Abstract

The tracklang package is provided for package developers who want a simple interface to find out which languages the user has requested through packages such as babel and polyglossia. *This package doesn't provide any translations.* Its purpose is simply to track which languages have been requested by the user. Generic \TeX{} code is in tracklang.tex for non-\TeX{} users.

If the shell escape is enabled or \directlua{} is available, this package may also be used to query the \texttt{LC\_ALL} or \texttt{LANG} environment variable (see Section 5). Windows users, who don’t have the locale stored in environment variables, can use \texttt{texosquery} in combination with tracklang. (Similarly if \texttt{LC\_ALL} or \texttt{LANG} don’t contain sufficient information.) In order to use \texttt{texosquery} through the restricted shell escape, you must have at least Java 8 and set up \texttt{texosquery.cfg} appropriately. (See the \texttt{texosquery} manual for further details.)

The fundamental aim of this generic package is to be able to effectively say:

The user (that is, the \textit{document} author) wants to use dialects \texttt{xx-XX}, \texttt{yy-YY-Scrp}, etc in their document. Any packages used by their document that provide multi-lingual or region-dependent support should do whatever is required to activate the settings for those languages and regions (or warn the user that there's no support).

Naturally, this is only of use if the locale-sensitive packages use tracklang to pick up this information, which is entirely up to the package authors, but at the moment there's no standard method for packages to detect the required language and region. The aim of tracklang is to provide that method. In particular, the emphasis is on using ISO language and region codes rather than hard-coding the various language labels used by different language packages.

1 Introduction

When I’m developing a package that provides multilingual support (for example, glossaries) it’s cumbersome trying to work out if the user has requested translations for fixed text. This usually involves checking if babel or ngerman or translator or polyglossia has been loaded and, if so, what language settings have been used. The result can be a tangled mass of conditional code. The alternative is to tell users to add the language as a document class option, which they may or may not want to do, or to tell them to supply the language settings to every package they load that provides multilingual support, which users are even less likely to want to do.

The tracklang package tries to neaten this up by working out as much of this information as possible for you and providing a command that iterates through the loaded languages. This way, you can just iterate through the list of tracked languages and, for each language, either define the translations or warn the user that there’s no translation for that language.

This package works best with ngerman or with recent versions of babel or when the language options are specified in the document class option list. It works fairly well with translator but will additionally assume the root language was also requested when a dialect is specified. So, for example,

\usepackage[british]{translator}
\usepackage{tracklang}

is equivalent to

\usepackage[british]{translator}
\usepackage[english,british]{tracklang}

This means that \ForEachTrackedDialect will iterate through the list “english,british” instead of just “british”, which can result in some redundancy.

Unfortunately I can’t work out how to pick up the language variant or script from polyglossia, so only the root languages are detected, which is suboptimal but at least provides some information. (polyglossia now provides \xpg@loaded, which tracklang uses to track the root languages, but the language variant command \xpg@loaded only seems to be set when the language changes, which doesn’t occur until the start of the document environment.)

I also can’t find any way of detecting a list of languages loaded through babel’s new \babelprovide command. As far as I can tell, the only stored list is in \bbl@loaded which only contains the languages loaded through package options.

If the ngerman package has been loaded, tracklang effectively does

\TrackPredefinedDialect{ngerman}

Similarly, if the german package has been loaded, tracklang effectively does

\TrackPredefinedDialect{german}
If any document class or package options are passed to tracklang, then tracklang won’t
bother checking for babel, translator, ngerman, german or polyglossia. So, if the above exam-
ple is changed to:

\documentclass[british]{article}
\usepackage{translator}
\usepackage{tracklang}

then the dialect list will just consist of “british” rather than “english,british”. This does, how-
ever, mean that if the user mixes class and package options, only the class options will be
detected. For example:

\documentclass[british]{article}
\usepackage[french]{babel}
\usepackage{tracklang}

In this case, only the “british” option will be detected. The user can therefore use the docu-
ment class option (or tracklang package option) to override the dialect and set the country
code (where provided). For example:

\documentclass[es-MX]{article}
\usepackage[spanish]{babel}
\usepackage{tracklang}

This sets the dialect to “mexicanspanish” and the root language to “spanish”.

Predefined dialects are listed in tables 1.1, 1.2 and 1.3. These may be passed in the docu-
ment class options or used in TrackPredefinedDialect, as illustrated above.

Section 2 provides brief examples of use for those who want a general overview before
reading the more detailed sections. Section 3 describes generic commands for identifying the
document languages. Section 4 is for package writers who want to add multilingual support
to their package and need to know which settings the user has requested through language
packages like babel. Section 5 is for developers of language definition packages who want to
help other package writers to detect what languages have been requested.

2 Summary of Use

There are three levels of use:

1. document level (code used by document authors);

2. locale-sensitive package level (code for package authors who need to know what languages or locale the document is using, such as glossaries to translate commands like `\descriptionname` or `datetime2` to provide localised formats or time zone information);

3. language set-up level (code for packages that set up the document languages, such as `babel` or `polyglossia`).

2.1 Document Level

2.1.1 Generic TeX

Unix user wants the locale information picked up from the locale environment variable:

```latex
\input tracklang % v1.3
\TrackLangFromEnv
% load packages that use tracklang for localisation
```

Windows user wants the locale information picked up from the operating system:

```latex
\input texosquery
\input tracklang % v1.3
\TrackLangFromEnv
% load packages that use tracklang for localisation
```

Or (texosquery v1.2)

```latex
\input texosquery % v1.2
\input tracklang % v1.3
\TeXOSQueryLangTag{\langtag}
\TrackLanguageTag{\langtag}
% load packages that use tracklang for localisation
```

Linux user who may or may not have texosquery setup to run in the shell escape:

```latex
\input texosquery
\input tracklang % v1.3
\ifx\TeXOSQueryLangTag\undefined
\TrackLangFromEnv
\else
\TeXOSQueryLangTag{\langtag}
\TrackLanguageTag{\langtag}
\fi
% load packages that use tracklang for localisation
```
User is writing in Italy in Armenian with a Latin script and the arevela variant:

\input tracklang % v1.3
\TrackLanguageTag{hy-Latn-IT-arevela}
% load packages that use tracklang for localisation

User is writing in English in the UK:

\input tracklang
\TrackPredefinedDialect{british}
% load packages that use tracklang for localisation

Find out information about the current language (supplied in \languagename):

\SetCurrentTrackedDialect{\languagename}
Dialect: \CurrentTrackedDialect.
Language: \CurrentTrackedLanguage.
ISO Code: \CurrentTrackedIsoCode.
Region: \CurrentTrackedRegion.
Modifier: \CurrentTrackedDialectModifier.
Variant: \CurrentTrackedDialectVariant.
Script: \CurrentTrackedDialectScript.
Sub-Lang: \CurrentTrackedDialectSubLang.
Additional: \CurrentTrackedDialectAdditional.
Language Tag: \CurrentTrackedLanguageTag.

Additional information about the script can be obtained by also loading tracklang-scripts:

\input tracklang-scripts

The name, numeric code and direction can now be obtained:

Name: \TrackLangScriptAlphaToName{\CurrentTrackedDialectScript}.
Numeric: \TrackLangScriptAlphaToNumeric{\CurrentTrackedDialectScript}.
Dir: \TrackLangScriptAlphaToDir{\CurrentTrackedDialectScript}.

Test for a specific script:

Latin?
\ifx\CurrentTrackedDialectScript\TrackLangScriptLatn Yes \else No \fi

2.1.2 \LaTeX

For babel users where the supplied babel dialect label is sufficient, there's no need to do anything special:

\documentclass[british,canadien]{article}
\usepackage[T1]{fontenc}
\usepackage{babel}
% load packages that use tracklang for localisation
If the region is important but there's no babel dialect that represents it, there are several options.

Use the class options recognised by tracklang and the root language labels when loading babel:

\documentclass[en-IE,ga-IE]{article}
\usepackage[english,irish]{babel}
% load packages that use tracklang for localisation

This method is needed for polyglossia where the regional information is required. For example

\documentclass[en-GB]{article}
\usepackage{polyglossia}
\setmainlanguage[variant=uk]{english}
% load packages that use tracklang for localisation

Another method with babel is to use \TrackLanguageTag and map the new dialect label to babel's nearest matching label:

\documentclass{article}
\usepackage{tracklang}% v1.3
\TrackLanguageTag{en-MT}
\SetTrackedDialectLabelMap{\TrackLangLastTrackedDialect}{UKenglish}
\usepackage[UKenglish]{babel}
% load packages that use tracklang for localisation

This ensures that the \captionsUKenglish hook is detected by the localisation packages. This mapping isn't needed for polyglossia as the caption hooks use the root language label. This mapping also isn't needed if british is used instead of UKenglish since the en-MT (maltaenglish) predefined dialect automatically sets up a mapping to british. (The default mappings are shown in table 1.3.)

2.2 Locale-Sensitive Packages

Let's suppose you are developing a package called mypackage.sty or mypackage.tex and you want to find out what languages the document author has requested. (See also: Using tracklang.tex in Packages with Localisation Features.)

Generic use:

\input tracklang

(Most of the commands used in this section require at least tracklang version 1.3 but 1.4 is better if you want to include the script tag in the ldf files.) Note that tracklang.tex has a check to determine if it's already been loaded, so you don't need to worry about that.

\LaTeX use:

\RequirePackage{tracklang}[2019/11/30]% at least v1.4
This will picked up any language options supplied in the document class options and will also detect if babel or polyglossia have been loaded.

(\LaTeX) If you want to allow the user to set the locale in the package options:

\DeclareOption*{\TrackLanguageTag{\CurrentOption}}

This means the user can do, say,

\usepackage[hy-Latn-IT-arevela]{mypackage}

With at least version 1.4, it’s better to use \TrackIfKnownLanguage:

\DeclareOption*{\TrackIfKnownLanguage{\CurrentOption}\
\PackageInfo{mypackage}{\text{Tracking language '/grave.ts1' \CurrentOption'}}\% successful
\% failed
\PackageError{mypackage}{\text{Unknown language specification '/grave.ts1' \CurrentOption'}}\%
{You need to supply either a known dialect label or a valid language tag}\
\%}

The rest of the example package in this section uses generic code.

If you want to fetch the locale information from the operating system when the user hasn’t requested a language:

\AnyTrackedLanguages{}
{% fetch locale information from the operating system
\ifx\TeXOSQueryLangTag\undefined
% texosquery v1.2 not available
\TrackLangFromEnv
\else
% texosquery v1.2 available
\TeXOSQueryLangTag{\langtag}
\TrackLanguageTag{\langtag}
\fi
%

Set up the defaults if necessary:

\def\fooname{Foo}
\def\barname{Bar}

Now load the resource files:

\AnyTrackedLanguages{%
\ForEachTrackedDialect{\thisdialect}{%\TrackLangRequireDialect{mypackage}{\thisdialect}{%}
%
}
{% no tracked languages, default already set up

Each resource file has the naming scheme (prefix)- (localeid).ldf. In this example, the (prefix) is mypackage. The (localeid) part may be the language or dialect label (for example, english or british) or a combination of the ISO language and region codes (for example,
en-GB or en or GB). As from version 1.4, (`localeid`) may also include the script or variant. (See the definition of `\IfTrackedLanguageFileExists` on page 35 for further details.)

The simplest scheme is to use the root language label (not the dialect label) for the base language settings and use the ISO codes for regional support.

For example, the file `mypackage-english.ldf`:

```latex
\TrackLangProvidesResource{english}[2016/10/06 v1.0]% identify this file
\TrackLangAddToCaptions{%
  \def\fooname{Foo}%
  \def\barname{Bar}%
}
```

This sets up appropriate the \captions... hook (if it's found). For other hooks, such as `\date...`, use `\TrackLangAddToHook{〈code〉}{〈hook type〉}` instead.

With pre-v1.4 versions of `tracklang`, the script isn't included in the file search. If it's needed then either require at least v1.4 or have a base ldf file that tries to load a version for the particular script (which can be accessed with `\CurrentTrackedScript`). Here's an example for a language with different writing systems. The resource file for Serbian `mypackage-serbian.ldf`:

```latex
\TrackLangProvidesResource{serbian}[2016/10/06 v1.0]% identify file
\TrackLangRequestResource{serbian-\CurrentTrackedScript}{% file not found, do something sensible here
\TrackLangProvidesResource{serbian-Latn}[2016/10/06 v1.0]
\TrackLangAddToCaptions{%
  \def\fooname{...}% provide appropriate Latin translations
  \def\barname{...}%
}
\TrackLangProvidesResource{serbian-Cyrl}[2016/10/06 v1.0]
\TrackLangAddToCaptions{%
  \def\fooname{...}% provide appropriate Cyrillic translations
  \def\barname{...}%
}
```

With v1.4+ you would just need `mypackage-sr-Latn.ldf`, `mypackage-sr-Cyrl.ldf` for the regionless versions.

### 2.3 Language Packages

Let's suppose now you're the developer of a package that sets up the language, hyphenation patterns and so on. It would be really helpful to the locale-sensitive packages in Section 2.2 to know what languages the document author has requested. You can use the `tracklang` package to identify this information by tracking the requested localisation, so that other packages can
have a consistent way of querying it. (See also: Integrating tracklang.tex into Language Packages.)

Generic use:
\input tracklang

Alternative \LaTeX{} use:
\RequirePackage{tracklang}[2019/11/30] % v1.4

Unlike \input, \RequirePackage will allow tracklang to pick up the document class options, but using \RequirePackage will also trigger the tests for known language packages. (If you want to find out if tracklang has already been loaded and locales have already been tracked, you can use the same code as in the previous section.)

When a user requests a particular language through your package, the simplest way of letting tracklang know about it is to use \TrackPredefinedDialect or \TrackLanguageTag. For example, if the user requests british, that's a predefined dialect so you can just do:
\TrackPredefinedDialect{british}

Alternatively
\TrackLanguageTag{en-GB}

If your package uses caption hooks, then you can set up a mapping between tracklang's internal dialect label and your caption label. For example, let's suppose the closest match to English used in Malta (en-MT) is the dialect UKenglish (for example, the date format is similar between GB and MT):
\TrackLanguageTag{en-MT}
\SetTrackedDialectLabelMap{\TrackLangLastTrackedDialect}{UKenglish}
\def\captionsUKenglish{\def\contentsname{Contents}%
\%...}

(The predefined maltaenglish option provided by tracklang automatically sets the mapping to british, but the above method will change that mapping to UKenglish.)

This now means that \TrackLangAddToHook and \TrackLangRedefHook commands can find your language hooks. You don't need the map if your dialect label is the same as tracklang's root language label for that locale. For example:
\TrackLanguageTag{en-MT}
\def\captionsenglish{\def\contentsname{Contents}%
\%...}

When the user switches language through commands like \selectlanguage it would be useful to also use \SetCurrentTrackedDialect{dialect} to make it easier for the document author or locale-sensitive packages to pick up the current locale. The \textit{dialect} argument may be tracklang's internal dialect label or the dialect label you assigned with
\SetTrackedDialectLabelMap. It may also be the root language label, in which case track-lang will search for the last dialect to be tracked with that language. For example:

\def\selectlanguage#1{\SetCurrentTrackedDialect(#1)%
% set up hyphenation patterns etc
}

See the example in Section 2.1 or the example in Integrating tracklang.tex into Language Packages.
3 Generic Use

For plain \TeX you can input tracklang.tex:
\input tracklang

or for \LaTeX formats that have an argument form for \input:
\input{tracklang}

As from version 1.3, you don't need to change the category code of \@ before loading tracklang.tex as it will automatically be changed to 11 and switched back at the end (if required).

The \LaTeX package tracklang.sty inputs the generic \TeX code in tracklang.tex, but before it does so it defines
\@tracklang@declareoption{(name)}

to
\DeclareOption{(name)}{\TrackPredefinedDialect{(name)}}

This means that all the predefined languages and dialects (tables 1.1, 1.2 and 1.3) automatically become package options, so the tracklang package can pick up document class options and add them to tracklang's internal list of tracked document languages.

If you're not using \LaTeX, this option isn't available (although you could redefine the internal command \@tracklang@declareoption to use something analogous to \DeclareOption). Instead, the document languages need to be explicitly identified (using any of the following commands) so that tracklang knows about them.

\TrackPredefinedDialect{(dialect label)}

This will add the predefined dialect and its associated ISO codes to the list of tracked document languages. The \textit{(dialect label)} may be any of those listed in tables 1.1, 1.2 and 1.3. (See also Section 6.2.5 and Section 6.2.6.)

For example:
\input tracklang
\TrackPredefinedDialect{british}

is the Plain \TeX alternative to
\documentclass[british]{article}
\usepackage{tracklang}
Note that it's impractical to define every possible language and region combination as it would significantly slow the time taken to load tracklang so, after version 1.3, I don't intend adding any new predefined dialects. As from version 1.3, if you want to track a dialect that’s not predefined by tracklang, then you can use:

\TrackLocale{{locale}}

If \locale{} is a recognised dialect, this is equivalent to using \TrackPredefinedDialect, otherwise \locale{} needs to be in one the following formats:

- (ISO lang)
- (ISO lang)@\{modifier\}
- (ISO lang)-(ISO country)
- (ISO lang)-(ISO country)@\{modifier\}

where (ISO lang) is the ISO 639-1 or 639-2 code identifying the language (lower case), (ISO country) is the 3166-1 ISO code identifying the territory (upper case) and \{modifier\} is the modifier or variant. The hyphen may be replaced by an underscore character. Code set information in the form .\{codeset\} may optionally appear before the modifier. For example, de-DE.utf8@new (modifier is new) or en-GB.utf8 (modifier is missing). The codeset will be ignored if present, but it won’t interfere with the parsing.

For example:

\TrackLocale{de-NA@new}

indicates German in Namibia using the new spelling.

If a language has different “T” and “B” ISO 639-2 codes, then the “T” form should be used. (So for the above example, deu may be used instead of de, but ger won’t be recognised.)

Alternatively, you can use

\TrackLanguageTag{{tag}}

where \tag{} is a regular, well-formed language tag or a recognised dialect label. (Irregular grandfather tags aren’t recognised.) This command will fully expand \tag{}. A warning is issued if the tag is empty.

If you want to first check that \tag{} includes a valid language code, then you can instead use:

\TrackIfKnownLanguage{{tag}}{{success code}}{{fail code}}

This will only track \tag{} (and then do \success{} code) if \tag{} starts with a valid language code (or is a predefined dialect) otherwise it will do \fail{}. Both \TrackLanguageTag
and \TrackIfKnownLanguage will check if \textit{\langle tag \rangle} is a predefined option. (This saves parsing
the tag if it's recognised.)

For example:

\TrackLanguageTag{hy-Latn-IT-arevela}
\TrackIfKnownLanguage{Latn-ME}{success}{fail}.
brazilian: \TrackIfKnownLanguage{brazilian}{success}{fail}.

This will track hy-Latn-IT-arevela and brazilian (pt-BR) but not Latn-ME (because it doesn't
contain a valid language code) even though it's a valid script and country code. The above
is just for illustrative purposes. Typically the language tracking isn't performed within the
document text.

The datetime2 package assumes that any unknown package option is a language identifier.
It could simply do:

\TrackLanguageTag{\CurrentOption}

but users can make mistakes sometimes and this won't provide any helpful information if
they, for example, misspelt a package option or forgot the “\textit{\langle key \rangle}=” part of a \textit{\langle key \rangle}=(\textit{value})
setting. Instead (as from v1.5.5) it does:

\TrackIfKnownLanguage{\CurrentOption}{...}{\PackageError{...}{...}{...}}

This will now give the user some guidance.

If \textit{\langle tag \rangle} contains a sub-language tag, this will be set as the 639-3 code for the \textit{dialect} label.
Note that this is different to the root language codes which are set using the language label.
For example

\TrackLanguageTag{zh-cmn-Hans-CN}

creates a new dialect with the label zhcmnHansCN. The root language chinese has the ISO
639-1 code zh and the dialect zhcmnHansCN has the ISO 639-3 code cmn.

ISO 639-1: \TrackedIsoCodeFromLanguage{639-1}{chinese}.
ISO 639-3: \TrackedIsoCodeFromLanguage{639-3}{zhcmnHansCN}.

Version 1.2 of texosquery provides the command \TeXOSQueryLangTag, which may be
used to fetch the operating system's regional information as a language tag. These commands
can be used as follows:

\input tracklang X v1.3
\input texosquery X v1.2
\TeXOSQueryLangTag{\langtag}
\TrackLanguageTag{\langtag}

(If the shell escape is disabled, \textit{\langtag} will be empty, which will trigger a warning but no
errors.)

Some of the predefined root language options listed in table 1.2 have an associated region
(denoted by \textit{†}). If \TrackLocale is used with just the language ISO code, no region is tracked
for that language. For example

\TrackLocale{manx}
will track the “IM” ISO 3166-1 code but
\TrackLocale{gv}

won’t track the region. Similarly for \TrackLanguageTag.

(New to version 1.3.) There’s a similar command to \TrackLocale that doesn’t take an argument:
\TrackLangFromEnv

If the shell escape has been enabled or \directlua is available, this will try to get the language information from the system environment variables LC_ALL or LANG and, if successful, track that.

Since tracklang is neither able to look up the POSIX locale tables nor interpret file locales, if the result is C or POSIX or starts with a forward slash / then the locale value is treated as empty.

Not all operating systems use environment variables for the system locale information. For example, Windows stores the locale information in the registry. In which case, consider using texosquery.

If the operating system locale can’t be obtained from environment variables, then tracklang will use \TeXOSQueryLocale as a fallback if texosquery has been loaded. Since texosquery requires both the shell escape and the Java runtime environment, tracklang doesn’t automatically load it.

Plain \TeX example:
\input texosquery
\input tracklang
\TrackLangFromEnv

with \etex --shell-escape \texttt{\textless \textgreater}

\TeX example:
\usepackage{texosquery}
\usepackage{tracklang}
\TrackLangFromEnv

with \latex --shell-escape \texttt{\textless \textgreater}

If the locale can’t be determined, there will be warning messages. These can be suppressed using
\TrackLangShowWarningsfalse

or switched back on again using
\TrackLangShowWarningstrue
For example, I have the environment variable LANG set to en_GB.utf8 on my Linux system so instead of

\TrackPredefinedDialect{british}

I can use

\TrackLangFromEnv

With \LaTeX documents I can do

\documentclass{article}
\usepackage{tracklang}
\TrackLangFromEnv

However, this only helps subsequently loaded packages that use tracklang to determine the required regional settings. For example:

\documentclass{article}
\usepackage{tracklang}
\TrackLangFromEnv
\usepackage[useregional]{datetime2}

In my case, with LANG set to en_GB.utf8 and shell escape enabled, this automatically switches on the en-GB date style. Naturally this doesn't help locale-sensitive packages that don't use tracklang.

The \TrackLangFromEnv command also incidentally sets \TrackLangEnv to the value of the environment variable or empty if the query was unsuccessful (for example, the shell escape is unavailable).

If \TrackLangEnv is already defined before \TrackLangFromEnv is used, then the environment variable won't be queried and the value of \TrackLangEnv will be parsed instead.

The parser which splits the locale string into its component parts first tries splitting on the underscore _ with its usual category code 8, then tries splitting on a hyphen - with category code 12, and then tries splitting on the underscore _ with category code 12.

For example:

\def\TrackLangEnv{en-GB}
\TrackLangFromEnv

This doesn't perform a shell escape since \TrackLangEnv is already defined. In this case, you may just as well use

\TrackLocale{en-GB}
If the shell escape is unavailable (for example, your \TeX installation prohibits it), you can set this value when you invoke \TeX. For example, if the document file is called myDoc.tex (and it's in Plain \TeX):

tex "\\def TrackLangEnv{$LANG}\input myDoc"

The TrackLangFromEnv command also happens to store the component parts of the environment variable value in the following commands. (These aren't provided by TrackLocale.)

The language code is stored in:

\TrackLangEnvLang

The territory (if present) is stored in:

\TrackLangEnvTerritory

(Defined to empty if not present.)

The codeset (if present) is stored in:

\TrackLangEnvCodeSet

(Defined to empty if not present.)

The modifier (if present) is stored in:

\TrackLangEnvModifier

(Defined to empty if not present.)

If you want to query the language environment, but don't want to track the result, you can just use:

\TrackLangQueryEnv

This only tries to fetch the value of the language environment variable (and use texosquery as a fallback, if it has been loaded). It doesn't try to parse the result. The result is stored in TrackLangEnv (empty if unsuccessful). Unlike TrackLangFromEnv, this doesn't check if TrackLangEnv already exists. A warning will occur if the shell escape is unavailable. For systems that store the locale information in environment variables, this is more efficient than using texosquery's TeXOSQueryLocale command (which is what's used as the fallback).

The above queries LC_ALL and, if that is unsuccessful, then queries LANG (before optionally falling back on texosquery). If you want another environment variable tried after LC_ALL and before LANG, you can instead use:

\TrackLangQueryOtherEnv{〈name〉}
For example, to also query LC_MONETARY:

\TrackLangQueryOtherEnv{LC_MONETARY}

Since this sets \TrackLangEnv, you can use it before \TrackLangFromEnv. For example:

\TrackLangQueryOtherEnv{LC_MONETARY}
\TrackLangFromEnv

Remember that if you only want to do the shell escape if \TrackLangEnv hasn't already been defined, you can test for this first:

\ifx\TrackLangEnv\undefined
  \TrackLangQueryOtherEnv{LC_MONETARY}
\fi
\TrackLangFromEnv

It’s also possible to just parse the value of \TrackLangEnv without tracking the result using:

\TrackLangParseFromEnv

This is like \TrackLangFromEnv but assumes that \TrackLangEnv has already been set and doesn't track the result. The component parts are stored as for \TrackLangFromEnv.

Example (Plain \LaTeX):

\input tracklang
\def\TrackLangEnv{fr-BE.utf8@euro}
\TrackLangParseFromEnv

Language: \TrackLangEnvLang.
Territory: \TrackLangEnvTerritory.
Codeset: \TrackLangEnvCodeSet.
Modifier: \TrackLangEnvModifier.
Any tracked languages? \AnyTrackedLanguages{Yes}{No}.

This produces:

Compare this with:

\input tracklang
\def\TrackLangEnv{fr-BE.utf8@euro}
\TrackLangFromEnv

Language: \TrackLangEnvLang.
Territory: \TrackLangEnvTerritory.
Codeset: \TrackLangEnvCodeSet.
Modifier: \TrackLangEnvModifier.
Any tracked languages? \AnyTrackedLanguages{Yes}{No}.
Tracked dialect(s):%\ForEachTrackedDialect{\thisdialect}{\space\thisdialect}.
This produces:

If \TrackLangFromEnv doesn't recognise the given language and territory combination, it will define a new dialect and add that.

For example, tracklang doesn't recognise en-BE, so the sample document below defines a new dialect labelled enBEeuro:

\input tracklang
\def\TrackLangEnv{en-BE.utf8@euro}
\TrackLangFromEnv

Language: \TrackLangEnvLang. Territory: \TrackLangEnvTerritory. Codeset: \TrackLangEnvCodeSet. Modifier: \TrackLangEnvModifier. Any tracked languages? \AnyTrackedLanguages{Yes}{No}. Tracked dialect(s): %\ForEachTrackedDialect{\thisdialect}{\space\thisdialect}.

This now produces:

4 Detecting the User’s Requested Languages

The tracklang package tries to track the loaded languages and the option names used to identify those languages. For want of a better term, the language option names are referred to as dialects even if they’re only a synonym for the language rather than an actual dialect. For example, if the user has requested british, the root language label is english and the dialect is british, whereas if the user requested UKenglish, the root language label is english and the dialect is UKenglish. The exceptions to this are the tracklang package options that have been specified in the form \textit{〈iso lang〉-〈iso country〉} (listed in table 1.2). For example, the package option en-GB behaves as though the user requested the package option british.

If \texttt{\TrackLocale} or \texttt{\TrackLangFromEnv} are used and the locale isn’t recognised a new dialect is created with the label formed from the ISO codes (and modifier, if present). Similarly for \texttt{\TrackLanguageTag} a new dialect is created with a label that’s essentially the language tag without the hyphen separators. For example,

\texttt{\TrackLocale{xx-YY}}

will add a new dialect with the label xxYY,

\texttt{\TrackLocale{xx-YY@mod}}

will add a new dialect with the label xxYYmod and

\texttt{\TrackLanguageTag{xx-Latn-YY}}

will add a new dialect with the label xxLatnYY.

If \texttt{\TrackLocale} or \texttt{\TrackLangFromEnv} find a modifier, the value will be sanitized to allow it to be used as a label. If the modifier is set explicitly using \texttt{\SetTrackedDialectModifier}, no sanitization is performed.

In addition to the root language label and the dialect identifier, many of the language options also have corresponding ISO codes. In most cases there is an ISO 639-1 or an ISO 639-2 code (or both), and in some cases there is an ISO 3166-1 code identifying the dialect region. Where a language has both a “T” and a “B” ISO 639-2 code, the “T” version is assumed.

When the tracklang \LaTeX{} package is loaded, it first attempts to find the language options through the package options supplied to tracklang. This means that any languages that have been supplied in the document class options should get identified (provided that the document class has used the standard option declaration mechanism). If no languages have been
supplied in this way, tracklang then attempts to identify any babel language options and failing that it will try the translator language options. It will then check if \texttt{ngerman} or polyglossia have been loaded.

Each identified language and dialect is added to the \texttt{tracked language} and \texttt{tracked dialect} lists. Note that the tracked language and tracked dialect are labels rather than proper nouns. If a dialect label is identical to its root language label, the label will appear in both lists.

You can check whether or not any languages have been detected using:

\begin{verbatim}
\AnyTrackedLanguages{{\texttt{true part}}}{{\texttt{false part}}}
\end{verbatim}

This will do \texttt{\textlangle true part\textrangle} if one or more languages have been detected otherwise it will do \texttt{\textlangle false part\textrangle}. (Each detected dialect will automatically have the root language label added to the tracked language list, if it's not already present.)

If you want to find out if any of the tracked dialects matches a particular language tag, you can use:

\begin{verbatim}
\GetTrackedDialectFromLanguageTag{{\texttt{tag}}}{{\texttt{cs}}}
\end{verbatim}

If successful, the supplied control sequence \texttt{(cs)} is set to the dialect label, otherwise \texttt{(cs)} is set to empty. The test is for an exact match on the root language, script, sub-language, variant and region. The control sequence \texttt{(cs)} will be empty if none of the tracked dialects matches all five of those elements. (If the script isn't given explicitly, the default for that language is assumed.) In the event that \texttt{(cs)} is empty, you can now (as from v1.3.6) get the closest match with

\begin{verbatim}
\TrackedDialectClosestSubMatch
\end{verbatim}

(which is set by \texttt{\GetTrackedDialectFromLanguageTag}). This will be empty if no tracked dialects match on the root language or if there's a tracked dialect label that exactly matches the label formed by concatenating the language code, sub-language, script, region, modifier and variant.

For example (Plain Ti\TeX):

\begin{verbatim}
\input tracklang
\TrackLanguageTag{en-826}
Has en-Latn-GB been tracked?
\GetTrackedDialectFromLanguageTag{en-Latn-GB}{\thisdialect}\
\ifdef\thisdialect{}\empty\else\Yes! Dialect label: \thisdialect.\fi
\bye
\end{verbatim}

This matches because the territory code 826 is recognised as equivalent to the code GB, and the default script for \texttt{english} is \texttt{Latn}. In this case, the dialect label is \texttt{british}. Note that this doesn't require the use of \texttt{\TrackLanguageTag} to track the dialect. It also works if the dialect has been tracked using other commands, such as \texttt{\TrackLocale}.
Here's an example that doesn't have an exact match, but does have a partial match:

\input tracklang
\TrackLanguageTag{de-CH-1996}
\Ifx\thisdialect\empty
  No!
\else
  Closest match: \TrackedDialectClosestSubMatch.
\fi
\else
  Yes! Dialect label: \thisdialect.
\fi
\bye

In this case the result is:

Has de-DE-1996 been tracked? No! Closest match: nswissgerman.

You can iterate through each tracked dialect using:

\ForEachTrackedDialect
\ForEachTrackedDialect\{\cs\}\{\code\}

At the start of each iteration, this sets the control sequence \cs to the tracked dialect and does \code.

You can iterate through each tracked language using:

\ForEachTrackedLanguage
\ForEachTrackedLanguage\{\cs\}\{\code\}

At the start of each iteration, this sets the control sequence \cs to the tracked language and does \code.

The above for-loops use the same internal mechanism as \TeX's \for loop. The provided control sequence \cs is updated at the start of each iteration to the current element. The loop is terminated when this control sequence is set to \@nil. This special control sequence should never been used as it's just a marker and isn't actually defined. If you get an error message stating that \@nil is undefined, then it's most likely due to a loop control sequence being used outside the loop. This can occur if the loop contains code that isn't expanded until later. For example, if the loop code includes \AtBeginDocument, you need to ensure that the loop control sequence is expanded before being added to the hook.

You can test if a root language has been detected using:

\IfTrackedLanguage\{\label\}\{\true part\}\{\false part\}

where \label is the language label. If true, this does \true part otherwise it does \false part.

You can test if a particular dialect has been detected using:

\IfTrackedDialect\{\label\}\{\true part\}\{\false part\}
where \(<label>\) is the dialect label. If the root language was explicitly specified, then it will also be detected as a dialect.

For example:

\documentclass[british,dutch]{article}
\usepackage{tracklang}
\begin{document}
\begin{verbatim}
"english" \IfTrackedDialect{english}{has}{hasn't} been specified.
"british" \IfTrackedDialect{british}{has}{hasn't} been specified.
"flemish" \IfTrackedDialect{flemish}{has}{hasn't} been specified.
"dutch" \IfTrackedDialect{dutch}{has}{hasn't} been specified.
"english" or an English variant
\IfTrackedLanguage{english}{has}{hasn't} been specified.
\end{verbatim}
\end{document}

This produces:

“english” hasn't been specified.
“british” has been specified.
“flemish” hasn't been specified.
“dutch” has been specified.
“english” or an English variant has been specified.

You can find the root language label for a given tracked dialect using:

\TrackedLanguageFromDialect{\dialect}

If \(<\dialect>\) hasn't been defined this does nothing otherwise it expands to the root language label.

You can find the tracked dialects from a given root language using:

\TrackedDialectsFromLanguage{\root language label}

This will expand to a comma-separated list of dialect labels if the root language label has been defined, otherwise it does nothing.

You can test if a language or dialect has a corresponding ISO code using:

\IfTrackedLanguageHasIsoCode{\code type}{\label}{\true part}{\false part}

where \(<code type>\) is the type of ISO code (for example, 639–1 for root languages or 3166–1 for regional dialects), and \(<label>\) is the language or dialect label. Note that the 639–3 may be set for the dialect rather than root language for sub-languages parsed using \TrackLanguageTag.
Alternatively, you can test if a particular ISO code has been defined using:

\IfTrackedIsoCode{\langle code type\rangle}{\langle code\rangle}{\langle true part\rangle}{\langle false part\rangle}

where \langle code type\rangle is again the type of ISO code (for example, 639-1 or 3166-1), and \langle code\rangle is the particular code (for example, en for ISO 639-1 or GB for ISO 3166-1).

You can fetch the language (or dialect) label associated with a given ISO code using:

\TrackedLanguageFromIsoCode{\langle code type\rangle}{\langle code\rangle}

This does nothing if the given \langle code\rangle for the given ISO \langle code type\rangle has not been defined, otherwise it expands a comma-separated list of language or dialect labels.

You can fetch the ISO code for a given code type using:

\TrackedIsoCodeFromLanguage{\langle code type\rangle}{\langle label\rangle}

where \langle label\rangle is the language or dialect label and \langle code type\rangle is the ISO code type (for example, 639-1 or 3166-1). Unlike \TrackedLanguageFromIsoCode, this command only expands to a single label rather than a comma-separated list.

The above commands do nothing in the event of an unknown code or code type, so if you accidentally get the wrong code type, you won’t get an error. If you’re unsure of the code type, you can use the following commands:

\TwoLetterIsoCountryCode

This expands to 3166-1 and is used for the two-letter country codes.

\TwoLetterIsoLanguageCode

This expands to 639-1 and is used for the two-letter root language codes.

\ThreeLetterIsoLanguageCode

This expands to 639-2 and is used for the three-letter root language codes.

\ThreeLetterExtIsoLanguageCode

(New to v1.3.) This expands to 639-3. This code is only used for a root language if there's no 639-1 or 639-2 code. It may also be used for a dialect if a sub-language part has been set in the language tag parsed by \TrackLanguageTag.

The \Get... commands below are designed to be expandable. If the supplied \langle dialect\rangle is unrecognised they expand to empty. Remember that the dialect must first be identified as a tracked language for it to be recognised.

As from v1.3, the language tag for a given dialect can be obtained using:
where \(\text{dialect}\) is the label identifying the dialect. Uses the und (undetermined) code for unknown languages.

As from v1.3, each tracked dialect may also have an associated modifier, which can be fetched using:

\[
\text{\GetTrackedDialectModifier}\{\text{dialect}\}
\]

where \(\text{dialect}\) is the label identifying the dialect. This value is typically obtained by parsing a POSIX locale identifier with \text{\TrackLocale} or \text{\TrackLangFromEnv} but may be set explicitly. (See Section 5 for setting this value. Likewise for the following commands.)

You can test if a dialect has an associated modifier using:

\[
\text{\IfHasTrackedDialectModifier}\{\text{dialect}\}\{\text{true}\}\{\text{false}\}
\]

If the dialect has an associated modifier this does \text{true} otherwise it does \text{false}.

For example:

\[
\text{\documentclass}\{british,francais,american,canadian,canadien,dutch\}\{article\}
\]

\[
\text{\usepackage}\{tracklang\}
\]

\[
\text{\begin{document}}
\]

Languages: \text{\ForEachTrackedLanguage}\{\text{\ThisLanguage}\}\{\text{\ThisLanguage}\space (ISO \text{\TwoLetterIsoLanguageCode}: \text{\TrackedIsoCodeFromLanguage}\{\text{\TwoLetterIsoLanguageCode}\}\{\text{\ThisLanguage}\}''). }

Dialects: \text{\ForEachTrackedDialect}\{\text{\ThisDialect}\}\{\text{\ThisDialect}\space (\text{\IfTrackedLanguageHasIsoCode}\{\text{\TwoLetterIsoCountryCode}\}\{\text{\ThisDialect}\}\{\text{\IfTrackedLanguageHasIsoCode}\{\text{\TwoLetterIsoCountryCode}\}\{\text{\ThisDialect}\}'\})%).
\text{\TrackedIsoCodeFromLanguage}\{\text{\TwoLetterIsoLanguageCode}\}\{\text{\ThisDialect}\}'\})%}
\text{\no specific region};
\text{\root}: \text{\TrackedLanguageFromDialect}\{\text{\ThisDialect}\}).
\}

Language for ISO \text{\TwoLetterIsoCountryCode}\: \text{``GB'':}
\text{\TrackedLanguageFromIsoCode}\{\text{\TwoLetterIsoCountryCode}\}\{GB\}.

Language for ISO \text{\TwoLetterIsoCountryCode}\: \text{``CA'':}
\text{\TrackedLanguageFromIsoCode}\{\text{\TwoLetterIsoCountryCode}\}\{CA\}.

Country ISO \text{\TwoLetterIsoCountryCode}\: code for \text{``canadian'':}
\text{\TrackedIsoCodeFromLanguage}\{\text{\TwoLetterIsoCountryCode}\}\{canadian\}.
\}
\end{document}

This produces:

Language for ISO 3166-1 “GB”: british.
Language for ISO 3166-1 “CA”: canadian, canadien.
Country ISO 3166-1 code for “canadian”: CA.

As from v1.3, each tracked dialect may also have an associated variant, which can be fetched using:

\GetTrackedDialectVariant

where \textit{dialect} is the label identifying the dialect. This value is typically obtained by parsing a language tag with \TrackLanguageTag but may be set explicitly.

You can test if a dialect has an associated variant using:

\IfHasTrackedDialectVariant

As from v1.3, each tracked dialect may also have an associated script, which can be fetched using:

\GetTrackedDialectScript

where \textit{dialect} is the label identifying the dialect.

You can test if a dialect has an associated script using:

\IfHasTrackedDialectScript

If the dialect has an associated script this does \textit{true} otherwise it does \textit{false}. This information is provided for language packages that need to know what script is required, but there's no guarantee that the script will actually be set in the document. Similarly for all the other attributes described here.

Note that the script should be a recognised four-letter ISO 15924 code, such as Latn or Cyril. If a dialect doesn't have an associated script then the default for the root language should be assumed. For example, “Latn” for English dialects or “Cyril” for Russian dialects. (The default script for known languages can be obtained using \TrackLangGetDefaultScript, see Section 6.2.2 for further details. Most root languages have a default script, but there are a few without one as it may depend on region, politics or ideology.)

There's a convenient expandable command for testing the script:

\IfTrackedDialectIsScriptCs

This tests if the given tracked dialect has an associated script and compares the value with the replacement text of \textit{cs}. If the dialect hasn't been explicitly assigned a script, then test is performed against the default script for the root language.
The supplementary package tracklang-scripts provides some additional commands relating to writing systems, including commands in the form `\TrackLangScript{code}` where `<code>` is the ISO 15924 four-letter code. If the dialect doesn’t have an associated script, `<false>` is done. This package isn’t loaded automatically, so you’ll need to explicitly load it. The generic code is in `tracklang-scripts.tex`:

```latex
\input tracklang-scripts
```

There’s a convenient \LaTeX wrapper `tracklang-scripts.sty`:

```latex
\usepackage{tracklang-scripts}
```

See Section 6.5 for further details of that package.

For example, the following defines a command to check if the given dialect should use a Latin script:

```latex
\input tracklang-scripts
\def\islatin#1#2#3{% 
  \IfTrackedDialectIsScriptCs{#1}{\TrackLangScriptLatn}{#2}{#3}%
}
```

Note that the script value doesn’t mean that the document is actually using that script. It means that this is the user’s desired script, but whether that script is actually set relies on the appropriate settings in the relevant language package (such as polyglossia’s script key).

As from v1.3, each tracked dialect may also have a sub-language identifier (for example, arevela), which can be fetched using:

```
\GetTrackedDialectSubLang{(dialect)}
```

where `<dialect>` is the label identifying the dialect.

You can test if a dialect has an associated sub-tag using:

```
\IfHasTrackedDialectSubLang{(dialect)}{(true)}{(false)}
```

If the dialect has an associated sub-tag this does `<true>` otherwise it does `<false>`.

As from v1.3, each tracked dialect may also have additional information, which can be fetched using:

```
\GetTrackedDialectAdditional{(dialect)}
```

where `<dialect>` is the label identifying the dialect.

You can test if a dialect has additional information using:

```
\IfHasTrackedDialectAdditional{(dialect)}{(true)}{(false)}
```
If the dialect has additional information this does \texttt{true} otherwise it does \texttt{false}.

Most packages that implement multilingual support have a set of language definition files for each supported language or dialect. It may be that only the root language is needed, if there are no variations between that language's dialect (for the purposes of that package), or it may be that separate definition files are required for each dialect. However it can be awkward trying to map the requested dialect or language label to the file name. Should, say, the file containing the French code be called \texttt{(prefix)-french-(suffix)} or \texttt{(prefix)-français-(suffix)}? Should, say, the file containing the British English code be called \texttt{(prefix)-british-(suffix)} or \texttt{(prefix)-UKenglish-(suffix)}? If you want to modularise the language support for your package so that each language module has a different maintainer will the maintainers know what tag to use for their language?

To help with this, tracklang provides:

\begin{verbatim}
\IfTrackedLanguageFileExists{\texttt{dialect}}{\texttt{(prefix)}}{\texttt{(suffix)}}{\texttt{(true part)}}
{\texttt{false part}}
\end{verbatim}

This attempts to find the file called \texttt{(prefix)\langle localeid\rangle\texttt{(suffix)}} where \texttt{\langle localeid\rangle} is determined from \texttt{\langle dialect\rangle} (see below). If the file is found \texttt{CurrentTrackedTag} is set to \texttt{\langle localeid\rangle} and \texttt{\langle true part\rangle} is done, otherwise \texttt{\langle false part\rangle} is done. If this command is empty, then the dialect hasn’t been detected. If the dialect has been detected, but no file can be found, then \texttt{CurrentTrackedTag} is set to the final attempt at determining \texttt{\langle localeid\rangle}.

There’s a convenient shortcut command new to version 1.3:

\begin{verbatim}
\TrackLangRequireDialect{\texttt{(load code)}}{\texttt{(pkgname)}}{\texttt{(dialect)}}
\end{verbatim}

which uses \texttt{\IfTrackedLanguageFileExists} to input the resource file if found. The prefix is given by \texttt{\langle pkgname\rangle} - and the suffix is .ldf. A warning is issued if no resource file is found. Note that while it makes sense for \texttt{\langle pkgname\rangle} to be the same as the base name of the package that uses these resource files, they don’t have to be the same. This command additionally defines

\begin{verbatim}
\TrackLangRequireDialectPrefix{\texttt{(pkgname)}}
\end{verbatim}

to \texttt{\langle pkgname\rangle}, which allows the prefix to be picked up by resource file commands, such as \texttt{\TrackLangProvidesResource} and \texttt{\TrackLangRequireResource}. (See below.)

The optional argument \texttt{\langle load code\rangle} is the code that actually inputs the required file. This defaults to

\begin{verbatim}
\TrackLangRequireResource{\texttt{CurrentTrackedTag}}
\end{verbatim}

The \texttt{\IfTrackedLanguageFileExists} command sets up the current tracked dialect with \texttt{\SetCurrentTrackedDialect{\texttt{(dialect)}}}, which enables the following commands that may be used within \texttt{\langle true part\rangle} or \texttt{\langle false part\rangle}: 

\begin{verbatim}
\TrackLangProvideResource{\texttt{CurrentTrackedTag}}
\TrackLangRequireResource{\texttt{CurrentTrackedTag}}
\end{verbatim}
\CurrentTrackedDialect

The dialect label.

\CurrentTrackedLanguage

If the dialect hasn't been detected, this command will be empty, otherwise it will expand to the root language label (which may be the same as the dialect label).

\CurrentTrackedRegion

If the dialect hasn't been detected, this command will be empty. If the dialect has been assigned an ISO 3166-1 code, \CurrentTrackedRegion will expand to that code, otherwise it will be empty.

\CurrentTrackedIsoCode

If the dialect hasn't been detected, this command will be empty. Otherwise it may be empty or it may expand to the ISO 639-1 or ISO 639-2 or ISO 639-3 code.

\CurrentTrackedDialectModifier

The dialect's modifier or empty if not set. (This is set but not used in the set of possible ⟨localeid⟩ values.)

\CurrentTrackedDialectVariant

The dialect's variant or empty if not set.

\CurrentTrackedDialectSubTag

The dialect's sub-language code or empty if not set.

\CurrentTrackedDialectAdditional

The dialect's additional information or empty if not set.

\CurrentTrackedLanguageTag

The dialect's language tag. Take care not to confuse this with \CurrentTrackedTag.

\CurrentTrackedDialectScript

The dialect's script. If the dialect doesn't have the script set, the default script for the language is used instead.
\IfTrackedLanguageFileExists behaves as follows:

- If no dialect with the given label has been detected, the condition evaluates to false and \CurrentTrackedTag is empty.

- If a dialect with the given label has been detected, then:
  - For each possible \texttt{localeid} in an ordered set of tags determined by the dialect label (see below), the first file matching \texttt{prefix}\texttt{localeid}\texttt{suffix} that's found on \TeX's path results in the condition evaluating to true and \CurrentTrackedTag is set to the current \texttt{localeid} in the set. The rest of the set of possible values of \texttt{localeid} is skipped.
  - If no file matching \texttt{prefix}\texttt{localeid}\texttt{suffix} is found on \TeX's path, then the condition evaluates to false and \CurrentTrackedTag is set to the final \texttt{localeid} in the set (the language label).

The ordered set of possible values of \texttt{localeid} is determined from the given dialect.

The ordering has changed in version 1.4, which now also includes the script and variant. This new ordering should typically make the more common combinations closer to the start of the search.

The possible values of \texttt{localeid} are listed below in the order of priority used by \IfTrackedLanguageFileExists. Note that the set may contain repetitions (for example, if the dialect label is the same as the root language label). If an item contains an element that hasn't been set (such as the ISO 639-3 code or a sub-language \texttt{sublang} or variant) then that item is skipped.

1. \texttt{localeid} is just the value of \CurrentTrackedLanguageTag.

2. \texttt{localeid} is just the dialect label.

3. \texttt{localeid} is \texttt{ISO 639-1}-\texttt{sublang}-\texttt{script}-\texttt{region}.

4. \texttt{localeid} is \texttt{ISO 639-1}\texttt{-script}-\texttt{region}.

5. \texttt{localeid} is \texttt{ISO 639-1}-\texttt{sublang}-\texttt{region} (if there's no script or if the script is the default for the given language). \texttt{ISO 639-1}-\texttt{region} (if there's no script or if the script is the default for the given language).

6. \texttt{localeid} is \texttt{ISO 639-1}-\texttt{sublang}-\texttt{script}.

7. \texttt{localeid} is \texttt{ISO 639-1}-\texttt{script}.

8. \texttt{localeid} is \texttt{ISO 639-1}-\texttt{sublang}.

9. \texttt{localeid} is just \texttt{ISO 639-1}.

10. \texttt{localeid} is \texttt{ISO 639-2}-\texttt{sublang}-\texttt{script}-\texttt{region}.
11. \( \text{localeid} \) is \( \langle \text{ISO 639-2} \rangle - \langle \text{script} \rangle - \langle \text{region} \rangle. \)

12. \( \text{localeid} \) is \( \langle \text{ISO 639-2} \rangle - \langle \text{sublang} \rangle - \langle \text{region} \rangle \) (if there's no script or if the script is the default for the given language). \( \langle \text{ISO 639-2} \rangle - \langle \text{region} \rangle \) (if there's no script or if the script is the default for the given language).

13. \( \text{localeid} \) is \( \langle \text{ISO 639-2} \rangle - \langle \text{sublang} \rangle - \langle \text{script} \rangle. \)

14. \( \text{localeid} \) is \( \langle \text{ISO 639-2} \rangle - \langle \text{script} \rangle. \)

15. \( \text{localeid} \) is \( \langle \text{ISO 639-2} \rangle - \langle \text{sublang} \rangle. \)

16. \( \text{localeid} \) is just \( \langle \text{ISO 639-2} \rangle. \)

17. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{sublang} \rangle - \langle \text{script} \rangle - \langle \text{region} \rangle. \)

18. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{script} \rangle - \langle \text{region} \rangle. \)

19. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{sublang} \rangle - \langle \text{script} \rangle - \langle \text{region} \rangle \) (if there's no script or if the script is the default for the given language). \( \langle \text{ISO 639-3} \rangle - \langle \text{region} \rangle \) (if there's no script or if the script is the default for the given language).

20. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{sublang} \rangle - \langle \text{script} \rangle. \)

21. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{script} \rangle. \)

22. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{sublang} \rangle. \)

23. \( \text{localeid} \) is just \( \langle \text{ISO 639-3} \rangle. \)

24. \( \text{localeid} \) is just \( \langle \text{region} \rangle. \)

25. \( \text{localeid} \) is \( \langle \text{ISO 639-1} \rangle - \langle \text{sublang} \rangle - \langle \text{variant} \rangle \) or \( \langle \text{ISO 639-1} \rangle - \langle \text{variant} \rangle \) if \( \langle \text{sublang} \rangle \) is missing.

26. \( \text{localeid} \) is \( \langle \text{ISO 639-2} \rangle - \langle \text{sublang} \rangle - \langle \text{variant} \rangle \) or \( \langle \text{ISO 639-2} \rangle - \langle \text{variant} \rangle \) if \( \langle \text{sublang} \rangle \) is missing.

27. \( \text{localeid} \) is \( \langle \text{ISO 639-3} \rangle - \langle \text{sublang} \rangle - \langle \text{variant} \rangle \) or \( \langle \text{ISO 639-3} \rangle - \langle \text{variant} \rangle \) if \( \langle \text{sublang} \rangle \) is missing.

28. \( \text{localeid} \) is just the value of \( \langle \text{CurrentTrackedLanguage} \rangle \) (the root language label).

For example (pre v1.3):

\begin{verbatim}
\AnyTrackedLanguages
\ForEachTrackedDialect{\ThisDialect}{%
\IfTrackedLanguageFileExists{\ThisDialect}{%
\input mypackage-\CurrentTrackedTag.ldf}% file found
\end{verbatim}
With version 1.3 onwards, this can be written more concisely as:
\AnyTrackedLanguages
\ForEachTrackedDialect{\ThisDialect}\%
{ try to load the language file for this dialect
  \TrackLangRequireDialect{mypackage}{\ThisDialect}\%
}\%
{ no languages detected so use defaults
}\%

which additionally enables the tracklang version 1.3 commands described below, such as \TrackLangRequireResource.
If, for example, \ThisDialect is british, then the file search will be in the order:

1. mypackage-en-GB.1df (language tag)
2. mypackage-british.1df (dialect label)
3. mypackage-en-Latn-GB.1df (639-1 language code, script, region)
4. mypackage-en-GB.1df (639-1 language code, region)
5. mypackage-en-Latn.1df (639-1 language code, script)
6. mypackage-en.1df (639-1 language code)
7. mypackage-eng-Latn-GB.1df (639-2 language code, script, region)
8. mypackage-eng-GB.1df (639-2 language code, region)
9. mypackage-eng-Latn.1df (639-2 language code, script)
10. mypackage-eng.1df (639-2 language code)
11. mypackage-GB.1df (region)
12. mypackage-english.1df (language label)

If, for example, \ThisDialect is naustrian, then the file search will be in the order:

1. mypackage-de-AT-1996.1df (language tag)
2. mypackage-naustrian.1df (dialect label)
3. mypackage-de-Latn-AT.1df (639-1 language code, script, region)
4. mypackage-de-AT.1df (639-1 language code, region)
5. mypackage-de-Latn.1df (639-1 language code, script)
6. mypackage-de.1df (639-1 language code)
7. mypackage-deu-Latn-AT.1df (639-2 language code, script, region)
8. mypackage-deu-AT.1df (639-2 language code, region)
9. mypackage-deu-Latn.1df (639-2 language code, script)
10. mypackage-deu.1df (639-2 language code)
11. mypackage-AT.1df (region)
12. mypackage-de-1996.1df (639-1 language code, variant)
13. mypackage-deu-1996.1df (639-2 language code, variant)
14. mypackage-german.1df (language label)

If, for example, `ThisDialect is francais`, then the file search will be in the order:

1. mypackage-fr.1df (language tag)
2. mypackage-francais.1df (dialect label)
3. mypackage-fr-Latn.1df (639-1 language code, script)
4. mypackage-fr.1df (639-1 language code)
5. mypackage-fra-Latn.1df (639-2 language code, script)
6. mypackage-french.1df (639-2 language code)
7. mypackage-french.1df (language)

This is because the predefined `francais` option has no region assigned to it. Be careful if the dialect label is the actual root language. For example, if `ThisDialect is french`, then the file search will be in the order:

1. mypackage-fr.1df (language tag)
2. mypackage-french.1df (dialect label)
3. mypackage-fr-Latn.1df (639-1 language code, script)
4. mypackage-fr.1df (639-1 language code)
5. mypackage-fra-Latn.1df (639-2 language code, script)
6. mypackage-fra.1df (639-2 language code)
7. mypackage-french.1df (language)

Note that the last try will always fail in this case since if the file exists, it will be found on the second try.

If the dialect label is identical to the root language label then it means that all associated information is the default for that language. For example, in the above case of french, the script is Latn and the region is unspecified. The root language label can therefore be used as the fallback in the event of no other match but for the specific case where the dialect is identical to the root language then all unnecessary file name checks can be skipped.

If you're only providing support for the root languages (pre v1.3):

\AnyTrackedLanguages
{|%\ForEachTrackedLanguage{\ThisLanguage}|%%
  |{% try to load the language file for this root language %}%
  |{\IfTrackedLanguageFileExists{\ThisLanguage}|%}%
  |{\mypackage-%|% file prefix |%}%
  |{(.ldf)|% file suffix |%}%
  |{\input mypackage-\CurrentTrackedTag.1df}|% file found
    |{\PackageWarning{mypackage}{No support for language \\ThisLanguage}}%
  |{\}%
|}%

{% no languages detected so use defaults %}

With version 1.3 onwards, this can be written more concisely as:

\AnyTrackedLanguages
{|%\ForEachTrackedLanguage{\ThisLanguage}|%%
  |{\TrackLangRequireDialect{mypackage}{\ThisLanguage}|%}%
|}%

{% no languages detected so use defaults %}

which additionally enables the commands described below. Note that in this case, if more than one dialect for the same language has been tracked, only the hooks for the last dialect for that language will be adjusted, so it's usually best to iterate over the dialects.

The following \TrackLang...Resource... commands may only be used in resource files that are loaded using \TrackLangRequireDialect. An error will occur if the file is input through some other method.

Within the resource file (pkgname)-(localeid).1df, you can identify the file using (new to version 1.3):

\TrackLangProvidesResource{\TrackLangProvidesResource{(tag)}}{(version info)}
If \ProvidesFile is defined (through the \LaTeX kernel) this is used, otherwise a simplified
generic alternative is used that's suitable for other \LaTeX formats.

The resource file can load another resource file \texttt{\langle pkgname \rangle - \langle localeid2 \rangle.1df}, using (new to
version 1.3):

\TrackLangRequireResource{\langle localeid2 \rangle}

For example, the dialect file \texttt{foo-en-GB.1df} might need to load the root language resource
file \texttt{foo-english.1df}:

\TrackLangProvidesResource{en-GB}
\TrackLangRequireResource{english}

If \texttt{foo-english.1df} is also identified with \TrackLangProvidesResource, this will ensure
that it's only loaded once.

If you require the resource file and want to perform \texttt{\langle code1 \rangle} if it's loaded at this point or
\texttt{\langle code2 \rangle} if it's already been loaded then you can use (new to version 1.3):

\TrackLangRequireResourceOrDo{\langle localeid2 \rangle}{\langle code1 \rangle}{\langle code2 \rangle}

If you want to load a resource file if it exists (without an error if it doesn't exist), then you
can use

\TrackLangRequestResource{\langle localeid2 \rangle}{\langle not found code \rangle}

If the file doesn't exist, \texttt{\langle not found code \rangle} is done.

\textbf{Note that these \...Resource commands are only permitted within the resource files. They are internally enabled through \TrackLangRequireDialect.}

The above restriction on the resource files loaded through \TrackLangRequireDialect, and the fact that it internally uses \IfTrackedLanguageFileExists, means that commands like \CurrentTrackedLanguage or \CurrentTrackedDialect may be used in those files.
This means that the name of the captions hook can be obtained through them. (Remember
that the file \texttt{foo-en-GB.1df} might have been loaded with, say, the british dialect or with
the synonymous UKenglish dialect or with a dialect label that doesn't have a corresponding
caption hook, such as enGELatin.)

The polyglossia package has caption hooks in the form \texttt{\captions\langle language \rangle} whereas babel has captions hooks in the form \texttt{\captions\langle dialect \rangle}. This leads to a rather cumbersome
set of conditionals:

\ifcsundef{\captions\CurrentTrackedLanguage}{%\ifcsundef{\captions\CurrentTrackedDialect}{\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\}
Note that the above has been simplified through the use of etoolbox commands, which isn't suitable for generic use. It also doesn't query the mapping from tracklang's dialect label to the closest matching babel dialect label.

Instead (new to version 1.3), tracklang provides a command to perform this set of conditionals using generic code:

\TrackLangAddToHook{\textit{code}}{\textit{type}}

where \textit{code} is the code to append to the \textit{type} hook. This always performs \textit{code} after testing for the hook in case the hook is undefined or has already been called (for example, \texttt{ngerman} uses \texttt{\captionsngerman} when the package is loaded, not at the start of the document).

Note that this command is enabled through \TrackLangRequireDialect so should only be used inside resource files.

Since captions is a commonly used hook type, there's a shortcut command provided:

\TrackLangAddToCaptions{\textit{code}}

This is equivalent to \TrackLangAddToHook{\textit{code}}{\textit{captions}}.

There may be some hooks, such as \texttt{\date\{label\}}, that need redefining rather than appending to. As from v1.4, there's an analogous command:

\TrackLangRedefHook{\textit{code}}{\textit{type}}

which will redefined the hook to do \textit{code}.

Note that no expansion is performed on \textit{code} when appending or redefining a hook.

### 4.1 Examples

The examples in this section illustrate the above commands.

#### 4.1.1 animals.sty

This example is for a trivial package called animals.sty that defines three textual commands: \texttt{\catname}, \texttt{\dogname} and \texttt{\ladybirdname}. The default values are: "cat", "dog" and "bishy-
barney-bee”\footnote{Thass Broad Norfolk, my bewties :-P}. The supported languages are defined in files with the prefix animals- and the suffix .1df. Here’s the code for animals.sty:

\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{animals}
\RequirePackage{tracklang}[2019/11/30] %v1.4

% Any undeclared options are language settings:
\DeclareOption*{%
  \TrackIfKnownLanguage{\CurrentOption}%
  \PackageInfo{animals}{Tracking language \CurrentOption')}% successful
  \% failed
  \PackageError{animals}{Unknown language specification \CurrentOption'}%  
  \hspace{1cm}(You need to supply either a known dialect label or a valid language tag)%
}%
\ProcessOptions

% Default definitions
\newcommand\catname{cat}
\newcommand\dogname{dog}
\newcommand\ladybirdname{bishy-barney-bee}

\AnyTrackedLanguages
\ForEachTrackedDialect{\this@dialect}{%
  \TrackLangRequireDialect{animals}{\this@dialect}%
}%
}{% no tracked languages, default already set up
}
\endinput

Here’s a Plain \LaTeX version that picks up the language from the locale environment variable:

\input tracklang
\TrackLangFromEnv

% Default definitions
\def\catname{cat}
\def\dogname{dog}
\def\ladybirdname{bishy-barney-bee}

\AnyTrackedLanguages
\ForEachTrackedDialect{\this@dialect}{%
  \TrackLangRequireDialect{animals}{\this@dialect}%
}%
}{% no tracked languages, default already set up
}
In the event that a user or supplementary package for some reason wants to load a resource file for a language that hasn’t been tracked, it might be worth providing a command for this purpose:

```latex
\newcommand*{\RequireAnimalsDialect}[1]{\TrackLangRequireDialect{animals}{#1}}
```

The loop can then be changed to:

```latex
\ForEachTrackedDialect{\this@dialect}{{\RequireAnimalsDialect{\this@dialect}}}
```

The `animals-english.ldf` file valid for both the Plain \TeX{} and \LaTeX{} formats contains:

```latex
\TrackLangProvidesResource{english}
\def\englishanimals{%
  \def\catname{cat}%
  \def\dognames{dog}%
  \def\ladybirdname{bishy-barney-bee}%
}
\TrackLangAddToCaptions{\englishanimals}
```

The `animals-en-GB.ldf` file contains:

```latex
\TrackLangProvidesResource{en-GB}
\TrackLangRequireResource{english}
\def\enGBanimals{%
  \englishanimals
  \def\ladybirdname{ladybird}%
}
\TrackLangAddToCaptions{\enGBanimals}
```

The `animals-en-US.ldf` file contains:

```latex
\TrackLangProvidesResource{en-US}
\TrackLangRequireResource{english}
\def\enUSanimals{%
  \englishanimals
  \def\ladybirdname{ladybug}%
}
\TrackLangAddToCaptions{\enUSanimals}
```

Here’s a German version in the file `animals-german.ldf`:

```latex
\TrackLangProvidesResource{german}
\def\germananimals{%
  \def\catname{Katze}%
  \def\dognames{Hund}%
  \def\ladybirdname{Marienkäfer}%
}
\TrackLangAddToCaptions{\germananimals}
```
This means that if babel or polyglossia are loaded, the redefinitions are automatically performed whenever the language is changed, but if there’s no caption mechanism the user can switch the fixed names using the \...animals commands.

Here’s an example \LaTeX{} document that doesn’t have any caption hooks:

\documentclass[english,german,a4paper]{article}
\usepackage{animals}
\begin{document}
\englishanimals
\catname.
\dogname.
\ladybirdname.
\germananimals
\catname.
\dogname.
\ladybirdname.
\end{document}

Here’s a babel example document:

\documentclass[american,german,british,a4paper]{article}
\usepackage{babel}
\usepackage{animals}
\begin{document}
\selectlanguage{american}
\catname.
\dogname.
\ladybirdname.
\selectlanguage{german}
\catname.
\dogname.
\ladybirdname.
\selectlanguage{british}
\catname.
\dogname.
\ladybirdname.
\end{document}

There is some redundancy with the above resource files. Consider the babel example above. The american dialect is the first option, so in that case animals-en-US.ldf is loaded followed by animals-english.ldf. This means that the \captionsamerican hook now includes

\englishanimals
\enUSanimals
Since \enUSanimals includes \englishanimals, there is redundant code. However, when the british dialect is processed, this loads the file animals-en-GB.1df but not the file animals-english.1df (since it's already been loaded). This means that \captionsbritish contains \enGBanimals but not \englishanimals.

If this redundancy is an issue (for example, there are so many redefinitions needed that it significantly slows the document build process), then it can be addressed with the following modifications. The animals-en-GB.1df file is now:

\TrackLangProvidesResource{en-GB}
\def\enGBanimals{\englishanimals
  \def\ladybirdname{ladybird}}

\TrackLangRequireResourceOrDo{english}
{\TrackLangAddToCaptions{\ladybirdname{ladybird}}}
{
  \TrackLangAddToCaptions{\enGBanimals}}

The animals-en-US.1df file is now:

\TrackLangProvidesResource{en-US}
\providecommand*{\enUSanimals}{\englishanimals
  \renewcommand*{\ladybirdname}{ladybug}}

\TrackLangRequireResourceOrDo{english}
{\TrackLangAddToCaptions{\ladybirdname{ladybird}}}
{
  \TrackLangAddToCaptions{\enUSanimals}{\enUSanimals}}

This means that the document that has the dialects listed in the order american, british now has

\englishanimals
\def\ladybirdname{ladybird}

in the \captionsbritish hook and just \enUSanimals in the \captionsamerican hook, which has removed most of the redundancy.

Note that polyglossia has a \captionsenglish hook but not \captionsamerican or \captionsbritish, so this code doesn't allow for switching between variants of the same language with polyglossia.
4.1.2 regions.sty

Earlier, I mentioned the search order for `\IfTrackedLanguageFileExists` where, for example, the dialect is `british`, the file search (v1.4+) will be:

1. mypackage-british.ldf
2. mypackage-en-GB.ldf
3. mypackage-en.ldf
4. mypackage-eng-GB.ldf
5. mypackage-eng.ldf
6. mypackage-GB.ldf
7. mypackage-english.ldf

You may have wondered why `mypackage-GB.ldf` is included in the search given that some countries have multiple official languages, which means that the country code on its own may not indicate the language.

The reason for including just the country code as the `<localeid>` in the file search is to allow for region rather than language dependent settings. For example, suppose I want to write a package that needs to know whether to use imperial or metric measurements in the document, but I also want to provide multilingual support. The language alone won’t tell me whether to use imperial or metric (for example, the US uses imperial and the UK uses metric for most product attributes). I could provide .ldf files for every language and region combination, but this would result in a lot redundancy.

`\TrackLangRequireDialect` has an optional argument for adjusting the way the resource files are loaded. Suppose I have `<localeid>` .ldf resource files, then

```
\TrackLangRequireDialect{regions}{\this@dialect}
```

loads the resource file for the dialect given by `\this@dialect` using

```
\TrackLangRequireResource{\CurrentTrackedTag}
```

I can use the optional argument to also load the resource file for the root language as well:

```
\newcommand*{\RequireRegionsDialect}[1]{%
  \TrackLangRequireDialect
  \TrackLangRequireResource{\CurrentTrackedTag}%
  \TrackLangRequireResource{\CurrentTrackedLanguage}%
  \regions(#1)%
%}
```

Now the dialect `british` can load both `regions-GB.ldf` and `regions-english.ldf`.

The example package (regions.sty) below illustrates this.

```
\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{regions}
```

48
There are separate .ldf files for region and language. First are the regions.

- **regions-BE.1df** (Belgium):

  \TrackLangProvidesResource(BE)
  \providecommand*{\BEunits}{
    \renewcommand*{\weightunit}{kg}\n    \renewcommand*{\lengthunit}{mm}\n    \renewcommand*{\currencyunit}{EUR}\n  }\n  \TrackLangAddToCaptions{\BEunits}

- **regions-CA.1df** (Canada):

  \TrackLangProvidesResource(CA)
  \providecommand*{\CAunits}{
    \renewcommand*{\weightunit}{kg}\n    \renewcommand*{\lengthunit}{mm}\n    \renewcommand*{\currencyunit}{CAD}\n  }\n  \TrackLangAddToCaptions{\CAunits}

- **regions-GB.1df** (Great Britain):
Now the language files:

- **regions-dutch.ldr**:  
  \TrackLangProvidesResource(dutch)
  \providecommand*{\dutchnames}{%
    \renewcommand*{\unitname}{meeteenheden}%
  }
  \TrackLangAddToCaptions{\dutchnames}

- **regions-english.ldr**:  
  \TrackLangProvidesResource(english)
  \providecommand*{\englishnames}{%
    \renewcommand*{\unitname}{units}%
  }
  \TrackLangAddToCaptions{\englishnames}

- **regions-french.ldr**:  
  \TrackLangProvidesResource(french)
  \providecommand*{\frenchnames}{%
    \renewcommand*{\unitname}{unit\'es}%
  }
  \TrackLangAddToCaptions{\frenchnames}
regions-german.ldf:

\TrackLangProvidesResource(french)
\providecommand*{\germannames}{%
  \renewcommand*{\unitname}{Ma\ss einheiten}%
}
\TrackLangAddToCaptions{\germannames}

Here's an example document that uses this package:
\documentclass[canadien]{article}
\usepackage{regions}
\begin{document}
\unitname: \weightunit, \lengthunit, \currencyunit.
\end{document}
\end{document}

This works because the \texttt{localeid} search looks for the country code before the root language label. However, this will fail if the dialect label is the same as a root language label that has an associated territory, marked with \textsuperscript{†} in table 1.2, as then it will be picked up before the country code.

In the above example, regions-CA.ldf is matched rather than regions-french.ldf, so regions-CA.ldf is loaded by

\TrackLangRequireResource{\CurrentTrackedTag}

After this, the language file regions-french.ldf is then loaded:

\TrackLangRequireResource{\CurrentTrackedLanguage}

This assumes that there's a country code .ldf file available. This example needs a little modification to use default units in case the region is missing:

\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{regions}
% Pass all options to tracklang:
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{tracklang}}
% ProcessOptions
\RequirePackage{tracklang}
\newcommand*{\weightunit}{kg}
\newcommand*{\lengthunit}{mm}
\newcommand*{\currencyunit}{EUR}
\newcommand*{\defaultunits}{%
  \renewcommand*{\weightunit}{kg}%
  \renewcommand*{\lengthunit}{mm}%
  \renewcommand*{\currencyunit}{EUR}%
}
\newcommand*{\RequireRegionsDialect}{% \\TrackLangRequireDialect \\
{\TrackLangRequireResource{\CurrentTrackedTag}}% \ifx\CurrentTrackedTag\CurrentTrackedLanguage \\
{\TrackLangAddToCaptions{\defaultunits}}% \else \\
{\TrackLangRequireResource{\CurrentTrackedLanguage}}% \fi \\
{regions}{#1}}% \
\AnyTrackedLanguages 
{% 
{\ForEachTrackedDialect{\this@dialect}{% 
{\RequireRegionsDialect{\this@dialect}}% }% 
}% \no \text{tracked languages, default already set up } 
\endinput 

Note that we still have a problem for dialect labels that are identical to root language labels with an associated territory (such as manx). This case can be checked with the following adjustment:

\newcommand*{\RequireRegionsDialect}{% \\TrackLangRequireDialect \\
{\TrackLangRequireResource{\CurrentTrackedTag}}% \ifx\CurrentTrackedTag\CurrentTrackedLanguage \\
{\ifx\CurrentTrackedRegion{\empty} \\
{\TrackLangAddToCaptions{\defaultunits}}% \else \\
{\TrackLangRequireResource{\CurrentTrackedRegion}}% \fi \\
\else \\
{\TrackLangRequireResource{\CurrentTrackedLanguage}}% \fi \\
{regions}{#1}}% 

In the case where both the dialect and root language label are manx with the resource files regions-manx.ldf and regions-IM.ldf, then \CurrentTrackedTag will be manx (the dialect label) so regions-manx.ldf will be loaded with:

\TrackLangRequireResource{\CurrentTrackedTag} 

In this case \CurrentTrackedRegion is IM (that is, it's not empty) so then regions-IM.ldf will be loaded with:

\TrackLangRequireResource{\CurrentTrackedRegion} 

Here's another document that sets up dialects with tracklang labels that aren't recognised by babel. This means that there's no corresponding \captions... hook for either the dialect
label or the root language label, so mappings need to be defined from the tracklang dialect label to the matching babel dialect label.

\documentclass{article}
\usepackage{tracklang}
\TrackLanguageTag{de-US-1996}
\SetTrackedDialectLabelMap{\TrackLangLastTrackedDialect}{ngerman}
\TrackLanguageTag{en-MT}
\SetTrackedDialectLabelMap{\TrackLangLastTrackedDialect}{UKenglish}
\usepackage[main=ngerman,UKenglish]{babel}
\usepackage{regions}
\begin{document}
\selectlanguage{ngerman}
\unitname: \weightunit, \lengthunit, \currencyunit.
\selectlanguage{UKenglish}
\unitname: \weightunit, \lengthunit, \currencyunit.
\end{document}

This produces:

Maßeinheiten: lb, in, USD.

units: kg, mm, EUR.

Compare this with:

\documentclass{article}
\usepackage[main=ngerman,UKenglish]{babel}
\usepackage{regions}
\begin{document}
\selectlanguage{ngerman}
\unitname: \weightunit, \lengthunit, \currencyunit.
\selectlanguage{UKenglish}
\unitname: \weightunit, \lengthunit, \currencyunit.
\end{document}

which produces:

Maßeinheiten: kg, mm, EUR.

units: kg, mm, GBP.

Note that these mappings aren't needed if babel is loaded with the root language labels instead. For example:
\documentclass{article}
\usepackage{tracklang}
\TrackLanguageTag{de-US-1996}
\SetTrackedDialectLabelMap{\TrackLangLastTrackedDialect}{ngerman}
\TrackLanguageTag{en-MT}
\usepackage[main=ngerman,english]{babel}
\usepackage{regions2}
\begin{document}
\selectlanguage{ngerman}
\unitname: \weightunit, \lengthunit, \currencyunit.
\selectlanguage{english}
\unitname: \weightunit, \lengthunit, \currencyunit.
\end{document}

No mapping is required for the en-MT locale as it can pick up \captionsenglish when \TrackLangAddToHook (used by \TrackLangAddToCaptions) queries the root language label after failing to find the language hook from the dialect label.

Some of the predefined tracklang dialects come with a mapping to the closest matching babel dialect label. For example, the option ngermanDE listed in table 1.3 automatically provides a mapping to ngerman. Since a tracklang dialect label can only map to one babel label, this can be problematic for synonymous labels such as british/UKenglish or american/USenglish. The default mappings used by tracklang are shown in table 1.3.
5 Adding Support for Language Tracking

If you are writing a package that sets up the document languages (rather than a package that provides multilingual support if the user has already loaded a language package) then you can load tracklang and use the commands below to help other packages track your provided languages. (See also: Integrating tracklang.tex into Language Packages.)

The tracklang package can be loaded using

\input tracklang

or (\LaTeX only)

\RequirePackage{tracklang}

When using \LaTeX, there’s a difference between the two. The first case prevents tracklang from picking up the document class options but skips the check for known language packages. This check is redundant since your package is the language package, so you need to decide is whether or not to allow the user to set up the localisation information through the document class options.

If you prefer \RequirePackage over \input but you want to make tracklang.sty skip the check for known language packages then (as from v1.3.8) define the pre-language package check hook as follows:

\providecommand\@tracklang@prelangpkgcheck@hook{\endinput}
\RequirePackage{tracklang} [2019/10/06]

This will still pick up languages supplied through the document class options.

If you just use \input, there’s a test at the start of tracklang.tex to determine if it’s already been loaded, so you don’t need to worry if the document has already loaded it.

To integrate tracklang into your language package, you need to consider the following steps:

1. Does tracklang define your supported ISO 15924 language scripts in the tracklang-scripts.tex file?
   - If yes, then skip this step. Otherwise create a file with the relevant \TrackLangScriptMap command for each unknown script and identify this new file with \TrackLangAddExtraScript (see Section 5.3). This usually won’t be necessary unless you have a custom script or a child script (a script that’s a sub-category of another script).

2. Does tracklang recognise the root language?
   - If yes, then skip this step.
If your package is setting up a language that tracklang doesn't recognise then you will need to define the root language using `\TrackLangNewLanguage` (see Section 5.5).

This usually won't be the case as tracklang should support all languages that have an official ISO 639-1 alpha-2 code.

If you simply have a different label from tracklang identifying the root language, then you can just set up your label as a dialect using `\TrackLangProvidePredefinedDialect` (see Section 5.6).

3. Does tracklang define the relevant ISO 3166 region codes in the `tracklang-region-codes.tex` file?

If yes, then skip this step. Otherwise create a file with the relevant `\TrackLangRegionMap` command for each new region and identify this new file with `\TrackLangAddExtraRegionFile` (see Section 5.4). This usually won't be necessary as tracklang should recognise all countries that have an alpha-2 region code, but you may require it if you need a broader region, such as EU.

4. Do you want to define some convenient dialect labels that can be used with `\TrackPredefinedDialect`?

If no, then skip this step. Otherwise you can use `\TrackLangProvidePredefinedLanguage` for root languages and `\TrackLangProvidePredefinedDialect` for dialects with additional information, such as a region, sub-language or script (see Section 5.6).

5. In your language initialisation code, add the tracklang code to track the particular dialect (for example, use `\TrackPredefinedDialect` for recognised dialect labels or use the `\AddTracked...` set of commands). See Section 5.1.

6. In your language selection code (such as `\selectlanguage`), add `\SetCurrentTrackedDialect{〈label〉}` to allow the document author to easily query the current localisation settings (such as the region). See Section 5.2.

### 5.1 Initialising a New Language or Dialect

When the user requests a particular dialect through your language package, you can notify tracklang of this choice using

```
\TrackPredefinedDialect{〈dialect〉}
```

provided the dialect label is recognised by tracklang (all those listed in tables 1.1, 1.2 and 1.3). If there's no matching dialect predefined by tracklang, you can just use `\TrackLocale` or `\TrackLanguageTag` (described in Section 3) with the appropriate ISO codes if you're not providing caption hooks.

If you are providing a captions hook mechanism in the form `\captions{dialect}`, then if `〈dialect〉` doesn't match the corresponding tracklang dialect label, you can provide a mapping using `\SetTrackedDialectLabelMap`, described below.
5.2 Switching Language or Dialect

When the document author switches to a different language or dialect, the current localisation information can be set with:

```latex
\SetCurrentTrackedDialect{\langle dialect \rangle}
```

where \(\langle dialect \rangle\) may be the tracklang dialect label, or the mapped label previously set through \SetTrackLanguage{\langle dialect \rangle}, described below, or the language label (in which case the last dialect to be tracked with that root language will be assumed).

This will make the following commands available which may be of use to other packages:

- \CurrentTrackLanguage The dialect label recognised by tracklang (which may not be the same as \(\langle dialect \rangle\)).
- \CurrentTrackLanguageThe root language label used by tracklang.
- \CurrentTrackLanguage The dialect modifier.
- \CurrentTrackLanguage The dialect variant.
- \CurrentTrackLanguage The dialect script. Note that if tracklang-scripts is also loaded, this allows the script direction to be accessed using

\TrackLanguageScriptAlphaToDir{\CurrentTrackLanguageScript}

See Section 6.5 for further details.

- \CurrentTrackLanguage The dialect sub-language code.
- \CurrentTrackLanguage The dialect's additional information.
- \CurrentTrackLanguage The dialect's root language ISO code. (The first found in the sequence 639-1, 639-2, 639-3.)
- \CurrentTrackLanguage The dialect's ISO 3166-1 region code.
- \CurrentTrackLanguage The dialect's language tag.

(Without this automated use of \SetCurrentTrackLanguage, the same information can be picked up using commands like \CurrentTrackLanguageScript, but that's less convenient, especially if \CurrentTrackLanguage needs to be converted to \(\langle dialect \rangle\). See the accompanying sample file sample-setlang.tex for an example.)
5.3 Defining New Scripts

The `tracklang-scripts.tex` file isn't automatically loaded, but if it is then, as from v1.4, it contains a hook at the end of the file that can be used to load additional files that define supplementary scripts. This entails creating a file called, say, `mypackage-scripts.tex` that contains:

```
\TrackLangScriptMap{\alpha\text{code}}{\text{numeric\ code}}{\text{name}}{\text{direction}}{
\text{parent}}
```

The first argument (**alpha code**) is the four-letter ISO 15924 code (such as `Latn`), the second argument is the numeric code (such as 215), the third argument (**name**) is the name of the script (such as Latin), the fourth argument is the direction (such as LR for left-to-right) and the final argument is the parent script (leave blank if there's no parent). Note that this command will override any previous mapping for those codes. No check is performed to determine if they have already been defined.

The supplementary file should be identified with:

```
\TrackLangAddExtraScriptFile{\text{filename}}
```

5.4 Defining New Regions

The `tracklang-region-codes.tex` file isn't automatically loaded, but if it is then, as from v1.4, it contains a hook at the end of the file that can be used to load additional files that define supplementary regions. This entails creating a file called, say, `mypackage-regions.tex` that contains:

```
\TrackLangRegionMap{\text{numeric\ code}}{\text{alpha-2\ code}}{\text{alpha-3\ code}}
```

where the first argument is the numeric region code (such as 826), the second argument is the alpha-2 region code (such as GB) and the third argument is the alpha-3 region code (such as GBR). Note that this command will override any previous mapping for those codes. No check is performed to determine if they have already been defined.

The supplementary file should be identified with:

```
\TrackLangAddExtraRegionFile{\text{filename}}
```

5.5 Defining a New Language

(New to version 1.3.) If the root language isn't recognised by tracklang (not listed in table 1.2), then it can be defined (but not tracked at this point) using:
\TrackLangNewLanguage{\langle language name \rangle}{\langle 639-1 code \rangle}{\langle 639-2 (T) \rangle}{\langle 639-2 (B) \rangle}{\langle 639-3 \rangle}{\langle 3166-1 \rangle}{\langle default script \rangle}

where \langle language name \rangle is the root language name, \langle 639-1 code \rangle is the ISO 639-1 code for that language (may be empty if there isn't one), \langle 639-2 (T) \rangle is the ISO 639-2 (T) code for that language (may be empty if there isn't one), \langle 639-2 (B) \rangle is the ISO 639-2 (B) code for that language (may be empty if it's the same as \langle 639-2 (T) \rangle), \langle 639-3 \rangle is the ISO 639-3 code for that language (empty if the same as the 639-2 code), \langle 3166-1 \rangle is the territory ISO code for languages that are only spoken in one territory (should be empty if the language is spoken in multiple territories), and \langle default script \rangle is the default script (empty if disputed or varies according to region).

You can then track this language using \AddTrackedDialect for dialects or, if no regional variant is needed, you can instead use:

\AddTrackedLanguage{\langle root language label \rangle}

This is equivalent to \AddTrackedDialect{\langle root language label \rangle}{\langle root language label \rangle}.

### 5.6 Defining New tracklang Labels

A dialect label may be predefined with associated information that allows that particular combination to be easily tracked with \TrackPredefinedDialect. In the case of a dialect label that only requires the information provided in \TrackLangNewLanguage you can use:

\TrackLangProvidePredefinedLanguage{\langle label \rangle}

where \langle label \rangle corresponds to the language label used in \TrackLangNewLanguage. This allows \TrackPredefinedDialect{\langle label \rangle} to not only track the root language but also the associated ISO codes.

If the dialect label doesn't match the root language label then use:

\TrackLangProvidePredefinedDialect{\langle dialect \rangle}{\langle language \rangle}{\langle region \rangle}{\langle modifier \rangle}{\langle variant \rangle}{\langle map \rangle}{\langle script \rangle}

where \langle dialect \rangle is the new tracklang dialect label, \langle language \rangle is the tracklang root language label, \langle region \rangle is the ISO 3166-1 region code (may be empty), \langle modifier \rangle is the modifier (may be empty), \langle variant \rangle is the variant information (may be empty), \langle map \rangle is your package's language label that corresponds to the tracklang dialect label supplied in the first argument (may be empty if identical), and \langle script \rangle is the ISO 15914 alpha-4 script code (may be empty if it's the same as the default script for the root language).

For compatibility with pre version 1.3, if the dialect isn't predefined by tracklang, then you can use:
where \textit{(root language label)} is the label for the dialect's root language (table 1.2) and \textit{(dialect)} matches the captions hook. If the dialect is already in the tracked dialect list, it won't be added again. If the root language is already in the tracked language list, it won't be added again. As from version 1.3 this additionally defines:

\textbf{TrackLangLastTrackedDialect} \addTrackedDialect{}

\textbf{SetTrackedDialectLabelMap} \setTrackedDialectLabelMap{}

\addTrackedLanguageIsoCodes{}

\setTrackedDialectModifier{}

As from v1.3, you can also provide a modifier for a given dialect using:
Note that no sanitization is performed on \langle value \rangle when the modifier is set explicitly through \SetTrackedDialectModifier, since it's assumed that any package that specifically sets the modifier in this way is using a sensible labelling system. If the modifier is obtained through commands like \TrackLocale, then the modifier is sanitized as the value may have been obtained from the operating system and there's no guarantee that it won't contain problematic characters.

The modifier is typically obtained by parsing locale information in POSIX format.

\langle language \rangle[\langle territory \rangle][\langle codeset \rangle][@\langle modifier \rangle]

whereas the variant is typically obtained by parsing the language tag.

The information provided in the commands below (such as the script) are typically obtained by parsing the language tag. For example, with Serbian in the Latin alphabet the modifier would be latin whereas the script would be Latn:

\AddTrackedDialect{serbianlatin}{serbian}
\AddTrackedLanguageIsoCodes{serbian}
\SetTrackedDialectModifier{serbianlatin}{latin}
\SetTrackedDialectScript{serbianlatin}{Latn}

As from v1.3, you can provide a script (for example, “Latn” or “Cyrl”) using:

\SetTrackedDialectScript\{\langle dialect \rangle\}\{\langle value \rangle\}

where \langle dialect \rangle is the dialect label and \langle value \rangle is the four letter script identifier. For example:

\AddTrackedDialect{serbiancyrl}{serbian}
\AddTrackedLanguageIsoCodes{serbian}
\SetTrackedDialectScript{serbiancyrl}{Cyrl}

As from v1.3, you can provide a variant for a given dialect using:

\SetTrackedDialectVariant\{\langle dialect \rangle\}\{\langle value \rangle\}

For example:

\AddTrackedDialect{german1901}{german}
\SetTrackedDialectVariant{german1901}{1901}

As from v1.3, you can also provide a sub-language using:

\SetTrackedDialectSubLang\{\langle dialect \rangle\}\{\langle value \rangle\}

where \langle dialect \rangle is the dialect label and \langle value \rangle is the code. For example:

\AddTrackedDialect{mandarin}{chinese}
\AddTrackedLanguageIsoCodes{chinese}
\SetTrackedDialectSubLang{mandarin}{cmn}
\AddTrackedIsoLanguage{639-3}{cmn}{mandarin}
As from v1.3, you can also provide additional information using:

\SetTrackedDialectAdditional{(dialect)}{(value)}

where (dialect) is the dialect label and (value) is the additional information.

5.7 Example

Suppose I want to create a language package alien.sty that defines the martian language with regional dialects lowermartian and uppermartian. First, let's suppose that tracklang recognises the root language martian:

\ProvidesPackage{alien}
\input{tracklang}% v1.3
\DeclareOption{martian}{% 
  TrackPredefinedDialect{martian}
} \DeclareOption{lowermartian}{% 
  AddTrackedDialect{lowermartian}{martian} 
  AddTrackedIsoLanguage{3166-1}{YY}{lowermartian} 
  % other attributes such as 
  % \SetTrackedDialectVariant{lowermartian}{...}
} \DeclareOption{uppermartian}{% 
  AddTrackedDialect{uppermartian}{martian} 
  AddTrackedIsoLanguage{3166-1}{XX}{uppermartian} 
  % other attributes such as 
  % \SetTrackedDialectVariant{uppermartian}{...}
}
\ProcessOptions
\newcommand*{\selectlanguage}[1]{% 
  \def\languagename{#1}% 
  % other stuff 
  \SetCurrentTrackedDialect{#1}%
}
\AnyTrackedLanguages
{
  %ForEachTrackedDialect{\thisdialect}
  %\TrackLangRequireDialect(alien){\thisdialect}
}

The caption commands and language set up are in the files alien-〈localeid〉.ldf as in the examples from Section 4.1. This allows for the user having already loaded tracklang before alien and used \TrackLangFromEnv to pick up the locale from the operating system's environment variables. (For example, they may have LANG set to xx_YY.)
The resource files may need to set the mapping between the tracklang dialect label and the alien dialect label. For example, in `alien-xx-YY.ldf`:

\TrackLangProvidesResource{xx-YY}
\TrackLangRequireResource{martian} % load common elements
\newcommand{\captionslowermartian}{\captionsmartian}
\def\contentsname{X'flurp} % regional variation
\SetTrackedDialectLabelMap{\CurrentTrackedDialect}{lowermartian}

Now let's consider the case where tracklang doesn't know about the martian language. In this case the user can't track the dialect until the root language has been defined, so the user can't use `\TrackLangFromEnv` before using the alien package.

With tracklang v1.3. The new root language can be defined with a minor adjustment to the above code:

\ProvidesPackage{alien}
\input{tracklang} % needs v1.3
\TrackLangIfKnownLang{martian}
{} % tracklang already knows about the martian language
{} % tracklang doesn't know about the martian language, so define it
% with ISO 639-1 (xx) and ISO 639-2 (xxx) codes:
\TrackLangNewLanguage{martian}{xx}{xxx}{\{}\{}{Latn}

The rest is as before.

Now other package writers who want to provide support for the Martian dialects can easily detect which language options the user requested through my package, *without needing to know anything about my alien package.*
6 The Code

6.1 LaTeX Code (tracklang.sty)

To ensure maximum portability this file only uses \LaTeX\ kernel commands, rather than using more convenient commands provided by packages such as etoolbox.

\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{tracklang}[2020/06/30 v1.5 (NLCT) Track Languages]

\@tracklang@declareoption
\@tracklang@declareoption
\@tracklang@declareoption
\providecommand*{\@tracklang@declareoption}[1]{% 
  \DeclareOption{#1}{\TrackPredefinedDialect{#1}}%
}\)

Load generic code:
\input{tracklang}

There are no other options as this package will typically be loaded using \RequirePackage by a package. Explicitly adding an option at that point might create a package option clash. The declared package options are all the possible language names that might be passed as a document class option. (Also, adding any non-language options here will interfere with \@tracklang@declaredoptions.)

\@tracklang@declaredoptions
\@tracklang@declaredoptions
\@tracklang@declaredoptions
\ProcessOptions

Unset \@tracklang@declareoption:
\let\@tracklang@declareoption\@gobble

In the event that the language hasn’t been supplied through the package options (or through the class options, which the package options should process provided the document class has used the standard option declarations) we need to check if any of the known language packages have been loaded. This is a bit risky as it relies on the packages not changing their internal language macros. It would be easier if all the language packages could provide a reliable user interface to determine which languages (and variants) have been loaded.

In the event that any of the language packages choose to load this package and use tracklang.tex’s commands to identify the tracked languages and regions, then they can first define \@tracklang@prelangpkgcheck@hook to do \endinput which will skip the checks.

\csname @tracklang@prelangpkgcheck@hook\endcsname
\ifx\@tracklang@languages\empty
First try babel. If babel has been loaded, the languages are stored in `\bb1@loaded`, so check if this command has been defined, and if it has add those languages.

```latex
@ifundefined{bb1@loaded}%
%
If translator has been loaded, the languages are stored in `\trans@languages`

```latex
@ifundefined{trans@languages}%
%
Has ngerman been loaded?

```latex
@ifpackageloaded{ngerman}%
{%
 @tracklang@add@ngerman
%
%
Has german been loaded?

```latex
@ifpackageloaded{german}%
{%
 @tracklang@add@german
%
%
Has polyglossia been loaded?

```latex
@ifpackageloaded{polyglossia}%
%
polyglossia sets `\lang@loaded` for each loaded language, so check this for all known languages. I don’t know how to consistently check for variants. (Conditionals such as `\if@british@locale` are set immediately with `\setotherlanguage` but are deferred to the start of the document with `\setmainlanguage`, which is too late for `tracklang`) Script names seem to be stored in `\xpg:scripttag@\langle language\rangle` but again this doesn’t seem to be set for the main language until the start of the document. New versions of polyglossia store the list of loaded languages in `\xpg@loaded`, so check if this is defined.

```latex
@ifundefined{xpg@loaded}%
%
\xpg@loaded isn’t defined, so iterate over known options and check if the language has been loaded.

```latex
PackageInfo{tracklang}{polyglossia loaded but
string\xpg@loaded\space not defined. Will attempt
to track known languages.}%
\@for\this@language:=\@tracklang@declaredoptions\do{%
@ifundefined{\this@language\loaded}%
{}%
@nameuse{\tracklang@add@\this@language}%
}%
\@for\this@language:=\xpg@loaded\do{%
@ifundefined{\tracklang@add@\this@language}%
PackageWarning{tracklang}%
{Adding unknown polyglossia language `
\this@language'}%
\AddTrackedLanguage{\this@language}%
@nameuse{\tracklang@add@\this@language}%
```
None of the known packages have been loaded, so do nothing in case another package wants to load this one before setting up the language options. However, if at this point babel has been loaded, then it’s an older version that hasn’t defined \bbl@loaded so check for this.

\def\PackageInfo{tracklang}{babel loaded but \string\bbl@loaded\space not defined. Will attempt to track known languages.}%
\if\this@language:-\tracklang@declareoptions\do{%
  \@ifundefined{\captions\this@language}\{%
    \PackageError{tracklang}{this@language}{\@nameuse{\tracklang@add@\this@language}}\}%
  \%}
}\%
%
%
}
%
\%
%
%
}%
%
%
%

Add from translator. If translator has been loaded, the language names are stored in \trans@languages but these are labels used by translator, so some mapping is required.

\let\tracklang@add@Acadian@tracklang@add@Acadian
\let\tracklang@add@French@tracklang@add@French
\let\tracklang@add@Afrikaans@tracklang@add@Afrikaans
\let\tracklang@add@AmericanEnglish@tracklang@add@AmericanEnglish
\let\tracklang@add@Austrian@tracklang@add@Austrian
\@namedef{\tracklang@add@Austrian1997}{\tracklang@add@Austrian}
\let\tracklang@add@Bahasa@tracklang@add@Bahasa
\let\tracklang@add@Basque@tracklang@add@Basque
\let\tracklang@add@Brazilian@tracklang@add@Brazilian
\let\tracklang@add@Portuguese@tracklang@add@Portuguese
\let\tracklang@add@Breton@tracklang@add@Breton
\let\tracklang@add@BritishEnglish@tracklang@add@BritishEnglish
\let\tracklang@add@Bulgarian@tracklang@add@Bulgarian
\let\tracklang@add@Canadian@tracklang@add@Canadian
\let\tracklang@add@Catalan@tracklang@add@Catalan
\let\tracklang@add@Croatian@tracklang@add@Croatian
\let\tracklang@add@Czech@tracklang@add@Czech
\let\tracklang@add@Danish@tracklang@add@Danish
\let\tracklang@add@Dutch@tracklang@add@Dutch
\let\tracklang@add@English@tracklang@add@English
\let\tracklang@add@Esperanto@tracklang@add@Esperanto
\let\tracklang@add@Estonian@tracklang@add@Estonian
\let\tracklang@add@Finnish@tracklang@add@Finnish
\let\tracklang@add@French@tracklang@add@French
\let\tracklang@add@Galician@tracklang@add@Galician
\let\tracklang@add@German@tracklang@add@German
\@namedef{\tracklang@add@German1997}{\tracklang@add@German}
\let\tracklang@add@Greek@tracklang@add@Greek
\let\tracklang@add@Polutionico@tracklang@add@Polutionico
\let\tracklang@add@Hebrew@tracklang@add@Hebrew
Now iterate through the declared languages:
\for\this@language:=\trans@languages\do{\
  \ifundefined{\tracklang@add@\this@language}{\PackageWarning{tracklang}{Adding unknown babel language \this@language}}{\nameuse{\tracklang@add@\this@language}}
}

If babel has been loaded with serbian, then the script needs to be set to Latn. (The Cyrillic script is provided with serbianc.)
\if\captionsserbian\undefined
  \else
    \SetTrackedDialectScript{serbian}{Latn}
  \fi

End of check for language packages
\f i

6.2 Generic Code (tracklang.tex)

Does the category code of @ need changing?
First check if this file has already been loaded:
\ifx\@tracklang@languages\undefined
\else
\@tracklang@restore@at
\expandafter\endinput
\fi

Version info.
\expandafter\def\csname ver@tracklang.tex\endcsname{%
2020/06/30 v1.5 (NLCT) Track Languages Generic Code}

Define a long command for determining the existence of a control sequence by its name.
(\relax is considered undefined.)
\@tracklang@ifundef
\long\def\@tracklang@ifundef#1#2#3{%

\@tracklang@info
  Allow user to switch information messages on or off.
\@tracklang@verbose
  Allow user to switch verbose (debugging) information messages on or off. Note that verbose
  information will be off regardless of this switch if the info switch is off.
\@tracklang@debug
  Allow user to switch debugging messages on or off.
\@tracklang@trace
  Allow user to switch tracing messages on or off.
Provide a way to query the environment variables LC_ALL or LANG to determine the region and language. The result is stored in \TrackLangEnv if it can be obtained. If it can't be obtained, \TrackLangEnv is set to empty. Also define \TrackLangQueryOtherEnv{⟨name⟩} to query LC_ALL, ⟨name⟩, LANG. For example

\TrackLangQueryOtherEnv{LC_MONETARY}

Note that there's not much that can be done from within \TeX for the C or POSIX locale or a locale starting with a slash, so provide a check for them.

\TrackLangCheckLocale

Check for leading slash.

\TrackLangCheckLocale#1
We can't use Lua, so we'll have to use the shell escape if it's enabled. First determine if the
shell escape is available.

No shell escape.

Can't determine if the shell escape has been enabled.

\shellescape is defined. Check no one's been messing around with it and set it to \relax.
\pdfshellescape is defined. Check no one's been messing around with it and set it to \relax. (Default no-op already set.)
\ifx\pdfshellescape\relax
\pdfshellescape has been set to \relax. Is it possible that \shellescape is available?
\ifx\shellescape\undefined

6.2.1 Internal Lists
\@tracklang@languages  Provide a list to keep track of all the languages.
\def\@tracklang@languages{}
\@tracklang@dialects  Provide a list to keep track of all the dialects. Here the "dialect" isn't necessarily an actual
dialect but may be a root language or a synonym. It will usually correspond to the language
name as specified by the user in the package option.
\def\@tracklang@dialects{}
\@tracklang@ifinlist  Checks if \texttt{item} is in \texttt{list}. (Performs a one-level expansion on \texttt{list} but no expansion on
\texttt{item}.)
\def\@tracklang@ifinlist#1#2#3#4{\%
  \def\@tracklang@doifinlist##1,#1,##2\end@tracklang@doifinlist{\%
    \def\@before{##1}%
    \def\@after{##2}%
  }\%

% \csname @tracklang@todialect@#2\endcsname 
% }% 
% \edef\TrackLangLastTrackedDialect{#1} 
% }

Provide a convenient way of referencing the last dialect to be tracked.
\edef\TrackLangLastTrackedDialect{#1} 
}

Add a dialect.
\def\AddTrackedLanguage#1{% 
\AddTrackedDialect{#1}{#1} 
}

6.2.2 Known Languages

List of known (root) languages (that may or may not be tracked).
\def\@tracklang@known@langs{}
Identifies a new language that may be tracked. The code arguments may be empty if not available. (v1.3 switched from unexpanded to expanded def. All labels should be expandable.) Most root languages don't have an associated country code as they're spoken in multiple regions. The \textit{(default script)} is the default script identified with the ISO 15924 alpha script code. To reduce overheads, only define 639-3 if there's no 639-1 or 639-2 code.

\begin{verbatim}

Gets the ISO 639-2 (B) language code.

\def\TrackLangGetKnownIsoThreeLetterLangB#1{\%
  \@tracklang@nameuse{@tracklang@knowniso@639@2B@#1}%
}
Checks if the given ISO language code (639-1 or 639-2 or 639-3) is recognised (but not necessarily tracked).
\def\TrackLangIfKnownLangFromIso#1#2#3{\@tracklang@ifundef{@tracklang@knownisolang@#1}{#3}{#2}}

Gets the root language label from the given ISO code (639-1 or 639-2).
\def\TrackLangGetKnownLangFromIso#1{\@tracklang@nameuse{@tracklang@knownisolang@#1}}

Checks if the given language has an ISO 3166-1 country code (but is not necessarily tracked).
\def\TrackLangIfHasKnownCountry#1#2#3{\@tracklang@ifundef{@tracklang@knowniso@3166@#1}{#3}{#2}}

Fetches the ISO 3166-1 country code for the given language.
\def\TrackLangGetKnownCountry#1{\@tracklang@nameuse{@tracklang@knowniso@3166@#1}}

Gets the default script for the given root language label.
\def\TrackLangGetDefaultScript#1{\@tracklang@nameuse{@tracklang@knowniso@script@#1}}

If there's a default script for \texttt{(language)}, do \texttt{(true)} otherwise do \texttt{(false)}.
\def\TrackLangIfHasDefaultScript#1#2#3{\@tracklang@ifundef{@tracklang@knowniso@script@#1}{#3}{#2}}
6.2.3 Mappings

\AddTrackedIsoLanguage{\{code type\}\{code\}\{language\}}

Adds a mapping between the given ISO code and language name. There may be multiple mappings from an ISO code to a language name, but only one mapping from a language name to an ISO code. (v1.3 switched from unexpanded to expanded def. All labels should be expandable.)

\def\AddTrackedIsoLanguage#1#2#3{%
  \@tracklang@enamedef{@tracklang@#1@isofromlang@#3}{#2}%
  \@tracklang@ifundef{@tracklang@#1@isotolang@#2}%
  {\@tracklang@enamedef{@tracklang@#1@isotolang@#2}{#3}}%
  {%
    \def\@tracklang@lang{#3}%
    \expandafter\@tracklang@add\expandafter\@tracklang@lang
    \csname @tracklang@#1@isotolang@#2\endcsname
  }%
%
}

\TrackedLanguageFromIsoCode{\{code type\}\{code\}}

Fetches the language label (or labels) associated with the given code.

\def\TrackedLanguageFromIsoCode#1#2{%
  \@tracklang@nameuse{@tracklang@#1@isotolang@#2}%
%
}

\TrackedIsoCodeFromLanguage{\{code type\}\{language\}}

Fetches the code associated with the given language or dialect.

\def\TrackedIsoCodeFromLanguage#1#2{%
  \@tracklang@nameuse{@tracklang@#1@isofromlang@#2}%
%
}

\TrackedLanguageFromDialect{\{dialect\}}

Fetches the language name from the given dialect.

\def\TrackedLanguageFromDialect#1{%
  \@tracklang@nameuse{@tracklang@fromdialect@#1}%
%
}

\TrackedDialectsFromLanguage{\{root language label\}}

Fetches the tracked dialects whose language is given by \texttt{(root language label)}. 

\def\TrackedDialectsFromLanguage#1{%
  \@tracklang@nameuse{@tracklang@todialect@#1}%
%
}
\TwoLetterIsoCountryCode \def\TwoLetterIsoCountryCode{3166-1}

\ThreeLetterExtIsoLanguageCode \def\ThreeLetterExtIsoLanguageCode{639-3}
\SetTrackedDialectModifier \SetTrackedDialectModifier{\langle dialect \rangle}{\langle value \rangle}
Set the modifier for \langle dialect \rangle. (For example, old or new.) Arguments are expanded.
\SetTrackedDialectModifier\SetTrackedDialectModifier{#1#2}{\@tracklang@enamedef{\@tracklang@modifier@\#1}{\#2}}
\GetTrackedDialectModifier \GetTrackedDialectModifier{\langle dialect \rangle}
Get the modifier for \langle dialect \rangle.
\GetTrackedDialectModifier\GetTrackedDialectModifier{#1}{\@tracklang@nameuse{\@tracklang@modifier@\#1}}
\IfHasTrackedDialectModifier \IfHasTrackedDialectModifier{\langle dialect \rangle}{\langle true \rangle}{\langle false \rangle}
If there's a modifier for \langle dialect \rangle, do \langle true \rangle otherwise do \langle false \rangle.
\IfHasTrackedDialectModifier\IfHasTrackedDialectModifier{#1#2#3}{\@tracklang@ifundef{\@tracklang@modifier@\#1}{\#3}{\#2}}
\SetTrackedDialectScript \SetTrackedDialectScript{\langle dialect \rangle}{\langle value \rangle}
Set the script for \langle dialect \rangle. (For example, Latn or Cyrl.) Arguments are expanded.
\SetTrackedDialectScript\SetTrackedDialectScript{#1#2}{\@tracklang@enamedef{\@tracklang@script@\#1}{\#2}}
\GetTrackedDialectScript \GetTrackedDialectScript{\langle dialect \rangle}
Get the script for \langle dialect \rangle.
\GetTrackedDialectScript\GetTrackedDialectScript{#1}{\@tracklang@nameuse{\@tracklang@script@\#1}}
If there’s a script for \langle dialect \rangle, do \langle true \rangle otherwise do \langle false \rangle.

\def\IfHasTrackedDialectScript#1#2#3{\%\@tracklang@ifundef{@tracklang@script@#1}{#3}{#2}\%}\

If the given tracked dialect has an associated script and that script code matches the replacement text for the control sequence \langle cs \rangle then do \langle true \rangle otherwise to \langle false \rangle. If the tracked dialect doesn’t have an associated script then the default script for the root language is tested. The use of a control sequence allows \texttt{\ifx} for the test, which means that this command can expand. The supplementary package \texttt{tracklang-script} provides control sequences for known ISO 15924 codes.

\def\IfTrackedDialectIsScriptCs#1#2#3#4{\%\IfHasTrackedDialectScript{#1}\%\expandafter\ifx\expandafter#2\csname @tracklang@script@#1\endcsname #3\else #4\fi\%\%\TrackLangIfHasDefaultScript{\TrackedLanguageFromDialect{#1}}\%\expandafter\ifx\expandafter \csname @tracklang@knowniso@script@\TrackedLanguageFromDialect{#1}\endcsname \%\else #4\fi\%\%\}#4\%\}%}\

Set the modifier for \langle dialect \rangle. (For example, old or new.) Arguments are expanded.

\def\SetTrackedDialectVariant#1#2{\%\@tracklang@enamedef{@tracklang@variant@#1}{#2}\%}\

Get the modifier for \langle dialect \rangle.
\IfHasTrackedDialectVariant\IfHasTrackedDialectVariant{(dialect)}{(true)}{(false)}

If there's a modifier for \textit{dialect}, do \textit{true} otherwise do \textit{false}.

\def\IfHasTrackedDialectVariant#1#2#3{%
  \@tracklang@ifundef{@tracklang@variant@#1}{#3}{#2}%
}

\SetTrackedDialectSubLang\SetTrackedDialectSubLang{(dialect)}{(value)}

Set the sublang for \textit{dialect}. Arguments are expanded.

\def\SetTrackedDialectSubLang#1#2{%
  \@tracklang@enamedef{@tracklang@sublang@#1}{#2}%
}

\GetTrackedDialectSubLang\GetTrackedDialectSubLang{(dialect)}

Get the sublang for \textit{dialect}.

\def\GetTrackedDialectSubLang#1{%
  \@tracklang@nameuse{@tracklang@sublang@#1}%
}

\IfHasTrackedDialectSubLang\IfHasTrackedDialectSubLang{(dialect)}{(true)}{(false)}

If there's a sublang for \textit{dialect}, do \textit{true} otherwise do \textit{false}.

\def\IfHasTrackedDialectSubLang#1#2#3{%
  \@tracklang@ifundef{@tracklang@sublang@#1}{#3}{#2}%
}

\SetTrackedDialectAdditional\SetTrackedDialectAdditional{(dialect)}{(value)}

Set the extra for \textit{dialect}. Arguments are expanded.

\def\SetTrackedDialectAdditional#1#2{%
  \@tracklang@enamedef{@tracklang@extra@#1}{#2}%
}

\GetTrackedDialectAdditional\GetTrackedDialectAdditional{(dialect)}

Get the extra for \textit{dialect}.

\def\GetTrackedDialectAdditional#1{%
  \@tracklang@nameuse{@tracklang@extra@#1}%
}

\IfHasTrackedDialectAdditional\IfHasTrackedDialectAdditional{(dialect)}{(true)}{(false)}

If there's extra info for \textit{dialect}, do \textit{true} otherwise do \textit{false}.
Get the language tag for \textit{dialect}.

The \texttt{GetTrackedLanguageTag} command is provided for use by language hooks to establish the current tracked dialect. This command doesn't change \texttt{\languagename} or hyphenation patterns etc. It just provides convenient commands that can be accessed. The argument may be a tracklang dialect label or the language hook label from which a tracklang dialect label can be obtained or the root language label.

```
\def\GetTrackedLanguageTag#1{%
  \IfTrackedLanguageHasIsoCode{639-1}{\TrackedLanguageFromDialect{#1}}%
  {\IfTrackedLanguageHasIsoCode{639-2}{\TrackedLanguageFromDialect{#1}}%
    {\IfTrackedLanguageHasIsoCode{639-3}{\TrackedLanguageFromDialect{#1}}%

6.2.5 Predefined Root Languages

The ISO 639-1 and 639-2 codes are used to map the root language name to the ISO language code. The 3166-1 codes are used to map the dialect/variant to the ISO country code. The country code is omitted if ambiguous (for example, the language is spoken in multiple countries). Languages that have a country code may be spoken as a minority language in another region. In this case, \TrackLocale should be used instead to set the country code as appropriate. Some “dialects” are just synonyms for a language name, such as “français” or “frenchb”. These are defined in Section 6.2.6. Some of the languages have two ISO 639-2 codes designated as “B” (bibliographic) or “T” (terminology). In these cases the terminology code is used as the primary 639-2 code. The extra “B” and “T” codes are only provided if they are different.

\@tracklang@declareoption

Provide a hook to declare a predefined setting as a package option. This is defined by tracklang.sty before loading tracklang.tex but if this file isn’t loaded through tracklang.sty provide a definition that ignores its argument if not already defined.

\ifx\@tracklang@declareoption\undefined
\def\@tracklang@declareoption#1{}

6.2.6 Predefined Dialects

Provide some predefined dialects.

\TrackLangProvidePredefinedDialect{dialect}{root language}{3166-1 code}{modifier}{variant}{map}{script}

This defines a predefined dialect label that can be used by \TrackPredefinedDialect. The arguments must be expanded before use. The final argument \textless map\textgreater is the mapping from \textless dialect\textgreater to the closest babel dialect label.

\def\TrackLangProvidePredefinedDialect#1#2#3#4#5#6#7{
  \ifx\relax#3\relax
    No region.
  \else

6.2.8 Conditionals and Loops

```latex
\IfTrackedLanguage{\langle language \rangle}\{\langle true part \rangle}\{\langle false part \rangle}\}
```

First find out if the language name is empty.
```latex
\edef\@tracklang@element{\langle #1 \rangle}
\ifx\@tracklang@element\empty
Language is empty, so do false part.
\else
\expandafter\@tracklang@ifinlist\expandafter{\@tracklang@element}{\@tracklang@languages}
\fi
```
In list, so do true part.
```latex
\Else
\expandafter\@tracklang@ifinlist\expandafter{\@tracklang@element}{\@tracklang@languages}
\fi
```
Not in list, so do false part.
```latex
\IfTrackedDialect{\langle dialect \rangle}\{\langle true part \rangle}\{\langle false part \rangle}\}
```
```latex
\IfTrackedIsoCode{\langle code type \rangle}{\langle code \rangle}\{\langle true part \rangle}\{\langle false part \rangle}\}
```
\IfTrackedLanguageHasIsoCode
\IfTrackedLanguageHasIsoCode{(code type)}{(language)}{(true part)}
{(false part)}

\ForEachTrackedLanguage
\ForEachTrackedLanguage{(cs)}{(body)}

Iterates through the list of tracked languages. On each iteration (cs) is set to the language tag and (body) is performed.

\ForEachTrackedDialect
\ForEachTrackedDialect{(cs)}{(body)}

Iterates through the list of tracked dialects. On each iteration (cs) is set to the dialect tag and (body) is performed.

\AnyTrackedLanguages
\AnyTrackedLanguages{(prefix)}{(suffix)}{(true part)}{(false part)}

Determines if the file (prefix)(tag)(suffix) exists, where (tag) is an ISO code or ISO codes or label identifying the language. If (dialect) hasn't been identified as a tracked dialect, this just does (false part), otherwise this tries various different combinations for (tag). If the file (prefix)(tag)(suffix) exists, \CurrentTrackedTag is set to (tag) and (true part) is performed, otherwise (false part) is performed. The order of priority has changed with version 1.4 and now includes a check for variations that include the script. If the original ordering is specifically required, the old behaviour can be obtained with \IfTrackedLanguageFileExists@orig.

\Initialise.
\def\CurrentTrackedTag{}
Select this dialect.
\SetCurrentTrackedDialect{#1}\
\IfTrackedDialect{#1}\
{\%

Save the three types of language codes to for reference.
\edef\CurrentTrackedIsoCodeI{\TrackedIsoCodeFromLanguage{639-1}{\CurrentTrackedLanguage}}%
\edef\CurrentTrackedIsoCodeII{\TrackedIsoCodeFromLanguage{639-2}{\CurrentTrackedLanguage}}%
\edef\CurrentTrackedIsoCodeIII{\TrackedIsoCodeFromLanguage{639-3}{\CurrentTrackedLanguage}}%

Earlier versions of this had too many nested conditionals, which was confusing and hard to follow. This is a rewrite that removes the nesting and adds extra checks for dialect scripts.

The new definition of `\IfTrackedLanguageFileExists` has a different order of priority. If the original behaviour is specifically required, this has the pre version 1.4 definition.

```latex
\long\def\IfTrackedLanguageFileExists@orig#1#2#3#4#5{\%\tracklang@verbose{Finding file for dialect ‘#1’ (pre-v1.4)}\%\def\CurrentTrackedTag()\%\SetCurrentTrackedDialect(#1)\%\IfTrackedDialect(#1)\%\def\CurrentTrackedTag(#1)\%\tracklang@verbose{Testing tag ‘\CurrentTrackedTag’}\%\tracklang@if@file@exists\CurrentTracked Tag\CurrentTrackedDialect\CurrentTrackedIsoCode\%#4\%\IfTrackedLanguageHasIsoCode\{639-1\}\CurrentTrackedLanguage\%\def\CurrentTrackedIsoCode%(#5)\%\}
```

162
6.2.9 Resources

Provide some commands to make it easier for package authors to integrate the package code with tracklang. In the command definition describes below, \textit{(pkgname)} indicates the initial part of the resource files that follow the naming convention, \textit{(pkgname)-(tag).1df}. Typically this will match the base name of the package that uses those resource files, but this isn't compulsory. The argument \textit{(tag)} is the current tracked tag obtained from \texttt{\IfTrackedLanguageFileExists}.
If \ProvidesFile exists, we can use that, otherwise we need to provide a generic version.
\if\ProvidesFile\undefined

Generic code uses simplistic method to grab the version details in the final optional argument. Since we’re not using \TeX we don’t have commands like \@ifnextchar available.
\long\def\TrackLangProvidesResource#1#2{%
  \if\TrackLangRequireDialectPrefix\undefined
    \@tracklang@err{Resources files using \string\TrackLangProvidesResource\space must be loaded with \string\TrackLangRequireDialect}\%
  \fi
  \if#2[\relax
    \def\@tracklang@next{%
      \@tracklang@providesresource(\TrackLangRequireDialectPrefix-#1.ldf)#2%
    }
  \else
    \expandafter\xdef\csname ver@\TrackLangRequireDialectPrefix-#1.ldf\endcsname{}%
    \newlinechar='\^^J
    \def\MessageBreak{^^J}%
    \message{^^JFile: \TrackLangRequireDialectPrefix-#1.ldf^^J}%
  \}\long\def\@tracklang@next{#2}%
  \@tracklang@next
  }%}
  \def\@tracklang@providesresource#1[#2]{%
    \expandafter\xdef\csname ver@#1\endcsname{#2}%
    \newlinechar='\^^J
    \def\MessageBreak{^^J}%
    \message{^^JFile: #1 #2^^J}%
  }%
\else

\TeX code can simply use \ProvidesFile.
\def\TrackLangProvidesResource#1{%
  \if\TrackLangRequireDialectPrefix\undefined
    \@tracklang@err{Resources files using \string\TrackLangProvidesResource\space must be loaded with \string\TrackLangRequireDialect}\%
  \fi
  \ProvidesFile(\TrackLangRequireDialectPrefix-#1.ldf)%
}
\fi

Within the resource files, a check is required for the language hook, where the hook type is given by \texttt{(type)}. For example, if \texttt{(type)} is captions, the for babel, this is \texttt{\captions(dialect)} (dialect obtained through \texttt{\CurrentTrackedDialect}) and for polyglossia, this is \texttt{\captions(language)} (language obtained through \texttt{\CurrentTrackedLanguage}). This command is not permitted.
outside resource files.
\def\TrackLangAddToHook{\noop@TrackLangAddToHook}

\noop@TrackLangAddToHook
\def\noop@TrackLangAddToHook#1#2{% 
  \@tracklang@err{\string\TrackLangAddToHook\space 
    only permitted within resource files}
}
\@TrackLangAddToHook
\def\@TrackLangAddToHook#1#2{% babel check first.
  \@tracklang@ifundef{#2\CurrentTrackedDialect}%
    \IfTrackedDialectHasMapping{\CurrentTrackedDialect}%
    \{%
      \Try the mapping label next.
      \edef\@tracklang@tmp{% 
        \csname @tracklang@dialectmap@tohook@\CurrentTrackedDialect\endcsname} 
      \@tracklang@ifundef{#2\@tracklang@tmp}%
        \{%
        No captions hook. Try polyglossia.
        \@tracklang@ifundef{#2\CurrentTrackedLanguage}%
          \{%
          No captions hook. Do nothing (it's possible no language package has been loaded).
          \@tracklang@verbose{no hook found for \CurrentTrackedDialect}%
          \}%
          \}
          }
      }
          }
    }
    }
  }
  }
}{%

\@tracklang@ifundef{#2\CurrentTrackedLanguage}%
\{%
  No captions hook.
  \@tracklang@verbose{no hook found for \CurrentTrackedDialect}%
  \}%
  }
  }
}
Do the code now. (This is needed for cases such as the ngerman which defines `\captionsgerman` but calls it immediately rather than at the start of the document.)

```latex
\@tracklang@addtohook\{(type)\}{(label)\}{(code)\}
```

Since the captions hook is the most common, provide a shortcut.

```latex
\TrackLangAddToCaptions\{(code)\}
```

Similar to `\TrackLangAddToHook` but redefines the hook rather than appending to it. This command is not permitted outside resource files.

```latex
\TrackLangRedefHook\{(code)\}{(type)\}
```

```latex
\@tracklang@addtohook\{\#1\}{\#2\#3\}
\expandafter\let\expandafter\@tracklang@hook\csname \#1\#2\endcsname
\expandafter\gdef\csname \#1\#2\endcsname{\@tracklang@hook\#3}
```

```latex
\TrackLangAddToHook\{\#1\}{captions}
```

```latex
\TrackLangRedefHook\{\#1\}{\#2\}
\@tracklang@err{\string\TrackLangRedefHook\space only permitted within resource files}
```

```latex
\TrackLangRedefHook\#1\#2\%
\@tracklang@ifundef{\#2\CurrentTrackedDialect}\
\IfTrackedDialectHasMapping{\CurrentTrackedDialect}\
\edef\@tracklang@tmp{\csname @tracklang@dialectmap@tohook@\CurrentTrackedDialect\endcsname}\
\@tracklang@ifundef{\#2\@tracklang@tmp}\
\@tracklang@ifundef{\#2\CurrentTrackedLanguage}\
```

```latex
\TrackLangRedefHook\{\#1\}{\#2}\%
```

```latex
\TrackLangRedefHook\{\#1\}{\#2}\%
```
No captions hook. Do nothing (it’s possible no language package has been loaded).

```latex
\@tracklang@verbose{no hook found for \CurrentTrackedDialect}\%\%
\%\%
\@tracklang@redefhook(#2){\CurrentTrackedLanguage}{(#1)}\%
\%\%
\%\%
\@tracklang@redefhook(#2){\@tracklang@tmp}{(#1)}\%
\%
\%
```

polyglossia check next.

```latex
\@tracklang@ifundef{#2\CurrentTrackedLanguage}\%
\%\%
```

No captions hook.

```latex
\@tracklang@verbose{no hook found for \CurrentTrackedDialect}\%\%
\%\%
\@tracklang@redefhook(#2){\CurrentTrackedLanguage}{(#1)}\%
\%\%
\%\%
\@tracklang@redefhook(#2){\CurrentTrackedDialect}{(#1)}\%
\%
```

Do the code now in case the hook has already been used.

```latex
#1%\%
```

```latex\@tracklang@redefhook```

```latex\def\@tracklang@redefhook#1#2#3{\expandafter\gdef\csname#1#2\endcsname{#3}}```

```latex\@tracklang@ifundef```

```latex\@tracklang@enamedef```

```latex\@tracklang@def```

```latex\@tracklang@SetTrackedDialectLabelMap```

Define a mapping between a tracklang dialect label and the corresponding label used by the language hook. For example, ngermanDE is a recognised tracklang dialect label, but the closest babel equivalent is ngerman, so ngermanDE would need to be mapped to ngerman for the language hooks. The arguments are \textit{\textlangle tracklang-label \textrangle} (the tracklang dialect label) and \textit{\textlangle hook-label \textrangle} (the label, polyglossia etc label).

```latex\def\SetTrackedDialectLabelMap#1#2{\%\}%
\%\%
```

Store the mapping that can obtain the hook label from the tracklang label (tracklang to hook).

```latex\@tracklang@enamedef{\@tracklang@dialectmap@tohook@#1}{#2}\%```

Store the mapping that can obtain the tracklang label from the hook label.

```latex\@tracklang@enamedef{\@tracklang@dialectmap@fromhook@#2}{#1}\%```
\IfTrackedDialectHasMapping\IfTrackedDialectHasMapping{(tracklang label)}{(true)}{(false)}

Test if the tracklang dialect label has been assigned a mapping to a language hook.
\def\IfTrackedDialectHasMapping#1#2#3{\@tracklang@ifundef{\@tracklang@dialectmap@tohook@#1}{#3}{#2}\
\}

\IfHookHasMappingFromTrackedDialect\IfHookHasMappingFromTrackedDialect{(hook label)}{(true)}{(false)}

Tests if the language hook label has been assigned a mapping from a tracklang dialect label.
\def\IfHookHasMappingFromTrackedDialect#1#2#3{\@tracklang@ifundef{\@tracklang@dialectmap@fromhook@#1}{#3}{#2}\
\}

\GetTrackedDialectToMapping\GetTrackedDialectToMapping{(tracklang label)}

Gets the mapping for the given tracklang dialect label to a language hook label or the \langle label \rangle itself if no mapping has been defined.
\def\GetTrackedDialectToMapping#1{\@tracklang@ifundef{\@tracklang@dialectmap@tohook@#1}{#1}{\csname \@tracklang@dialectmap@tohook@#1\endcsname}\
\}

6.4 ISO 15924 Scripts \LaTeX Package (tracklang-scripts.sty)

This is just a \LaTeX package wrapper for the generic code in tracklang-scripts.tex.

\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{tracklang-scripts}[2020/06/30 v1.5 (NLCT) Track Language Scripts (LaTeX)]
\RequirePackage{tracklang}
\input{tracklang-scripts}

6.5 ISO 15924 Scripts Generic Code (tracklang-scripts.tex)

Provides information about ISO 15924 scripts. Not automatically loaded.

Check if this file has already been loaded:

\ifnum\catcode\@=11\relax
  \def\@tracklang@scripts@restore@at{}\else
  \expandafter\edef\csname @tracklang@scripts@restore@at\endcsname{
    \noexpand\catcode\@=\number\catcode\@\relax
  }\fi
\catcode\@=11\relax
\fi
Define mapping. To avoid problems with encodings, only use ASCII characters in the arguments. The first argument is the four-letter ISO 15924 code. The second argument is the numeric code. The third argument is just intended for informational purposes. The fourth argument indicates the direction. This may be LR (left-to-right), RL (right-to-left), TB (top-to-bottom), varies or inherited. The (parent) argument is for the parent writing system, which may be left blank. (Currently, this is blank for all the mappings provided here, but the syntax has five arguments in case of future development.)

This user command is provided to make it easier to test the script using \ifx.

\def\TrackLangScriptMap#1#2#3#4#5{\% 
\TrackLang@enamedef{TrackLangScript#1}{#1} \% 
\TrackLang@enamedef{\@tracklang@script@numtoalpha@#2}{#1} \%
