begin{tikzpicture}
  \node [spring] (spring) at (0,0) {\pgfnodealias{spring}{spring}};
  \node [viscoe, v=V] (viscoe) at (spring.east) {\pgfnodealias{viscoe}{viscoe}};
  \draw (spring.west) to [viscoe] (viscoe.east);
\end{tikzpicture}
\end{center}

If you think they are too tight or too loose you can use a (developer-only) key to adjust the distance:
Notice that by default the key \texttt{bipoles/mybipole/voltage/additional label shift} is not defined, so if you want to use it you must create it before (this is the meaning of the \texttt{.initial} here).

As a final note, notice that the \texttt{viscoe} element is already added to the standard package.

### 8.3 Node-style component

Adding a node-style component is much more straightforward. Just define it by following examples in, for example, \texttt{pgfcirctripoles.tex} or the other files; be careful that you should define all the geographical anchors of the shape if you want that the Ti\textit{k}Z positioning options (like \texttt{left}, \texttt{above}, etc.) behave correctly with your component.

To have a scalable component, for example in the \texttt{transistors} class, you should use something like

\begin{verbatim}
\savedmacro{\ctikzclass}{{\edef\ctikzclass{transistors}}}
\saveddimen{\scaledRlen}{\pgfmathsetlength{\pgf@x}{\ctikzvalof{\ctikzclass/scale}\pgf@circ@Rlen}}
\end{verbatim}

at the start of anchors and macros definition, and use (for example, the exact code will change greatly depending on your component):

\begin{verbatim}
\pgf@circ@scaled@Rlen=\scaledRlen
\end{verbatim}

in all the \texttt{savedanchors}.

Then, in the drawing part, you should start with:

\begin{verbatim}
\pgf@circ@scaled@Rlen=\scaledRlen
\end{verbatim}

and then use \texttt{\pgf@circ@scaled@Rlen} (or the anchors) as default lengths while you draw it.

### 8.3.1 Finishing your work

Once you have a satisfactory element, you should

- clean up your code;
- write a piece of documentation explaining its use, with an example;
- propose the element for inclusion in the GitHub page of the project (you will have to license this as explained in that page, of course).

The best way of contributing is forking the project, adding your component in the correct files, modifying the manual and creating a pull request for the developers to merge. Anyway, if this is a problem, just open an issue and someone (when they have time...) will answer.

10 Changelog and Release Notes

The major changes among the different circuitikz versions are listed here. See https://github.com/circuitikz/circuitikz/commits for a full list of changes.

- **Version 1.1.1** (2020-04-24)
  One-line bugfix release for the IEEE ports “not” circle thickness

- **Version 1.1.0** (2020-04-19)
  Version bumped to 1.1 because the new logic ports are quite a big addition: now there is a new style for logic ports, conforming to IEEE recommendations. Several minor additions all over the map too.
  - added IEEE standard logic ports suggested by user Jason-s on GitHub
  - added configurability to european logic port “not” output symbol, suggested by j-hap on GitHub
  - added inerter component by user Tadashi on GitHub
  - added variable outer base height for IGBT, suggested by user RA-EE on GitHub
  - added configurable “+” and “-” signs on american-style voltage generators
  - text on amplifiers can be positioned to the left or centered

- **Version 1.0.2** (2020-03-22)
  - added Schottky transistors (thanks to a suggestion by Jérôme Monclard on GitHub)
  - fixed formatting of CHANGELOG.md

- **Version 1.0.1** (2020-02-22)
  Minor fixes and addition to 1.0, in time to catch the freeze for TL2020.
  - add v1.0 version snapshots
  - added crossed generic impedance (suggested by Radványi Patrik Tamás)
  - added open barrier bipole (suggested by Radványi Patrik Tamás)
  - added two flags to flip the direction of light’s arrows on LED and photodiode (suggested by karlkappe on GitHub)
  - added a special key to help with precision loss in case of fractional scaling (thanks to AndreaDiPietro92 on GitHub for noticing and reporting, and to Schrödinger’s cat for finding a fix)
  - fixed a nasty bug for the flat file generation for ConTeXt

- **Version 1.0** (2020-02-04)
  And finally... version 1.0 (2020-02-04) of circuitikz is released.
  The main updates since version 0.8.3, which was the last release before Romano started co-maintaining the project, are the following — part coded by Romano, part by several collaborators around the internet:
  - The manual has been reorganized and extended, with the addition of a tutorial part; tens of examples have been added all over the map.
  - Around 74 new shapes where added. Notably, now there are chips, mux-demuxes, multi-terminal transistors, several types of switches, flip-flops, vacuum tubes, 7-segment displays, more amplifiers, and so on.
  - Several existing shapes have been enhanced; for example, logic gates have a variable number of inputs, transistors are more configurable, resistors can be shaped more, and more.
  - You can style your circuit, changing relative sizes, default thickness and fill color, and more details of how you like your circuit to look; the same you can do with labels (voltages, currents, names of components and so on).
A lot of bugs have been squashed; especially the (very complex) voltage direction conundrum has been clarified and you can choose your preferred style here too.

A detailed list of changes can be seen below.

- **Version 1.0.0-pre3 (not released)**
  - Added a Reed switch
  - Put the copyright and license notices on all files and update them
  - Fixed the loading of style; we should not guard against reload

- **Version 1.0.0-pre2 (2020-01-23)**
  **Really** last additions toward the 1.0.0 version. The most important change is the addition of multiplexer and de-multiplexers; also added the multi-wires (bus) markers.
  - Added mux-demux shapes
  - Added the possibility to suppress the input leads in logic gates
  - Added multiple wires markers
  - Added a style to switch off the automatic rotation of instruments
  - Changed the shape of the or-type american logic ports (reversible with a flag)

- **Version 1.0.0-pre1 (2019-12-22)**
  Last additions before the long promised 1.0! In this pre-release we feature a flip-flop library, a revamped configurability of amplifiers (and a new amplifier as a bonus) and some bug fix around the clock.
  - Added a flip-flop library
  - Added a single-input generic amplifier with the same dimension as “plain amp”
  - Added border anchors to amplifiers
  - Added the possibility (expert only!) to add transparency to poles (after a suggestion from user @matthuszagh on GitHub)
  - Make plus and minus symbol on amplifiers configurable
  - Adjusted the position of text in triangular amplifiers
  - Fixed “plain amp” not respecting “noinv input up”
  - Fixed minor incompatibility with ConTeXt and Plain TeX

- **Version 0.9.7 (2019-12-01)**
  The important thing in this release is the new position of transistor’s labels; see the manual for details.
  - Fix the position of transistor’s text. There is an option to revert to the old behavior.
  - Added anchors for adding circuits (like snubbers) to the flyback diodes in transistors (after a suggestion from @EdAlvesSilva on GitHub).

- **Version 0.9.6 (2019-11-09)**
  The highlights of this release are the new multiple terminals BJTs and several stylistic addition and fixes; if you like to pixel-peep, you will like the fixed transistors arrows. Additionally, the transformers are much more configurable now, the “pmos” and “nmos” elements have grown an optional bulk connection, and you can use the “flow” arrows outside of a path.
  Several small and less small bugs have been fixed.
  - Added multi-collectors and multi-emitter bipolar transistors
  - Added the possibility to style each one of the two coils in a transformer independently
  - Added bulk connection to normal MOSFETs and the respective anchors
  - Added “text” anchor to the flow arrows, to use them alone in a consistent way
Fixed flow, voltage, and current arrow positioning when “auto” is active on the path

– Fixed transistors arrows overshooting the connection point, added a couple of anchors
– Fixed a spelling error on op-amp key “noinv input down”
– Fixed a problem with “quadpoles style=inner” and “transformer core” having the core lines running too near

• Version 0.9.5 (2019-10-12)
This release basically add features to better control labels, voltages and similar text “ornaments” on bipoles, plus some other minor things.
On the bug fixes side, a big incompatibility with ConTeXt has been fixed, thanks to help from @TheTeXnician and @hmenke on github.com.
– Added a “midtap” anchor for coils and exposed the inner coils shapes in the transformers
– Added a “curved capacitor” with polarity coherent with “ecapacitor”
– Added the possibility to apply style and access the nodes of bipole’s text ornaments (labels, annotations, voltages, currents and flows)
– Added the possibility to move the wiper in resistive potentiometers
– Added a command to load and set a style in one go
– Fixed internal font changing commands for compatibility with ConTeXt
– Fixed hardcoded black color in “elko” and “elmec”

• Version 0.9.4 (2019-08-30)
This release introduces two changes: a big one, which is the styling of the components (please look at the manual for details) and a change to how voltage labels and arrows are positioned. This one should be backward compatible unless you used voltage shift introduced in 0.9.0, which was broken when using the global scale parameter.
The styling additions are quite big, and, although in principle they are backward compatible, you can find corner cases where they are not, especially if you used to change parameters for pgfcirc.defines.tex, so a snapshot for the 0.9.3 version is available.
– Fixed a bug with “inline” gyrators, now the circle will not overlap
– Fixed a bug in input anchors of european not ports
– Fixed “tlinestub” so that it has the same default size than “tline” (TL)
– Fixed the “transistor arrows at end” feature, added to styling
– Changed the behavior of “voltage shift” and voltage label positioning to be more robust
– Added several new anchors for “elmec” element
– Several minor fixes in some component drawings to allow fill and thickness styles
– Add 0.9.3 version snapshots.
– Added styling of relative size of components (at a global or local level)
– Added styling for fill color and thickness
– Added style files

• Version 0.9.3 (2019-07-13)
– Added the option to have “dotless” P-MOS (to use with arrowmos option)
– Fixed a (puzzling) problem with coupler2
– Fixed a compatibility problem with newer PGF (>3.0.1a)

• Version 0.9.2 (2019-06-21)
– (hopefully) fixed ConTeXt compatibility. Most new functionality is not tested; testers and developers for the ConTeXt side are needed.
– Added old ConTeXt version for 0.8.3
- Added tailless ground

- **Version 0.9.1 (2019-06-16)**
  - Added old LaTeX versions for 0.8.3, 0.7, 0.6 and 0.4
  - Added the option to have inline transformers and gyrators
  - Added rotary switches
  - Added more configurable bipole nodes (connectors) and more shapes
  - Added 7-segment displays
  - Added vacuum tubes by J. op den Brouw
  - Made the open shape of dcisources configurable
  - Made the arrows on vcc and vee configurable
  - Fixed anchors of diamondpole nodes
  - Fixed a bug (#205) about unstable anchors in the chip components
  - Fixed a regression in label placement for some values of scaling
  - Fixed problems with cute switches anchors

- **Version 0.9.0 (2019-05-10)**
  - Added Romano Giannetti as contributor
  - Added a CONTRIBUTING file
  - Added options for solving the voltage direction problems.
  - Adjusted ground symbols to better match ISO standard, added new symbols
  - Added new sources (cute european versions, noise sources)
  - Added new types of amplifiers, and option to flip inputs and outputs
  - Added bidirectional diodes (diac) thanks to Andre Lucas Chinazzo
  - Added L,R,C sensors (with european, american and cute variants)
  - Added stacked labels (thanks to the original work by Claudio Fiandrino)
  - Make the position of voltage symbols adjustable
  - Make the position of arrows in FETs and BJTs adjustable
  - Added chips (DIP, QFP) with a generic number of pins
  - Added special anchors for transformers (and fixed the wrong center anchor)
  - Changed the logical port implementation to multiple inputs (thanks to John Kormylo) with border anchors.
  - Added several symbols: bulb, new switches, new antennas, loudspeaker, microphone, coaxial connector, viscoelastic element
  - Make most components fillable
  - Added the oscilloscope component and several new instruments
  - Added viscoelastic element
  - Added a manual section on how to define new components
  - Fixed american voltage symbols and allow to customize them
  - Fixed placement of straightlabels in several cases
  - Fixed a bug about straightlabels (thanks to @fotesan)
  - Fixed labels spacing so that they are independent on scale factor
  - Fixed the position of text labels in amplifiers

- **Version 0.8.3 (2017-05-28)**
  - Removed unwanted lines at to-paths if the starting point is a node without a explicit anchor.
- Fixed scaling option, now all parts are scaled by bipoles/length
- Surge arrester appears no more if a to path is used without \[\]-options
- Fixed current placement now possible with paths at an angle of around 280°
- Fixed voltage placement now possible with paths at an angle of around 280°
- Fixed label and annotation placement (at some angles position not changable)
- Adjustable default distance for straight-voltages: ‘bipoles/voltage/straight label distance’
- Added Symbol for bandstop filter
- New annotation type to show flows using $f=\ldots$ like currents, can be used for thermal, power or current flows

**Version 0.8.2 (2017-05-01)**
- Fixes pgfkeys error using alternatively specified mixed colors (see pgfplots manual section “4.7.5 Colors”)
- Added new switches “ncs” and “nos”
- Reworked arrows at spst-switches
- Fixed direction of controlled american voltage source
- “v<=” and “i<=” do not rotate the sources anymore (see them as “counting direction indication”, this can be different then the shape orientation); Use the option “invert” to change the direction of the source/apperance of the shape.
- Current label “i=” can now be used independent of the regular label “l=” at current sources
- Rewrite of current arrow placement. Current arrows can now also be rotated on zero-length paths
- New DIN/EN compliant operational amplifier symbol “en amp”

**Version 0.8.1 (2017-03-25)**
- Fixed unwanted line through components if target coordinate is a name of a node
- Fixed position of labels with subscript letters.
- Absolute distance calculation in terms of ex at rotated labels
- Fixed label for transistor paths (no label drawn)

**Version 0.8 (2017-03-08)**
- Allow use of voltage label at a [short]
- Correct line joins between path components (to[\ldots])
- New Pole-shape .-- to fill perpendicular joins
- Fixed direction of controlled american current source
- Fixed incorrect scaling of magnetron
- Fixed: Number of american inductor coils not adjustable
- Fixed Battery Symbols and added new battery2 symbol
- Added non-inverting Schmitttrigger

**Version 0.7 (2016-09-08)**
- Added second annotation label, showing, e.g., the value of an component
- Added new symbol: magnetron
- Fixed name conflict of diamond shape with tikz.shapes package
- Fixed varcap symbol at small scalings
- New packet-option “straightvoltages, to draw straight(no curved) voltage arrows
- New option “invert” to revert the node direction at paths
- Fixed american voltage label at special sources and battery
- Fixed/rotated battery symbol (longer lines by default positive voltage)
- New symbol Schmitttrigger

• Version 0.6 (2016-06-06)
- Added Mechanical Symbols (damper, mass, spring)
- Added new connection style diamond, use (d-d)
- Added new sources voosource and ioosource (double zero-style)
- All diode can now drawn in a stroked way, just use globel option “strokediode” or stroke instead of full/empty, or D-. Use this option for compliance with DIN standard EN-60617
- Improved Shape of Diodes: tunnel diode, Zener diode, schottky diode (bit longer lines at cathode)
- Reworked igt: New anchors G, gate and new L-shaped form Lnigt, Lpigbt
- Improved shape of all fet-transistors and mirrored p-chan fets as default, as npn, pmos, p fet are already. This means a backward-incompatibility, but smaller code, because p-channels mosfet are by default in the correct direction(source at top). Just remove the ‘yscale=-1’ from your p-chan fets at old pictures.

• Version 0.5 (2016-04-24)
- new option boxed and dashed for hf-symbols
- new option solderdot to enable/disable solderdot at source port of some fets
- new parts: photovoltaic source, piezo crystal, electrolytic capacitor, electromechanical device (motor, generator)
- corrected voltage and current direction (option to use old behaviour)
- option to show body diode at fet transistors

• Version 0.4
- minor improvements to documentation
- comply with TDS
- merge high frequency symbols by Stefan Erhardt
- added switch (not opening nor closing)
- added solder dot in some transistors
- improved ConTeXt compatibility

• Version 0.3.1
- different management of color...
- fixed typo in documentation
- fixed an error in the angle computation in voltage and current routines
- fixed problem with label size when scaling a tikz picture
- added gas filled surge arrester
- added compatibility option to work with Tikz’s own circuit library
- fixed infinite in arctan computation

• Version 0.3.0
- fixed gate node for a few transistors
- added mixer
- added fully differential op amp (by Kristofer M. Monisit)
- now general settings for the drawing of voltage can be overridden for specific components
– made arrows more homogeneous (either the current one, or latex' bt pgf)
– added the single battery cell
– added fuse and asymmetric fuse
– added toggle switch
– added varistor, photoresistor, thermocouple, push button
– added thermistor, thermistor ptc, thermistor ptc
– fixed misalignment of voltage label in vertical bipoles with names
– added isfet
– added noiseless, protective, chassis, signal and reference grounds (Luigi «Liverpool»)

• Version 0.2.4
– added square voltage source (contributed by Alistair Kwan)
– added buffer and plain amplifier (contributed by Danilo Piazzalunga)
– added squid and barrier (contributed by Cor Molenaar)
– added antenna and transmission line symbols contributed by Leonardo Azzinnari
– added the changeover switch spdt (suggestion of Fabio Maria Antoniali)
– rename of context.tex and context.pdf (thanks to Karl Berry)
– updated the email address
– in documentation, fixed wrong (non-standard) labelling of the axis in an example (thanks to prof. Claudio Beccaria)
– fixed scaling inconsistencies in quadrupoles
– fixed division by zero error on certain vertical paths
– introduced options straighlabels, rotatelabels, smartlabels

• Version 0.2.3
– fixed compatibility problem with label option from tikz
– Fixed resizing problem for shape ground
– Variable capacitor
– polarized capacitor
– ConTeXt support (read the manual!)
– nfet, nigfete, nigfetd, pfet, pigfete, pigfetd (contribution of Clemens Helfmeier and Theodor Borsche)
– njfet, pjfet (contribution of Danilo Piazzalunga)
– pigbt, nigbt
– backward incompatibility potentiometer is now the standard resistor-with-arrow-in-the-middle; the old potentiometer is now known as variable resistor (or vR), similarly to variable inductor and variable capacitor
– triac, thyristor, memristor
– new property “name” for bipoles
– fixed voltage problem for batteries in american voltage mode
– european logic gates
– backward incompatibility new american standard inductor. Old american inductor now called “cute inductor”
– backward incompatibility transformer now linked with the chosen type of inductor, and version with core, too. Similarly for variable inductor
– backward incompatibility styles for selecting shape variants now end are in the plural to avoid conflict with paths
- new placing option for some tripoles (mostly transistors)
- mirror path style

- **Version 0.2.2 - 20090520**
  - Added the shape for lamps.
  - Added options `europeanresistor`, `europeaninductor`, `americanresistor` and `americaninductor`, with corresponding styles.
  - FIXED: error in transistor arrow positioning and direction under negative `xscale` and `yscale`.

- **Version 0.2.1 - 20090503**
  - Op-amps added
  - added options `arrowmos` and `noarrowmos`, to add arrows to pmos and nmos

- **Version 0.2 - 20090417 First public release on CTAN**
  - *Backward incompatibility*: labels ending with `:angle` are not parsed for positioning anymore.
  - Full use of TikZ keyval features.
  - White background is not filled anymore: now the network can be drawn on a background picture as well.
  - Several new components added (logical ports, transistors, double bipoles, ...).
  - Color support.
  - Integration with `{siunitx}`.
  - Voltage, american style.
  - Better code, perhaps. General cleanup at the very least.

- **Version 0.1 - 2007-10-29 First public release**
**Index of the components**
