**pst-tools**
Helper functions; v.0.11

September 13, 2021

Package author(s):
*Herbert Voß*
This package defines some tools which are useful for all packages not only the PStricks like packages. Since the version 0.10 it includes the macros from random.tex.

Thanks to: Marcel Krüger; Pablo Gonzáles Luengo; Rolf Niepraschk;
1 Predefined styles

The style \texttt{mmpaper} is defined for \texttt{psgrid}:

\begin{pspicture}(6,3)
\psgrid[style=mmpaper](6,3)
\end{pspicture}

\begin{pspicture}(6,3)
\psgrid[style=mmpaper,gridcolor=blue,subgridcolor=blue!80](6,3)
\end{pspicture}

2 \texttt{psPrintValue}

This macro allows to print single values of a math function. It has the syntax

\begin{quote}
\texttt{\textbackslash psPrintValue [\texttt{Options}] \{\texttt{PostScript code}\}}
\texttt{\textbackslash psPrintValue \{\texttt{algebraic,...}\} \{x value, algebraic code\}}
\end{quote}

Important is the fact, that \texttt{psPrintValue} works on \texttt{PostScript} side. For \TeX{} it is only a box of zero dimension. This is the reason why you have to put it into a box, which reserves horizontal space.

There are the following valid options for \texttt{psPrintValue}:

<table>
<thead>
<tr>
<th>name</th>
<th>value</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSfont</td>
<td>PS font name</td>
<td>Times</td>
</tr>
</tbody>
</table>

only valid \texttt{PostScript} font names are possible, e.g. \texttt{Times-Roman}, \texttt{Helvetica}, \texttt{Courier}, \texttt{Helvetica}, \texttt{Bookman}. If you want to embed the fonts use always the \texttt{URW} names \texttt{NimbusRomNo9L-Regu}, \texttt{NimbusSanL-Regu} and \texttt{NimbusMonL-Regu}. However, the names may vary on different operating systems. If you leave the argument empty, it will choose the currently active font.
name | value | default
--- | --- | ---
postString | <string> {} | will be appended to the number string
trimSpaces | <boolean> false | will strip spaces on the right
fontscale | <number> 10 | the font scale in pt
valuewidth | <number> 10 | the width of the string for the converted real number; if it is too small, no value is printed
decimals | <number> -1 | the number of printed decimals, a negative value prints all possible digits.
xShift | <number> 0 | the x shift in pt for the output, relative to the current point.
algebraic | <boolean> false | function in algebraic notation.
VarName | <string> {} | saves the value in /<VarName> for further use
comma | <boolean> false | comma instead of the dot for decimals

\psset{fontscale =12}
\makebox[2em]{x(deg)} \makebox[5em]{$\sin x$} \makebox[4em]{$\cos x$} \makebox[5em]{$\sqrt x$} \makebox[7em]{$\sin x + \cos x$} \makebox[6em]{$\sin^2 x + \cos^2 x$}
\multido {\iA=0+10}{18}{
\makebox[1em]{\iA} \makebox[5em]{\psPrintValue{\PSfont =NimbusRomNo 9L-Regu,xShift =-10}{\iA\space sin}} \makebox[4em]{\psPrintValue{\PSfont ={},fontscale =10,decimals =3,xShift =-20}{\iA\space cos}} \makebox[5em]{\psPrintValue{\valuewidth =15,linecolor =blue,PSfont =NimbusSanL -Regu}{\iA\space sqrt}} \makebox[7em]{\psPrintValue{\comma,PSfont =NimbusRomNo 9L-ReguItal}{\iA\space dup sin exch cos add}} \makebox[6em]{\psPrintValue{\PSfont =Palatino -Roman}{\iA\space dup sin dup mul exch cos dup mul add}}}

With enabled algebraic option there must be two arguments, separated by a comma. The first one is the x value as a number, which can also be PostScript code, which leaves a number on the stack. The second part is the function described in algebraic notation. Pay attention, in algebraic notation angles must be in radian and not degrees.
\begin{tabular}{ccccccc}
\hline
x(deg) & \sin x & \cos x & \sqrt{x} & \sin x + \cos x & \sin^2 x + \cos^2 x \\
\hline

1.40009 & 0.985465 & 0.169 & 1.18325 & 1.15534 & 1 \\
1.50009 & 0.997501 & 0.07 & 1.22478 & 1.06815 & 1 \\
1.6001 & 0.999571 & -0.03 & 1.26495 & 0.970271 & 1 \\
1.7001 & 0.991652 & -0.129 & 1.30388 & 0.862708 & 1 \\
\hline
\end{tabular}
\section*{3 \texttt{\psRegisterList}}

The macro defines for every list item an own macro for an easy access to the items. It must be a comma separated list.

\begin{Verbatim}
\psRegisterList{\textit{Name}}{\textit{value list}}\ \\
\langle \textit{Name} \rangle \{ \textit{Index} \}
\end{Verbatim}

\begin{Verbatim}
\psRegisterList{\texttt{Color}}{\texttt{yellow,blue,green,red}} \% defines macro \texttt{Color}
\begin{pspicture}(\texttt{-7,-4.5})(\texttt{7,5.5})
\psaxes{-}(\texttt{0,0})(\texttt{-6.5,-4.5})(\texttt{6.75,5})
\psset{plotpoints=400,algebraic,linewidth=1pt,fillstyle=solid,opacity=0.4}
\multido{\texttt{iA}=\texttt{1+1}}{\texttt{4}}{
\psplot[linecolor=\texttt{\Color{iA}},fillcolor=\texttt{\Color{iA}!60}]{-6.283}{6.283}{\texttt{iA*sin(iA*x)}}%}
\psset{plotpoints=400,algebraic}
\psforeach{\texttt{iA}}{\texttt{1,2,3,4}}{
\psplot[linecolor=\texttt{\Color{iA}}]{-6.28}{6.28}{\texttt{iA*sin(iA*x)}}%}
\end{pspicture}
\end{Verbatim}

\section*{4 Random numbers}

The file \texttt{random.tex} from Donald Arseneau is no more part of CTAN due to a missing licence statement. \texttt{pst-tools} at version 0.10 includes the code. The documentation was inside the package itself:

Random integers are generated in the range 1 to 2147483646 by the macro \texttt{\nextrandom}. The result is returned in the counter \texttt{\randomi}. Do not change \texttt{\randomi} except, perhaps, to initialize it at some random value. If you do not initialize it, it will be initialized using the time and date. (This is a sparse initialization, giving fewer than a million different starting values, but you should use other sources of numbers if they are available—just remember that most of the numbers available to \TeX{} are not at all random.)

The \texttt{\nextrandom} command is not very useful by itself, unless you have exactly 2147483646 things to choose from. Much more useful is the \texttt{\setrannum} command which sets a given counter to a random value within a specified range. There are three parameters:
5 List of the defined PostScript functions

\setrannum{<counter>}{<minimum>}{<maximum>}

For example, to simulate a die-roll:
\setrannum{\die}{1}{6} \ifcase\die...

If you need random numbers that are not integers, you will have to use dimen registers and \setrandimen. For example, to set a random page width:
\setrandimen \hsize{3in}{6.5in}

The »\pointless« macro will remove the »pt« that TeX gives so you can use the dimensions as pure ‘real’ numbers. In that case, specify the range in pt units. For example,
\setrandimen\answer(2.71828pt){3.14159pt}

The answer is \pointless\answer.

The random number generator is the one by Lewis, Goodman, and Miller (1969) and used as ran0 in »Numerical Recipes« using Schrage’s method for avoiding overflows. The multiplier is 16807(75), the added constant is 0, and the modulus is 2147483647(231−1). The range of integers generated is 1 − 2147483646. A smaller range would reduce the complexity of the macros a bit, but not much−most of the code deals with initialization and type-conversion. On the other hand, the large range may be wasted due to the sparse seed initialization.

5 List of the defined PostScript functions
