

The **hulipsum** package

v1.1 (2020/11/03)

Tibor Tómacs

tomacs.tibor@uni-eszterhazy.hu

The *Lorem ipsum* is an improper Latin filler dummy text. It is commonly used for demonstrating the textual elements of a document template (see https://en.wikipedia.org/wiki/Lorem_ipsum). The *Lórum ipse* is a Hungarian variation of the *Lorem ipsum*. (*Lórum* is a Hungarian card game, and *ipse* is a Hungarian slang word, it means *bloke*.)

With the **hulipsum** package you can typeset 150 paragraphs of *Lórum ipse*. All paragraphs are taken with permission from <http://www.lorumipse.hu/>. Thanks to *Lórum Ipse Lab* (Viktor Nagy and Dávid Takács) for their work.

Usage

Load the package as usual, with

```
\usepackage{hulipsum}
```

in the preamble of your document. This package provides several macros:

```
\hulipsum[⟨num1⟩-⟨num2⟩]
```

The $\langle num1 \rangle$ and $\langle num2 \rangle$ are positive integers, and $1 \leq \langle num1 \rangle \leq \langle num2 \rangle \leq 150$. This macro typesets the *Lórum ipse* paragraphs $\langle num1 \rangle$ to $\langle num2 \rangle$. If $\langle num1 \rangle = \langle num2 \rangle$, then it typesets the $\langle num1 \rangle^{\text{th}}$ paragraph. The paragraphs will be separated by the `\par` macro.

`\hulipsum` is equivalent to `\hulipsum[1-7]`.

`\hulipsum[-]` is equivalent to `\hulipsum[1-150]`.

`\hulipsum[-⟨num⟩]` is equivalent to `\hulipsum[1-⟨num⟩]`.

`\hulipsum[⟨num⟩-]` is equivalent to `\hulipsum[⟨num⟩-150]`.

`\hulipsum[⟨num⟩]` is equivalent to `\hulipsum[⟨num⟩-⟨num⟩]`.

```
\sethulipsumdefault{⟨value⟩}
```

After this the default option of `\hulipsum` will be $\langle value \rangle$. By default the $\langle value \rangle$ is set to 1-7. For example using `\hulipsum` after `\sethulipsumdefault{10-15}`, the result will be equivalent to `\hulipsum[10-15]`.

```
\hulipsum*[⟨num1⟩-⟨num2⟩]
```

It works like `\hulipsum`, but it omits the insertion of `\par` after each paragraph and inserts space instead.

```
\hulipsumsave[⟨num1⟩-⟨num2⟩]
```

It works like `\hulipsum`, except that instead of typesetting the paragraphs, it saves the mere text of paragraphs into the `\hulipsumexp`. The paragraphs will be separated by the `\par` macro.

`\hulipsumsave[⟨num1⟩-⟨num2⟩]\hulipsumexp` is equivalent to `\hulipsum[⟨num1⟩-⟨num2⟩]`.

```
\hulipsumsave*[⟨num1⟩-⟨num2⟩]
```

It works like `\hulipsumsave`, but the paragraphs will be separated by space in the `\hulipsumexp`.

`\hulipsumsave*[⟨num1⟩-⟨num2⟩]\hulipsumexp` is equivalent to `\hulipsum*[⟨num1⟩-⟨num2⟩]`.

```
\hulipsumdocument
```

It creates a blind document with title, author, date, table of contents, chapter, section, subsection, subsubsection, paragraph, subparagraph, figure, lists and bibliography.

```
\hulipsumdocument[part]
```

It works like `\hulipsumdocument`, but it creates a part before the chapter and section.
