Abstract

This is the reference documentation for the expl3 programming environment. The expl3 modules set up an experimental naming scheme for \LaTeX commands, which allow the \LaTeX programmer to systematically name functions and variables, and specify the argument types of functions.

The \TeX and \\ɛ\TeX primitives are all given a new name according to these conventions. However, in the main direct use of the primitives is not required or encouraged: the expl3 modules define an independent low-level \LaTeX3 programming language.

The expl3 modules are designed to be loaded on top of \LaTeX2e. With an up-to-date \LaTeX2e kernel, this material is loaded as part of the format. The fundamental programming code can also be loaded with other \TeX formats, subject to restrictions on the full range of functionality.

Contents

I Introduction 1

1 Introduction to expl3 and this document 2
  1.1 Naming functions and variables 2
  1.2 Terminological inexactitude 5
  1.3 Formal language conventions which apply generally 7
  1.4 \TeX{} concepts not supported by \LaTeX{}3 7

II Bootstrapping 8

2 The l3bootstrap package: Bootstrap code 9
  2.1 Using the \LaTeX{}3 modules 9

3 The l3names package: Namespace for primitives 11
  3.1 Setting up the \LaTeX{}3 programming language 11

III Programming Flow 12

4 The l3basics package: Basic definitions 13
  4.1 No operation functions 13
  4.2 Grouping material 13
  4.3 Control sequences and functions 14
    4.3.1 Defining functions 14
    4.3.2 Defining new functions using parameter text 15
    4.3.3 Defining new functions using the signature 17
    4.3.4 Copying control sequences 19
    4.3.5 Deleting control sequences 20
    4.3.6 Showing control sequences 20
    4.3.7 Converting to and from control sequences 20
  4.4 Analysing control sequences 22
  4.5 Using or removing tokens and arguments 23
    4.5.1 Selecting tokens from delimited arguments 25
  4.6 Predicates and conditionals 25
    4.6.1 Tests on control sequences 27
    4.6.2 Primitive conditionals 27
  4.7 Starting a paragraph 28
  4.8 Debugging support 29
5 The \texttt{bexpa}n package: Argument expansion 30
5.1 Defining new variants ............................................. 30
5.2 Methods for defining variants ................................... 31
5.3 Introducing the variants ......................................... 32
5.4 Manipulating the first argument ................................. 34
5.5 Manipulating two arguments .................................... 36
5.6 Manipulating three arguments .................................. 36
5.7 Unbraced expansion ............................................... 37
5.8 Preventing expansion ............................................. 38
5.9 Controlled expansion ............................................. 39
5.10 Internal functions ............................................... 42

6 The \texttt{bsort} package: Sorting functions 43
6.1 Controlling sorting ............................................... 43

7 The \texttt{bstl-analysis} package: Analysing token lists 45

8 The \texttt{bregen} package: Regular expressions in \TeX{} 46
8.1 Syntax of regular expressions .................................... 47
  8.1.1 Regular expression examples ................................ 47
  8.1.2 Characters in regular expressions .......................... 48
  8.1.3 Characters classes .......................................... 48
  8.1.4 Structure: alternatives, groups, repetitions .......... 49
  8.1.5 Matching exact tokens ....................................... 50
  8.1.6 Miscellaneous ................................................ 52
8.2 Syntax of the replacement text ................................ 52
8.3 Pre-compiling regular expressions ............................ 54
8.4 Matching .......................................................... 55
8.5 Submatch extraction ............................................. 56
8.6 Replacement ........................................................ 57
8.7 Scratch regular expressions .................................... 59
8.8 Bugs, misfeatures, future work, and other possibilities .... 59

9 The \texttt{bprg} package: Control structures 62
9.1 Defining a set of conditional functions ......................... 62
9.2 The boolean data type ........................................... 64
  9.2.1 Scratch booleans ........................................... 66
9.3 Boolean expressions ............................................. 66
9.4 Logical loops ..................................................... 68
9.5 Producing multiple copies ..................................... 69
9.6 Detecting \TeX{}'s mode .......................................... 70
9.7 Primitive conditionals .......................................... 70
9.8 Nestable recursions and mappings ................................ 70
  9.8.1 Simple mappings ........................................... 71
9.9 Internal programming functions ................................. 71
10 The \texttt{l3sys} package: System/runtime functions \hfill 72
10.1 The name of the job \hfill 72
10.2 Date and time \hfill 72
10.3 Engine \hfill 73
10.4 Output format \hfill 73
10.5 Platform \hfill 74
10.6 Random numbers \hfill 74
10.7 Access to the shell \hfill 74
10.8 Loading configuration data \hfill 75
10.8.1 Final settings \hfill 76

11 The \texttt{l3msg} package: Messages \hfill 77
11.1 Creating new messages \hfill 77
11.2 Customizable information for message modules \hfill 78
11.3 Contextual information for messages \hfill 78
11.4 Issuing messages \hfill 80
11.4.1 Messages for showing material \hfill 83
11.4.2 Expandable error messages \hfill 83
11.5 Redirecting messages \hfill 83

12 The \texttt{l3file} package: File and I/O operations \hfill 85
12.1 Input–output stream management \hfill 85
12.1.1 Reading from files \hfill 87
12.1.2 Writing to files \hfill 90
12.1.3 Wrapping lines in output \hfill 92
12.1.4 Constant input–output streams, and variables \hfill 93
12.1.5 Primitive conditionals \hfill 93
12.2 File operation functions \hfill 93

13 The \texttt{l3luatex} package: Lua\TeX{}-specific functions \hfill 98
13.1 Breaking out to Lua \hfill 98
13.2 Lua interfaces \hfill 99

14 The \texttt{l3legacy} package: Interfaces to legacy concepts \hfill 101

IV Data types \hfill 102

15 The \texttt{l3tl} package: Token lists \hfill 103
15.1 Creating and initialising token list variables \hfill 103
15.2 Adding data to token list variables \hfill 104
15.3 Token list conditionals \hfill 105
15.3.1 Testing the first token \hfill 107
15.4 Working with token lists as a whole \hfill 108
15.4.1 Using token lists \hfill 108
15.4.2 Counting and reversing token lists \hfill 109
15.4.3 Viewing token lists \hfill 110
15.5 Manipulating items in token lists \hfill 111
15.5.1 Mapping over token lists \hfill 111
15.5.2 Head and tail of token lists \hfill 113

- 33.12 Using boxes efficiently ............................................................. 280
- 33.13 Affine transformations ............................................................ 281
- 33.14 Primitive box conditionals ....................................................... 284

### 34 The \texttt{l3coffins} package: Coffin code layer

- 34.1 Creating and initialising coffins ............................................... 285
- 34.2 Setting coffin content and poles .............................................. 286
- 34.3 Coffin affine transformations ................................................... 287
- 34.4 Joining and using coffins ........................................................ 287
- 34.5 Measuring coffins .................................................................... 288
- 34.6 Coffin diagnostics .................................................................... 288
- 34.7 Constants and variables ............................................................ 289

### 35 The \texttt{l3color} package: Color support

- 35.1 Color in boxes ........................................................................... 291
- 35.2 Color models ............................................................................ 291
- 35.3 Color expressions ..................................................................... 293
- 35.4 Named colors ........................................................................... 294
- 35.5 Selecting colors ....................................................................... 294
- 35.6 Colors for fills and strokes ....................................................... 295
  - 35.6.1 Coloring math mode material .............................................. 295
- 35.7 Multiple color models .............................................................. 295
- 35.8 Exporting color specifications ............................................... 296
- 35.9 Creating new color models ...................................................... 297
  - 35.9.1 Color profiles .................................................................... 298

### 36 The \texttt{l3pdf} package: Core PDF support

- 36.1 Objects ..................................................................................... 299
- 36.2 Version ..................................................................................... 300
- 36.3 Compression .............................................................................. 301
- 36.4 Destinations ............................................................................. 301
- 36.5 Deprecated functions ............................................................. 302

### VII Additions and removals

Part I
Introduction
Chapter 1

Introduction to expl3 and this document

This document is intended to act as a comprehensive reference manual for the expl3 language. A general guide to the \LaTeX3 programming language is found in expl3.pdf.

1.1 Naming functions and variables

\LaTeX3 does not use $\@$ as a “letter” for defining internal macros. Instead, the symbols $\_\$ and $:\$ are used in internal macro names to provide structure. The name of each function is divided into logical units using $\_\$, while $:\$ separates the name of the function from the argument specifier (“arg-spec”). This describes the arguments expected by the function. In most cases, each argument is represented by a single letter. The complete list of arg-spec letters for a function is referred to as the signature of the function.

Each function name starts with the module to which it belongs. Thus apart from a small number of very basic functions, all expl3 function names contain at least one underscore to divide the module name from the descriptive name of the function. For example, all functions concerned with comma lists are in module \clist and begin $\clist$.

Every function must include an argument specifier. For functions which take no arguments, this will be blank and the function name will end $:\$. Most functions take one or more arguments, and use the following argument specifiers:

\textbf{N} and \textbf{n} These mean \textit{no manipulation}, of a single token for \textbf{N} and of a set of tokens given in braces for \textbf{n}. Both pass the argument through exactly as given. Usually, if you use a single token for an \textbf{n} argument, all will be well.

\textbf{c} This means $\textit{csname}$, and indicates that the argument will be turned into a csname before being used. So $\texttt{\foo:c\{ArgumentOne\}}$ will act in the same way as $\texttt{\foo:N\ ArgumentOne}$. All macros that appear in the argument are expanded. An internal error will occur if the result of expansion inside a c-type argument is not a series of character tokens.

\textbf{V} and \textbf{v} These mean \textit{value of variable}. The V and v specifiers are used to get the content of a variable without needing to worry about the underlying \TeX structure containing the data. A V argument will be a single token (similar to N), for example
\foo:V \MyVariable; on the other hand, using v a csname is constructed first, and then the value is recovered, for example \foo:v \{MyVariable\}.

- This means \textit{expansion once}. In general, the V and v specifiers are favoured over o for recovering stored information. However, o is useful for correctly processing information with delimited arguments.

- The x specifier stands for \textit{exhaustive expansion}: every token in the argument is fully expanded until only unexpandable ones remain. The \TeX \texttt{\edef} primitive carries out this type of expansion. Functions which feature an x-type argument are not expandable.

- The e specifier is in many respects identical to x, but with a very different implementation. Functions which feature an e-type argument may be expandable. The drawback is that e is extremely slow (often more than 200 times slower) in older engines, more precisely in non-Lua\TeX engines older than 2019.

- The f specifier stands for \textit{full expansion}, and in contrast to x stops at the first non-expandable token (reading the argument from left to right) without trying to expand it. If this token is a ⟨space token⟩, it is gobbled, and thus won’t be part of the resulting argument. For example, when setting a token list variable (a macro used for storage), the sequence

\begin{verbatim}
\tl_set:Nn \l_mya_tl { A }
\tl_set:Nn \l_myb_tl { B }
\tl_set:Nf \l_mya_tl { \l_mya_tl \l_myb_tl }
\end{verbatim}

will leave \l_mya_tl with the content A\l_myb_tl, as A cannot be expanded and so terminates expansion before \l_myb_tl is considered.

\textbf{T and F} For logic tests, there are the branch specifiers T (true) and F (false). Both specifiers treat the input in the same way as n (no change), but make the logic much easier to see.

- The letter p indicates \TeX parameters. Normally this will be used for delimited functions as expl3 provides better methods for creating simple sequential arguments.

- Finally, there is the w specifier for \textit{weird} arguments. This covers everything else, but mainly applies to delimited values (where the argument must be terminated by some specified string).

\textbf{D} The D stands for \textit{Do not use}. All of the \TeX primitives are initially \texttt{\let} to a D name, and some are then given a second name. These functions have no standardized syntax, they are engine dependent and their name can change without warning, thus their use is \textit{strongly discouraged} in package code: programmers should instead use the interfaces documented in \texttt{interface3.pdf}.

Notice that the argument specifier describes how the argument is processed prior to being passed to the underlying function. For example, \texttt{\foo:c} will take its argument, convert it to a control sequence and pass it to \texttt{\foo:N}.

\footnote{If a primitive offers a functionality not yet in the kernel, programmers and users are encouraged to write to the \LaTeX-L mailing list (mailto:LATEX-L@listserv.uni-heidelberg.de) describing their use-case and intended behaviour, so that a possible interface can be discussed. Temporarily, while an interface is not provided, programmers may use the procedure described in the \texttt{l3styleguide.pdf}.}
Variables are named in a similar manner to functions, but begin with a single letter to define the type of variable:

- **c** Constant: global parameters whose value should not be changed.
- **g** Parameters whose value should only be set globally.
- **l** Parameters whose value should only be set locally.

Each variable name is then built up in a similar way to that of a function, typically starting with the module name and then a descriptive part. Variables end with a short identifier to show the variable type:

- **clist** Comma separated list.
- **dim** “Rigid” lengths.
- **fp** Floating-point values;
- **int** Integer-valued count register.
- **muskip** “Rubber” lengths for use in mathematics.
- **seq** “Sequence”: a data-type used to implement lists (with access at both ends) and stacks.
- **skip** “Rubber” lengths.
- **str** String variables: contain character data.
- **tl** Token list variables: placeholder for a token list.

Applying V-type or v-type expansion to variables of one of the above types is supported, while it is not supported for the following variable types:

- **bool** Either true or false.
- **box** Box register.
- **coffin** A “box with handles” — a higher-level data type for carrying out box alignment operations.
- **flag** Integer that can be incremented expandably.
- **fparray** Fixed-size array of floating point values.
- **intarray** Fixed-size array of integers.
- **ior/iow** An input or output stream, for reading from or writing to, respectively.
- **prop** Property list: analogue of dictionary or associative arrays in other languages.
- **regex** Regular expression.

The module names are not used in case of generic scratch registers defined in the data type modules, e.g., the int module contains some scratch variables called $\l_tmpa_int$, $\l_tmpb_int$, and so on. In such a case adding the module name up front to denote the module and in the back to indicate the type, as in $\l_int_tmpa_int$ would be very unreadable.
1.1.1 Scratch variables

Modules focussed on variable usage typically provide four scratch variables, two local and two global, with names of the form \(\langle\text{scope}\rangle_{\text{tmpa}}_{\langle\text{type}\rangle}/\langle\text{scope}\rangle_{\text{tmpb}}_{\langle\text{type}\rangle}\). These are never used by the core code. The nature of \TeX{} grouping means that as with any other scratch variable, these should only be set and used with no intervening third-party code.

1.1.2 Terminological inexactitude

A word of warning. In this document, and others referring to the expl3 programming modules, we often refer to “variables” and “functions” as if they were actual constructs from a real programming language. In truth, \TeX{} is a macro processor, and functions are simply macros that may or may not take arguments and expand to their replacement text. Many of the common variables are also macros, and if placed into the input stream will simply expand to their definition as well — a “function” with no arguments and a “token list variable” are almost the same.\(^3\) On the other hand, some “variables” are actually registers that must be initialised and their values set and retrieved with specific functions.

The conventions of the expl3 code are designed to clearly separate the ideas of “macros that contain data” and “macros that contain code”, and a consistent wrapper is applied to all forms of “data” whether they be macros or actually registers. This means that sometimes we will use phrases like “the function returns a value”, when actually we just mean “the macro expands to something”. Similarly, the term “execute” might be used in place of “expand” or it might refer to the more specific case of “processing in \TeX{}’s stomach” (if you are familiar with the \TeX{}book parlance).

If in doubt, please ask; chances are we’ve been hasty in writing certain definitions and need to be told to tighten up our terminology.

1.2 Documentation conventions

This document is typeset with the experimental l3doc class; several conventions are used to help describe the features of the code. A number of conventions are used here to make the documentation clearer.

Each group of related functions is given in a box. For a function with a “user” name, this might read:

\begin{verbatim}
\ExplSyntaxOn\ExplSyntaxOff
\ExplSyntaxOn\ExplSyntaxOff
\end{verbatim}

The textual description of how the function works would appear here. The syntax of the function is shown in mono-spaced text to the right of the box. In this example, the function takes no arguments and so the name of the function is simply reprinted.

For programming functions, which use _ and : in their name there are a few additional conventions: If two related functions are given with identical names but different argument specifiers, these are termed variants of each other, and the latter functions are printed in grey to show this more clearly. They will carry out the same function but will take different types of argument:

\footnote{\TeX{}nically, functions with no arguments are \texttt{\long} while token list variables are not.}
When a number of variants are described, the arguments are usually illustrated only for
the base function. Here, \textit{sequence} indicates that \texttt{\seq_new:N} expects the name of a
sequence. From the argument specifier, \texttt{\seq_new:c} also expects a sequence name, but
as a name rather than as a control sequence. Each argument given in the illustration
should be described in the following text.

**Fully expandable functions** Some functions are fully expandable, which allows them
to be used within an \texttt{x}-type or \texttt{e}-type argument (in \LaTeX{} terms, inside an \texttt{edef}
or \texttt{expanded}), as well as within an \texttt{f}-type argument. These fully expandable functions are
indicated in the documentation by a star:

\begin{verbatim}
\cs_to_str:N \cs_to_str:N \langle cs \rangle
\end{verbatim}

As with other functions, some text should follow which explains how the function works.
Usually, only the star will indicate that the function is expandable. In this case, the
function expects a \texttt{(cs)}, shorthand for a \texttt{(control sequence)}.

**Restricted expandable functions** A few functions are fully expandable but cannot
be fully expanded within an \texttt{f}-type argument. In this case a hollow star is used to indicate
this:

\begin{verbatim}
\seq_map_function:NN \seq_map_function:NN \langle seq \rangle \langle function \rangle
\end{verbatim}

**Conditional functions** Conditional (\texttt{if}) functions are normally defined in three vari-
ants, with \texttt{T}, \texttt{F} and \texttt{TF} argument specifiers. This allows them to be used for different
“true”/“false” branches, depending on which outcome the conditional is being used to
test. To indicate this without repetition, this information is given in a shortened form:

\begin{verbatim}
\sys_if_engine_xetex:TF \sys_if_engine_xetex:TF \{\langle true code \rangle\} \{\langle false code \rangle\}
\end{verbatim}

The underlining and italic of \texttt{TF} indicates that three functions are available:

- \texttt{\sys_if_engine_xetex:T}
- \texttt{\sys_if_engine_xetex:F}
- \texttt{\sys_if_engine_xetex:TF}

Usually, the illustration will use the \texttt{TF} variant, and so both \texttt{(true code)} and \texttt{(false code)}
will be shown. The two variant forms \texttt{T} and \texttt{F} take only \texttt{(true code)} and \texttt{(false code)},
respectively. Here, the star also shows that this function is expandable. With some minor
exceptions, \textit{all} conditional functions in the \texttt{expl3} modules should be defined in this way.

Variables, constants and so on are described in a similar manner:

\begin{verbatim}
\ll_tmpa_tl
\end{verbatim}

A short piece of text will describe the variable: there is no syntax illustration in this case.

In some cases, the function is similar to one in \LaTeX{} or plain \TeX{}. In these cases,
the text will include an extra \textit{“\LaTeX{}hackers note”} section:
The normal description text.

\textbf{\LaTeX{}hackers} note: Detail for the experienced \TeX{} or \LaTeX{}2\epsilon programmer. In this case, it would point out that this function is the \TeX{} primitive \texttt{\string}.

\begin{description}
\item[Changes to behaviour] When new functions are added to \texttt{expl3}, the date of first inclusion is given in the documentation. Where the documented behaviour of a function changes after it is first introduced, the date of the update will also be given. This means that the programmer can be sure that any release of \texttt{expl3} after the date given will contain the function of interest with expected behaviour as described. Note that changes to code internals, including bug fixes, are not recorded in this way \textit{unless} they impact on the expected behaviour.
\end{description}

\section{Formal language conventions which apply generally}

As this is a formal reference guide for \LaTeX{}3 programming, the descriptions of functions are intended to be reasonably “complete”. However, there is also a need to avoid repetition. Formal ideas which apply to general classes of function are therefore summarised here.

For tests which have a \texttt{TF} argument specification, the test if evaluated to give a logically \texttt{TRUE} or \texttt{FALSE} result. Depending on this result, either the \texttt{true code} or the \texttt{false code} will be left in the input stream. In the case where the test is expandable, and a predicate (\_p) variant is available, the logical value determined by the test is left in the input stream: this will typically be part of a larger logical construct.

\section{\TeX{} concepts not supported by \LaTeX{}3}

The \TeX{} concept of an \texttt{\outer} macro is \textit{not supported} at all by \LaTeX{}3. As such, the functions provided here may break when used on top of \LaTeX{}2\epsilon if \texttt{\outer} tokens are used in the arguments.
Part II

Bootstrapping
Chapter 2

The \texttt{l3bootstrap} package

Bootstrap code

2.1 Using the \LaTeX3 modules

The modules documented in source are designed to be used on top of \LaTeX2 and are loaded all as one with the usual \texttt{\usepackage{expl3}} or \texttt{\RequirePackage{expl3}} instructions.

As the modules use a coding syntax different from standard \LaTeX2 it provides a few functions for setting it up.

\begin{verbatim}
\ExplSyntaxOn
\ExplSyntaxOn \langle code \rangle \ExplSyntaxOff
\ExplSyntaxOn
\ExplSyntaxOn \langle code \rangle \ExplSyntaxOff
\end{verbatim}

\ExplSyntaxOn function switches to a category code regime in which spaces and new lines are ignored, and in which the colon (:) and underscore (_) are treated as "letters", thus allowing access to the names of code functions and variables. Within this environment, - is used to input a space. The \texttt{\ExplSyntaxOff} reverts to the document category code regime.

\textbf{\LaTeX hackers note:} Spaces introduced by - behave much in the same way as normal space characters in the standard category code regime: they are ignored after a control word or at the start of a line, and multiple consecutive - are equivalent to a single one. However, - is not ignored at the end of a line.

\begin{verbatim}
\ProvidesExplPackage \RequirePackage{expl3}
\ProvidesExplClass \ProvidesExplFile
\end{verbatim}

These functions act broadly in the same way as the corresponding \LaTeX2 kernel functions \texttt{\ProvidesPackage}, \texttt{\ProvidesClass} and \texttt{\ProvidesFile}. However, they also implicitly switch \texttt{\ExplSyntaxOn} for the remainder of the code with the file. At the end of the file, \texttt{\ExplSyntaxOff} will be called to reverse this. (This is the same concept as \LaTeX2 provides in turning on \texttt{\makeatletter} within package and class code.) The \texttt{\langle date \rangle} should be given in the format \texttt{(year)/(month)/(day)} or in the ISO date format \texttt{(year)-(month)-(day)}. If the \texttt{\langle version \rangle} is given then it will be prefixed with \texttt{v} in the package identifier line.
\RequirePackage{l3bootstrap}
\GetIdInfo $Id: ⟨SVN info field⟩ $ \{(description)\}

Extracts all information from a SVN field. Spaces are not ignored in these fields. The information pieces are stored in separate control sequences with \ExplFileName for the part of the file name leading up to the period, \ExplFileDate for date, \ExplFileVersion for version and \ExplFileDescription for the description.

To summarize: Every single package using this syntax should identify itself using one of the above methods. Special care is taken so that every package or class file loaded with \RequirePackage or similar are loaded with usual \LaTeX category codes and the \LaTeX3 category code scheme is reloaded when needed afterwards. See implementation for details. If you use the \GetIdInfo command you can use the information when loading a package with

\ProvidesExplPackage{\ExplFileName}
  \{\ExplFileDate}\{\ExplFileVersion}\{\ExplFileDescription}
Chapter 3

The \texttt{l3names} package
Namespace for primitives

3.1 Setting up the \LaTeX{}3 programming language

This module is at the core of the \LaTeX{}3 programming language. It performs the following tasks:

- defines new names for all \TeX{} primitives;
- emulate required primitives not provided by default in \LuaTeX{};
- switches to the category code régime for programming;

This module is entirely dedicated to primitives (and emulations of these), which should not be used directly within \LaTeX{}3 code (outside of “kernel-level” code). As such, the primitives are not documented here: \textit{The \TeX{}book}, \textit{\TeX{} by Topic} and the manuals for \pdfTeX{}, \XeTeX{}, \LuaTeX{}, \pTeX{} and \upTeX{} should be consulted for details of the primitives. These are named \texttt{\textbackslash tex\_\{name\}:D}, typically based on the primitive’s \texttt{\{name\}} in \pdfTeX{} and omitting a leading \texttt{pdf} when the primitive is not related to pdf output.

Programming Flow
Chapter 4

The l3basics package

Basic definitions

As the name suggest this package holds some basic definitions which are needed by most or all other packages in this set.

Here we describe those functions that are used all over the place. With that we mean functions dealing with the construction and testing of control sequences. Furthermore the basic parts of conditional processing are covered; conditional processing dealing with specific data types is described in the modules specific for the respective data types.

4.1 No operation functions

\prg_do_nothing:  ⋆ \prg_do_nothing:

An expandable function which does nothing at all: leaves nothing in the input stream after a single expansion.

\scan_stop:  \scan_stop:

A non-expandable function which does nothing. Does not vanish on expansion but produces no typeset output.

4.2 Grouping material

\group_begin:  \group_end:

These functions begin and end a group for definition purposes. Assignments are local to groups unless carried out in a global manner. (A small number of exceptions to this rule will be noted as necessary elsewhere in this document.) Each \group_begin: must be matched by a \group_end:, although this does not have to occur within the same function. Indeed, it is often necessary to start a group within one function and finish it within another, for example when seeking to use non-standard category codes.
\group_insert_after:N \group_insert_after:N \token

Adds \token to the list of \tokens to be inserted when the current group level ends. The list of \tokens to be inserted is empty at the beginning of a group: multiple applications of \group_insert_after:N may be used to build the inserted list one \token at a time. The current group level may be closed by a \group_end: function or by a token with category code 2 (close-group), namely a } if standard category codes apply.

\group_show_list: \group_log_list: \group_show_list: \group_log_list:

Display (to the terminal or log file) a list of the groups that are currently opened. This is intended for tracking down problems.

\TeXhackers note: This is a wrapper around the \showgroups primitive.

### 4.3 Control sequences and functions

As \TeX{} is a macro language, creating new functions means creating macros. At point of use, a function is replaced by the replacement text (“code”) in which each parameter in the code (#1, #2, etc.) is replaced the appropriate arguments absorbed by the function. In the following, \texttt{(code)} is therefore used as a shorthand for “replacement text”.

Functions which are not “protected” are fully expanded inside an \texttt{x} expansion. In contrast, “protected” functions are not expanded within \texttt{x} expansions.

#### 4.3.1 Defining functions

Functions can be created with no requirement that they are declared first (in contrast to variables, which must always be declared). Declaring a function before setting up the code means that the name chosen is checked and an error raised if it is already in use. The name of a function can be checked at the point of definition using the \texttt{\cs_new:...} functions: this is recommended for all functions which are defined for the first time.

There are three ways to define new functions. All classes define a function to expand to the substitution text. Within the substitution text the actual parameters are substituted for the formal parameters (#1, #2, …).

- \texttt{new} Create a new function with the \texttt{new} scope, such as \texttt{\cs_new:Npn}. The definition is global and results in an error if it is already defined.
- \texttt{set} Create a new function with the \texttt{set} scope, such as \texttt{\cs_set:Npn}. The definition is restricted to the current \TeX{} group and does not result in an error if the function is already defined.
- \texttt{gset} Create a new function with the \texttt{gset} scope, such as \texttt{\cs_gset:Npn}. The definition is global and does not result in an error if the function is already defined.

Within each set of scope there are different ways to define a function. The differences depend on restrictions on the actual parameters and the expandability of the resulting function.

- \texttt{nopar} Create a new function with the \texttt{nopar} restriction, such as \texttt{\cs_set_nopar:Npn}. The parameter may not contain \texttt{\par} tokens.
protected  Create a new function with the protected restriction, such as \cs_set_-
protected:Npn. The parameter may contain \par tokens but the function will not
expand within an x-type or e-type expansion.

Finally, the functions in Subsections 4.3.2 and 4.3.3 are primarily meant to define
base functions only. Base functions can only have the following argument specifiers:

N and n  No manipulation.

T and F  Functionally equivalent to n (you are actually encouraged to use the family of
\prg_new Conditional: functions described in Section 9.1).

p and w  These are special cases.

The \cs_new: functions below (and friends) do not stop you from using other argu-
ment specifiers in your function names, but they do not handle expansion for you. You
should define the base function and then use \cs_generate_variant:Nn to generate
custom variants as described in Section 5.2.

4.3.2 Defining new functions using parameter text

\cs_new:Npn \cs_new:cpn \cs_new:Npx \cs_new:cpx

Within the \textbf{(code)}, the \textbf{parameters} \textbf{(#1, #2, etc.)} will be replaced by those absorbed by the function. The assignment of a meaning to the \textbf{(function)} is restricted to the current \TeX{} group level: the assignment is global. The \textbf{(function)} will not expand within an \textbf{x}-type or \textbf{e}-type argument.
\cs_gset_protected_nopar:Npn \cs_gset_protected_nopar:cpn \cs_gset_protected_nopar:Npx \cs_gset_protected_nopar:cpn

Globally sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the \textit{(parameters)} (#1, #2, etc.) will be replaced by those absorbed by the function. When the \textit{(function)} is used the \textit{(parameters)} absorbed cannot contain \texttt{\par} tokens. The assignment of a meaning to the \textit{(function)} is not restricted to the current \TeX{} group level: the assignment is global. The \textit{(function)} will not expand within an \texttt{x}-type or \texttt{e}-type argument.

### 4.3.3 Defining new functions using the signature

\cs_new:Nn \cs_new:(cn|N|x|c)x\hspace{1em} \cs_new:Nn \cs_new:(cn|N|x|c)x

Creates \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} (#1, #2, etc.) will be replaced by those absorbed by the function. The \textit{(function)} is already defined.

\cs_new: NOPar:Nn \cs_new: NOPar:(cn|N|x|c)x\hspace{1em} \cs_new: NOPar:Nn \cs_new: NOPar:(cn|N|x|c)x

Creates \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} (#1, #2, etc.) will be replaced by those absorbed by the function. When the \textit{(function)} is used the \textit{(parameters)} absorbed cannot contain \texttt{\par} tokens. The definition is global and an error results if the \textit{(function)} is already defined.

\cs_new_protected:Nn \cs_new_protected:(cn|N|x|c)x\hspace{1em} \cs_new_protected:Nn \cs_new_protected:(cn|N|x|c)x

Creates \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} (#1, #2, etc.) will be replaced by those absorbed by the function. The \textit{(function)} will not expand within an \texttt{x}-type or \texttt{e}-type argument. The definition is global and an error results if the \textit{(function)} is already defined.

\cs_new_protected_nopar:Nn \cs_new_protected_nopar:(cn|N|x|c)x\hspace{1em} \cs_new_protected_nopar:Nn \cs_new_protected_nopar:(cn|N|x|c)x

Creates \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} (#1, #2, etc.) will be replaced by those absorbed by the function. The \textit{(function)} will not expand within an \texttt{x}-type or \texttt{e}-type argument. The definition is global and an error results if the \textit{(function)} is already defined.

\cs_set:Nn \cs_set:(cn|N|x|c)x\hspace{1em} \cs_set:Nn \cs_set:(cn|N|x|c)x

Sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the \textit{(function)} is restricted to the current \TeX{} group level.

17
Sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} \((\#1, \#2, \text{etc.})\) will be replaced by those absorbed by the function. When the \textit{(function)} is used the \textit{(parameters)} absorbed cannot contain \texttt{\par} tokens. The assignment of a meaning to the \textit{(function)} is restricted to the current \TeX{} group level.

Sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} \((\#1, \#2, \text{etc.})\) will be replaced by those absorbed by the function. The \textit{(function)} will not expand within an \texttt{x-type} or \texttt{e-type} argument. The assignment of a meaning to the \textit{(function)} is restricted to the current \TeX{} group level.

Sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} \((\#1, \#2, \text{etc.})\) will be replaced by those absorbed by the function. The \textit{(function)} is detected automatically from the function signature. These \textit{(parameters)} \((\#1, \#2, \text{etc.})\) will be replaced by those absorbed by the function. When the \textit{(function)} is used the \textit{(parameters)} absorbed cannot contain \texttt{\par} tokens. The assignment of a meaning to the \textit{(function)} is restricted to the current \TeX{} group level.

Sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} \((\#1, \#2, \text{etc.})\) will be replaced by those absorbed by the function. When the \textit{(function)} is used the \textit{(parameters)} absorbed cannot contain \texttt{\par} tokens. The assignment of a meaning to the \textit{(function)} is restricted to the current \TeX{} group level.

Sets \textit{(function)} to expand to \textit{(code)} as replacement text. Within the \textit{(code)}, the number of \textit{(parameters)} is detected automatically from the function signature. These \textit{(parameters)} \((\#1, \#2, \text{etc.})\) will be replaced by those absorbed by the function. The \textit{(function)} will not expand within an \texttt{x-type} or \texttt{e-type} argument. The assignment of a meaning to the \textit{(function)} is restricted to the current \TeX{} group level.
Sets \textit{function} to expand to \textit{code} as replacement text. Within the \textit{code}, the number of \textit{parameters} is detected automatically from the function signature. These \textit{parameters} (\#1, \#2, etc.) will be replaced by those absorbed by the function. When the \textit{function} is used the \textit{parameters} absorbed cannot contain \texttt{par} tokens. The \textit{function} will not expand within an \texttt{x}-type or \texttt{e}-type argument. The assignment of a meaning to the \textit{function} is global.

\begin{verbatim}
\cs_new_eq:NN \cs1 \cs2
\cs_new_eq:NN \cs1 \token
\end{verbatim}

Globally creates \textit{control sequence1} and sets it to have the same meaning as \textit{control sequence2} or \textit{token}. The second control sequence may subsequently be altered without affecting the copy.

\begin{verbatim}
\cs_set_eq:NN \cs1 \cs2
\cs_set_eq:NN \cs1 \token
\end{verbatim}

Sets \textit{control sequence1} to have the same meaning as \textit{control sequence2} (or \textit{token}). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the \textit{control sequence1} is restricted to the current \TeX group level.

\begin{verbatim}
\cs_gset_eq:NN \cs1 \cs2
\cs_gset_eq:NN \cs1 \token
\end{verbatim}

Globally sets \textit{control sequence1} to have the same meaning as \textit{control sequence2} (or \textit{token}). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the \textit{control sequence1} is not restricted to the current \TeX group level: the assignment is global.
4.3.5 Deleting control sequences

There are occasions where control sequences need to be deleted. This is handled in a very simple manner.

\cs_undefine:N \cs_undefine:c

Sets \textit{(control sequence)} to be globally undefined.

4.3.6 Showing control sequences

\cs_meaning:N \cs_meaning:c

This function expands to the \textit{meaning} of the \textit{(control sequence)} control sequence. For a macro, this includes the \textit{(replacement text)}.

\textbf{\TeX{}hackers note:} This is \TeX{}'s \texttt{\meaning} primitive. For tokens that are not control sequences, it is more logical to use \texttt{\token_to_meaning:N}. The \texttt{c} variant correctly reports undefined arguments.

\cs_show:N \cs_show:c

Displays the definition of the \textit{(control sequence)} on the terminal.

\textbf{\TeX{}hackers note:} This is similar to the \TeX{} primitive \texttt{\show}, wrapped to a fixed number of characters per line.

\cs_log:N \cs_log:c

Writes the definition of the \textit{(control sequence)} in the log file. See also \texttt{\cs_show:N} which displays the result in the terminal.

4.3.7 Converting to and from control sequences

\use:c \use:c \{\textit{(control sequence name)}\}

Expands the \textit{(control sequence name)} until only characters remain, and then converts this into a control sequence. This process requires two expansions. As in other \texttt{c}-type arguments the \textit{(control sequence name)} must, when fully expanded, consist of character tokens, typically a mixture of category code 10 (space), 11 (letter) and 12 (other).

As an example of the \texttt{\use:c} function, both
\begin{verbatim}
\use:c \{ a b c \}
\end{verbatim}

and
\begin{verbatim}
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl \{ a b c \}
\use:c \{ \tl_use:N \l_my_tl \}
\end{verbatim}
would be equivalent to
\abc

after two expansions of \use:c.

\cs_if_exist_use:N \cs_if_exist_use:c \cs_if_exist_use:N \cs_if_exist_use:c \cs_if_exist_use:N \cs_if_exist_use:c
\cs_if_exist_use:N \cs_if_exist_use:N \cs_if_exist_use:N \cs_if_exist_use:N \cs_if_exist_use:N \cs_if_exist_use:N

Tests whether the \textit{control sequence} is currently defined according to the conditional \cs_if_exist:NTF (whether as a function or another control sequence type), and if it is inserts the \textit{control sequence} into the input stream followed by the \textit{true code}. Otherwise the \textit{false code} is used.

\cs:w \cs:end:
\cs:end:

Converts the given \textit{control sequence name} into a single control sequence token. This process requires one expansion. The content for \textit{control sequence name} may be literal material or from other expandable functions. The \textit{control sequence name} must, when fully expanded, consist of character tokens which are not active: typically of category code 10 (space), 11 (letter) or 12 (other), or a mixture of these.

\TeX{}hackers note: These are the \TeX{} primitives \texttt{\csname} and \texttt{\endcsname}.

As an example of the \texttt{\cs:w} and \texttt{\cs_end:} functions, both
\cs:w a b c \cs_end:

and
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\cs:w \tl_use:N \l_my_tl \cs:end:

would be equivalent to
\abc

after one expansion of \cs:w.

\cs_to_str:N
\cs_to_str:N

Converts the given \textit{control sequence} into a series of characters with category code 12 (other), except spaces, of category code 10. The result does \textit{not} include the current escape token, contrarily to \texttt{token_to_str:N}. Full expansion of this function requires exactly 2 expansion steps, and so an \texttt{x}-type or \texttt{e}-type expansion, or two \texttt{o}-type expansions are required to convert the \textit{control sequence} to a sequence of characters in the input stream. In most cases, an \texttt{f}-expansion is correct as well, but this loses a space at the start of the result.
4.4 Analysing control sequences

\cs_split_function:N

\cs_split_function:N \langle function \rangle

Splits the \langle function \rangle into the \langle name \rangle (i.e. the part before the colon) and the \langle signature \rangle (i.e. after the colon). This information is then placed in the input stream in three parts: the \langle name \rangle, the \langle signature \rangle and a logic token indicating if a colon was found (to differentiate variables from function names). The \langle name \rangle does not include the escape character, and both the \langle name \rangle and \langle signature \rangle are made up of tokens with category code 12 (other).

The next three functions decompose \TeX macros into their constituent parts: if the \langle token \rangle passed is not a macro then no decomposition can occur. In the latter case, all three functions leave \scan_stop: in the input stream.

\cs_prefix_spec:N

\cs_prefix_spec:N \langle token \rangle

If the \langle token \rangle is a macro, this function leaves the applicable \TeX prefixes in input stream as a string of tokens of category code 12 (with spaces having category code 10). Thus for example

\cs_set:Npn \next:nn \#1\#2 \{ x \#1-y \#2 \}
\cs_prefix_spec:N \next:nn

leaves \long in the input stream. If the \langle token \rangle is not a macro then \scan_stop: is left in the input stream.

\textbf{\TeXhackers note:} The prefix can be empty, \long, \protected or \protected\long with backslash replaced by the current escape character.

\cs_parameter_spec:N

\cs_parameter_spec:N \langle token \rangle

If the \langle token \rangle is a macro, this function leaves the primitive \TeX parameter specification in input stream as a string of character tokens of category code 12 (with spaces having category code 10). Thus for example

\cs_set:Npn \next:nn \#1\#2 \{ x \#1 y \#2 \}
\cs_parameter_spec:N \next:nn

leaves \#1\#2 in the input stream. If the \langle token \rangle is not a macro then \scan_stop: is left in the input stream.

\textbf{\TeXhackers note:} If the parameter specification contains the string ->, then the function produces incorrect results.
If the \textit{token} is a macro, this function leaves the replacement text in input stream as a string of character tokens of category code 12 (with spaces having category code 10). Thus for example

\begin{verbatim}
\cs_set:Npn \next:nn #1#2 { x #1~y #2 }
\cs_replacement_spec:N \next:nn
\end{verbatim}

leaves $x\#1_y\#2$ in the input stream. If the \textit{token} is not a macro then \texttt{\textbackslash scan\_stop:} is left in the input stream.

\textbf{\TeXhacksnote}: If the parameter specification contains the string \texttt{->}, then the function produces incorrect results.

### 4.5 Using or removing tokens and arguments

Tokens in the input can be read and used or read and discarded. If one or more tokens are wrapped in braces then when absorbing them the outer set is removed. At the same time, the category code of each token is set when the token is read by a function (if it is read more than once, the category code is determined by the situation in force when first function absorbs the token).

\begin{verbatim}
\use:n \use:nn \use:nnn \use:nnnn
\end{verbatim}

As illustrated, these functions absorb between one and four arguments, as indicated by the argument specifier. The braces surrounding each argument are removed and the remaining tokens are left in the input stream. The category code of these tokens is also fixed by this process (if it has not already been by some other absorption). All of these functions require only a single expansion to operate, so that one expansion of

\begin{verbatim}
\use:nn { abc } { { def } }
\end{verbatim}

results in the input stream containing

\begin{verbatim}
abc { def }
\end{verbatim}

\textit{i.e.} only the outer braces are removed.

\textbf{\TeXhacksnote}: The \texttt{\use:n} function is equivalent to \LaTeX{} 2e’s \texttt{\textbackslash firstofone}.
These functions absorb two arguments from the input stream. The function \texttt{use\_i:nn} discards the second argument, and leaves the content of the first argument in the input stream. \texttt{use\_ii:nn} discards the first argument and leaves the content of the second argument in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

\textbf{TeXhackers note:} These are equivalent to \LaTeX\textrm{2\iota}'s \texttt{@firstoftwo} and \texttt{@secondoftwo}.

These functions absorb three arguments from the input stream. The function \texttt{use\_i:nnn} discards the second and third arguments, and leaves the content of the first argument in the input stream. \texttt{use\_ii:nnn} and \texttt{use\_iii:nnn} work similarly, leaving the content of second or third arguments in the input stream, respectively. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

These functions absorb four arguments from the input stream. The function \texttt{use\_i:nnnn} discards the second, third and fourth arguments, and leaves the content of the first argument in the input stream. \texttt{use\_ii:nnnn}, \texttt{use\_iii:nnnn} and \texttt{use\_iv:nnnn} work similarly, leaving the content of second, third or fourth arguments in the input stream, respectively. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

This function absorbs three arguments and leaves the content of the first and second in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the function to take effect. An example:

\begin{verbatim}
\texttt{use\_i\_ii:nnn} \{ abc \} \{ \texttt{def} \} \{ ghi \}
\end{verbatim}

results in the input stream containing

\begin{verbatim}
abc \{ def \}
\end{verbatim}

i.e. the outer braces are removed and the third group is removed.

This function absorbs two arguments and leaves the content of the second and first in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the function to take effect.

\textbf{Rev: 2019-06-02}
These functions absorb between one and nine groups from the input stream, leaving nothing on the resulting input stream. These functions work after a single expansion. One or more of the \( n \) arguments may be an unbraced single token (i.e. an \( N \) argument).

**\TeXhackers note:** These are equivalent to \LaTeX\( \text{2e} \)'s \texttt{\@gobble}, \texttt{\@gobbletwo}, etc.

Fully expands the \textit{token list} in an \textsc{x}-type manner, but the function remains fully expandable, and parameter character (usually \#) need not be doubled.

**\TeXhackers note:** \texttt{\use:e} is a wrapper around the primitive \texttt{\expanded} where it is available: it requires two expansions to complete its action. When \texttt{\expanded} is not available this function is very slow.

Fully expands the \textit{expandable tokens} and inserts the result into the input stream at the current location. Any hash characters (\#) in the argument must be doubled.

### 4.5.1 Selecting tokens from delimited arguments

A different kind of function for selecting tokens from the token stream are those that use delimited arguments.

Absorb the \textit{balanced text} from the input stream delimited by the marker given in the function name, leaving nothing in the input stream.

Absorb the \textit{balanced text} from the input stream delimited by the marker given in the function name, leaving \textit{inserted tokens} in the input stream for further processing.

### 4.6 Predicates and conditionals

\LTX3 has three concepts for conditional flow processing:
Branching conditionals Functions that carry out a test and then execute, depending on its result, either the code supplied as the \textit{(true code)} or the \textit{(false code)}. These arguments are denoted with \texttt{T} and \texttt{F}, respectively. An example would be

\begin{verbatim}
cs_if_free:cTF {abc} \{ (true code) \} \{ (false code) \}
\end{verbatim}

a function that turns the first argument into a control sequence (since it’s marked as \texttt{c}) then checks whether this control sequence is still free and then depending on the result carries out the code in the second argument (true case) or in the third argument (false case).

These type of functions are known as “conditionals”: whenever a \texttt{TF} function is defined it is usually accompanied by \texttt{T} and \texttt{F} functions as well. These are provided for convenience when the branch only needs to go a single way. Package writers are free to choose which types to define but the kernel definitions always provide all three versions.

Important to note is that these branching conditionals with \textit{(true code)} and/or \textit{(false code)} are always defined in a way that the code of the chosen alternative can operate on following tokens in the input stream.

These conditional functions may or may not be fully expandable, but if they are expandable they are accompanied by a “predicate” for the same test as described below.

Predicates “Predicates” are functions that return a special type of boolean value which can be tested by the boolean expression parser. All functions of this type are expandable and have names that end with \texttt{_p} in the description part. For example,

\begin{verbatim}
cs_if_free_p:N
\end{verbatim}

would be a predicate function for the same type of test as the conditional described above. It would return “true” if its argument (a single token denoted by \texttt{N}) is still free for definition. It would be used in constructions like

\begin{verbatim}
\bool_if:nTF {
  \cs_if_free_p:N \l_tmpz_tl || \cs_if_free_p:N \g_tmpz_tl
} \{ (true code) \} \{ (false code) \}
\end{verbatim}

For each predicate defined, a “branching conditional” also exists that behaves like a conditional described above.

Primitive conditionals There is a third variety of conditional, which is the original concept used in plain \TeX and \LaTeX\textit{2e}. Their use is discouraged in \texttt{expl3} (although still used in low-level definitions) because they are more fragile and in many cases require more expansion control (hence more code) than the two types of conditionals described above.

\begin{verbatim}
c_true_bool
c_false_bool
\end{verbatim}

Constants that represent \texttt{true} and \texttt{false}, respectively. Used to implement predicates.
4.6.1 Tests on control sequences

| \cs_if_eq_p:NN   | \cs_if_eq_p:NN ⟨cs₁⟩ ⟨cs₂⟩                           |
| \cs_if_eq:NNTF   | \cs_if_eq:NNTF ⟨cs₁⟩ ⟨cs₂⟩ \{(true code)\} \{(false code)\} |

Compares the definition of two ⟨control sequences⟩ and is logically true if they are the same, i.e. if they have exactly the same definition when examined with \cs_show:N.

| \cs_if_exist_p:N  | \cs_if_exist_p:N ⟨control sequence⟩                      |
| \cs_if_exist_p:c   | \cs_if_exist_p:c ⟨control sequence⟩ \{(true code)\} \{(false code)\} |
| \cs_if_exist:NTF   | \cs_if_exist:NTF ⟨control sequence⟩ \{(true code)\} \{(false code)\} |
| \cs_if_exist:NTF   | \cs_if_exist:NTF ⟨control sequence⟩ \{(true code)\} \{(false code)\} |

Tests whether the ⟨control sequence⟩ is currently defined (whether as a function or another control sequence type). Any definition of ⟨control sequence⟩ other than \relax evaluates as true.

| \cs_if_free_p:N   | \cs_if_free_p:N ⟨control sequence⟩                      |
| \cs_if_free_p:c   | \cs_if_free_p:c ⟨control sequence⟩ \{(true code)\} \{(false code)\} |
| \cs_if_free:NTF   | \cs_if_free:NTF ⟨control sequence⟩ \{(true code)\} \{(false code)\} |
| \cs_if_free:NTF   | \cs_if_free:NTF ⟨control sequence⟩ \{(true code)\} \{(false code)\} |

Tests whether the ⟨control sequence⟩ is currently free to be defined. This test is false if the ⟨control sequence⟩ currently exists (as defined by \cs_if_exist:NTF).

4.6.2 Primitive conditionals

The ε-TeX engine itself provides many different conditionals. Some expand whatever comes after them and others don’t. Hence the names for these underlying functions often contains a :w part but higher level functions are often available. See for instance \int_compare_p:nNn which is a wrapper for \if_int_compare:w.

Certain conditionals deal with specific data types like boxes and fonts and are described there. The ones described below are either the universal conditionals or deal with control sequences. We prefix primitive conditionals with \if_.

| \if_true:         | \if_true: ⟨true code⟩ \else: ⟨false code⟩ \fi: |
| \if_false:        | \if_false: ⟨true code⟩ \else: ⟨false code⟩ \fi: |
| \else:            | \reverse_if:N ⟨primitive conditional⟩ |
| \fi:              | \reverse_if:N ⟨true code⟩, while \if_false: always executes ⟨false code⟩. \reverse_if:N reverses any two-way primitive conditional. \else: and \fi: delimit the branches of the conditional. The function \or: is documented in \texttt{l3int} and used in case switches. |

\TeXhackers note: These are equivalent to their corresponding \TeX primitive conditionals; \reverse_if:N is ε-TeX’s \unless.

| \if_meaning:w     | \if_meaning:w ⟨arg₁⟩ ⟨arg₂⟩ ⟨true code⟩ \else: ⟨false code⟩ \fi: |

\if_meaning:w executes ⟨true code⟩ when ⟨arg₁⟩ and ⟨arg₂⟩ are the same, otherwise it executes ⟨false code⟩. ⟨arg₁⟩ and ⟨arg₂⟩ could be functions, variables, tokens; in all cases the unexpanded definitions are compared.

\TeXhackers note: This is \TeX’s \ifx.
These conditionals expand any following tokens until two unexpandable tokens are left. If you wish to prevent this expansion, prefix the token in question with \exp_not:N. \if_catcode:w tests if the category codes of the two tokens are the same whereas \if:w tests if the character codes are identical. \if_charcode:w is an alternative name for \if:w.

\if cs_exist:N * \if cs_exist:w * \if cs_exist:w \if cs_exist:w \if cs_exist:w \if cs_exist:w
Check if \cs appears in the hash table or if the control sequence that can be formed from \tokens appears in the hash table. The latter function does not turn the control sequence in question into \scan_stop:! This can be useful when dealing with control sequences which cannot be entered as a single token.

\if_mode_horizontal: * \if_mode_horizontal: \if_mode_horizontal: \if_mode_horizontal: \if_mode_horizontal: \if_mode_horizontal:
\if_mode_vertical: * \if_mode_math: * \if_mode_inner: 
Execute \true code if currently in horizontal mode, otherwise execute \false code. Similar for the other functions.

4.7 Starting a paragraph

\mode_leave_vertical: \mode_leave_vertical: \mode_leave_vertical: \mode_leave_vertical: \mode_leave_vertical:
Ensures that TEX is not in vertical (inter-paragraph) mode. In horizontal or math mode this command has no effect, in vertical mode it switches to horizontal mode, and inserts a box of width \parindent, followed by the \everypar token list.

\TeXhackers note: This results in the contents of the \everypar token register being inserted, after \mode_leave_vertical: is complete. Notice that in contrast to the \TeX2c \leavevmode approach, no box is used by the method implemented here.
4.8 Debugging support

\debug_on:n \debug_on:n \{ comma-separated list \} \\
\debug_off:n \debug_off:n \{ comma-separated list \} \\

New: 2017-07-16
Updated: 2017-08-02

Turn on and off within a group various debugging code, some of which is also available as expl3 load-time options. The items that can be used in the ⟨list⟩ are

- **check-declarations** that checks all expl3 variables used were previously declared and that local/global variables (based on their name or on their first assignment) are only locally/globally assigned;
- **check-expressions** that checks integer, dimension, skip, and muskip expressions are not terminated prematurely;
- **deprecation** that makes soon-to-be-deprecated commands produce errors;
- **log-functions** that logs function definitions;
- **all** that does all of the above.

Providing these as switches rather than options allows testing code even if it relies on other packages: load all other packages, call \debug_on:n, and load the code that one is interested in testing. These functions can only be used in \LaTeXe package mode loaded with enable-debug or another option implying it.

\debug_suspend: \debug_suspen... \debug_resume:
\debug_suspend: ... \debug_resume:

New: 2017-11-28

Suppress (locally) errors and logging from \debug commands, except for the **deprecation** errors or warnings. These pairs of commands can be nested. This can be used around pieces of code that are known to fail checks, if such failures should be ignored. See for instance l3cfoffins.
Chapter 5

The l3expan package

Argument expansion

This module provides generic methods for expanding \TeX arguments in a systematic manner. The functions in this module all have prefix `exp`.

Not all possible variations are implemented for every base function. Instead only those that are used within the \L\TeX kernel or otherwise seem to be of general interest are implemented. Consult the module description to find out which functions are actually defined. The next section explains how to define missing variants.

5.1 Defining new variants

The definition of variant forms for base functions may be necessary when writing new functions or when applying a kernel function in a situation that we haven’t thought of before.

Internally preprocessing of arguments is done with functions of the form `\exp_...`. They all look alike, an example would be `\exp_args:NNo`. This function has three arguments, the first and the second are a single tokens, while the third argument should be given in braces. Applying `\exp_args:NNo` expands the content of third argument once before any expansion of the first and second arguments. If `\seq_gpush:No` was not defined it could be coded in the following way:

\begin{verbatim}
\exp_args:NNo \seq_gpush:Nn \g_file_name_stack { \l_tmpa_tl }
\end{verbatim}

In other words, the first argument to `\exp_args:NNo` is the base function and the other arguments are preprocessed and then passed to this base function. In the example the first argument to the base function should be a single token which is left unchanged while the second argument is expanded once. From this example we can also see how the variants are defined. They just expand into the appropriate `\exp_` function followed by the desired base function, e.g.

\begin{verbatim}
\cs_generate_variant:Nn \seq_gpush:Nn { No }
\end{verbatim}

results in the definition of `\seq_gpush:No`
Providing variants in this way in style files is safe as the \cs_generate_variant:Nn function will only create new definitions if there is not already one available. Therefore adding such definition to later releases of the kernel will not make such style files obsolete.

The steps above may be automated by using the function \cs_generate_variant:Nn, described next.

### 5.2 Methods for defining variants

We recall the set of available argument specifiers.

- **N** is used for single-token arguments while c constructs a control sequence from its name and passes it to a parent function as an N-type argument.

- Many argument types extract or expand some tokens and provide it as an n-type argument, namely a braced multiple-token argument: V extracts the value of a variable, v extracts the value from the name of a variable, n uses the argument as it is, o expands once, f expands fully the front of the token list, e and x expand fully all tokens (differences are explained later).

- A few odd argument types remain: T and F for conditional processing, otherwise identical to n-type arguments, p for the parameter text in definitions, w for arguments with a specific syntax, and D to denote primitives that should not be used directly.
This function is used to define argument-specifier variants of the \emph{(parent control sequence)} for \TeX3 code-level macros. The \emph{(parent control sequence)} is first separated into the \emph{(base name)} and \emph{(original argument specifier)}. The comma-separated list of \emph{(variant argument specifiers)} is then used to define variants of the \emph{(original argument specifier)} if these are not already defined. For each \emph{(variant)} given, a function is created that expands its arguments as detailed and passes them to the \emph{(parent control sequence)}. So for example

\begin{verbatim}
  \cs_set:Npn \foo:Nn #1#2 { code here }
  \cs_generate_variant:Nn \foo:Nn { c }
\end{verbatim}

creates a new function \texttt{\foo:cn} which expands its first argument into a control sequence name and passes the result to \texttt{\foo:Nn}. Similarly

\begin{verbatim}
  \cs_generate_variant:Nn \foo:Nn { NV , cV }
\end{verbatim}

generates the functions \texttt{\foo:NV} and \texttt{\foo:cV} in the same way. The \texttt{\cs_generate_variant:Nn} function can only be applied if the \emph{(parent control sequence)} is already defined. If the \emph{(parent control sequence)} is protected or if the \emph{(variant)} involves any \texttt{x} argument, then the \emph{(variant control sequence)} is also protected. The \emph{(variant)} is created globally, as is any \texttt{\exp_args:N(variant)} function needed to carry out the expansion.

Only \texttt{n} and \texttt{N} arguments can be changed to other types. The only allowed changes are

- \texttt{c} variant of an \texttt{N} parent;
- \texttt{o}, \texttt{V}, \texttt{v}, \texttt{f}, \texttt{e}, or \texttt{x} variant of an \texttt{n} parent;
- \texttt{N}, \texttt{n}, \texttt{T}, \texttt{F}, or \texttt{p} argument unchanged.

This means the \emph{(parent)} of a \emph{(variant)} form is always unambiguous, even in cases where both an \texttt{n}-type parent and an \texttt{N}-type parent exist, such as for \texttt{\tl_count:n} and \texttt{\tl_count:N}.

For backward compatibility it is currently possible to make \texttt{n}, \texttt{o}, \texttt{V}, \texttt{v}, \texttt{f}, \texttt{e}, or \texttt{x}-type variants of an \texttt{N}-type argument or \texttt{N} or \texttt{c}-type variants of an \texttt{n}-type argument. Both are deprecated. The first because passing more than one token to an \texttt{N}-type argument will typically break the parent function’s code. The second because programmers who use that most often want to access the value of a variable given its name, hence should use a \texttt{V}-type or \texttt{v}-type variant instead of \texttt{c}-type. In those cases, using the lower-level \texttt{\exp_args:No} or \texttt{\exp_args:Nc} functions explicitly is preferred to defining confusing variants.

### 5.3 Introducing the variants

The \texttt{V} type returns the value of a register, which can be one of \texttt{tl}, \texttt{clist}, \texttt{int}, \texttt{skip}, \texttt{dim}, \texttt{muskip}, or built-in \TeX registers. The \texttt{v} type is the same except it first creates a control sequence out of its argument before returning the value.

In general, the programmer should not need to be concerned with expansion control. When simply using the content of a variable, functions with a \texttt{V} specifier should be used. For those referred to by \texttt{(cs)name}, the \texttt{v} specifier is available for the same purpose. Only
when specific expansion steps are needed, such as when using delimited arguments, should the lower-level functions with \texttt{o} specifiers be employed.

The \texttt{e} type expands all tokens fully, starting from the first. More precisely the expansion is identical to that of \TeX's \texttt{\message} (in particular \texttt{#} needs not be doubled). It was added in May 2018. In recent enough engines (starting around 2019) it relies on the primitive \texttt{\expanded} hence is fast. In older engines it is very much slower. As a result it should only be used in performance critical code if typical users will have a recent installation of the \TeX{} ecosystem.

The \texttt{x} type expands all tokens fully, starting from the first. In contrast to \texttt{e}, all macro parameter characters \texttt{#} must be doubled, and omitting this leads to low-level errors. In addition this type of expansion is not expandable, namely functions that have \texttt{x} in their signature do not themselves expand when appearing inside \texttt{x} or \texttt{e} expansion.

The \texttt{f} type is so special that it deserves an example. It is typically used in contexts where only expandable commands are allowed. Then \texttt{x}-expansion cannot be used, and \texttt{f}-expansion provides an alternative that expands the front of the token list as much as can be done in such contexts. For instance, say that we want to evaluate the integer expression \texttt{3 + 4} and pass the result \texttt{7} as an argument to an expandable function \texttt{\example:n}. For this, one should define a variant using \texttt{\cs_generate_variant:Nn \example:n { f }}, then do

\begin{verbatim}
\example:f { \int_eval:n { 3 + 4 } }
\end{verbatim}

Note that \texttt{x}-expansion would also expand \texttt{\int_eval:n} fully to its result \texttt{7}, but the variant \texttt{\example:x} cannot be expandable. Note also that \texttt{o}-expansion would not expand \texttt{\int_eval:n} fully to its result since that function requires several expansions. Besides the fact that \texttt{x}-expansion is protected rather than expandable, another difference between \texttt{f}-expansion and \texttt{x}-expansion is that \texttt{f}-expansion expands tokens from the beginning and stops as soon as a non-expandable token is encountered, while \texttt{x}-expansion continues expanding further tokens. Thus, for instance

\begin{verbatim}
\example:f { \int_eval:n { 1 + 2 } , \int_eval:n { 3 + 4 } }
\end{verbatim}

results in the call

\begin{verbatim}
\example:n { 3 , \int_eval:n { 3 + 4 } }
\end{verbatim}

while using \texttt{\example:x} or \texttt{\example:e} instead results in

\begin{verbatim}
\example:n { 3 , 7 }
\end{verbatim}

at the cost of being protected (for \texttt{x} type) or very much slower in old engines (for \texttt{e} type). If you use \texttt{f} type expansion in conditional processing then you should stick to using \texttt{TF} type functions only as the expansion does not finish any \texttt{\if... \fi}: itself!

It is important to note that both \texttt{f} and \texttt{o}-type expansion are concerned with the expansion of tokens from left to right in their arguments. In particular, \texttt{o}-type expansion applies to the first \textit{token} in the argument it receives: it is conceptually similar to

\begin{verbatim}
\exp_after:wN \texttt{<base function>} \exp_after:wN \{ \texttt{<argument>} \}
\end{verbatim}

At the same time, \texttt{f}-type expansion stops at the \textit{first} non-expandable token. This means for example that both

\begin{verbatim}
\tl_set:Nn \tl_tmpa_tl { \{ \g_tmpb_tl \} }
\end{verbatim}
Variants with \texttt{x}-type arguments (that are fully expanded before being passed to the \texttt{n}-type base function) are never expandable even when the base function is. Such variants cannot work correctly in arguments that are themselves subject to expansion. Consider using \texttt{f} or \texttt{e} expansion.

- In contrast, \texttt{e} expansion (full expansion, almost like \texttt{x} except for the treatment of \#) does not prevent variants from being expandable (if the base function is). The drawback is that \texttt{e} expansion is very much slower in old engines (before 2019). Consider using \texttt{f} expansion if that type of expansion is sufficient to perform the required expansion, or \texttt{x} expansion if the variant will not itself need to be expandable.

- Finally \texttt{f} expansion only expands the front of the token list, stopping at the first non-expandable token. This may fail to fully expand the argument.

When speed is essential (for functions that do very little work and whose variants are used numerous times in a document) the following considerations apply because internal functions for argument expansion come in two flavours, some faster than others.

- Arguments that might need expansion should come first in the list of arguments.

- Arguments that should consist of single tokens \texttt{N}, \texttt{c}, \texttt{V}, or \texttt{v} should come first among these.

- Arguments that appear after the first multi-token argument \texttt{n}, \texttt{f}, \texttt{e}, or \texttt{o} require slightly slower special processing to be expanded. Therefore it is best to use the optimized functions, namely those that contain only \texttt{N}, \texttt{c}, \texttt{V}, and \texttt{v}, and, in the last position, \texttt{o}, \texttt{f}, \texttt{e}, with possible trailing \texttt{N} or \texttt{n} or \texttt{T} or \texttt{F}, which are not expanded. Any \texttt{x}-type argument causes slightly slower processing.

### 5.4 Manipulating the first argument

These functions are described in detail: expansion of multiple tokens follows the same rules but is described in a shorter fashion.

\begin{verbatim}
\exp_args:Nc \exp_args:cc
\end{verbatim}

This function absorbs two arguments (the \texttt{function} name and the \texttt{tokens}). The \texttt{tokens} are expanded until only characters remain, and are then turned into a control sequence. The result is inserted into the input stream after reinsertion of the \texttt{function}. Thus the \texttt{function} may take more than one argument: all others are left unchanged.

The \texttt{:cc} variant constructs the \texttt{function} name in the same manner as described for the \texttt{tokens}.
This function absorbs two arguments (the \textit{function} name and the \textit{tokens}). The \textit{tokens} are expanded once, and the result is inserted in braces into the input stream after reinsertion of the \textit{function}. Thus the \textit{function} may take more than one argument: all others are left unchanged.

This function absorbs two arguments (the names of the \textit{function} and the \textit{variable}). The content of the \textit{variable} are recovered and placed inside braces into the input stream after reinsertion of the \textit{function}. Thus the \textit{function} may take more than one argument: all others are left unchanged.

This function absorbs two arguments (the \textit{function} name and the \textit{tokens}). The \textit{tokens} are expanded until only characters remain, and are then turned into a control sequence. This control sequence should be the name of a \textit{variable}. The content of the \textit{variable} are recovered and placed inside braces into the input stream after reinsertion of the \textit{function}. Thus the \textit{function} may take more than one argument: all others are left unchanged.

This function absorbs two arguments (the \textit{function} name and the \textit{tokens}) and exhaustively expands the \textit{tokens}. The result is inserted in braces into the input stream after reinsertion of the \textit{function}. Thus the \textit{function} may take more than one argument: all others are left unchanged.

\textbf{\LaTeX} hackers note: This relies on the \texttt{\expanded} primitive when available (in \LaTeX{} and starting around 2019 in other engines). Otherwise it uses some fall-back code that is very much slower. As a result it should only be used in performance-critical code if typical users have a recent installation of the \TeX{} ecosystem.

This function absorbs two arguments (the \textit{function} name and the \textit{tokens}) and exhaustively expands the \textit{tokens}. The result is inserted in braces into the input stream after reinsertion of the \textit{function}. Thus the \textit{function} may take more than one argument: all others are left unchanged.

This function absorbs two arguments (the \textit{function} name and the \textit{tokens}) and exhaustively expands the \textit{tokens}. The result is inserted in braces into the input stream after reinsertion of the \textit{function}. Thus the \textit{function} may take more than one argument: all others are left unchanged.
5.5 Manipulating two arguments

\[ \exp_args:NNc \langle \text{token}_1 \rangle \langle \text{token}_2 \rangle \{\langle \text{tokens} \rangle} \]

These optimized functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments.

\[ \exp_args:NNo \langle \text{token} \rangle \{\langle \text{tokens}_1 \rangle\} \{\langle \text{tokens}_2 \rangle} \]

These functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments. These functions need slower processing.

\[ \exp_args:Nxc \langle \text{token}_1 \rangle \langle \text{token}_2 \rangle \{\langle \text{tokens} \rangle} \]

These functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments. These functions are not expandable due to their x-type argument.

5.6 Manipulating three arguments

\[ \exp_args:NNNo \langle \text{token}_1 \rangle \langle \text{token}_2 \rangle \langle \text{token}_3 \rangle \{\langle \text{tokens} \rangle} \]

These optimized functions absorb four arguments and expand the second, third and fourth as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second argument, etc.
These functions absorb four arguments and expand the second, third and fourth as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second argument, etc. These functions need slower processing.

\exp_last_unbraced:NNf
\exp_last_unbraced:NNNo
\exp_last_unbraced:NNnf

\exp_last_unbraced:Nf \foo_bar:w \{ \} \q_stop leads to an infinite loop, as the quark is f-expanded.

\TeXhackers\ note: As an optimization, the last argument is unbraced by some of those functions before expansion. This can cause problems if the argument is empty: for instance, Updated: 2018-05-15

5.7 Unbraced expansion

Updated: 2018-05-15
\exp_last_unbraced:Nx \exp_last_unbraced:Nx \langle function \rangle \{ \langle tokens \rangle \}

This function fully expands the \langle tokens \rangle and leaves the result in the input stream after reinsertion of the \langle function \rangle. This function is not expandable.

\exp_last_two_unbraced:Noo \exp_last_two_unbraced:Noo \langle token \rangle \{ \langle tokens_1 \rangle \} \{ \langle tokens_2 \rangle \}

This function absorbs three arguments and expands the second and third once. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments, which are not wrapped in braces. This function needs special (slower) processing.

\exp_after:wN \exp_after:wN \langle token_1 \rangle \langle token_2 \rangle

Carries out a single expansion of \langle token_2 \rangle (which may consume arguments) prior to the expansion of \langle token_1 \rangle. If \langle token_2 \rangle has no expansion (for example, if it is a character) then it is left unchanged. It is important to notice that \langle token_1 \rangle may be any single token, including group-opening and -closing tokens (\{ or \} assuming normal \TeX{} category codes). Unless specifically required this should be avoided: expansion should be carried out using an appropriate argument specifier variant or the appropriate \exp_arg:N function.

\TeX hackers note: This is the \TeX{} primitive \expandafter renamed.

### 5.8 Preventing expansion

Despite the fact that the following functions are all about preventing expansion, they’re designed to be used in an expandable context and hence are all marked as being ‘ expansible’ since they themselves disappear after the expansion has completed.

\exp_not:N \exp_not:N \langle token \rangle

Prevents expansion of the \langle token \rangle in a context where it would otherwise be expanded, for example an \texttt{x}-type argument or the first token in an \texttt{o} or \texttt{e} or \texttt{f} argument.

\TeX hackers note: This is the \TeX{} \noexpand primitive. It only prevents expansion. At the beginning of an \texttt{f}-type argument, a space \langle token \rangle is removed even if it appears as \exp_not:N \c_space_token. In an \texttt{x}-expanding definition (\cs_new:Npx), a macro parameter introduces an argument even if it appears as \exp_not:N # 1. This differs from \exp_not:n.

\exp_not:c \exp_not:c \{ \langle tokens \rangle \}

Expands the \langle tokens \rangle until only characters remain, and then converts this into a control sequence. Further expansion of this control sequence is then inhibited using \exp_not:N.
\textbf{\exp_not:n} \hspace*{1em} \exp_not:n \{\langle \text{tokens} \rangle\}

Prevents expansion of the \langle tokens \rangle in an \texttt{e} or \texttt{x}-type argument. In all other cases the \langle tokens \rangle continue to be expanded, for example in the input stream or in other types of arguments such as \texttt{c}, \texttt{f}, \texttt{v}. The argument of \exp_not:n must be surrounded by braces.

\textbf{\TeXhackers note:} This is the \texttt{\textasciitilde\TeX} \texttt{\textbackslash unexpanded} primitive. In an \texttt{x}-expanding definition (\cs_new:N PX), \exp_not:n \{#1\} is equivalent to \#\#1 rather than to \#1, namely it inserts the two characters # and 1. In an \texttt{e}-type argument \exp_not:n \{\#\} is equivalent to \#, namely it inserts the character #.

\textbf{\exp_not:o} \hspace*{1em} \exp_not:o \{\langle \text{tokens} \rangle\}

Expands the \langle tokens \rangle once, then prevents any further expansion in \texttt{x}-type or \texttt{e}-type arguments using \exp_not:n.

\textbf{\exp_not:V} \hspace*{1em} \exp_not:V \{\langle \text{variable} \rangle\}

Recovers the content of the \langle variable \rangle, then prevents expansion of this material in \texttt{x}-type or \texttt{e}-type arguments using \exp_not:n.

\textbf{\exp_not:v} \hspace*{1em} \exp_not:v \{\langle \text{tokens} \rangle\}

Expands the \langle tokens \rangle until only characters remains, and then converts this into a control sequence which should be a \langle variable \rangle name. The content of the \langle variable \rangle is recovered, and further expansion in \texttt{x}-type or \texttt{e}-type arguments is prevented using \exp_not:n.

\textbf{\exp_not:e} \hspace*{1em} \exp_not:e \{\langle \text{tokens} \rangle\}

Expands \langle tokens \rangle exhaustively, then protects the result of the expansion (including any tokens which were not expanded) from further expansion in \texttt{e} or \texttt{x}-type arguments using \exp_not:n. This is very rarely useful but is provided for consistency.

\textbf{\exp_not:f} \hspace*{1em} \exp_not:f \{\langle \text{tokens} \rangle\}

Expands \langle tokens \rangle fully until the first unexpandable token is found (if it is a space it is removed). Expansion then stops, and the result of the expansion (including any tokens which were not expanded) is protected from further expansion in \texttt{x}-type or \texttt{e}-type arguments using \exp_not:n.

\textbf{\exp_stop_f:} \hspace*{1em} \foo_bar:f \{\langle \text{tokens} \rangle \exp_stop_f: \langle \text{more tokens} \rangle\}

This function terminates an \texttt{f}-type expansion. Thus if a function \foo_bar:f starts an \texttt{f}-type expansion and all of \langle tokens \rangle are expandable \exp_stop_f: terminates the expansion of tokens even if \langle more tokens \rangle are also expandable. The function itself is an implicit space token. Inside an \texttt{x}-type or \texttt{e}-type expansion, it retains its form, but when typeset it produces the underlying space (\texttt{\textbackslash \textasciitilde}).

\section*{5.9 Controlled expansion}

The \texttt{expl3} language makes all efforts to hide the complexity of \TeXX expansion from the programmer by providing concepts that evaluate/expand arguments of functions prior to
calling the “base” functions. Thus, instead of using many \expandafter calls and other trickery it is usually a matter of choosing the right variant of a function to achieve a desired result.

Of course, deep down \TeX{} is using expansion as always and there are cases where a programmer needs to control that expansion directly; typical situations are basic data manipulation tools. This section documents the functions for that level. These commands are used throughout the kernel code, but we hope that outside the kernel there will be little need to resort to them. Instead the argument manipulation methods document above should usually be sufficient.

While \exp_after:wN expands one token (out of order) it is sometimes necessary to expand several tokens in one go. The next set of commands provide this functionality. Be aware that it is absolutely required that the programmer has full control over the tokens to be expanded, i.e., it is not possible to use these functions to expand unknown input as part of \langle expandable-tokens\rangle as that will break badly if unexpandable tokens are encountered in that place!

\begin{tabular}{|l|}
\hline
\exp:w & \exp:w \langle expandable tokens\rangle \exp_end: \\
\exp_end: & * \exp_end: * \\
\hline
\end{tabular}

Expands \langle expandable-tokens\rangle until reaching \exp_end: at which point expansion stops. The full expansion of \langle expandable tokens\rangle has to be empty. If any token in \langle expandable tokens\rangle or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result \exp_end: will be misinterpreted later on.

In typical use cases the \exp_end: is hidden somewhere in the replacement text of \langle expandable-tokens\rangle rather than being on the same expansion level than \exp:w, e.g., you may see code such as

\begin{verbatim}
\exp:w \@@_case:NnTF #1 {#2} { } { }
\end{verbatim}

where somewhere during the expansion of \@@_case:NnTF the \exp_end: gets generated.

\TeX{}hackers note: The current implementation uses \romannumeral hence ignores space tokens and explicit signs + and – in the expansion of the \langle expandable tokens\rangle, but this should not be relied upon.

\footnote{Due to the implementation you might get the character in position 0 in the current font (typically “\texttt{“}”) in the output without any error message!}
Expands \langle expandable-tokens \rangle until reaching \exp_end_continue_f:w at which point expansion continues as an \f-type expansion expanding \langle further-tokens \rangle until an unexpandable token is encountered (or the \f-type expansion is explicitly terminated by \exp_stop_f:). As with all \f-type expansions a space ending the expansion gets removed.

The full expansion of \langle expandable-tokens \rangle has to be empty. If any token in \langle expandable-tokens \rangle or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result \exp_end_continue_f:w will be misinterpreted later on.\(^5\)

In typical use cases \langle expandable-tokens \rangle contains no tokens at all, e.g., you will see code such as

\begin{verbatim}
\exp_after:wN { \exp:w \exp_end_continue_f:w #2 }
\end{verbatim}

where the \exp_after:wN triggers an \f-type expansion of the tokens in #2. For technical reasons this has to happen using two tokens (if they would be hidden inside another command \exp_after:wN would only expand the command but not trigger any additional \f-expansion).

You might wonder why there are two different approaches available, after all the effect of

\begin{verbatim}
\exp:w \langle expandable-tokens \rangle \exp_end:
\end{verbatim}

can be alternatively achieved through an \f-type expansion by using \exp_stop_f:, i.e.

\begin{verbatim}
\exp:w \exp_end_continue_f:w \langle expandable-tokens \rangle \exp_stop_f:
\end{verbatim}

The reason is simply that the first approach is slightly faster (one less token to parse and less expansion internally) so in places where such performance really matters and where we want to explicitly stop the expansion at a defined point the first form is preferable.

\begin{verbatim}
\exp:w \langle expandable-tokens \rangle \exp_end_continue_f:nw \langle further-tokens \rangle
\end{verbatim}

The difference to \exp_end_continue_f:w is that we first we pick up an argument which is then returned to the input stream. If \langle further-tokens \rangle starts with space tokens then these space tokens are removed while searching for the argument. If it starts with a brace group then the braces are removed. Thus such spaces or braces will not terminate the \f-type expansion.

\(^5\)In this particular case you may get a character into the output as well as an error message.
5.10 Internal functions

\cs_new:Npn \exp_args:Ncof { \::c \::o \::f \::: }
\exp_last_unbraced:Nno { \::n \::o_unbraced \::: }

Internal forms for the base expansion types. These names do *not* conform to the general \TeX{}3 approach as this makes them more readily visible in the log and so forth. They should not be used outside this module.

\cs_new:Npn \exp_last_unbraced:Nno { \::n \::o_unbraced \::: }

Internal forms for the expansion types which leave the terminal argument unbraced. These names do *not* conform to the general \TeX{}3 approach as this makes them more readily visible in the log and so forth. They should not be used outside this module.
Chapter 6

The \texttt{l3sort} package

Sorting functions

6.1 Controlling sorting

\LaTeX{} comes with a facility to sort list variables (sequences, token lists, or comma-lists) according to some user-defined comparison. For instance,

\begin{verbatim}
\clist_set:Nn \l_foo_clist { 3 , 01 , -2 , 5 , +1 }
\clist_sort:Nn \l_foo_clist
{ \int_compare:nNnTF { #1 } > { #2 }
{ \sort_return_swapped: }
{ \sort_return_same: }
}
\end{verbatim}

results in $\l_foo_clist$ holding the values $\{-2, 01, +1, 3, 5\}$ sorted in non-decreasing order.

The code defining the comparison should call \texttt{\sort_return_swapped}: if the two items given as \texttt{#1} and \texttt{#2} are not in the correct order, and otherwise it should call \texttt{\sort_return_same}: to indicate that the order of this pair of items should not be changed.

For instance, a \langle\textit{comparison code}\rangle consisting only of \texttt{\sort_return_same}: with no test yields a trivial sort: the final order is identical to the original order. Conversely, using a \langle\textit{comparison code}\rangle consisting only of \texttt{\sort_return_swapped}: reverses the list (in a fairly inefficient way).

\textbf{\LaTeX{}hackers note}: The current implementation is limited to sorting approximately 20000 items (40000 in \LaTeX{}), depending on what other packages are loaded.

Internally, the code from \texttt{l3sort} stores items in \texttt{\toks} registers allocated locally. Thus, the \langle\textit{comparison code}\rangle should not call \texttt{\newtoks} or other commands that allocate new \texttt{\toks} registers. On the other hand, altering the value of a previously allocated \texttt{\toks} register is not a problem.
\texttt{\textbf{\textcolor{red}{sort\_return\_same}}}: \texttt{\textbackslash seq\_sort\_Nn (seq \ var)}

\texttt{\textbf{\textcolor{red}{sort\_return\_swapped}}}: \{ \ldots \ texttt{\textcolor{red}{sort\_return\_same}}: \texttt{or \textcolor{red}{sort\_return\_swapped}}: \ldots \} 

\textbf{New: 2017-02-06}

Indicates whether to keep the order or swap the order of two items that are compared in the sorting code. Only one of the \texttt{\textcolor{red}{sort\_return\_\ldots}} functions should be used by the code, according to the results of some tests on the items \#1 and \#2 to be compared.
Chapter 7

The l3tl-analysis package: Analysing token lists

This module provides functions that are particularly useful in the l3regex module for mapping through a token list one (token) at a time (including begin-group/end-group tokens). For \tl_analysis_map_inline:Nn or \tl_analysis_map_inline:nn, the token list is given as an argument; the analogous function \peek_analysis_map_inline:n documented in l3token finds tokens in the input stream instead. In both cases the user provides (inline code) that receives three arguments for each ⟨token⟩:

- ⟨tokens⟩, which both o-expand and x-expand to the ⟨token⟩. The detailed form of ⟨tokens⟩ may change in later releases.
- ⟨char code⟩, a decimal representation of the character code of the ⟨token⟩, −1 if it is a control sequence.
- ⟨catcode⟩, a capital hexadecimal digit which denotes the category code of the ⟨token⟩ (0: control sequence, 1: begin-group, 2: end-group, 3: math shift, 4: alignment tab, 6: parameter, 7: superscript, 8: subscript, A: space, B: letter, C: other, D: active). This can be converted to an integer by writing "⟨catcode⟩".

In addition, there is a debugging function \tl_analysis_show:n, very similar to the \ShowTokens macro from the ted package.

\tl_analysis_show:N  \tl_analysis_show:n {⟨token list⟩}
\tl_analysis_log:N  \tl_analysis_log:n {⟨token list⟩}

Displays to the terminal (or log) the detailed decomposition of the ⟨token list⟩ into tokens, showing the category code of each character token, the meaning of control sequences and active characters, and the value of registers.

\tl_analysis_map_inline:nn  \tl_analysis_map_inline:nn {⟨token list⟩} {⟨inline function⟩}
\tl_analysis_map_inline:Nn  \tl_analysis_map_inline:Nn {⟨token list⟩} {⟨inline function⟩}

Applies the ⟨inline function⟩ to each individual ⟨token⟩ in the ⟨token list⟩. The ⟨inline function⟩ receives three arguments as explained above. As all other mappings the mapping is done at the current group level, i.e. any local assignments made by the ⟨inline function⟩ remain in effect after the loop.

45
Chapter 8

The \texttt{l3regex} package: Regular expressions in \TeX

The \texttt{l3regex} package provides regular expression testing, extraction of submatches, splitting, and replacement, all acting on token lists. The syntax of regular expressions is mostly a subset of the \texttt{pcre} syntax (and very close to \texttt{POSIX}), with some additions due to the fact that \TeX manipulates tokens rather than characters. For performance reasons, only a limited set of features are implemented. Notably, back-references are not supported.

Let us give a few examples. After

\begin{verbatim}
\tl_set:Nn \l_my_tl { That\text{-}cat. }
\regex_replace_once:nnN { at } { is } \l_my_tl
\end{verbatim}

the token list variable \texttt{\l_my_tl} holds the text “This \textit{cat.}”, where the first occurrence of “at” was replaced by “is”. A more complicated example is a pattern to emphasize each word and add a comma after it:

\begin{verbatim}
\regex_replace_all:nnN { \w+ } { \texttt{\texttt{\c{emph}}\cB\{ \0 \cE\} , } } \l_my_tl
\end{verbatim}

The \texttt{\w} sequence represents any “word” character, and \texttt{+} indicates that the \texttt{\w} sequence should be repeated as many times as possible (at least once), hence matching a word in the input token list. In the replacement text, \texttt{\0} denotes the full match (here, a word). The command \texttt{\texttt{\c{emph}}} is inserted using \texttt{\c{emph}}, and its argument \texttt{\0} is put between braces \texttt{\cB\{ and \cE\}}.

If a regular expression is to be used several times, it can be compiled once, and stored in a regex variable using \texttt{\regex_set:Nn}. For example,

\begin{verbatim}
\regex_new:N \l_foo_regex
\regex_set:Nn \l_foo_regex { \c{begin} \cB. (\c[^BE].*) \cE. }
\end{verbatim}

stores in \texttt{\l_foo_regex} a regular expression which matches the starting marker for an environment: \texttt{\texttt{\begin}}, followed by a begin-group token (\texttt{\cB.}), then any number of tokens which are neither begin-group nor end-group character tokens (\texttt{\c[^BE].*}), ending with an end-group token (\texttt{\cE.}). As explained in the next section, the parentheses “capture” the result of \texttt{\c[^BE].*}, giving us access to the name of the environment when doing replacements.
8.1 Syntax of regular expressions

8.1.1 Regular expression examples

We start with a few examples, and encourage the reader to apply \regshow:n to these regular expressions.

- Cat matches the word “Cat” capitalized in this way, but also matches the beginning of the word “Cattle”: use \bCat\b to match a complete word only.

- [abc] matches one letter among “a”, “b”, “c”; the pattern (a|b|c) matches the same three possible letters (but see the discussion of submatches below).

- [A-Za-z]* matches any number (due to the quantifier *) of Latin letters (not accented).

- \c{[A-Za-z]*} matches a control sequence made of Latin letters.

- \_\[^\_\]*\_ matches an underscore, any number of characters other than underscore, and another underscore; it is equivalent to \_.?\_ where \_ matches arbitrary characters and the lazy quantifier *? means to match as few characters as possible, thus avoiding matching underscores.

- [\+-]?\d+ matches an explicit integer with at most one sign.

- [\+-]?\d+\.* matches an explicit integer with any number of + and − signs, with spaces allowed except within the mantissa, and surrounded by spaces.

- [\+-]?\d+\.* matches an explicit integer or decimal number; using [ , ] instead of \ would allow the comma as a decimal marker.

- [\+-]?\d+\.*((?i)pt|in|[cem]\m|ex|\[bs\]p|\[dn\]d|\[pcn\]c)\.* matches an explicit dimension with any unit that \TeX knows, where (?i) means to treat lowercase and uppercase letters identically.

- [\+-]?\d+\.*((?i)nan|inf|((\d+|\d*.\d+)\.* matches an explicit floating point number or the special values nan and inf (with signs and spaces allowed).

- [\+-]?\d+\.*((?i)\C.)\.* matches an explicit integer or control sequence (without checking whether it is an integer variable).

- \G.*?\K at the beginning of a regular expression matches and discards (due to \K) everything between the end of the previous match (\G) and what is matched by the rest of the regular expression; this is useful in \repall:nn when the goal is to extract matches or submatches in a finer way than with \reg extract_all:nn.

While it is impossible for a regular expression to match only integer expressions, [\+-]*\d+\.*\((\d+|\d*.\d+)\.* matches among other things all valid integer expressions (made only with explicit integers). One should follow it with further testing.
8.1.2 Characters in regular expressions

Most characters match exactly themselves, with an arbitrary category code. Some characters are special and must be escaped with a backslash (e.g., \* matches a star character). Some escape sequences of the form backslash–letter also have a special meaning (for instance \d matches any digit). As a rule,

- every alphanumeric character (A–Z, a–z, 0–9) matches exactly itself, and should not be escaped, because \A, \B, … have special meanings;
- non-alphanumeric printable ascii characters can (and should) always be escaped: many of them have special meanings (e.g., use \\l, \\?, \\..); spaces should always be escaped (even in character classes);
- any other character may be escaped or not, without any effect: both versions match exactly that character.

Note that these rules play nicely with the fact that many non-alphanumeric characters are difficult to input into \TeX under normal category codes. For instance, \abc\% matches the characters \abc\% (with arbitrary category codes), but does not match the control sequence \abc followed by a percent character. Matching control sequences can be done using the \c{⟨regex⟩} syntax (see below).

Any special character which appears at a place where its special behaviour cannot apply matches itself instead (for instance, a quantifier appearing at the beginning of a string), after raising a warning.

Characters.

- \x{hh…} Character with hex code hh…
- \xhh Character with hex code hh.
  - \a Alarm (hex 07).
  - \e Escape (hex 1B).
  - \f Form-feed (hex 0C).
  - \n New line (hex 0A).
  - \r Carriage return (hex 0D).
  - \t Horizontal tab (hex 09).

8.1.3 Characters classes

Character properties.

- . A single period matches any token.
- \d Any decimal digit.
- \h Any horizontal space character, equivalent to [\ \^I]: space and tab.
- \s Any space character, equivalent to [\ \^I\^J\^L\^M].

48
\v Any vertical space character, equivalent to [\^\^J\^\^K\^\^L\^\^M]. Note that \^\^K is a vertical space, but not a space, for compatibility with Perl.

\w Any word character, \textit{i.e.}, alphanumerics and underscore, equivalent to the explicit class [A-Za-z0-9\_].

\d Any token not matched by \d.

\D Any token not matched by \D.

\h Any token not matched by \h.

\H Any token not matched by \H.

\n Any token other than the \n character (hex 0A).

\s Any token not matched by \s.

\S Any token not matched by \S.

\v Any token not matched by \v.

\V Any token not matched by \V.

Of those, \, \, \D, \H, \D, \S, \V, and \W match arbitrary control sequences. Character classes match exactly one token in the subject.

[... ] Positive character class. Matches any of the specified tokens.

[^... ] Negative character class. Matches any token other than the specified characters.

x-y Within a character class, this denotes a range (can be used with escaped characters).

[:\{name\}:] Within a character class (one more set of brackets), this denotes the POSIX character class (name), which can be alnum, alpha, ascii, blank, cntrl, digit, graph, lower, print, punct, space, upper, word, or xdigit.

[:\{name\}:] Negative POSIX character class.

For instance, [a=\-q=z\c\c.] matches any lowercase latin letter except p, as well as control sequences (see below for a description of \c).

In character classes, only [, ^, -, \, and spaces are special, and should be escaped. Other non-alphanumeric characters can still be escaped without harm. Any escape sequence which matches a single character (\d, \D, \h, etc.) is supported in character classes. If the first character is ^, then the meaning of the character class is inverted; ^ appearing anywhere else in the range is not special. If the first character (possibly following a leading ^) is ] then it does not need to be escaped since ending the range there would make it empty. Ranges of characters can be expressed using -, for instance, [\D 0-5] and [^6-9] are equivalent.

8.1.4 Structure: alternatives, groups, repetitions

Quantifiers (repetition).

? 0 or 1, greedy.

?? 0 or 1, lazy.

* 0 or more, greedy.

*? 0 or more, lazy.

+ 1 or more, greedy.
+? 1 or more, lazy.

{n} Exactly n.

{n,} n or more, greedy.

{n,}? n or more, lazy.

{n, m} At least n, no more than m, greedy.

{n, m}? At least n, no more than m, lazy.

For greedy quantifiers the regex code will first investigate matches that involve as many repetitions as possible, while for lazy quantifiers it investigates matches with as few repetitions as possible first.

Alternation and capturing groups.

A|B|C Either one of A, B, or C, investigating A first.

(... ) Capturing group.

(?:...) Non-capturing group.

(?1...) Non-capturing group which resets the group number for capturing groups in each alternative. The following group is numbered with the first unused group number.

Capturing groups are a means of extracting information about the match. Parenthesized groups are labelled in the order of their opening parenthesis, starting at 1. The contents of those groups corresponding to the “best” match (leftmost longest) can be extracted and stored in a sequence of token lists using for instance \regex_extract_once:nnNTF.

The \K escape sequence resets the beginning of the match to the current position in the token list. This only affects what is reported as the full match. For instance,

\regex_extract_all:nnN { a \K . } { a123aaxyz } \l_foo_seq

results in \l_foo_seq containing the items {1} and {a}: the true matches are {a1} and {aa}, but they are trimmed by the use of \K. The \K command does not affect capturing groups: for instance,

\regex_extract_once:nnN { (. \K c)+ \d } { acbc3 } \l_foo_seq

results in \l_foo_seq containing the items {c3} and {bc}: the true match is {acbc3}, with first submatch {bc}, but \K resets the beginning of the match to the last position where it appears.

8.1.5 Matching exact tokens

The \c escape sequence allows to test the category code of tokens, and match control sequences. Each character category is represented by a single uppercase letter:

- C for control sequences;
- B for begin-group tokens;
- E for end-group tokens;
• M for math shift;
• T for alignment tab tokens;
• P for macro parameter tokens;
• U for superscript tokens (up);
• D for subscript tokens (down);
• S for spaces;
• L for letters;
• O for others; and
• A for active characters.

The \c escape sequence is used as follows.

\c{⟨regex⟩} A control sequence whose csname matches the ⟨regex⟩, anchored at the beginning and end, so that \c{begin} matches exactly \begin, and nothing else.

\cX Applies to the next object, which can be a character, escape character sequence such as \{0A}, character class, or group, and forces this object to only match tokens with category X (any of BEMTUDSLOA). For instance, \cL[0-9] matches uppercase letters and digits of category code letter, \cC. matches any control sequence, and \cO(abc) matches abc where each character has category other.\footnote{This last example also captures “abc” as a regex group; to avoid this use a non-capturing group \cO(?:abc).}

\c[XYZ] Applies to the next object, and forces it to only match tokens with category X, Y, or Z (each being any of BEMTUDSLOA). For instance, \c[LO](abc) matches two tokens of category letter, space, or other.

\c[^XYZ] Applies to the next object and prevents it from matching any token with category X, Y, or Z (each being any of BEMTUDSLOA). For instance, \c[^O]\d matches digits which have any category different from other.

The category code tests can be used inside classes; for instance, [\cO\d \c[LO][A-F]] matches what TpX considers as hexadecimal digits, namely digits with category other, or uppercase letters from A to F with category either letter or other. Within a group affected by a category code test, the outer test can be overridden by a nested test: for instance, \cL(ab\cO\*cd) matches ab*cd where all characters are of category letter, except * which has category other.

The \u escape sequence allows to insert the contents of a token list directly into a regular expression or a replacement, avoiding the need to escape special characters. Namely, \u{⟨var name⟩} matches the exact contents (both character codes and category codes) of the variable \⟨var name⟩, which are obtained by applying \exp_not:v \{⟨var name⟩\} at the time the regular expression is compiled. Within a \c{…} control sequence matching, the \u escape sequence only expands its argument once, in effect performing \tl_to_str:v. Quantifiers are supported.

The \ur escape sequence allows to insert the contents of a regex variable into a larger regular expression. For instance, A\ur{\1_tmpa_regex}D matches the tokens A and
D separated by something that matches the regular expression \l_tmpa_regex. This behaves as if a non-capturing group were surrounding \l_tmpa_regex, and any group contained in \l_tmpa_regex is converted to a non-capturing group. Quantifiers are supported.

For instance, if \l_tmpa_regex has value B|C, then A\ur{l_tmpa_regex}D is equivalent to A(?B|CD) (matching ABD or ACD) and not to AB|CD (matching AB or CD). To get the latter effect, it is simplest to use \TeX’s expansion machinery directly: if \l_\-=\mymodule_BC_tl contains B|C then the following two lines show the same result:

\begin{verbatim}
\regex_show:n { A \u{l_mymodule_BC_tl} D }
\regex_show:n { A B | C D }
\end{verbatim}

\section{Miscellaneous}

Anchors and simple assertions.

\b Word boundary: either the previous token is matched by \w and the next by \W, or the opposite. For this purpose, the ends of the token list are considered as \W.

\B Not a word boundary: between two \w tokens or two \W tokens (including the boundary).

\^ or \A Start of the subject token list.

\$ or \z End of the subject token list.

\G Start of the current match. This is only different from \^ in the case of multiple matches: for instance \regex_count:nnN { \G a } { aaba } \l_tmpa_int yields 2, but replacing \G by \^ would result in \l_tmpa_int holding the value 1.

The option (?i) makes the match case insensitive (treating A–Z and a–z as equivalent, with no support yet for Unicode case changing). This applies until the end of the group in which it appears, and can be reverted using (?-i). For instance, in (?i)(a(?-i)b|c)d, the letters a and d are affected by the i option. Characters within ranges and classes are affected individually: (?i)\{?\-B\} is equivalent to \{?\Ab\} (and differs from the much larger class \{?\-b\}), and (?i)\[^aeiou\] matches any character which is not a vowel. The i option has no effect on \c{...}, on \u{...}, on character properties, or on character classes, for instance it has no effect at all in (?i)\u{l_foo_tl}\d\d[[:lower:]].

\section{Syntax of the replacement text}

Most of the features described in regular expressions do not make sense within the replacement text. Backslash introduces various special constructions, described further below:

\begin{itemize}
  \item \0 is the whole match;
  \item \1 is the submatch that was matched by the first (capturing) group (…); similarly for \2, …, \9 and \g{number};
  \item \␣ inserts a space (spaces are ignored when not escaped);
\end{itemize}
• \(a\), \(e\), \(f\), \(n\), \(r\), \(t\), \(x\{hh\} \) correspond to single characters as in regular expressions;
• \(\c\{\langle cs\ name\ \rangle\} \) inserts a control sequence;
• \(\c\langle\langle category\rangle\langle character\rangle\) (see below);
• \(\u\{\langle tl\ var\ name\ \rangle\} \) inserts the contents of the \(\langle\tl\ var\ \rangle\) (see below).

Characters other than backslash and space are simply inserted in the result (but since the replacement text is first converted to a string, one should also escape characters that are special for \(\text{TeX}\), for instance use \(\\#\)). Non-alphanumeric characters can always be safely escaped with a backslash.

For instance,

\[
\tl_set:Nn \l_my_tl { Hello,-world! }
\regex_replace_all:nnN { (\[er\]?l|o) . } { (\0--\1) } \l_my_tl
\]

results in \(\l_my_tl\) holding \(H(ell--el)(o,--o)\ w(or--o)(1d--l)!\)

The submatches are numbered according to the order in which the opening parenthesis of capturing groups appear in the regular expression to match. The \(n\)-th submatch is empty if there are fewer than \(n\) capturing groups or for capturing groups that appear in alternatives that were not used for the match. In case a capturing group matches several times during a match (due to quantifiers) only the last match is used in the replacement text. Submatches always keep the same category codes as in the original token list.

By default, the category code of characters inserted by the replacement are determined by the prevailing category code regime at the time where the replacement is made, with two exceptions:

• space characters (with character code 32) inserted with \(\x\) or \(\x20\) or \(\x{20}\) have category code 10 regardless of the prevailing category code regime;
• if the category code would be 0 (escape), 5 (newline), 9 (ignore), 14 (comment) or 15 (invalid), it is replaced by 12 (other) instead.

The escape sequence \(\c\) allows to insert characters with arbitrary category codes, as well as control sequences.

\(\cX(\ldots)\) Produces the characters “\(\ldots\)” with category \(X\), which must be one of \(\text{CBEMTPUDSLOA}\) as in regular expressions. Parentheses are optional for a single character (which can be an escape sequence). When nested, the innermost category code applies, for instance \(\cL(Hello\cS\ world)!\) gives this text with standard category codes.

\(\c\{\langle text\rangle\}\) Produces the control sequence with csname \(\langle text\rangle\). The \(\langle text\rangle\) may contain references to the submatches \(\0, \1\), and so on, as in the example for \(\u\) below.

The escape sequence \(\u\{\langle var\ name\ \rangle\} \) allows to insert the contents of the variable with name \(\langle var\ name\ \rangle\) directly into the replacement, giving an easier control of category codes. When nested in \(\c\{\ldots\}\) and \(\u\{\ldots\}\) constructions, the \(\u\) and \(\c\) escape sequences perform \(\tl_to_str:v\), namely extract the value of the control sequence and turn it into a string. Matches can also be used within the arguments of \(\c\) and \(\u\). For instance,

\[
\tl_set:Nn \l_my_one_tl { first }
\tl_set:Nn \l_my_two_tl { \emph{second} }
\tl_set:Nn \l_my_tl { one , two , one , one }
\regex_replace_all:nnN { [\-,]+ } { \u\{\l_my_\0_tl\} } \l_my_tl
\]

53
results in \l_my_tl holding first, \textit{second}, first, first.

Regex replacement is also a convenient way to produce token lists with arbitrary category codes. For instance

\lclear:N \l_tmpa_tl
\regex_replace_all:nnN { } { \texttt{\cU\% \cA\~} } \l_tmpa_tl

results in \l_tmpa_tl containing the percent character with category code 7 (superscript) and an active tilde character.

\section{Pre-compiling regular expressions}

If a regular expression is to be used several times, it is better to compile it once rather than doing it each time the regular expression is used. The compiled regular expression is stored in a variable. All of the \texttt{l3regex} module’s functions can be given their regular expression argument either as an explicit string or as a compiled regular expression.

\begin{verbatim}
\regex_new:N \l_my_regex
\regex_set:Nn \l_my_regex { my\ (simple\ )? reg(ex|ular\ expression) }
\end{verbatim}

\begin{verbatim}
\regex_new:N \l_regex
\regex_set:Nn \l_regex { \A X|Y }
\regex_log:n \l_regex
\end{verbatim}

+--branch
  anchor at start (\A)
  char code 88 (X)
+--branch
  char code 89 (Y)

indicating that the anchor \A only applies to the first branch: the second branch is not anchored to the beginning of the match.
8.4 Matching

All regular expression functions are available in both :n and :N variants. The former require a “standard” regular expression, while the later require a compiled expression as generated by \regex_set:Nn.

\regex_match:nnTF \regex_match:Nn \regex_count:nnN \regex_count:Nn \regex_match_case:nnTF

Tests whether the \langle regular expression \rangle matches any part of the \langle token list \rangle. For instance,

\regex_match:nnTF { b [cde]* } { abedcx } { TRUE } { FALSE }
\regex_match:nnTF { [b-dq-w] } { example } { TRUE } { FALSE }

leaves TRUE then FALSE in the input stream.

Sets \langle int var \rangle within the current \TeX{} group level equal to the number of times \langle regular expression \rangle appears in \langle token list \rangle. The search starts by finding the left-most longest match, respecting greedy and lazy (non-greedy) operators. Then the search starts again from the character following the last character of the previous match, until reaching the end of the token list. Infinite loops are prevented in the case where the regular expression can match an empty token list: then we count one match between each pair of characters. For instance,

\int_new:N \l_foo_int
\regex_count:nnN \l_foo_int

\regex_match_case:nnTF

\regex_match_case:nTF

\regex_match_case:nnTF

Determines which of the \langle regular expressions \rangle matches at the earliest point in the \langle token list \rangle, and leaves the corresponding \langle code \rangle followed by the \langle true code \rangle in the input stream. If several \langle regex \rangle match starting at the same point, then the first one in the list is selected and the others are discarded. If none of the \langle regex \rangle match, the \langle false code \rangle is left in the input stream. Each \langle regex \rangle can either be given as a regex variable or as an explicit regular expression.

In detail, for each starting position in the \langle token list \rangle, each of the \langle regex \rangle is searched in turn. If one of them matches then the corresponding \langle code \rangle is used and everything else is discarded, while if none of the \langle regex \rangle match at a given position then the next starting position is attempted. If none of the \langle regex \rangle match anywhere in the \langle token list \rangle then nothing is left in the input stream. Note that this differs from nested \regex_match:nTF statements since all \langle regex \rangle are attempted at each position rather than attempting to match \langle regex1 \rangle at every position before moving on to \langle regex2 \rangle.
8.5 Submatch extraction

\regex_extract_once:nnN { ⟨regex⟩ } { ⟨token list⟩ } { ⟨seq var⟩ }
\regex_extract_once:nnNTF { ⟨regex⟩ } { ⟨token list⟩ } { ⟨seq var⟩ } { ⟨true code⟩ } { ⟨false code⟩ }

Finds the first match of the ⟨regular expression⟩ in the ⟨token list⟩. If it exists, the match is stored as the first item of the ⟨seq var⟩, and further items are the contents of capturing groups, in the order of their opening parenthesis. The ⟨seq var⟩ is assigned locally. If there is no match, the ⟨seq var⟩ is cleared. The testing versions insert the ⟨true code⟩ into the input stream if a match was found, and the ⟨false code⟩ otherwise.

For instance, assume that you type

\regex_extract_once:nnNTF { \A(La)?TeX(!*)\Z } { LaTeX!!! } \l_foo_seq
{ true } { false }

Then the regular expression (anchored at the start with \A and at the end with \Z) must match the whole token list. The first capturing group, (La)?, matches La, and the second capturing group, (!*), matches !!! Thus, \l_foo_seq contains as a result the items {LaTeX!!}, {La}, and {!!!}, and the true branch is left in the input stream. Note that the n-th item of \l_foo_seq, as obtained using \seq_item:Nn, correspond to the submatch numbered \( n - 1 \) in functions such as \regex_replace_once:nnN.

\regex_extract_all:nnN { ⟨regex⟩ } { ⟨token list⟩ } { ⟨seq var⟩ }
\regex_extract_all:nnNTF { ⟨regex⟩ } { ⟨token list⟩ } { ⟨seq var⟩ } { ⟨true code⟩ } { ⟨false code⟩ }

Finds all matches of the ⟨regular expression⟩ in the ⟨token list⟩, and stores all the submatch information in a single sequence (concatenating the results of multiple \regex_extract_once:nnN calls). The ⟨seq var⟩ is assigned locally. If there is no match, the ⟨seq var⟩ is cleared. The testing versions insert the ⟨true code⟩ into the input stream if a match was found, and the ⟨false code⟩ otherwise. For instance, assume that you type

\regex_extract_all:nnNTF { \w+ } { Hello,-world! } \l_foo_seq
{ true } { false }

Then the regular expression matches twice, the resulting sequence contains the two items {Hello} and {world}, and the true branch is left in the input stream.
Splits the \<token list\> into a sequence of parts, delimited by matches of the \<regular expression\>. If the \<regular expression\> has capturing groups, then the token lists that they match are stored as items of the sequence as well. The assignment to \<seq var\> is local. If no match is found the resulting \<seq var\> has the \<token list\> as its sole item. If the \<regular expression\> matches the empty token list, then the \<token list\> is split into single tokens. The testing versions insert the \<true code\> into the input stream if a match was found, and the \<false code\> otherwise. For example, after

\seq_new:N \l_path_seq
\regex_split:nnNTF { / } { the/path/for/this/file.tex } \l_path_seq
{ true } { false }

the sequence \\l_path_seq contains the items \{the\}, \{path\}, \{for\}, \{this\}, and \{file.tex\}, and the \texttt{true} branch is left in the input stream.

8.6 Replacement

Replaces all occurrences of the \<regular expression\> in the contents of the \<tl var\> by the \<replacement\>, where \0 represents the full match, \1 represent the contents of the first capturing group, \2 of the second, \textit{etc}. Every match is treated independently, and matches cannot overlap. The result is assigned locally to \<tl var\>. 

\seq_new:N \l_path_seq
\regex_split:nnNTF { / } { the/path/for/this/file.tex } \l_path_seq
{ true } { false }

the sequence \\l_path_seq contains the items \{the\}, \{path\}, \{for\}, \{this\}, and \{file.tex\}, and the \texttt{true} branch is left in the input stream.
\regex_replace_case_once:nNTF \regex_replace_case_once:nNTF

Replaces the earliest match of the regular expression \(?1\langle regex1\rangle\ldots1\langle regex\rangle\) in the \langle token list variable \rangle by the \langle replacement \rangle corresponding to which \langle regex \rangle matched, then leaves the \langle true code \rangle in the input stream. If none of the \langle regex \rangle match, then the \langle tl var \rangle is not modified, and the \langle false code \rangle is left in the input stream. Each \langle regex \rangle can either be given as a regex variable or as an explicit regular expression.

In detail, for each starting position in the \langle token list \rangle, each of the \langle regex \rangle is searched in turn. If one of them matches then it is replaced by the corresponding \langle replacement \rangle as described for \regex_replace_once:nnN. This is equivalent to checking with \regex_match_case:nn which \langle regex \rangle matches, then performing the replacement with \regex_replace_once:nnN.

\regex_replace_case_all:nNTF \regex_replace_case_all:nNTF

Replaces all occurrences of all \langle regex \rangle in the \langle token list \rangle by the corresponding \langle replacement \rangle. Every match is treated independently, and matches cannot overlap. The result is assigned locally to \langle tl var \rangle, and the \langle true code \rangle or \langle false code \rangle is left in the input stream depending on whether any replacement was made or not.

In detail, for each starting position in the \langle token list \rangle, each of the \langle regex \rangle is searched in turn. If one of them matches then it is replaced by the corresponding \langle replacement \rangle, and the search resumes at the position that follows this match (and replacement). For instance

\tl_set:Nn \l_tmpa_tl { Hello,-world! }
\regex_replace_case_all:nNTF

results in \l_tmpa_tl having the contents ‘‘Hello’’---[,][,]‘world’’---[]. Note in particular that the word-boundary assertion \b did not match at the start of words because the case \[A-Za-z]+ matched at these positions. To change this, one could simply swap the order of the two cases in the argument of \regex_replace_case_all:nNTF.
8.7 Scratch regular expressions

\l_tmpa_regex
\l_tmpb_regex

Scratch regex for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_regex
\g_tmpb_regex

Scratch regex for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

8.8 Bugs, misfeatures, future work, and other possibilities

The following need to be done now.

- Rewrite the documentation in a more ordered way, perhaps add a BNF?
  Additional error-checking to come.
- Clean up the use of messages.
- Cleaner error reporting in the replacement phase.
- Add tracing information.
- Detect attempts to use back-references and other non-implemented syntax.
- Test for the maximum register \c_max_register_int.
- Find out whether the fact that \W and friends match the end-marker leads to bugs. Possibly update \_\_regex_item_reverse:n.
- The empty cs should be matched by \c{}, not by \c{csname .?endcsname \s?}.
  Code improvements to come.
- Shift arrays so that the useful information starts at position 1.
- Only build \c{...} once.
- Use arrays for the left and right state stacks when compiling a regex.
- Should \_\_regex_action_free_group:n only be used for greedy \{n,\} quantifier? (I think not.)
- Quantifiers for \u and assertions.
- When matching, keep track of an explicit stack of \texttt{curr\_state} and \texttt{curr\_submatches}.
- If possible, when a state is reused by the same thread, kill other subthreads.
• Use an array rather than `\g__regex_balance_tl` to build the function `\__regex_replacement_balance_one_match:n`.

• Reduce the number of epsilon-transitions in alternatives.

• Optimize simple strings: use less states (`abcade` should give two states, for `abc` and `ade`). [Does that really make sense?]

• Optimize groups with no alternative.

• Optimize states with a single `\__regex_action_free:n`.

• Optimize the use of `\__regex_action_success:` by inserting it in state 2 directly instead of having an extra transition.

• Optimize the use of `\int_step...` functions.

• Groups don’t capture within regexes for csnames; optimize and document.

• Better “show” for anchors, properties, and catcode tests.

• Does `\K` really need a new state for itself?

• When compiling, use a boolean `in_cs` and less magic numbers.

• Instead of checking whether the character is special or alphanumeric using its character code, check if it is special in regexes with `\cs_if_exist` tests.

The following features are likely to be implemented at some point in the future.

• General look-ahead/behind assertions.

• Regex matching on external files.

• Conditional subpatterns with look ahead/behind: “if what follows is [...], then [...]”.

• `(\*...)` and `(\?...)` sequences to set some options.

• UTF-8 mode for pdfTeX.

• Newline conventions are not done. In particular, we should have an option for . not to match newlines. Also, `\A` should differ from `^`, and `\Z`, `\z` and `$` should differ.

• Unicode properties: `\p{..}` and `\P{..}; `\X` which should match any “extended” Unicode sequence. This requires to manipulate a lot of data, probably using trees-boxes.

The following features of PCRE or Perl may or may not be implemented.

• Callout with `(?C...)` or other syntax: some internal code changes make that possible, and it can be useful for instance in the replacement code to stop a regex replacement when some marker has been found; this raises the question of a potential `\regex_break:` and then of playing well with `\tl_map_break:` called from `\tl_map_break:` within the code in a regex. It also raises the question of nested calls to the regex machinery, which is a problem since `\fontdimen` are global.
• Conditional subpatterns (other than with a look-ahead or look-behind condition): this is non-regular, isn’t it?

• Named subpatterns: \TeX\ programmers have lived so far without any need for named macro parameters.

The following features of \texttt{pcre} or Perl will definitely not be implemented.

• Back-references: non-regular feature, this requires backtracking, which is prohibitively slow.

• Recursion: this is a non-regular feature.

• Atomic grouping, possessive quantifiers: those tools, mostly meant to fix catastrophic backtracking, are unnecessary in a non-backtracking algorithm, and difficult to implement.

• Subroutine calls: this syntactic sugar is difficult to include in a non-backtracking algorithm, in particular because the corresponding group should be treated as atomic.

• Backtracking control verbs: intrinsically tied to backtracking.

• \texttt{\textbackslash ddd}, matching the character with octal code \texttt{ddd}: we already have \texttt{\textbackslash x{...}} and the syntax is confusingly close to what we could have used for backreferences (\texttt{\textbackslash 1, \textbackslash 2, ...}), making it harder to produce useful error message.

• \texttt{\textbackslash cx}, similar to \texttt{\TeX}'s own \textbackslash ^^x.

• Comments: \TeX\ already has its own system for comments.

• \texttt{\textbackslash Q...\textbackslash E} escaping: this would require to read the argument verbatim, which is not in the scope of this module.

• \texttt{\textbackslash C} single byte in UTF-8 mode: \texttt{Xe\TeX\} and \texttt{Lua\TeX\} serve us characters directly, and splitting those into bytes is tricky, encoding dependent, and most likely not useful anyways.
Chapter 9

The \texttt{l3prg} package

Control structures

Conditional processing in \LaTeX{} has two forms of conditional flow processing based on these states. The first form is predicate functions that turn the returned state into a boolean \texttt{(true)} or \texttt{(false)}. For example, the function \texttt{\cs_if_free_p:N} checks whether the control sequence given as its argument is free and then returns the boolean \texttt{(true)} or \texttt{(false)} values to be used in testing with \texttt{\if\texttt{predicate:w}} or in functions to be described below. The second form is the kind of functions choosing a particular argument from the input stream based on the result of the testing as in \texttt{\cs_if_free:NTF} which also takes one argument (the \texttt{N}) and then executes either \texttt{true} or \texttt{false} depending on the result.

\textbf{\LaTeX{}hackers note:} The arguments are executed after exiting the underlying \texttt{\if...\fi:} structure.

9.1 Defining a set of conditional functions

\begin{verbatim}
\prg_new_conditional:Npnn \prg_set_conditional:Npnn \prg_gset_conditional:Npnn
\prg_new_conditional:Nnn \prg_set_conditional:Nnn \prg_gset_conditional:Nnn
\end{verbatim}

These functions create a family of conditionals using the same \texttt{(code)} to perform the test created. Those conditionals are expandable if \texttt{(code)} is. The \texttt{new} versions check for existing definitions and perform assignments globally \texttt{(cf. \cs_new:Npn)} whereas the \texttt{set} versions do no check and perform assignments locally \texttt{(cf. \cs_set:Npn)}. The conditionals created are dependent on the comma-separated list of \texttt{(conditions)}, which should be one or more of \texttt{p}, \texttt{T}, \texttt{F} and \texttt{TF}.
These functions create a family of protected conditionals using the same \{code\} to perform the test created. The \{code\} does not need to be expandable. The new version check for existing definitions and perform assignments globally (cf. \cs_new:Npn) whereas the set version do not (cf. \cs_set:Npn). The conditionals created are depended on the comma-separated list of \{conditions\}, which should be one or more of T, F and TF (not P).

The conditionals are defined by \prg_new_protected_conditional:Npnn and friends as:

- \(\langle\text{name}\rangle_p:\langle\text{arg spec}\rangle\) — a predicate function which will supply either a logical true or logical false. This function is intended for use in cases where one or more logical tests are combined to lead to a final outcome. This function cannot be defined for protected conditionals.

- \(\langle\text{name}\rangle:\langle\text{arg spec}\rangle T\) — a function with one more argument than the original \{arg spec\} demands. The \{true branch\} code in this additional argument will be left on the input stream only if the test is true.

- \(\langle\text{name}\rangle:\langle\text{arg spec}\rangle F\) — a function with one more argument than the original \{arg spec\} demands. The \{false branch\} code in this additional argument will be left on the input stream only if the test is false.

- \(\langle\text{name}\rangle:\langle\text{arg spec}\rangle TF\) — a function with two more argument than the original \{arg spec\} demands. The \{true branch\} code in the first additional argument will be left on the input stream if the test is true, while the \{false branch\} code in the second argument will be left on the input stream if the test is false.

The \{code\} of the test may use \{parameters\} as specified by the second argument to \prg_set_protected_conditional:Npnn: this should match the \{argument specification\} but this is not enforced. The Nnn versions infer the number of arguments from the argument specification given (cf. \cs_new:Nn, etc.). Within the \{code\}, the functions \prg_return_true: and \prg_return_false: are used to indicate the logical outcomes of the test.

An example can easily clarify matters here:

\(\prg_set_protected_conditional:Npnn \\text{\textbackslash foo\_if\_bar:NN} \\langle\text{parameters}\rangle \{\langle\text{conditions}\rangle\} \{\langle\text{code}\rangle\}\)

\(\prg_new_protected_conditional:Npnn \\langle\text{name}\rangle:\langle\text{arg spec}\rangle\)

\(\text{\textbackslash if\_meaning:w} \ \text{l\_tmpa\_tl} \ #1\)

\(\text{\textbackslash prg\_return\_true:}\)

\(\text{\textbackslash else:}\)

\(\text{\textbackslash if\_meaning:w} \ \text{l\_tmpa\_tl} \ #2\)

\(\text{\textbackslash prg\_return\_true:}\)

\(\text{\textbackslash else:}\)

\(\text{\textbackslash prg\_return\_false:}\)

\(\text{\textbar f1:}\)

\(\text{\textbar f1:}\)
This defines the function \texttt{\textbackslash foo\_if\_bar\_p:NN}, \texttt{\textbackslash foo\_if\_bar:NNTF} and \texttt{\textbackslash foo\_if\_bar:NNT} but not \texttt{\textbackslash foo\_if\_bar:NNF} (because \texttt{F} is missing from the \texttt{\langle conditions\rangle} list). The return statements take care of resolving the remaining \texttt{\textbackslash else:} and \texttt{\textbackslash fi:} before returning the state. There must be a return statement for each branch; failing to do so will result in erroneous output if that branch is executed.

\begin{verbatim}
\prg_new_eq_conditional:NNn \prg_new_eq_conditional:NNn \langle name1\rangle:\langle arg\ spec1\rangle \langle name2\rangle:\langle arg\ spec2\rangle
\prg_set_eq_conditional:NNn \langle conditions\rangle
\end{verbatim}

These functions copy a family of conditionals. The new version checks for existing definitions \textit{(cf. \texttt{\textbackslash cs\_new\_eq:NN})} whereas the set version does not \textit{(cf. \texttt{\textbackslash cs\_set\_eq:NN})}. The conditionals copied are depended on the comma-separated list of \texttt{\langle conditions\rangle}, which should be one or more of \texttt{p}, \texttt{T}, \texttt{F} and \texttt{TF}.

\begin{verbatim}
\prg_return_true: \prg_return_false: \prg_return_true:
\prg_return_false:
\end{verbatim}

These “return” functions define the logical state of a conditional statement. They appear within the code for a conditional function generated by \texttt{\prg_set_conditional:Npnn}, etc, to indicate when a true or false branch should be taken. While they may appear multiple times each within the code of such conditionals, the execution of the conditional must result in the expansion of one of these two functions \textit{exactly once}.

The return functions trigger what is internally an \texttt{f}-expansion process to complete the evaluation of the conditional. Therefore, after \texttt{\prg_return_true:} or \texttt{\prg_return_false:} there must be no non-expandable material in the input stream for the remainder of the expansion of the conditional code. This includes other instances of either of these functions.

\begin{verbatim}
\prg_generate_conditional_variant:Nnn \prg_generate_conditional_variant:Nnn \langle name\rangle{:\langle arg\ spec\rangle} \langle variant\ argument\ specifiers\rangle \langle condition\ specifiers\rangle
\end{verbatim}

Defines argument-specifier variants of conditionals. This is equivalent to running \texttt{\cs\_generate\_variant:Nn} \texttt{(\langle conditional\rangle) \langle\langle variant\ argument\ specifiers\rangle\rangle} on each \texttt{\langle conditional\rangle} described by the \texttt{\langle condition\ specifiers\rangle}. These base-form \texttt{\langle condition\ specifiers\rangle} are obtained from the \texttt{\langle name\rangle} and \texttt{\langle arg\ spec\rangle} as described for \texttt{\prg_new_conditional:Npnn}, and they should be defined.

### 9.2 The boolean data type

This section describes a boolean data type which is closely connected to conditional processing as sometimes you want to execute some code depending on the value of a switch \textit{(e.g., draft/final)} and other times you perhaps want to use it as a predicate function in an \texttt{\if\_predicate:w} test. The problem of the primitive \texttt{\if\_false:} and \texttt{\if\_true:} tokens is that it is not always safe to pass them around as they may interfere with scanning for termination of primitive conditional processing. Therefore, we employ two canonical booleans: \texttt{\c\_true\_bool} or \texttt{\c\_false\_bool}. Besides preventing problems as described above, it also allows us to implement a simple boolean parser supporting the logical operations And, Or, Not, etc. which can then be used on both the boolean type and predicate functions.
All conditional \bool_ functions except assignments are expandable and expect the input to also be fully expandable (which generally means being constructed from predicate functions and booleans, possibly nested).

**TeXhackers note:** The \bool_ data type is not implemented using the \iffalse/\iftrue primitives, in contrast to \nevi_, etc., in plain TEX. IfTEX 2ε and so on. Programmers should not base use of \bool_ switches on any particular expectation of the implementation.

\bool_new:N  
\bool_new:c

Creates a new \langle boolean \rangle or raises an error if the name is already taken. The declaration is global. The \langle boolean \rangle is initially false.

\bool_const:Nn  
\bool_const:cn

Creates a new constant \langle boolean \rangle or raises an error if the name is already taken. The value of the \langle boolean \rangle is set globally to the result of evaluating the \langle boolexpr \rangle.

\bool_set_false:N  
\bool_set_false:c  
\bool_gset_false:N  
\bool_gset_false:c

Sets \langle boolean \rangle logically false.

\bool_set_true:N  
\bool_set_true:c  
\bool_gset_true:N  
\bool_gset_true:c

Sets \langle boolean \rangle logically true.

\bool_set_eq:NN  
\bool_set_eq:cn  
\bool_gset_eq:NN  
\bool_gset_eq:cn

Sets \langle boolean \rangle to the current value of \langle boolean \rangle.

\bool_set:Nn  
\bool_set:cn  
\bool_gset:Nn  
\bool_gset:cn

Evaluates the \langle boolean expression \rangle as described for \bool_if:nTF, and sets the \langle boolean \rangle variable to the logical truth of this evaluation.

\bool_if_p:N  
\bool_if_p:cn  
\bool_if:N  
\bool_if:c

Tests the current truth of \langle boolean \rangle, and continues expansion based on this result.

\bool_to_str:N  
\bool_to_str:c  
\bool_to_str:n

Expands to the letters true or false depending on the logical truth of the \langle boolean \rangle or \langle boolean expression \rangle.
9.2.1 Scratch booleans

\l_tmpa_bool
\l_tmpb_bool

A scratch boolean for local assignment. It is never used by the kernel code, and so is safe for use with any \LaTeX3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_bool
\g_tmpb_bool

A scratch boolean for global assignment. It is never used by the kernel code, and so is safe for use with any \LaTeX3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.

9.3 Boolean expressions

As we have a boolean datatype and predicate functions returning boolean \{true\} or \{false\} values, it seems only fitting that we also provide a parser for \{boolean expressions\}.

A boolean expression is an expression which given input in the form of predicate functions and boolean variables, return boolean \{true\} or \{false\}. It supports the logical operations And, Or and Not as the well-known infix operators && and || and prefix ! with their usual precedences (namely, && binds more tightly than ||). In addition to this, parentheses can be used to isolate sub-expressions. For example,
\int_compare_p:n \{ 1 = 1 \} \&\&
\left( \begin{array}{l}
\int_compare_p:n \{ 2 = 3 \} || \\
\int_compare_p:n \{ 4 <= 4 \} || \\
\str_if_eq_p:nn \{ abc \} \{ def \} \&\&
\end{array} \right)
! \int_compare_p:n \{ 2 = 4 \}

is a valid boolean expression.

Contrarily to some other programming languages, the operators \&\& and || evaluate both operands in all cases, even when the first operand is enough to determine the result. This “eager” evaluation should be contrasted with the “lazy” evaluation of \bool_lazy_-functions.

\textbf{\texttt{\TeX}hackers note:} The eager evaluation of boolean expressions is unfortunately necessary in \TeX. Indeed, a lazy parser can get confused if \&\& or || or parentheses appear as (unbraced) arguments of some predicates. For instance, the innocuous-looking expression below would break (in a lazy parser) if \#1 were a closing parenthesis and \l_tmpa_bool were true.

\begin{verbatim}
( \l_tmpa_bool || \token_if_eq_meaning_p:NN X \#1 )
\end{verbatim}

Minimal (lazy) evaluation can be obtained using the conditionals \bool_lazy_all:nTF, \bool_lazy_and:nnTF, \bool_lazy_any:nTF, or \bool_lazy_or:nnTF, which only evaluate their boolean expression arguments when they are needed to determine the resulting truth value. For example, when evaluating the boolean expression

\begin{verbatim}
\bool_lazy_and_p:nn
{ \bool_lazy_any_p:n
{ \int_compare_p:n \{ 2 = 3 \} }
{ \int_compare_p:n \{ 4 <= 4 \} }
{ \int_compare_p:n \{ 1 = \error \} } \% skipped
}
{ ! \int_compare_p:n \{ 2 = 4 \} }
\end{verbatim}

the line marked with \texttt{skipped} is not expanded because the result of \bool_lazy_any_p:n is known once the second boolean expression is found to be logically \texttt{true}. On the other hand, the last line is expanded because its logical value is needed to determine the result of \bool_lazy_and_p:nn.

\begin{verbatim}
\bool_if_p:n * \bool_if_p:n \{(boolean expression)\}
\bool_if:nTF * \bool_if:nTF \{boolean expression\} \{(true code)\} \{(false code)\}
\end{verbatim}

\textbf{Updated: 2017-07-15} Tests the current truth of \langle boolean expression \rangle, and continues expansion based on this result. The \langle boolean expression \rangle should consist of a series of predicates or boolean variables with the logical relationship between these defined using \&\& ("And"), || ("Or"), ! ("Not") and parentheses. The logical Not applies to the next predicate or group.
\bool_lazy_all_p:n * \bool_lazy_all:n \{ (boolexpr_1) \{boolexpr_2\} \ldots \{boolexpr_n\} \}
\bool_lazy_all:nTF * \bool_lazy_all:nTF \{ (boolexpr_1) \{boolexpr_2\} \ldots \{boolexpr_n\} \} \{true code\} \{false code\}

Updated: 2017-07-15

Implements the “And” operation on the \langle boolean expressions \rangle, hence is true if all of them are true and false if any of them is false. Contrarily to the infix operator &&, only the \langle boolean expressions \rangle which are needed to determine the result of \bool_lazy_all:nTF are evaluated. See also \bool_lazy_and:nTF when there are only two \langle boolean expressions \rangle.

\bool_lazy_p:n * \bool_p:n \langle boolean expression \rangle
\bool_p:nn * \bool_p:nn \langle boolean expression \rangle
\bool_p:nTF * \bool_p:nTF \langle boolean expression \rangle

Updated: 2017-07-15

Implements the “Or” operation on the \langle boolean expressions \rangle, hence is true if any of them is true and false if all of them are false. Contrarily to the infix operator ||, only the \langle boolean expressions \rangle which are needed to determine the result of \bool_lazy_any:nTF are evaluated. See also \bool_lazy_or:nTF when there are only two \langle boolean expressions \rangle.

\bool_or_p:n * \bool_or_p:n \{ (boolexpr_1) \{boolexpr_2\} \ldots \{boolexpr_n\} \}
\bool_or:nTF * \bool_or:nTF \{ (boolexpr_1) \{boolexpr_2\} \ldots \{boolexpr_n\} \} \{true code\} \{false code\}

Updated: 2017-07-15

Implements the “Or” operation between two boolean expressions, hence is true if either one is true. Contrarily to the infix operator ||, the \langle boolean expression \rangle is only evaluated if it is needed to determine the result of \bool_lazy_or:nTF. See also \bool_lazy_any:nTF when there are more than two \langle boolean expressions \rangle.

\bool_not_p:n * \bool_not:p:n \{ (boolean expression) \}

Updated: 2017-07-15

Function version of \langle boolean expression \rangle within a boolean expression.

\bool_xor_p:n * \bool_xor:p:n \{ (boolexpr_1) \{boolexpr_2\} \ldots \{boolexpr_n\} \}
\bool_xor:nTF * \bool_xor:nTF \{ (boolexpr_1) \{boolexpr_2\} \ldots \{boolexpr_n\} \} \{true code\} \{false code\}

Updated: 2018-05-09

Implements an “exclusive or” operation between two boolean expressions. There is no infix operation for this logical operation.

9.4 Logical loops

Loops using either boolean expressions or stored boolean values.

\bool_do_until:cn * \bool_do_until:cn \langle boolean \rangle \{ (code) \}
\bool_do_until:Nn * \bool_do_until:Nn \langle boolean \rangle \{ (code) \}

Updated: 2017-07-15

Placed the \langle code \rangle in the input stream for \LaTeX{} to process, and then checks the logical value of the \langle boolean \rangle. If it is false then the \langle code \rangle is inserted into the input stream again and the process loops until the \langle boolean \rangle is true.

68
\bool_do_while:Nn \bool_do_while:cn
\bool_until_do:Nn \bool_until_do:cn
\bool_while_do:Nn \bool_while_do:cn
\bool_do_until:nn \bool_do_until:cn
\bool_while_do:nn \bool_while_do:cn

\prg_replicate:nn \prg_replicate:cn

\section{Producing multiple copies}

\prg_replicate:nn \prg_replicate:cn

Places the \langle code\rangle in the input stream for \TeX{} to process, and then checks the logical value of the \langle boolean\rangle. If it is \texttt{true} then the \langle code\rangle is inserted into the input stream again and the process loops until the \langle boolean\rangle is \texttt{false}.

This function firsts checks the logical value of the \langle boolean\rangle. If it is \texttt{false} the \langle code\rangle is placed in the input stream and expanded. After the completion of the \langle code\rangle the truth of the \langle boolean\rangle is re-evaluated. The process then loops until the \langle boolean\rangle is \texttt{true}.

This function firsts checks the logical value of the \langle boolean expression\rangle as described for \texttt{\bool_if:nTF}. If it is \texttt{false} then the \langle code\rangle is inserted into the input stream again and the process loops until the \langle boolean expression\rangle evaluates to \texttt{true}.

This function firsts checks the logical value of the \langle boolean expression\rangle as described for \texttt{\bool_if:nTF}. If it is \texttt{true} then the \langle code\rangle is placed in the input stream and expanded. After the completion of the \langle code\rangle the truth of the \langle boolean expression\rangle is re-evaluated. The process then loops until the \langle boolean expression\rangle is \texttt{false}.

This function firsts checks the logical value of the \langle boolean expression\rangle (as described for \texttt{\bool_if:nTF}). If it is \texttt{false} the \langle code\rangle is placed in the input stream and expanded. After the completion of the \langle code\rangle the truth of the \langle boolean expression\rangle is re-evaluated. The process then loops until the \langle boolean expression\rangle is \texttt{true}.

This function firsts checks the logical value of the \langle boolean expression\rangle (as described for \texttt{\bool_if:nTF}). If it is \texttt{true} the \langle code\rangle is placed in the input stream and expanded. After the completion of the \langle code\rangle the truth of the \langle boolean expression\rangle is re-evaluated. The process then loops until the \langle boolean expression\rangle is \texttt{false}.

\subsection*{Producing multiple copies}

\prg_replicate:nn \prg_replicate:cn

Evaluates the \langle integer expression\rangle (which should be zero or positive) and creates the resulting number of copies of the \langle tokens\rangle. The function is both expandable and safe for nesting. It yields its result after two expansion steps.
9.6 Detecting \TeX’s mode

\texttt{\textbackslash \textbf{mode\_if\_horizontal\_p}}: \texttt{\textbackslash \textbf{mode\_if\_horizontal}}:TF \{\texttt{true code}\} \{\texttt{false code}\}

Detects if \TeX{} is currently in horizontal mode.

\texttt{\textbackslash \textbf{mode\_if\_inner\_p}}: \texttt{\textbackslash \textbf{mode\_if\_inner}}:TF \{\texttt{true code}\} \{\texttt{false code}\}

Detects if \TeX{} is currently in inner mode.

\texttt{\textbackslash \textbf{mode\_if\_math\_p}}: \texttt{\textbackslash \textbf{mode\_if\_math}}:TF \{\texttt{true code}\} \{\texttt{false code}\}

Detects if \TeX{} is currently in maths mode.

\texttt{\textbackslash \textbf{mode\_if\_vertical\_p}}: \texttt{\textbackslash \textbf{mode\_if\_vertical}}:TF \{\texttt{true code}\} \{\texttt{false code}\}

Detects if \TeX{} is currently in vertical mode.

9.7 Primitive conditionals

\texttt{\textbackslash \textbf{if\_predicate\_w}} \langle \texttt{predicate} \rangle \langle \texttt{true code} \rangle \texttt{\textbackslash }\texttt{else} : \langle \texttt{false code} \rangle \texttt{\textbackslash f i}:

This function takes a predicate function and branches according to the result. (In practice this function would also accept a single boolean variable in place of the \langle\texttt{predicate}\rangle but to make the coding clearer this should be done through \texttt{\textbackslash if\_bool:N}.)

\texttt{\textbackslash \textbf{if\_bool\_N}} \langle \texttt{boolean} \rangle \langle \texttt{true code} \rangle \texttt{\textbackslash }\texttt{else} : \langle \texttt{false code} \rangle \texttt{\textbackslash f i}:

This function takes a boolean variable and branches according to the result.

9.8 Nestable recursions and mappings

There are a number of places where recursion or mapping constructs are used in expl3. At a low-level, these typically require insertion of tokens at the end of the content to allow “clean up”. To support such mappings in a nestable form, the following functions are provided.

\texttt{\textbackslash \textbf{prg\_break\_point\_Nn}} \langle \texttt{type}\rangle \texttt{\textbackslash map\_break:} \{\texttt{code}\}

Used to mark the end of a recursion or mapping: the functions \langle\texttt{type}\rangle\texttt{\_map\_break:} and \langle\texttt{type}\rangle\texttt{\_map\_break:n} use this to break out of the loop (see \texttt{\textbackslash prg\_map\_break:Nn} for how to set these up). After the loop ends, the \langle\texttt{code}\rangle is inserted into the input stream. This occurs even if the break functions are not applied: \texttt{\textbackslash prg\_break\_point\_Nn} is functionally-equivalent in these cases to \texttt{\use\_ii\_nn}. 
Breaks a recursion in mapping contexts, inserting in the input stream the \langle user code\rangle after the \langle ending code\rangle for the loop. The function breaks loops, inserting their \langle ending code\rangle, until reaching a loop with the same \langle type\rangle as its first argument. This \langle type\rangle-\map_break: argument must be defined; it is simply used as a recognizable marker for the \langle type\rangle.

For types with mappings defined in the kernel, \langle type\rangle-\map_break: and \langle type\rangle-\map_break:n are defined as \prg_map_break:Nn \langle type\rangle-\map_break: {} and the same with {} omitted.

9.8.1 Simple mappings

In addition to the more complex mappings above, non-nestable mappings are used in a number of locations and support is provided for these.

This copy of \prg_do_nothing: is used to mark the end of a fast short-term recursion: the function \prg_break:n uses this to break out of the loop.

Breaks a recursion which has no \langle ending code\rangle and which is not a user-breakable mapping (see for instance \prop_get:Nn), and inserts the \langle code\rangle in the input stream.

9.9 Internal programming functions

These functions are used to enclose material in a \TeX{} alignment environment within a specially-constructed group. This group is designed in such a way that it does not add brace groups to the output but does act as a group for the & token inside \halign. This is necessary to allow grabbing of tokens for testing purposes, as \TeX{} uses group level to determine the effect of alignment tokens. Without the special grouping, the use of a function such as \peek_after:Nw would result in a forbidden comparison of the internal \endtemplate token, yielding a fatal error. Each \group_align_safe_begin: must be matched by a \group_align_safe_end:, although this does not have to occur within the same function.
Chapter 10

The l3sys package:
System/runtime functions

10.1 The name of the job

\c_sys_jobname_str

Constant that gets the “job name” assigned when \TeX starts.

\TeXhackers note: This copies the contents of the primitive \jobname. For technical
reasons, the string here is not of the same internal form as other, but may be manipulated using
normal string functions.

10.2 Date and time

\c_sys_minute_int
\c_sys_hour_int
\c_sys_day_int
\c_sys_month_int
\c_sys_year_int

The date and time at which the current job was started: these are all reported as integers.

\TeXhackers note: Whilst the underlying primitives can be altered by the user, this
interface to the time and date is intended to be the “real” values.
10.3 Engine

\sys_if_engine_latex_p: \sys_if_engine_pdftex:TF \{true code\} \{false code\}
Conditionals which allow engine-specific code to be used. The names follow naturally from those of the engine binaries: note that the (u)ptex tests are for \(\varepsilon\)-pT\(\varepsilon\) and \(\varepsilon\)-upT\(\varepsilon\) as expl3 requires the \(\varepsilon\)-T\(\varepsilon\) extensions. Each conditional is true for exactly one supported engine. In particular, \sys_if_engine_ptex_p: is true for \(\varepsilon\)-pT\(\varepsilon\) but false for \(\varepsilon\)-upT\(\varepsilon\).

\c_sys_engine_str
The current engine given as a lower case string: one of \texttt{luatex}, \texttt{pdftex}, \texttt{ptex}, \texttt{uptex} or \texttt{xetex}.

\c_sys_engine_exec_str
The name of the standard executable for the current T\(\varepsilon\)X engine given as a lower case string: one of \texttt{luatex}, \texttt{luahbtex}, \texttt{pdftex}, \texttt{eptex}, \texttt{euptex} or \texttt{xetex}.

\c_sys_engine_format_str
The name of the preloaded format for the current T\(\varepsilon\)X run given as a lower case string: one of \texttt{lualatex} (or \texttt{dvilualatex}), \texttt{pdflatex} (or \texttt{latex}), \texttt{platex}, \texttt{uplatex} or \texttt{xelatex} for L\(\varepsilon\)T\(\varepsilon\), similar names for plain T\(\varepsilon\)X (except \texttt{pdflatex} in DVI mode yields \texttt{etex}), and \texttt{cont-en} for ConT\(\varepsilon\)Xt (i.e. the \texttt{fmtname}).

\sys_timer:
Expands to the current value of the engine’s timer clock, a non-negative integer. This function is only defined for engines with timer support. This command measures not just CPU time but real time (including time waiting for user input). The unit are scaled seconds \((2^{-16} \text{ seconds})\).

10.4 Output format

\sys_if_output_dvi_p: \sys_if_output_dvi:TF \{true code\} \{false code\}
Conditionals which give the current output mode the T\(\varepsilon\)X run is operating in. This is always one of two outcomes, DVI mode or PDF mode. The two sets of conditionals are thus complementary and are both provided to allow the programmer to emphasise the most appropriate case.

\c_sys_output_str
The current output mode given as a lower case string: one of \texttt{dvi} or \texttt{pdf}.
10.5 Platform

\texttt{\sys_if_platform_unix_p: \sys_if_platform_unix:TF \{\text{true code}\} \{\text{false code}\}}
\texttt{\sys_if_platform_unix:TF \}
\texttt{\sys_if_platform_windows_p: \sys_if_platform_windows:TF \}
\texttt{\sys_if_platform_windows:TF \}

\textit{New: 2018-07-27}

Conditionals which allow platform-specific code to be used. The names follow the Lua \texttt{os.type()} function, \textit{i.e.} all Unix-like systems are \texttt{unix} (including Linux and MacOS).

\texttt{\c_sys_platform_str \}

\textit{New: 2018-07-27}

\texttt{The current platform given as a lower case string: one of unix, windows or unknown.}

10.6 Random numbers

\texttt{\sys_rand_seed: \sys_rand_seed: \}

\textit{New: 2017-05-27}

Expands to the current value of the engine’s random seed, a non-negative integer. In engines without random number support this expands to 0.

\texttt{\sys_gset_rand_seed:n \{\text{intexpr}\}}

\textit{New: 2017-05-27}

Globally sets the seed for the engine’s pseudo-random number generator to the \texttt{\{integer expression\}}. This random seed affects all \texttt{\ldots_rand} functions (such as \texttt{\int_rand:nn} or \texttt{\clist_rand_item:n}) as well as other packages relying on the engine’s random number generator. In engines without random number support this produces an error.

\texttt{\texttt{\q{\text{T\text{P\text{X}h}ackers note: While a 32-bit (signed) integer can be given as a seed, only the absolute value is used and any number beyond }2^{28} \text{ is divided by an appropriate power of 2. We recommend using an integer in }[0,2^{28} - 1].}}}

10.7 Access to the shell

\texttt{\sys_get_shell:nnN \sys_get_shell:nnN \{(shell command)\} \{\text{setup}\} \{tl var\}}
\texttt{\sys_get_shell:nnNTF \{(shell command)\} \{\text{setup}\} \{tl var\} \{\text{true code}\} \{\text{false code}\}}
\textit{New: 2019-09-20}

Defines \texttt{\{tl var\}} to the text returned by the \texttt{(shell command)}. The \texttt{(shell command)} is converted to a string using \texttt{\tl_to_str:n}. Category codes may need to be set appropriately via the \texttt{\{setup\}} argument, which is run just before running the \texttt{(shell command)} (in a group). If shell escape is disabled, the \texttt{\{tl var\}} will be set to \texttt{\q{\text{n}o_{value}}} in the non-branching version. Note that quote characters (*) cannot be used inside the \texttt{(shell command)}. The \texttt{\sys_get_shell:nnNTF} conditional inserts the \texttt{true code} if the shell is available and no quote is detected, and the \texttt{false code} otherwise.
This variable exposes the internal triple of the shell escape status. The possible values are:

0 Shell escape is disabled
1 Unrestricted shell escape is enabled
2 Restricted shell escape is enabled

\sys_if_shell_p: \sys_if_shell_p:
\sys_if_shell:TF \sys_if_shell:TF \{(true code) \{(false code)\}

Performs a check for whether shell escape is enabled. This returns true if either of restricted or unrestricted shell escape is enabled.

\sys_if_shell_unrestricted_p: \sys_if_shell_unrestricted_p:
\sys_if_shell_unrestricted:TF \sys_if_shell_unrestricted:TF \{(true code) \{(false code)\}

Performs a check for whether unrestricted shell escape is enabled.

\sys_if_shell_restricted_p: \sys_if_shell_restricted_p:
\sys_if_shell_restricted:TF \sys_if_shell_restricted:TF \{(true code) \{(false code)\}

Performs a check for whether restricted shell escape is enabled. This returns false if unrestricted shell escape is enabled. Unrestricted shell escape is not considered a superset of restricted shell escape in this case. To find whether any shell escape is enabled use \sys_if_shell:.

\sys_shell_now:n \sys_shell_now:n \{(tokens)\}

Execute \{(tokens)\} through shell escape immediately.

\sys_shell_shipout:n \sys_shell_shipout:n \{(tokens)\}

Execute \{(tokens)\} through shell escape at shipout.

10.8 Loading configuration data

\sys_load_backend:n \sys_load_backend:n \{(backend)\}

Loads the additional configuration file needed for backend support. If the \{(backend)\} is empty, the standard backend for the engine in use will be loaded. This command may only be used once.

\sys_ensure_backend: \sys_ensure_backend:

Ensures that a backend has been loaded by calling \sys_load_backend:n if required.
Set to the name of the backend in use by `\sys_load_backend:n` when issued. Possible values are

- `pdftex`
- `luatex`
- `xetex`
- `dvips`
- `dvipdfmx`
- `dvisvgm`

Load the additional configuration file for debugging support.

### 10.8.1 Final settings

Finalises all system-dependent functionality: required before loading a backend.
Chapter 11

The l3msg package

Messages

Messages need to be passed to the user by modules, either when errors occur or to indicate how the code is proceeding. The l3msg module provides a consistent method for doing this (as opposed to writing directly to the terminal or log).

The system used by l3msg to create messages divides the process into two distinct parts. Named messages are created in the first part of the process; at this stage, no decision is made about the type of output that the message will produce. The second part of the process is actually producing a message. At this stage a choice of message class has to be made, for example error, warning or info.

By separating out the creation and use of messages, several benefits are available. First, the messages can be altered later without needing details of where they are used in the code. This makes it possible to alter the language used, the detail level and so on. Secondly, the output which results from a given message can be altered. This can be done on a message class, module or message name basis. In this way, message behaviour can be altered and messages can be entirely suppressed.

11.1 Creating new messages

All messages have to be created before they can be used. The text of messages is automatically wrapped to the length available in the console. As a result, formatting is only needed where it helps to show meaning. In particular, \\ may be used to force a new line and \ forces an explicit space. Additionally, \|, \#, \&, \% and \~ can be used to produce the corresponding character.

Messages may be subdivided by one level using the / character. This is used within the message filtering system to allow for example the \LaTeX{} kernel messages to belong to the module \LaTeX{} while still being filterable at a more granular level. Thus for example

\msg_new:nnnn { mymodule } { submodule / message } ...

will allow to filter out specifically messages from the submodule.
\msg_new:nnnn \msg_new:nnn

Creates a \langle message \rangle for a given \langle module \rangle. The message is defined to first give \langle text \rangle and then \langle more text \rangle if the user requests it. If no \langle more text \rangle is available then a standard text is given instead. Within \langle text \rangle and \langle more text \rangle four parameters (#1 to #4) can be used: these will be supplied at the time the message is used. An error is raised if the \langle message \rangle already exists.

\msg_set:nnnn \msg_set:nnn \msg_gset:nnnn \msg_gset:nnnn

 Sets up the text for a \langle message \rangle for a given \langle module \rangle. The message is defined to first give \langle text \rangle and then \langle more text \rangle if the user requests it. If no \langle more text \rangle is available then a standard text is given instead. Within \langle text \rangle and \langle more text \rangle four parameters (#1 to #4) can be used: these will be supplied at the time the message is used.

\msg_if_exist_p:nn \msg_if_exist:nnTF

Tests whether the \langle message \rangle for the \langle module \rangle is currently defined.

11.2 Customizable information for message modules

\msg_module_name:n \msg_module_name:n

Expands to the public name of the \langle module \rangle as defined by \g_msg_module_name_prop (or otherwise leaves the \langle module \rangle unchanged).

\msg_module_type:n \msg_module_type:n

Expands to the description which applies to the \langle module \rangle, for example a Package or Class. The information here is defined in \g_msg_module_type_prop, and will default to Package if an entry is not present.

\g_msg_module_name_prop \g_msg_module_type_prop

Provides a mapping between the module name used for messages, and that for documentation.

Provides a mapping between the module name used for messages, and that type of module. For example, for \LaTeX{} core messages, an empty entry is set here meaning that they are not described using the standard Package text.

11.3 Contextual information for messages

\msg_line_context: \msg_line_context:

Prints the current line number when a message is given, and thus suitable for giving context to messages. The number itself is proceeded by the text on line.
\msg_line_number: \msg_line_number:
Prints the current line number when a message is given.

\msg_fatal_text:n \msg_fatal_text:n \langle\texttt{module}\rangle
Produces the standard text
\textbf{Fatal Package} \langle\texttt{module}\rangle Error
This function can be redefined to alter the language in which the message is given, using
\#1 as the name of the \langle\texttt{module}\rangle to be included.

\msg_critical_text:n \msg_critical_text:n \langle\texttt{module}\rangle
Produces the standard text
\textbf{Critical Package} \langle\texttt{module}\rangle Error
This function can be redefined to alter the language in which the message is given, using
\#1 as the name of the \langle\texttt{module}\rangle to be included.

\msg_error_text:n \msg_error_text:n \langle\texttt{module}\rangle
Produces the standard text
\textbf{Package} \langle\texttt{module}\rangle Error
This function can be redefined to alter the language in which the message is given, using
\#1 as the name of the \langle\texttt{module}\rangle to be included.

\msg_warning_text:n \msg_warning_text:n \langle\texttt{module}\rangle
Produces the standard text
\textbf{Package} \langle\texttt{module}\rangle Warning
This function can be redefined to alter the language in which the message is given, using
\#1 as the name of the \langle\texttt{module}\rangle to be included. The \langle\texttt{type}\rangle of \langle\texttt{module}\rangle may be adjusted:
\textbf{Package} is the standard outcome: see \msg_module_type:n.

\msg_info_text:n \msg_info_text:n \langle\texttt{module}\rangle
Produces the standard text:
\textbf{Package} \langle\texttt{module}\rangle Info
This function can be redefined to alter the language in which the message is given, using
\#1 as the name of the \langle\texttt{module}\rangle to be included. The \langle\texttt{type}\rangle of \langle\texttt{module}\rangle may be adjusted:
\textbf{Package} is the standard outcome: see \msg_module_type:n.
Produces the standard text

See the \langle module \rangle documentation for further information.

This function can be redefined to alter the language in which the message is given, using \#1 as the name of the \langle module \rangle to be included. The name of the \langle module \rangle is produced using \msg_module_name:n.

11.4 Issuing messages

Messages behave differently depending on the message class. In all cases, the message may be issued supplying 0 to 4 arguments. If the number of arguments supplied here does not match the number in the definition of the message, extra arguments are ignored, or empty arguments added (of course the sense of the message may be impaired). The four arguments are converted to strings before being added to the message text: the x-type variants should be used to expand material. Note that this expansion takes place with the standard definitions in effect, which means that shorthands such as \~ or \\ are not available; instead one should use \iow_char:N \~ and \iow_newline:, respectively. The following message classes exist:

- \texttt{fatal}, ending the \TeX{} run;
- \texttt{critical}, ending the file being input;
- \texttt{error}, interrupting the \TeX{} run without ending it;
- \texttt{warning}, written to terminal and log file, for important messages that may require corrections by the user;
- \texttt{note} (less common than \texttt{info}) for important information messages written to the terminal and log file;
- \texttt{info} for normal information messages written to the log file only;
- \texttt{term} and \texttt{log} for un-decorated messages written to the terminal and log file, or to the log file only;
- \texttt{none} for suppressed messages.

\msg_fatal:nnnnnn \msg_fatal:nnxxxx \msg_fatal:nnnn \msg_fatal:nnnx \msg_fatal:nnn \msg_fatal:nnx \msg_fatal:nn

Issues \langle module \rangle error \langle message \rangle, passing \langle arg one \rangle to \langle arg four \rangle to the text-creating functions. After issuing a fatal error the \TeX{} run halts. No PDF file will be produced in this case (DVI mode runs may produce a truncated DVI file).
\msg_critical:nnnnn {\langle message $\rangle$ \langle arg one $\rangle$ \langle arg two $\rangle$ \langle arg three $\rangle$ \langle arg four $\rangle$}

Issues \langle module $\rangle$ error \langle message $\rangle$, passing \langle arg one $\rangle$ to \langle arg four $\rangle$ to the text-creating functions. After issuing a critical error, \TeX{} stops reading the current input file. This may halt the \TeX{} run (if the current file is the main file) or may abort reading a sub-file.

\TeX{}hackers note: The \TeX{} \texttt{\endinput} primitive is used to exit the file. In particular, the rest of the current line remains in the input stream.

\msg_error:nnnnn {\langle module $\rangle$} {\langle message $\rangle$} {\langle arg one $\rangle$} {\langle arg two $\rangle$} {\langle arg three $\rangle$} {\langle arg four $\rangle$}

Issues \langle module $\rangle$ error \langle message $\rangle$, passing \langle arg one $\rangle$ to \langle arg four $\rangle$ to the text-creating functions. The error interrupts processing and issues the text at the terminal. After user input, the run continues.

\msg_warning:nnnnn {\langle module $\rangle$} {\langle message $\rangle$} {\langle arg one $\rangle$} {\langle arg two $\rangle$} {\langle arg three $\rangle$} {\langle arg four $\rangle$}

Issues \langle module $\rangle$ warning \langle message $\rangle$, passing \langle arg one $\rangle$ to \langle arg four $\rangle$ to the text-creating functions. The warning text is added to the log file and the terminal, but the \TeX{} run is not interrupted.
Issues (`module`) information (`message`), passing (`arg one`) to (`arg four`) to the text-creating functions. For the more common `<msg_info:nnnnnn>`, the information text is added to the log file only, while `<msg_note:nnnnnn>` adds the info text to both the log file and the terminal. The TeX run is not interrupted.
11.4.1 Messages for showing material

\msg_show:nnnnn \msg_show:nnnnn {\langle module\rangle} {\langle message\rangle} {\langle arg\ one\rangle} {\langle arg\ two\rangle} {\langle arg\ three\rangle} {\langle arg\ four\rangle}

Issues \langle module\rangle information \langle message\rangle, passing \langle arg\ one\rangle to \langle arg\ four\rangle to the text-creating functions. The information text is shown on the terminal and the \TeX run is interrupted in a manner similar to \tl_show:n. This is used in conjunction with \msg_show_item:n and similar functions to print complex variable contents completely. If the formatted text does not contain \texttt{\textasciitilde} at the start of a line, an additional line \texttt{\textasciitilde}. will be put at the end. In addition, a final period is added if not present.

New: 2017-12-04

11.4.2 Expandable error messages

In very rare cases it may be necessary to produce errors in an expansion-only context. The functions in this section should only be used if there is no alternative approach using \msg_error:nnnnnn or other non-expandable commands from the previous section. Despite having a similar interface as non-expandable messages, expandable errors must be handled internally very differently from normal error messages, as none of the tools to print to the terminal or the log file are expandable. As a result, short-hands such as \{ or \\ do not work, and messages must be very short (with default settings, they are truncated after approximately 50 characters). It is advisable to ensure that the message is understandable even when truncated, by putting the most important information up front. Another particularity of expandable messages is that they cannot be redirected or turned off by the user.

\msg_expandable_error:nnnnnn \msg_expandable_error:nnnff \msg_expandable_error:nnnn \msg_expandable_error:nnn \msg_expandable_error:nnf \msg_expandable_error:nnf \msg_expandable_error:nnf \msg_expandable_error:nnn

New: 2015-08-06
Updated: 2019-02-28

Issues an “Undefined error” message from \TeX itself using the undefined control sequence \texttt{\\::error} then prints “! \langle module\rangle: ”\langle error\ message\rangle, which should be short. With default settings, anything beyond approximately 60 characters long (or bytes in some engines) is cropped. A leading space might be removed as well.

11.5 Redirecting messages

Each message has a “name”, which can be used to alter the behaviour of the message when it is given. Thus we might have

\msg_new:nnnn \{ module \} \{ my-message \} \{ Some-text \} \{ Some-more-text \}
to define a message, with

\msg_error:nn { module } { my-message }

when it is used. With no filtering, this raises an error. However, we could alter the behaviour with

\msg_redirect_class:nn { error } { warning }

to turn all errors into warnings, or with

\msg_redirect_module:nnn { module } { error } { warning }

to alter only messages from that module, or even

\msg_redirect_name:nnn { module } { my-message } { warning }

to target just one message. Redirection applies first to individual messages, then to messages from one module and finally to messages of one class. Thus it is possible to select out an individual message for special treatment even if the entire class is already redirected.

Multiple redirections are possible. Redirections can be cancelled by providing an empty argument for the target class. Redirection to a missing class raises an error immediately. Infinite loops are prevented by eliminating the redirection starting from the target of the redirection that caused the loop to appear. Namely, if redirections are requested as $A \rightarrow B$, $B \rightarrow C$ and $C \rightarrow A$ in this order, then the $A \rightarrow B$ redirection is cancelled.

Changes the behaviour of messages of ⟨class one⟩ so that they are processed using the code for those of ⟨class two⟩. Each ⟨class⟩ can be one of fatal, critical, error, warning, note, info, term, log, none.

Redirects message of ⟨class one⟩ for ⟨module⟩ to act as though they were from ⟨class two⟩. Messages of ⟨class one⟩ from sources other than ⟨module⟩ are not affected by this redirection. This function can be used to make some messages “silent” by default. For example, all of the warning messages of ⟨module⟩ could be turned off with:

\msg_redirect_module:nnn { module } { warning } { none }

Redirects a specific ⟨message⟩ from a specific ⟨module⟩ to act as a member of ⟨class⟩ of messages. No further redirection is performed. This function can be used to make a selected message “silent” without changing global parameters:

\msg_redirect_name:nnn { module } { annoying-message } { none }
Chapter 12

The \texttt{l3file} package

File and I/O operations

This module provides functions for working with external files. Some of these functions apply to an entire file, and have prefix \texttt{\textbackslash file...}, while others are used to work with files on a line by line basis and have prefix \texttt{\textbackslash ior...} (reading) or \texttt{\textbackslash iow...} (writing).

It is important to remember that when reading external files \TeX{} attempts to locate them using both the operating system path and entries in the \TeX{} file database (most \TeX{} systems use such a database). Thus the “current path” for \TeX{} is somewhat broader than that for other programs.

For functions which expect a \texttt{(file name)} argument, this argument may contain both literal items and expandable content, which should on full expansion be the desired file name. Active characters (as declared in \texttt{\textbackslash l.char_active_seq}) are \emph{not} expanded, allowing the direct use of these in file names. Quote tokens (\texttt{"}) are not permitted in file names as they are reserved for internal use by some \TeX{} primitives.

Spaces are trimmed at the beginning and end of the file name: this reflects the fact that some file systems do not allow or interact unpredictably with spaces in these positions. When no extension is given, this will trim spaces from the start of the name only.

12.1 Input–output stream management

As \TeX{} engines have a limited number of input and output streams, direct use of the streams by the programmer is not supported in \LaTeX{}3. Instead, an internal pool of streams is maintained, and these are allocated and deallocated as needed by other modules. As a result, the programmer should close streams when they are no longer needed, to release them for other processes.

Note that I/O operations are global: streams should all be declared with global names and treated accordingly.
Globally reserves the name of the \langle stream\rangle, either for reading or for writing as appropriate. The \langle stream\rangle is not opened until the appropriate \texttt\ldots\texttt open:Nn function is used. Attempting to use a \langle stream\rangle which has not been opened is an error, and the \langle stream\rangle will behave as the corresponding \texttt\ldots\texttt c term_... function.

\ior_open:Nn \langle file name\rangle
\ior_open:cn
Opens \langle file name\rangle for reading using \langle stream\rangle as the control sequence for file access. If the \langle stream\rangle was already open it is closed before the new operation begins. The \langle stream\rangle is available for access immediately and will remain allocated to \langle file name\rangle until a \ior_close:N instruction is given or the \TeX\ run ends. If the file is not found, an error is raised.

\ior_open:NnTF \langle file name\rangle \{\langle true code\rangle\} \{\langle false code\rangle\}
\ior_open:cnTF
Opens \langle file name\rangle for reading using \langle stream\rangle as the control sequence for file access. If the \langle stream\rangle was already open it is closed before the new operation begins. The \langle stream\rangle is available for access immediately and will remain allocated to \langle file name\rangle until a \ior_close:N instruction is given or the \TeX\ run ends. The \langle true code\rangle is then inserted into the input stream. If the file is not found, no error is raised and the \langle false code\rangle is inserted into the input stream.

\ior_open:Nn \langle file name\rangle
\ior_open:cn
Opens \langle file name\rangle for writing using \langle stream\rangle as the control sequence for file access. If the \langle stream\rangle was already open it is closed before the new operation begins. The \langle stream\rangle is available for access immediately and will remain allocated to \langle file name\rangle until a \iow_close:N instruction is given or the \TeX\ run ends. Opening a file for writing clears any existing content in the file (\textit{i.e.} writing is not additive).

\ior_close:N
\ior_close:c
\iow_close:N
\iow_close:c
Closes the \langle stream\rangle. Streams should always be closed when they are finished with as this ensures that they remain available to other programmers.

\ior_show:N
\ior_show:c
\ior_log:N
\ior_log:c
\iow_show:N
\iow_show:c
\iow_log:N
\iow_log:c
Display (to the terminal or log file) the file name associated to the (read or write) \langle stream\rangle.
Display (to the terminal or log file) a list of the file names associated with each open (read or write) stream. This is intended for tracking down problems.

12.1.1 Reading from files

Reading from files and reading from the terminal are separate processes in expl3. The functions \ior_get:NN and \ior_str_get:NN, and their branching equivalents, are designed to work with files.

\ior_get:NN \ior_get:NN \ior_get:NNTF
\ior_get:NNTF \ior_get:NN \ior_get:NNTF (stream) (token list variable) (true code) (false code)

Function that reads one or more lines (until an equal number of left and right braces are found) from the file input ⟨stream⟩ and stores the result locally in the ⟨token list⟩ variable. The material read from the ⟨stream⟩ is tokenized by \TeX according to the category codes and \endlinechar in force when the function is used. Assuming normal settings, any lines which do not end in a comment character % have the line ending converted to a space, so for example input

a b c

results in a token list \a\ b\ c. Any blank line is converted to the token \par. Therefore, blank lines can be skipped by using a test such as

\ior_get:NN \l_my_stream \l_tmpa_tl
\tl_set:Nn \l_tmpb_tl { \par }
\tl_if_eq:NNF \l_tmpa_tl \l_tmpb_tl
...

Also notice that if multiple lines are read to match braces then the resulting token list can contain \par tokens. In the non-branching version, where the ⟨stream⟩ is not open the ⟨tl var⟩ is set to \q_no_value.

\TeXhackers note: This protected macro is a wrapper around the \TeX primitive \read. Regardless of settings, \TeX replaces trailing space and tab characters (character codes 32 and 9) in each line by an end-of-line character (character code \endlinechar, omitted if \endlinechar is negative or too large) before turning characters into tokens according to current category codes. With default settings, spaces appearing at the beginning of lines are also ignored.
\ior_str_get:NN \ior_str_get:NN \token list variable
\ior_str_get:NNNTF \ior_str_get:NN \token list variable \true code \false code

Function that reads one line from the file input \langle stream \rangle and stores the result locally in the \langle token list variable \rangle variable. The material is read from the \langle stream \rangle as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). Multiple whitespace characters are retained by this process. It always only reads one line and any blank lines in the input result in the \langle token list variable \rangle being empty. Unlike \ior_get:NN, line ends do not receive any special treatment. Thus input

a b c

results in a token list a b c with the letters a, b, and c having category code 12. In the non-branching version, where the \langle stream \rangle is not open the \langle tl var \rangle is set to \q_no_value.

TeXhackers note: This protected macro is a wrapper around the \vTeX primitive \readline. Regardless of settings, \TeX removes trailing space and tab characters (character codes 32 and 9). However, the end-line character normally added by this primitive is not included in the result of \ior_str_get:NN.

All mappings are done at the current group level, i.e. any local assignments made by the \langle function \rangle or \langle code \rangle discussed below remain in effect after the loop.

\ior_map_inline:Nn \ior_map_inline:Nn \langle \inline function \rangle

Applies the \langle \inline function \rangle to each set of \langle lines \rangle obtained by calling \ior_get:NN until reaching the end of the file. \TeX ignores any trailing new-line marker from the file it reads. The \langle \inline function \rangle should consist of code which receives the \langle line \rangle as \#1.

\ior_str_map_inline:Nn \ior_str_map_inline:Nn \langle \inline function \rangle

Applies the \langle \inline function \rangle to every \langle line \rangle in the \langle stream \rangle. The material is read from the \langle stream \rangle as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). The \langle \inline function \rangle should consist of code which receives the \langle line \rangle as \#1. Note that \TeX removes trailing space and tab characters (character codes 32 and 9) from every line upon input. \TeX also ignores any trailing new-line marker from the file it reads.

\ior_map_variable:NNn \ior_map_variable:NNn \langle \variable \rangle \langle \tl var \rangle \langle \code \rangle

For each set of \langle lines \rangle obtained by calling \ior_get:NN until reaching the end of the file, stores the \langle lines \rangle in the \langle tl var \rangle then applies the \langle code \rangle. The \langle code \rangle will usually make use of the \langle variable \rangle, but this is not enforced. The assignments to the \langle variable \rangle are local. Its value after the loop is the last set of \langle lines \rangle, or its original value if the \langle stream \rangle is empty. \TeX ignores any trailing new-line marker from the file it reads. This function is typically faster than \ior_map_inline:Nn.
\ior_str_map_variable:NNn \ior_str_map_variable:NNn ⟨stream⟩ ⟨variable⟩ {⟨code⟩}

For each ⟨line⟩ in the ⟨stream⟩, stores the ⟨line⟩ in the ⟨variable⟩ then applies the ⟨code⟩.

The material is read from the ⟨stream⟩ as a series of tokens with category code 12 (other),
with the exception of space characters which are given category code 10 (space). The
⟨code⟩ will usually make use of the ⟨variable⟩, but this is not enforced. The assignments to
the ⟨variable⟩ are local. Its value after the loop is the last ⟨line⟩, or its original value if the
⟨stream⟩ is empty. Note that \TeX removes trailing space and tab characters (character
codes 32 and 9) from every line upon input. \TeX also ignores any trailing new-line marker
from the file it reads. This function is typically faster than \ior_str_map_inline:Nn.

\ior_map_break:

\ior_map_break:

Used to terminate a \ior_map... function before all lines from the ⟨stream⟩ have been
processed. This normally takes place within a conditional statement, for example

\ior_map_inline:Nn \l_my_ior
{\str_if_eq:nnTF { #1 } { bingo } { \ior_map_break: } { % Do something useful } }

Use outside of a \ior_map... scenario leads to low level \TeX errors.

\TeXhackers note: When the mapping is broken, additional tokens may be inserted before
further items are taken from the input stream. This depends on the design of the mapping
function.

\ior_map_break:n

\ior_map_break:n {⟨code⟩}

Used to terminate a \ior_map... function before all lines in the ⟨stream⟩ have been
processed, inserting the ⟨code⟩ after the mapping has ended. This normally takes place
within a conditional statement, for example

\ior_map_inline:Nn \l_my_ior
{\str_if_eq:nnTF { #1 } { bingo } { \ior_map_break:n { ⟨code⟩ } } { % Do something useful } }

Use outside of a \ior_map... scenario leads to low level \TeX errors.

\TeXhackers note: When the mapping is broken, additional tokens may be inserted before
the ⟨code⟩ is inserted into the input stream. This depends on the design of the mapping function.
Testing if the end of a file \langle stream \rangle has been reached during a reading operation. The test also returns a \textit{true} value if the \langle stream \rangle is not open.

12.1.2 Writing to files

\texttt{\textbackslash iow\_now:Nn} \texttt{\textbackslash iow\_now: \langle tokens \rangle}

This function writes \langle tokens \rangle to the specified \langle stream \rangle immediately (\emph{i.e.} the write operation is called on expansion of \texttt{\textbackslash iow\_now:Nn}).

\texttt{\textbackslash iow\_log:n} \texttt{\textbackslash iow\_log:x}

This function writes the given \langle tokens \rangle to the log (transcript) file immediately: it is a dedicated version of \texttt{\textbackslash iow\_now:Nn}.

\texttt{\textbackslash iow\_term:n} \texttt{\textbackslash iow\_term:x}

This function writes the given \langle tokens \rangle to the terminal file immediately: it is a dedicated version of \texttt{\textbackslash iow\_now:Nn}.

\texttt{\textbackslash iow\_shipout:Nn} \texttt{\textbackslash iow\_shipout: \langle stream \rangle \{\langle tokens \rangle\}}

This function writes \langle tokens \rangle to the specified \langle stream \rangle when the current page is finalised (\emph{i.e.} at shipout). The \langle tokens \rangle are expanded at the time of writing in addition to any expansion when the function is used. This makes these functions suitable for including material finalised during the page building process (such as the page number integer).

\texttt{\textbackslash iow\_shipout\_x:Nn} \texttt{\textbackslash iow\_shipout\_x: \langle stream \rangle \{\langle tokens \rangle\}}

This functions writes \langle tokens \rangle to the specified \langle stream \rangle when the current page is finalised (\emph{i.e.} at shipout). The \langle tokens \rangle are expanded at the time of writing in addition to any expansion when the function is used. This makes these functions suitable for including material finalised during the page building process (such as the page number integer).

\texttt{\textbackslash iow\_shipout\_x: \langle stream \rangle \{\langle tokens \rangle\}}

This is a wrapper around the \TeX primitive \texttt{\textbackslash write}. When using \texttt{\textbackslash iow\_shipout\_x: \langle stream \rangle \{\langle tokens \rangle\}} with a format other than \LaTeX, new line characters inserted using \texttt{\textbackslash iow\_newline:} or using the line-wrapping code \texttt{\textbackslash iow\_wrap:mmn} are not recognized in the argument of \texttt{\textbackslash iow\_shipout:Nn}. This may lead to the insertion of additional unwanted line-breaks.
\iow_char:N \iow_char:N \langle \text{char} \rangle

Inserts \langle \text{char} \rangle into the output stream. Useful when trying to write difficult characters such as \%, {, }, etc. in messages, for example:

\iow_now:Nx \text{g\_my\_iow \{ \iow_char:N \text{\{ text } \iow_char:N \text{\}} \}}

The function has no effect if writing is taking place without expansion (e.g. in the second argument of \iow_now:Nn).

\iownewline: \iownewline:

Function to add a new line within the \langle tokens \rangle written to a file. The function has no effect if writing is taking place without expansion (e.g. in the second argument of \iow_now:Nn).

\TeXhackers note: When using expl3 with a format other than \LaTeX, the character inserted by \iownewline: is not recognized by \TeX, which may lead to the insertion of additional unwanted line-breaks. This issue only affects \iow_shipout:Nn, \iow_shipout_x:Nn and direct uses of primitive operations.
12.1.3 Wrapping lines in output

\iow_wrap:nnnN \{\langle text \rangle \} \{\langle run-on text \rangle \} \{\langle set up \rangle \} \{\langle function \rangle \}

This function wraps the \langle text \rangle to a fixed number of characters per line. At the start of each line which is wrapped, the \langle run-on text \rangle is inserted. The line character count targeted is the value of \l_iow_line_count_int minus the number of characters in the \langle run-on text \rangle for all lines except the first, for which the target number of characters is simply \l_iow_line_count_int since there is no run-on text. The \langle text \rangle and \langle run-on text \rangle are exhaustively expanded by the function, with the following substitutions:

- \ or \iow_newline: may be used to force a new line,
- \␣ may be used to represent a forced space (for example after a control sequence),
- \#, \%, \{, \} \~, may be used to represent the corresponding character,
- \iow_allow_break: may be used to allow a line-break without inserting a space (this is experimental),
- \iow_indent:n may be used to indent a part of the \langle text \rangle (not the \langle run-on text \rangle).

Additional functions may be added to the wrapping by using the \langle set up \rangle, which is executed before the wrapping takes place: this may include overriding the substitutions listed.

Any expandable material in the \langle text \rangle which is not to be expanded on wrapping should be converted to a string using \token_to_str:N, \tl_to_str:n, \tl_to_str:N, etc.

The result of the wrapping operation is passed as a braced argument to the \langle function \rangle, which is typically a wrapper around a write operation. The output of \iow_wrap:nnnN (i.e. the argument passed to the \langle function \rangle) consists of characters of category “other” (category code 12), with the exception of spaces which have category “space” (category code 10). This means that the output does not expand further when written to a file.

\TeX\ hackers note: Internally, \iow_wrap:nnnN carries out an x-type expansion on the \langle text \rangle to expand it. This is done in such a way that \exp_not:N or \exp_not:n could be used to prevent expansion of material. However, this is less conceptually clear than conversion to a string, which is therefore the supported method for handling expandable material in the \langle text \rangle.

\iow_indent:n \{\langle text \rangle \}

In the first argument of \iow_wrap:nnnN (for instance in messages), indents \langle text \rangle by four spaces. This function does not cause a line break, and only affects lines which start within the scope of the \langle text \rangle. In case the indented \langle text \rangle should appear on separate lines from the surrounding text, use \ or \iow_newline to force line breaks.

\l_iow_line_count_int

The maximum number of characters in a line to be written by the \iow_wrap:nnnN function. This value depends on the \TeX\ system in use: the standard value is 78, which is typically correct for unmodified \TeX\ Live and MiK\TeX\ systems.
12.1.4 Constant input–output streams, and variables

\g_tmpa_iow \g_tmpb_iow
Scratch input stream for global use. These are never used by the kernel code, and so are safe for use with any \TeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\c_log_iow \c_term_iow
Constant output streams for writing to the log and to the terminal (plus the log), respectively.

\g_tmpa_iow \g_tmpb_iow
Scratch output stream for global use. These are never used by the kernel code, and so are safe for use with any \TeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

12.1.5 Primitive conditionals

\if_eof:w ⟨stream⟩
 ⟨true code⟩
\else:
 ⟨false code⟩
\fi:
Tests if the ⟨stream⟩ returns “end of file”, which is true for non-existent files. The \else: branch is optional.

\TeXhackers note: This is the \TeX primitive \ifeof.

12.2 File operation functions

\g_file_curr_dir_str \g_file_curr_name_str \g_file_curr_ext_str
Contain the directory, name and extension of the current file. The directory is empty if the file was loaded without an explicit path (i.e., if it is in the \TeX search path), and does not end in / other than the case that it is exactly equal to the root directory. The ⟨name⟩ and ⟨ext⟩ parts together make up the file name, thus the ⟨name⟩ part may be thought of as the “job name” for the current file. Note that \TeX does not provide information on the ⟨ext⟩ part for the main (top level) file and that this file always has an empty ⟨dir⟩ component. Also, the ⟨name⟩ here will be equal to \c_sys_jobname_str, which may be different from the real file name (if set using \--jobname, for example).
Each entry is the path to a directory which should be searched when seeking a file. Each path can be relative or absolute, and should not include the trailing slash. The entries are not expanded when used so may contain active characters but should not feature any variable content. Spaces need not be quoted.

\TeXhackers note: When working as a package in \LaTeX\, \exp3 will automatically append the current \texttt{\input@path} to the set of values from \texttt{\l_file_search_path_seq}.

\file_if_exist:nTF \file_if_exist:nTF \file_if_exist:nTF {⟨file name⟩} {⟨true code⟩} {⟨false code⟩}

Searches for \langle file name \rangle using the current \TeX\ search path and the additional paths controlled by \texttt{\l_file_search_path_seq}.

\file_get:nnN \file_get:nnN \file_get:nnN \file_get:nnN ⟨filename⟩ {⟨setup⟩} ⟨tl⟩ \file_get:nnN ⟨filename⟩ {⟨setup⟩} ⟨tl⟩ {⟨true code⟩} {⟨false code⟩}

Defines ⟨tl⟩ to the contents of ⟨filename⟩. Category codes may need to be set appropriately via the ⟨setup⟩ argument. The non-branching version sets the ⟨tl⟩ to \texttt{\q_no_value} if the file is not found. The branching version runs the ⟨true code⟩ after the assignment to ⟨tl⟩ if the file is found, and ⟨false code⟩ otherwise.

\file_get_full_name:nN \file_get_full_name:VN \file_get_full_name:nN \file_get_full_name:nN ⟨file name⟩ ⟨tl⟩ \file_get_full_name:nN ⟨file name⟩ ⟨tl⟩ {⟨true code⟩} {⟨false code⟩}

Searches for ⟨file name⟩ in the path as detailed for \texttt{\file_if_exist:nTF}, and if found sets the ⟨tl var⟩ the fully-qualified name of the file, \textit{i.e.} the path and file name. This includes an extension .tex when the given ⟨file name⟩ has no extension but the file found has that extension. In the non-branching version, the ⟨tl var⟩ will be set to \texttt{\q_no_value} in the case that the file does not exist.

\file_full_name:n \file_full_name:V \file_full_name:n ⟨file name⟩ \file_full_name:n ⟨file name⟩ \file_full_name:n ⟨file name⟩ \file_full_name:n ⟨file name⟩ \file_full_name:n ⟨file name⟩ \file_full_name:n ⟨file name⟩

Searches for ⟨file name⟩ in the path as detailed for \texttt{\file_if_exist:nTF}, and if found leaves the fully-qualified name of the file, \textit{i.e.} the path and file name, in the input stream. This includes an extension .tex when the given ⟨file name⟩ has no extension but the file found has that extension. If the file is not found on the path, the expansion is empty.
\file_parse_full_name:nNNN \file_parse_full_name:VNNN

Parses the \( \text{full name} \) and splits it into three parts, each of which is returned by setting the appropriate local string variable:

- The \( \text{dir} \): everything up to the last / (path separator) in the \( \text{file path} \). As with system PATH variables and related functions, the \( \text{dir} \) does not include the trailing / unless it points to the root directory. If there is no path (only a file name), \( \text{dir} \) is empty.

- The \( \text{name} \): everything after the last / up to the last .., where both of those characters are optional. The \( \text{name} \) may contain multiple . characters. It is empty if \( \text{full name} \) consists only of a directory name.

- The \( \text{ext} \): everything after the last . (including the dot). The \( \text{ext} \) is empty if there is no . after the last /.

Before parsing, the \( \text{full name} \) is expanded until only non-expandable tokens remain, except that active characters are also not expanded. Quotes (") are invalid in file names and are discarded from the input.

\file_parse_full_name:n \file_parse_full_name:nNNN

\New: 2017-06-23
\Updated: 2020-06-24

\file_parse_full_name:n \star \file_parse_full_name:nNNN \{(full name)\}

Parses the \( \text{full name} \) as described for \file_parse_full_name:nNNN, and leaves \( \text{dir} \), \( \text{name} \), and \( \text{ext} \) in the input stream, each inside a pair of braces.

\file_parse_full_name_apply:n \file_parse_full_name_apply:nNN \{(full name)\} \{function\}

\New: 2020-06-24

Parses the \( \text{full name} \) as described for \file_parse_full_name:nNNN, and passes \( \text{dir} \), \( \text{name} \), and \( \text{ext} \) as arguments to \( \text{function} \), as an n-type argument each, in this order.

\file_hex_dump:n \star \file_hex_dump:nnn \{(file name)\}

\New: 2019-11-19

\file_hex_dump:n \star \file_hex_dump:nnn \{(file name)\} \{(start index)\} \{(end index)\}

Searches for \( \text{file name} \) using the current \TeX{} search path and the additional paths controlled by \texttt{\_\_file_search_path_seq}. It then expands to leave the hexadecimal dump of the file content in the input stream. The file is read as bytes, which means that in contrast to most \TeX{} behaviour there will be a difference in result depending on the line endings used in text files. The same file will produce the same result between different engines: the algorithm used is the same in all cases. When the file is not found, the result of expansion is empty. The \( \{\text{start index}\} \) and \( \{\text{end index}\} \) values work as described for \texttt{\_\_str_range:nnn}.

\file_get_hex_dump:n \star \file_get_hex_dump:nnn \{(file name)\} \{tl var\}

\New: 2019-11-19

\file_get_hex_dump:n \star \file_get_hex_dump:nnn \{(file name)\} \{\text{start index}\} \{\text{end index}\} \{tl var\}

\file_get_hex_dump:nnn \star \file_get_hex_dump:nnn \{tl var\}

Sets the \( \{\text{tl var}\} \) to the result of applying \texttt{\_\_file_hex_dump:n/\_\_file_hex_dump:nnn} to the \( \{\text{file}\} \). If the file is not found, the \( \{\text{tl var}\} \) will be set to \texttt{\_\_q_no_value}. 

95
\file_mdfive_hash:n \(\star\) \file_mdfive_hash:n \{\langle\text{name}\rangle\}

Searches for \langle\text{name}\rangle\) using the current \TeX\ search path and the additional paths controlled by \l_file_search_path_seq. It then expands to leave the MD5 sum generated from the contents of the file in the input stream. The file is read as bytes, which means that in contrast to most \TeX\ behaviour there will be a difference in result depending on the line endings used in text files. The same file will produce the same result between different engines: the algorithm used is the same in all cases. When the file is not found, the result of expansion is empty.

\file_get_mdfive_hash:nN \file_get_mdfive_hash:nN \{\langle\text{name}\rangle\} \langle\text{tl var}\rangle

Sets the \langle\text{tl var}\rangle\) to the result of applying \file_mdfive_hash:n\) to the \langle\text{file}\rangle\). If the file is not found, the \langle\text{tl var}\rangle\) will be set to \texttt{\q_no_value}.

\file_size:n \(\star\) \file_size:n \{\langle\text{name}\rangle\}

Searches for \langle\text{name}\rangle\) using the current \TeX\ search path and the additional paths controlled by \l_file_search_path_seq. It then expands to leave the size of the file in bytes in the input stream. When the file is not found, the result of expansion is empty.

\file_get_size:nN \file_get_size:nN \{\langle\text{name}\rangle\} \langle\text{tl var}\rangle

Sets the \langle\text{tl var}\rangle\) to the result of applying \file_size:n\) to the \langle\text{file}\rangle\). If the file is not found, the \langle\text{tl var}\rangle\) will be set to \texttt{\q_no_value}. This is not available in older versions of \XeTeX.

\file_timestamp:n \(\star\) \file_timestamp:n \{\langle\text{name}\rangle\}

Searches for \langle\text{name}\rangle\) using the current \TeX\ search path and the additional paths controlled by \l_file_search_path_seq. It then expands to leave the modification timestamp of the file in the input stream. The timestamp is of the form \texttt{D:\langle\text{year}\rangle\langle\text{month}\rangle\langle\text{day}\rangle\langle\text{hour}\rangle\langle\text{minute}\rangle\langle\text{second}\rangle\langle\text{offset}\rangle}, where the latter may be \texttt{Z} (UTC) or \langle\text{plus-minus}\rangle\langle\text{hours}\rangle'\langle\text{minutes}\rangle'. When the file is not found, the result of expansion is empty. This is not available in older versions of \XeTeX.

\file_get_timestamp:nN \file_get_timestamp:nN \{\langle\text{name}\rangle\} \langle\text{tl var}\rangle

Sets the \langle\text{tl var}\rangle\) to the result of applying \file_timestamp:n\) to the \langle\text{file}\rangle\). If the file is not found, the \langle\text{tl var}\rangle\) will be set to \texttt{\q_no_value}. This is not available in older versions of \XeTeX.
\file_compare_timestamp_p:nNn * \file_compare_timestamp:nNn \{\langle file-1 \rangle \langle comparator \rangle \{\langle file-2 \rangle \{\langle true \rangle \langle code \rangle \} \langle false code \rangle \}}

New: 2019-05-13
Updated: 2019-09-20

Compares the file stamps on the two \langle files \rangle as indicated by the \langle comparator \rangle, and inserts either the \langle true code \rangle or \langle false case \rangle as required. A file which is not found is treated as older than any file which is found. This allows for example the construct

\file_compare_timestamp:nNnT \{ source-file \} > \{ derived-file \}
{
    \langle code to regenerate derived file \rangle
}

to work when the derived file is entirely absent. The timestamp of two absent files is regarded as different. This is not available in older versions of Xe\TeX.

\file_input:n
\file_input:n \{\langle file name \rangle\}

Updated: 2017-06-26

Searches for \langle file name \rangle in the path as detailed for \file_if_exist:nTF, and if found reads in the file as additional \LaTeX source. All files read are recorded for information and the file name stack is updated by this function. An error is raised if the file is not found.

\file_if_exist_input:n
\file_if_exist_input:n \{\langle file name \rangle\}
\file_if_exist_input:nF \{\langle file name \rangle\} \{\langle false code \rangle\}

New: 2014-07-02

Searches for \langle file name \rangle using the current \TeX search path and the additional paths included in \i_file_search_path_seq. If found then reads in the file as additional \LaTeX source as described for \file_input:n, otherwise inserts the \langle false code \rangle. Note that these functions do not raise an error if the file is not found, in contrast to \file_input:n.

\file_input_stop
\file_input_stop:

New: 2017-07-07

Ends the reading of a file started by \file_input:n or similar before the end of the file is reached. Where the file reading is being terminated due to an error, \msg_critical:nn(nn) should be preferred.

\TeXhackers note: This function must be used on a line on its own: \TeX reads files line-by-line and so any additional tokens in the “current” line will still be read.

This is also true if the function is hidden inside another function (which will be the normal case), i.e., all tokens on the same line in the source file are still processed. Putting it on a line by itself in the definition doesn’t help as it is the line where it is used that counts!

\file_show_list
\file_log_list

These functions list all files loaded by \LaTeX commands that populate \@filelist or by \file_input:n. While \file_show_list: displays the list in the terminal, \file_log_list: outputs it to the log file only.
Chapter 13
The \texttt{l3luatex} package: \texttt{Lua\TeX}-specific functions

The \texttt{Lua\TeX} engine provides access to the Lua programming language, and with it access to the “internals” of \TeX. In order to use this within the framework provided here, a family of functions is available. When used with \texttt{pdf\TeX}, \texttt{d\TeX}, \texttt{up\TeX} or \texttt{X\TeX} these raise an error: use \texttt{\sys_if_engine_luatex:T} to avoid this. Details on using Lua with the \texttt{Lua\TeX} engine are given in the \texttt{Lua\TeX} manual.

13.1 Breaking out to Lua

\begin{verbatim}
\lua_now:n \langle token list⟩
\lua_now:e
\end{verbatim}

The \langle token list⟩ is first tokenized by \TeX, which includes converting line ends to spaces in the usual \TeX manner and which respects currently-applicable \TeX category codes. The resulting ⟨Lua input⟩ is passed to the Lua interpreter for processing. Each \texttt{\lua_now:n} block is treated by Lua as a separate chunk. The Lua interpreter executes the ⟨Lua input⟩ immediately, and in an expandable manner.

\TeXhackers note: \texttt{\lua_now:e} is a macro wrapper around \texttt{\directlua}: when \texttt{Lua\TeX} is in use two expansions are required to yield the result of the Lua code.

\begin{verbatim}
\lua_shipout_e:n \langle token list⟩
\lua_shipout:n
\end{verbatim}

The \langle token list⟩ is first tokenized by \TeX, which includes converting line ends to spaces in the usual \TeX manner and which respects currently-applicable \TeX category codes. The resulting ⟨Lua input⟩ is passed to the Lua interpreter when the current page is finalised (\textit{i.e.} at shipout). Each \texttt{\lua_shipout:n} block is treated by Lua as a separate chunk. The Lua interpreter will execute the ⟨Lua input⟩ during the page-building routine: no \TeX expansion of the ⟨Lua input⟩ will occur at this stage.

In the case of the \texttt{\lua_shipout_e:n} version the input is fully expanded by \TeX in an \texttt{e}-type manner during the shipout operation.

\TeXhackers note: At a \TeX level, the ⟨Lua input⟩ is stored as a “whatsit”.

\newpage
98
\lua_escape:n \lua_escape:e

Converts the \langle\text{token list}\rangle such that it can safely be passed to Lua: embedded backslashes, double and single quotes, and newlines and carriage returns are escaped. This is done by prepending an extra token consisting of a backslash with category code 12, and for the line endings, converting them to \texttt{\textbackslash n} and \texttt{\textbackslash r}, respectively.

\textbf{\TeX\ hackers note:} \lua_escape:e is a macro wrapper around \luaescapestring: when Lua\TeX\ is in use two expansions are required to yield the result of the Lua code.

\lua_load_module:n

Loads a Lua module into the Lua interpreter. \lua_now:n passes its \langle\text{token list}\rangle argument to the Lua interpreter as a single line, with characters interpreted under the current catcode regime. These two facts mean that \lua_now:n rarely behaves as expected for larger pieces of code. Therefore, package authors should \textbf{not} write significant amounts of Lua code in the arguments to \lua_now:n. Instead, it is strongly recommended that they write the majority of their Lua code in a separate file, and then load it using \lua_load_module:n.

\textbf{\TeX\ hackers note:} This is a wrapper around the Lua call \texttt{require '\langle\text{module}\rangle'}.

13.2 Lua interfaces

As well as interfaces for \TeX, there are a small number of Lua functions provided here.

\begin{verbatim}
\texttt{ltx.utils}  Most public interfaces provided by the module are stored within the \texttt{ltx.utils} table.

\texttt{ltx.utils.filedump}  \langle\text{name}\rangle = \texttt{ltx.utils.filedump(\langle\text{file}\rangle,\langle\text{offset}\rangle,\langle\text{length}\rangle)}

Returns the uppercase hexadecimal representation of the content of the \langle\text{file}\rangle read as bytes. If the \langle\text{length}\rangle is given, only this part of the file is returned; similarly, one may specify the \langle\text{offset}\rangle from the start of the file. If the \langle\text{length}\rangle is not given, the entire file is read starting at the \langle\text{offset}\rangle.

\texttt{ltx.utils.filename}  \langle\text{name}\rangle = \texttt{ltx.utils.filename(\langle\text{file}\rangle)}

Returns the MD5 sum of the file contents read as bytes; note that the result will depend on the nature of the line endings used in the file, in contrast to normal \TeX\ behaviour. If the \langle\text{file}\rangle is not found, nothing is returned with \texttt{no error raised}.

\texttt{ltx.utils.filemoddate}  \langle\text{name}\rangle = \texttt{ltx.utils.filemoddate(\langle\text{file}\rangle)}

Returns the date/time of last modification of the \langle\text{file}\rangle in the format

\texttt{D:\langle\text{year}\rangle\langle\text{month}\rangle\langle\text{day}\rangle\langle\text{hour}\rangle\langle\text{minute}\rangle\langle\text{second}\rangle\langle\text{offset}\rangle}

where the latter may be \texttt{Z} (UTC) or \langle\text{plus-minus}\rangle\langle\text{hours}\rangle'\langle\text{minutes}\rangle'. If the \langle\text{file}\rangle is not found, nothing is returned with \texttt{no error raised}.
\end{verbatim}
\texttt{ltx.utils.filesize} size = \texttt{ltx.utils.filesize(\langle file\rangle)}

Returns the size of the \langle file\rangle in bytes. If the \langle file\rangle is not found, nothing is returned with \textit{no error raised}. 
Chapter 14

The \texttt{l3legacy} package

Interfaces to legacy concepts

There are a small number of \TeX{} or \LaTeX{} concepts which are not used in \texttt{expl3} code but which need to be manipulated when working as a \LaTeX{} package. To allow these to be integrated cleanly into \texttt{expl3} code, a set of legacy interfaces are provided here.

\begin{verbatim}
\legacy_if_p:n \legacy_if:nTF \legacy_if_set_true:n \legacy_if_set_false:n \legacy_if_gset_true:n \legacy_if_gset_false:n
\end{verbatim}

Tests if the \LaTeX{} conditional (generated by \texttt{\newif}) if \texttt{true} or \texttt{false} and branches accordingly. The \texttt{name} of the conditional should \texttt{omit} the leading \texttt{if}.

\begin{verbatim}
\legacy_if_set:nn \legacy_if_gset:nn
\end{verbatim}

Sets the \LaTeX{} conditional \texttt{\if\langle name\rangle} (generated by \texttt{\newif}) to be \texttt{true} or \texttt{false}.

\begin{verbatim}
\legacy_if_set:nn \legacy_if_gset:nn
\end{verbatim}

Sets the \LaTeX{} conditional \texttt{\if\langle name\rangle} (generated by \texttt{\newif}) to the result of evaluating the \texttt{\langle boolean expression\rangle}. 

New: 2021-05-10
Part IV

Data types
Chapter 15

The l3tl package
Token lists

\TeX{} works with tokens, and \LaTeX{}3 therefore provides a number of functions to deal with lists of tokens. Token lists may be present directly in the argument to a function:

\texttt{\textbackslash foo:n \{ a collection of \textbackslash tokens \}}

or may be stored in a so-called “token list variable”, which have the suffix tl: a token list variable can also be used as the argument to a function, for example

\texttt{\textbackslash foo:N \textbackslash l\_some\_tl}

In both cases, functions are available to test and manipulate the lists of tokens, and these have the module prefix tl. In many cases, functions which can be applied to token list variables are paired with similar functions for application to explicit lists of tokens: the two “views” of a token list are therefore collected together here.

A token list (explicit, or stored in a variable) can be seen either as a list of “items”, or a list of “tokens”. An item is whatever \texttt{\use:n} would grab as its argument: a single non-space token or a brace group, with optional leading explicit space characters (each item is thus itself a token list). A token is either a normal N argument, or \&, \{, or \} (assuming normal \TeX{} category codes). Thus for example

\texttt{\{ Hello \} - world}

contains six items (Hello, w, o, r, l and d), but thirteen tokens ({, H, e, l, o, }, \&, w, o, r, l and d). Functions which act on items are often faster than their analogue acting directly on tokens.

15.1 Creating and initialising token list variables

\texttt{\textbackslash tl\_new:N \textbackslash tl\_new:N \langle tl\ var \rangle}
\texttt{\textbackslash tl\_new:C}

Creates a new \texttt{\langle tl\ var \rangle} or raises an error if the name is already taken. The declaration is global. The \texttt{\langle tl\ var \rangle} is initially empty.
\tl_const:Nn
\tl_const:(Nx|cn|cx)

\tl const:Nn \tl var {\langle token list\rangle}

Creates a new constant \langle tl var \rangle or raises an error if the name is already taken. The value of the \langle tl var \rangle is set globally to the \langle token list \rangle.

\tl clear:N
\tl clear:c
\tl_gclear:N
\tl_gclear:c

\tl clear:N \tl var
Clears all entries from the \langle tl var \rangle.

\tl clear_new:N
\tl clear_new:c
\tl_gclear_new:N
\tl_gclear_new:c

\tl clear_new:N \tl var
Ensures that the \langle tl var \rangle exists globally by applying \tl new:N if necessary, then applies \tl_(g)clear:N to leave the \langle tl var \rangle empty.

\tl_set_eq:NN
\tl_set_eq:NN (cN | Nc | cc)
\tl_gset_eq:NN
\tl_gset_eq:NN (cN | Nc | cc)

\tl_set_eq:NN \tl var 1 \tl var 2
Sets the content of \langle tl var 1 \rangle equal to that of \langle tl var 2 \rangle.

\tl_concat:NNN
\tl_concat:ccc
\tl_gconcat:NNN
\tl_gconcat:ccc

\tl_concat:NNN \tl var 1 \tl var 2 \tl var 3
Concatenates the content of \langle tl var 2 \rangle and \langle tl var 3 \rangle together and saves the result in \langle tl var 1 \rangle. The \langle tl var 2 \rangle is placed at the left side of the new token list.

\tl_if_exist_p:N
\tl_if_exist:NTF \tl var \{true code\} \{false code\}

\tl_if_exist_p:N \tl var
Tests whether the \langle tl var \rangle is currently defined. This does not check that the \langle tl var \rangle really is a token list variable.

15.2 Adding data to token list variables

\tl_set:Nn
\tl_set:(NV|Nv|Nf|Nx|cV|cV|co|cf|cx)
\tl_gset:Nn
\tl_gset:(NV|Nv|Nf|Nx|cV|cV|co|cf|cx)

\tl_set:Nn \tl var {\langle tokens\rangle}
Sets \langle tl var \rangle to contain \langle tokens \rangle, removing any previous content from the variable.

\tl_put_left:Nn
\tl_put_left:(NV|Nv|Nf|Nx|cV|cV|co|cf|cx)
\tl_gput_left:Nn
\tl_gput_left:(NV|Nv|Nf|Nx|cV|cV|co|cf|cx)

\tl_put_left:Nn \tl var {\langle tokens\rangle}
Appends \langle tokens \rangle to the left side of the current content of \langle tl var \rangle.
\appendix

\section{Token List Conditionals}

\begin{itemize}
  \item \texttt{\tl_if_blank_p:n} \{\langle token list\rangle\} \{\langle true code\rangle\} \{\langle false code\rangle\}
  \begin{itemize}
    \item Tests if the \langle token list\rangle consists only of blank spaces \textit{(i.e. contains no item)}. The test is true if \langle token list\rangle is zero or more explicit space characters \textit{(explicit tokens with character code 32 and category code 10)}, and is false otherwise.
  \end{itemize}

  \item \texttt{\tl_if_empty_p:N} \{\langle token list variable\rangle\} \{\langle true code\rangle\} \{\langle false code\rangle\}
  \begin{itemize}
    \item Tests if the \langle token list variable\rangle is entirely empty \textit{(i.e. contains no tokens at all)}.
  \end{itemize}

  \item \texttt{\tl_if_eq_p:NN} \{\langle token list\rangle\} \{\langle token list\rangle\} \{\langle true code\rangle\} \{\langle false code\rangle\}
  \begin{itemize}
    \item Compares the content of two \langle token list variables\rangle and is logically true if the two contain the same list of tokens \textit{(i.e. identical in both the list of characters they contain and the category codes of those characters)}. Thus for example
      \begin{verbatim}
      \tl_set:Nn \l_tmpa_tl { abc }
      \tl_set:Nx \l_tmpb_tl { \tl_to_str:n { abc } }
      \tl_if_eq:NN \l_tmpa_tl \l_tmpb_tl \{ true \} \{ false \}
      \end{verbatim}
    yields \texttt{false}. See also \texttt{\str_if_eq:nnTF} for a comparison that ignores category codes.
  \end{itemize}

\end{itemize}

\noindent
\texttt{\tl_if_eq:NN} \{\langle token list\rangle\} \{\langle token list\rangle\} \{\langle true code\rangle\} \{\langle false code\rangle\}
\begin{itemize}
  \item Tests if the \langle token list variable\rangle and the \langle token list\rangle contain the same list of tokens, both in respect of character codes and category codes. This conditional is not expandable: see \texttt{\tl_if_eq:NNTF} for an expandable version when both token lists are stored in variables, or \texttt{\str_if_eq:nnTF} if category codes are not important.
\end{itemize}

\newpage
\temp
\if_eq:nnTF \{\token list_1\} \{\token list_2\} \{\true code\} \{\false code\}
Tests if \{\token list_1\} and \{\token list_2\} contain the same list of tokens, both in respect of character codes and category codes. This conditional is not expandable: see \if_eq:NNTF for an expandable version when token lists are stored in variables, or \if_eq:nnTF if category codes are not important.

\if_in:NnTF \tl var \{\token list\} \{\true code\} \{\false code\}
Tests if the \{\token list\} is found in the content of the \tl var. The \{\token list\} cannot contain the tokens {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

\if_in:nnTF \{\token list_1\} \{\token list_2\} \{\true code\} \{\false code\}
Tests if \{\token list_2\} is found inside \{\token list_1\}. The \{\token list_2\} cannot contain the tokens {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). The search does not enter brace (category code 1/2) groups.

\if_novalue_p:n \{\token list\} \{\true code\} \{\false code\}
Tests if the \{\token list\} is exactly equal to the special \c_novalue_tl marker. This function is intended to allow construction of flexible document interface structures in which missing optional arguments are detected.

\if_single_p:N \tl var \if_single:NTF \tl var \{\true code\} \{\false code\}
Tests if the content of the \tl var consists of a single \{item\}, i.e. is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to \count:n.

\if_single_p:c \tl var \if_single:c \tl var \{\true code\} \{\false code\}
Updated: 2011-08-13

\if_single_token_p:n \{\token list\} \if_single_token:n \{\token list\} \{\true code\} \{\false code\}
Tests if the token list consists of exactly one token, i.e. is either a single space character or a single normal token. Token groups \{\ldots\} are not single tokens.
This function compares the \langle test token list variable \rangle in turn with each of the \langle token list variable cases \rangle. If the two are equal (as described for \tl_if_eq:NNTF) then the associated \langle code \rangle is left in the input stream and other cases are discarded. If any of the cases are matched, the \langle true code \rangle is also inserted into the input stream (after the code for the appropriate case), while if none match then the \langle false code \rangle is inserted. The function \tl_case:Nn, which does nothing if there is no match, is also available.

15.3.1 Testing the first token

Tests if the first \langle token \rangle in the \langle token list \rangle has the same category code as the \langle test token \rangle. In the case where the \langle token list \rangle is empty, the test is always false.

Tests if the first \langle token \rangle in the \langle token list \rangle has the same character code as the \langle test token \rangle. In the case where the \langle token list \rangle is empty, the test is always false.

Tests if the first \langle token \rangle in the \langle token list \rangle has the same meaning as the \langle test token \rangle. In the case where the \langle token list \rangle is empty, the test is always false.

Tests if the first \langle token \rangle in the \langle token list \rangle is an explicit begin-group character (with category code 1 and any character code), in other words, if the \langle token list \rangle starts with a brace group. In particular, the test is false if the \langle token list \rangle starts with an implicit token such as \c_group_begin_token, or if it is empty. This function is useful to implement actions on token lists on a token by token basis.
Tests if the first \textit{token} in the \textit{token list} is a normal N-type argument. In other words, it is neither an explicit space character (explicit token with character code 32 and category code 10) nor an explicit begin-group character (with category code 1 and any character code). An empty argument yields \texttt{false}, as it does not have a normal first token. This function is useful to implement actions on token lists on a token by token basis.

Tests if the first \textit{token} in the \textit{token list} is an explicit space character (explicit token with character code 32 and category code 10). In particular, the test is \texttt{false} if the \textit{token list} starts with an implicit token such as \texttt{\c_space_token}, or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

15.4 Working with token lists as a whole

15.4.1 Using token lists

Converting the \textit{token list} to a \textit{string}, leaving the resulting character tokens in the input stream. A \textit{string} is a series of tokens with category code 12 (other) with the exception of spaces, which retain category code 10 (space). This function requires only a single expansion. Its argument \texttt{must} be braced.

\textbf{\TeX} hackers note: This is the \texttt{\epsilon-\TeX} primitive \texttt{\detokenize}. Converting a \textit{token list} to a \textit{string} yields a concatenation of the string representations of every token in the \textit{token list}. The string representation of a control sequence is

- an escape character, whose character code is given by the internal parameter \texttt{\escapechar}, absent if the \texttt{\escapechar} is negative or greater than the largest character code;
- the control sequence name, as defined by \texttt{\cs_to_str:N};
- a space, unless the control sequence name is a single character whose category at the time of expansion of \texttt{\tl_to_str:n} is not “letter”.

The string representation of an explicit character token is that character, doubled in the case of (explicit) macro parameter characters (normally \#). In particular, the string representation of a token list may depend on the category codes in effect when it is evaluated, and the value of the \texttt{\escapechar}: for instance \texttt{\tl_to_str:n \{\a\}} normally produces the three character “backslash”, “lower-case a”, “space”, but it may also produce a single “lower-case a” if the escape character is negative and \a is currently not a letter.

Converting the content of the \textit{tl var} into a series of characters with category code 12 (other) with the exception of spaces, which retain category code 10 (space). This \textit{string} is then left in the input stream. For low-level details, see the notes given for \texttt{\tl_to_str:n}.
\texttt{\tl_use:N} * \texttt{\tl_use:N} \langle \texttt{tl var} \\ \texttt{\tl_use:c} * \\
Recovers the content of a \langle \texttt{tl var} \rangle and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Note that it is possible to use a \langle \texttt{tl var} \rangle directly without an accessor function.

### 15.4.2 Counting and reversing token lists

\texttt{\tl_count:n} * \texttt{\tl_count:n} \{(\texttt{tokens})\\ \texttt{\tl_count:(V)o} * \\
Counts the number of \langle \texttt{items} \rangle in \langle \texttt{tokens} \rangle and leaves this information in the input stream. Unbraced tokens count as one element as do each token group \((\{\ldots\})\). This process ignores any unprotected spaces within \langle \texttt{tokens} \rangle. See also \texttt{\tl_count:n}. This function requires three expansions, giving an \langle \texttt{integer denotation} \rangle. 

\texttt{\tl_count:n} * \texttt{\tl_count:C} * \\
Counts the number of \langle \texttt{items} \rangle in the \langle \texttt{tl var} \rangle and leaves this information in the input stream. Unbraced tokens count as one element as do each token group \((\{\ldots\})\). This process ignores any unprotected spaces within the \langle \texttt{tl var} \rangle. See also \texttt{\tl_count:n}. This function requires three expansions, giving an \langle \texttt{integer denotation} \rangle.

\texttt{\tl_count_tokens:n} * \texttt{\tl_count_tokens:n} \{(\texttt{tokens})\\ \\
Counts the number of \TeX{} tokens in the \langle \texttt{tokens} \rangle and leaves this information in the input stream. Every token, including spaces and braces, contributes one to the total; thus for instance, the token count of \texttt{a-{bc}} is 6.

\texttt{\tl_reverse:n} * \texttt{\tl_reverse:n} \{(\texttt{token list})\\ \texttt{\tl_reverse:(V)o} * \\
Reverses the order of the \langle \texttt{items} \rangle in the \langle \texttt{token list} \rangle, so that \langle \texttt{item}_1\langle \texttt{item}_2\langle \texttt{item}_3\ldots\langle \texttt{item}_n\rangle\ldots\langle \texttt{item}_2\langle \texttt{item}_1\rangle\rangle\ldots\rangle. This process preserves unprotected space within the \langle \texttt{token list} \rangle. Tokens are not reversed within braced token groups, which keep their outer set of braces. In situations where performance is important, consider \texttt{\tl_reverse_items:n}. See also \texttt{\tl_reverse:n}.

**\TeX{}hackers note:** The result is returned within \texttt{\unexpanded}, which means that the token list does not expand further when appearing in an \texttt{x-type} or \texttt{e-type} argument expansion.

\texttt{\tl_reverse:N} * \texttt{\tl_reverse:N} \langle \texttt{tl var} \\
\texttt{\tl_reverse:C} * \\
\texttt{\tl_reverse:N} \langle \texttt{tl var} \\
\texttt{\tl_reverse:C} * \\
Sets the \langle \texttt{tl var} \rangle to contain the result of reversing the order of its \langle \texttt{items} \rangle, so that \langle \texttt{item}_1\langle \texttt{item}_2\langle \texttt{item}_3\ldots\langle \texttt{item}_n\rangle\ldots\langle \texttt{item}_2\langle \texttt{item}_1\rangle\rangle\ldots\rangle. This process preserves unprotected spaces within the \langle \texttt{token list variable} \rangle. Braced token groups are copied without reversing the order of tokens, but keep the outer set of braces. This is equivalent to a combination of an assignment and \texttt{\tl_reverse:V}. See also \texttt{\tl_reverse_items:N} for improved performance.
\tl_reverse_items:n \{⟨token list⟩\}

Reverses the order of the ⟨items⟩ stored in ⟨tl var⟩, so that ⟨⟨item1⟩⟩⟨⟨item2⟩⟩⟨⟨item3⟩⟩… ⟨⟨itemn⟩⟩ becomes ⟨⟨itemn⟩⟩… ⟨⟨item3⟩⟩⟨⟨item2⟩⟩⟨⟨item1⟩⟩. This process removes any unprotected space within the ⟨token list⟩. Braced token groups are copied without reversing the order of tokens, and keep the outer set of braces. Items which are initially not braced are copied with braces in the result. In cases where preserving spaces is important, consider the slower function \tl_reverse:n.

\textbf{TEXhackers note:} The result is returned within \unexpanded, which means that the token list does not expand further when appearing in an x-type or e-type argument expansion.

\tl_trim_spaces:n
tl_trim_spaces:o

Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the ⟨token list⟩ and leaves the result in the input stream.

\textbf{TEXhackers note:} The result is returned within \unexpanded, which means that the token list does not expand further when appearing in an x-type or e-type argument expansion.

\tl_trim_spaces:NN
\tl_trim_spaces:ON
\tl_trim_spaces:NC
\tl_gtrim_spaces:N
\tl_gtrim_spaces:CN

Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the ⟨token list⟩ and passes the result to the ⟨function⟩ as an n-type argument.

Sets the ⟨tl var⟩ to contain the result of removing any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from its contents.

\textbf{15.4.3 Viewing token lists}

\tl_show:N
\tl_show:c

Displays the content of the ⟨tl var⟩ on the terminal.

\textbf{TEXhackers note:} This is similar to the \TeX primitive \show, wrapped to a fixed number of characters per line.

\tl_show:n

Displays the ⟨token list⟩ on the terminal.

\textbf{TEXhackers note:} This is similar to the \eTeX primitive \showtokens, wrapped to a fixed number of characters per line.
15.5 Manipulating items in token lists

15.5.1 Mapping over token lists

All mappings are done at the current group level, i.e. any local assignments made by the \langle function \rangle or \langle code \rangle discussed below remain in effect after the loop.

\tl_map_function:NN \star \tl_map_function:cn \star

\tl_map_function:nN \star \tl_map_function:nN \{\langle token list \rangle\} \{\langle function \rangle\}

Applies \langle function \rangle to every \langle item \rangle in the \langle tl var \rangle. The \langle function \rangle receives one argument for each iteration. This may be a number of tokens if the \langle item \rangle was stored within braces. Hence the \langle function \rangle should anticipate receiving n-type arguments. See also \tl_map_function:NN.

\tl_map_inline:Nn \tl_map_inline:cn

\tl_map_inline:nn \{\langle token list \rangle\} \{\langle inline function \rangle\}

Applies the \langle inline function \rangle to every \langle item \rangle stored within the \langle tl var \rangle. The \langle inline function \rangle should consist of code which receives the \langle item \rangle as \#1. See also \tl_map_\function:NN.
Analogue of \tl_map_function:NN which maps several tokens instead of a single function. The \(\text{code}\) receives each \(\text{item}\) in the \(\langle \text{tl var} \rangle\) or in \(\langle \text{tokens} \rangle\) as a trailing brace group. For instance,

\[
\text{\tl_map_tokens:Nn \ l_my_tl \{ \prg_replicate:nn \{ 2 \} \}}
\]

expands to twice each \(\text{item}\) in the \(\langle \text{tl var} \rangle\): for each \(\text{item}\) in \(\l_my_tl\) the function \(\prg_replicate:nn\) receives 2 and \(\text{item}\) as its two arguments. The function \texttt{\tl_map_inline:Nn} is typically faster but is not expandable.

\[
\tl_map_variable:NNn \tl_map_variable:cNn
\]

Updated: 2012-06-29

\[
\tl_map_variable:NNn \tl_map_variable:nNn
\]

Updated: 2012-06-29

\[
\tl_map_break:
\]

Updated: 2012-06-29

\[
\tl_map_inline:Nn \ l_my_tl
\{
\str_if_eq:nnT { #1 } { bingo } { \tl_map_break: }
% Do something useful
\}
\]

See also \texttt{\tl_map_break:n}. Use outside of a \texttt{\tl_map_...} scenario leads to low level \TeX{} errors.

\textbf{TeXhackers note}: When the mapping is broken, additional tokens may be inserted before the \(\langle \text{tokens} \rangle\) are inserted into the input stream. This depends on the design of the mapping function.
\tl_map_break:n \{code\}

Used to terminate a \tl_map... function before all entries in the \langle token list variable \rangle have been processed, inserting the \langle code \rangle after the mapping has ended. This normally takes place within a conditional statement, for example

\tl_map_inline:Nn \l_my_tl
{\str_if_eq:nnT { #1 } { bingo } { \tl_map_break:n \{ <code> \} } % Do something useful }

Use outside of a \tl_map... scenario leads to low level \TeX{} errors.

\TeXhackers note: When the mapping is broken, additional tokens may be inserted before the \langle code \rangle is inserted into the input stream. This depends on the design of the mapping function.

15.5.2 Head and tail of token lists

Functions which deal with either only the very first item (balanced text or single normal token) in a token list, or the remaining tokens.

\tl_head:n \{token list\}

Leaves in the input stream the first \langle item \rangle in the \langle token list \rangle, discarding the rest of the \langle token list \rangle. All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded; for example

\tl_head:n { abc }
and

\tl_head:n { - abc }

both leave a in the input stream. If the “head” is a brace group, rather than a single token, the braces are removed, and so

\tl_head:n { - { - ab } c }

yields \langle ab \rangle. A blank \langle token list \rangle (see \tl_if_blank:nTF) results in \tl_head:n leaving nothing in the input stream.

\TeXhackers note: The result is returned within \exp_not:n, which means that the token list does not expand further when appearing in an x-type or e-type argument expansion.
\tl_head:w \tl_head:w \langle \text{token list} \rangle \{ \} \q_stop

Leaves in the input stream the first \langle \text{item} \rangle in the \langle \text{token list} \rangle, discarding the rest of the \langle \text{token list} \rangle. All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded. A blank \langle \text{token list} \rangle (which consists only of space characters) results in a low-level \TeX{} error, which may be avoided by the inclusion of an empty group in the input (as shown), without the need for an explicit test. Alternatively, \tl_if_blank:nF may be used to avoid using the function with a “blank” argument. This function requires only a single expansion, and thus is suitable for use within an \o-type expansion. In general, \tl_head:n should be preferred if the number of expansions is not critical.

\tl_tail:N \tl_tail:n \tl_tail:(V|v|f) *

\tl_tail:n \{ \langle \text{token list} \rangle \}

Discards all leading explicit space characters (explicit tokens with character code 32 and category code 10) and the first \langle \text{item} \rangle in the \langle \text{token list} \rangle, and leaves the remaining tokens in the input stream. Thus for example

\tl_tail:n \{ a - \{bc\} d \}

and

\tl_tail:n \{ - a - \{bc\} d \}

both leave \{bc\}d in the input stream. A blank \langle \text{token list} \rangle (see \tl_if_blank:nF) results in \tl_tail:n leaving nothing in the input stream.

\TeX{} Hackers note: The result is returned within \exp_not:n, which means that the token list does not expand further when appearing in an \x-type or \e-type argument expansion.

If you wish to handle token lists where the first token may be a space, and this needs to be treated as the head/tail, this can be accomplished using \tl_if_head_is_space:nF, for example

\exp_last_unbraced:NNo
\cs_new:Npn \__mypkg_gobble_space:w \c_space_tl { }
\cs_new:Npn \mypkg_tl_head_keep_space:n #1
{ \tl_if_head_is_space:nF {#1} { ~ } { \tl_head:n {#1} } }
\cs_new:Npn \mypkg_tl_tail_keep_space:n #1
{ \tl_if_head_is_space:nF {#1} { \exp_not:o { \__mypkg_gobble_space:w #1 } } { \tl_tail:n {#1} } }

\textbf{Updated: 2012-09-01}
15.5.3 Items and ranges in token lists

\tl_item:nn \{\langle token list\rangle\} \{\langle integer expression\rangle\}

Indexing items in the \langle token list\rangle from 1 on the left, this function evaluates the \langle integer expression\rangle and leaves the appropriate item from the \langle token list\rangle in the input stream. If the \langle integer expression\rangle is negative, indexing occurs from the right of the token list, starting at $-1$ for the right-most item. If the index is out of bounds, then the function expands to nothing.

\TeX hacknote: The result is returned within the \unexpanded primitive (\exp_not:n), which means that the \langle item\rangle does not expand further when appearing in an x-type or e-type argument expansion.

\tl_rand_item:N \langle tl var\rangle
\tl_rand_item:n \{\langle token list\rangle\}

Selects a pseudo-random item of the \langle token list\rangle. If the \langle token list\rangle is blank, the result is empty. This is not available in older versions of \Xe\LaTeX.

\TeX hacknote: The result is returned within the \unexpanded primitive (\exp_not:n), which means that the \langle item\rangle does not expand further when appearing in an x-type or e-type argument expansion.
Leaves in the input stream the items from the \langle start index \rangle to the \langle end index \rangle inclusive. Spaces and braces are preserved between the items returned (but never at either end of the list). Here \langle start index \rangle and \langle end index \rangle should be \langle integer expressions \rangle. For describing in detail the functions' behavior, let \( m \) and \( n \) be the start and end index respectively. If either is 0, the result is empty. A positive index means 'start counting from the left end', and a negative index means 'from the right end'. Let \( l \) be the count of the token list.

The actual start point is determined as \( M = m \) if \( m > 0 \) and as \( M = l + m + 1 \) if \( m < 0 \). Similarly the actual end point is \( N = n \) if \( n > 0 \) and \( N = l + n + 1 \) if \( n < 0 \). If \( M > N \), the result is empty. Otherwise it consists of all items from position \( M \) to position \( N \) inclusive; for the purpose of this rule, we can imagine that the token list extends at infinity on either side, with void items at positions \( s \) for \( s \leq 0 \) or \( s > l \).

Spaces in between items in the actual range are preserved. Spaces at either end of the token list will be removed anyway (think to the token list being passed to \texttt{\tl_trim_spaces:n} to begin with.

Thus, with \( l = 7 \) as in the examples below, all of the following are equivalent and result in the whole token list

\begin{verbatim}
\tl_range:nnn { abcd-{e{}}fg } { 1 } { 7 }
\tl_range:nnn { abcd-{e{}}fg } { 1 } { 12 }
\tl_range:nnn { abcd-{e{}}fg } { -7 } { 7 }
\tl_range:nnn { abcd-{e{}}fg } { -12 } { 7 }
\end{verbatim}

Here are some more interesting examples. The calls

\begin{verbatim}
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { 2 } { 5 } }
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { 2 } { -3 } }
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { -6 } { 5 } }
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { -6 } { -3 } }
\end{verbatim}

are all equivalent and will print \texttt{bcd{e{}}} on the terminal; similarly

\begin{verbatim}
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { 2 } { 5 } }
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { 2 } { -3 } }
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { -6 } { 5 } }
\iow_term:x { \tl_range:nnn { abcd{-e{}}fg } } { -6 } { -3 } }
\end{verbatim}

are all equivalent and will print \texttt{bcd {e{}}} on the terminal (note the space in the middle). To the contrary,

\begin{verbatim}
\tl_range:nnn { abcd{-e{}}f } } { 2 } { 4 } }
\end{verbatim}

will discard the space after 'd'.

If we want to get the items from, say, the third to the last in a token list <tl>, the call is \texttt{\tl_range:nnn { <tl> } } { 3 } { -1 }. Similarly, for discarding the last item, we can do \texttt{\tl_range:nnn { <tl> } } { 1 } { -2 }.

For better performance, see \texttt{\tl_range_braced:nnn} and \texttt{\tl_range_unbraced:nnn}.

\textbf{TexHackers note:} The result is returned within the \texttt{\exp_not:n} primitive, which means that the \langle item \rangle does not expand further when appearing in an \texttt{x}\- or \texttt{e}\-type argument expansion.
15.5.4 Sorting token lists

\tl_sort:Nn \tl_sort:Nn \langle tl var \rangle \{ \langle comparison code \rangle \}
\tl_sort:cn \tl_sort:cn
\tl_gsort:Nn \tl_gsort:cn
\tl_gsort:Nn \tl_gsort:cn

Sorts the items in the \langle tl var \rangle according to the \langle comparison code \rangle, and assigns the result to \langle tl var \rangle. The details of sorting comparison are described in Section 6.1.

\tl_sort:nN \tl_sort:nN
\tl_gsort:nN \tl_gsort:nN

New: 2017-02-06

\tl_sort:nN \star \tl_sort:nN \langle \langle token list \rangle \{ \langle conditional \rangle \rangle
\tl_gsort:nN \tl_gsort:nN
\tl_gsort:nN \tl_gsort:nN

Sorts the items in the \langle token list \rangle, using the \langle conditional \rangle to compare items, and leaves the result in the input stream. The \langle conditional \rangle should have signature :nnTF, and return true if the two items being compared should be left in the same order, and false if the items should be swapped. The details of sorting comparison are described in Section 6.1.

\TeXhackers note: The result is returned within \exp_not:n, which means that the token list does not expand further when appearing in an x-type or e-type argument expansion.

15.6 Manipulating tokens in token lists

15.6.1 Replacing tokens

Within token lists, replacement takes place at the top level: there is no recursion into brace groups (more precisely, within a group defined by a category code 1/2 pair).

\tl_replace_once:Nnn \tl_replace_once:cn
\tl_greplace_once:Nnn \tl_greplace_once:cn

\tl_gremove_once:Nn \tl_gremove_one
\tl_remove_all:Nn \tl_remove_all:cn \tl_gremove_all:Nn \tl_gremove_all:cn

Removes all occurrences of \langle tokens \rangle from the \langle tl var \rangle. \langle Tokens \rangle cannot contain \{, \} or #
(more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern \langle tokens \rangle may remain after the removal, for instance.

\tl_set:Nn \l_tmpa_tl {abbccd} \tl_remove_all:Nn \l_tmpa_tl {bc}

results in \l_tmpa_tl containing abcd.

15.6.2 Reassigning category codes

These functions allow the rescanning of tokens: re-apply \TeX's tokenization process to apply category codes different from those in force when the tokens were absorbed. Whilst this functionality is supported, it is often preferable to find alternative approaches to achieving outcomes rather than rescanning tokens (for example construction of token lists token-by-token with intervening category code changes or using \char_generate:nn).

\tl_set_rescan:Nnn \tl_set_rescan:Nnn \tl_set_rescan:Nnn \tl_set_rescan:Nnn \tl_gset_rescan:Nnn \tl_gset_rescan:Nnn

Sets \langle tl var \rangle to contain \langle tokens \rangle, applying the category code régime specified in the \langle setup \rangle before carrying out the assignment. (Category codes applied to tokens not explicitly covered by the \langle setup \rangle are those in force at the point of use of \tl_set_rescan:Nnn.) This allows the \langle tl var \rangle to contain material with category codes other than those that apply when \langle tokens \rangle are absorbed. The \langle setup \rangle is run within a group and may contain any valid input, although changes in category codes, such as uses of \cctab_select:N, are relevant. See also \tl_rescan:nn.

\TeXhackers note: The \langle tokens \rangle are first turned into a string (using \tl_to_str:n). If the string contains one or more characters with character code \newlinechar (set equal to \endlinechar unless that is equal to 32, before the user \langle setup \rangle), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file.
\tl_rescan:nn \tl_rescan:nn \{\langle \text{setup}\rangle\} \{\langle \text{tokens}\rangle\}

Rescans \langle \text{tokens}\rangle\) applying the category code régime specified in the \langle \text{setup}\rangle, and leaves the resulting tokens in the input stream. (Category codes applied to tokens not explicitly covered by the \langle \text{setup}\rangle\) are those in force at the point of use of \tl_rescan:nn.) The \langle \text{setup}\rangle\ is run within a group and may contain any valid input, although only changes in category codes, such as uses of \texttt{\cctab_select:N}, are relevant. See also \tl_set_:nn_rescan:NNn, which is more robust than using \tl_set:Nn in the \langle \text{tokens}\rangle argument of \tl_rescan:nn.

\textbf{\texttt{\TeX}hackers note:} The \langle \text{tokens}\rangle\ are first turned into a string (using \tl_to_str:n). If the string contains one or more characters with character code \texttt{\newlinechar} (set equal to \endlinechar unless that is equal to 32, before the user \langle \text{setup}\rangle\), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file.

Contrarily to the \texttt{\scantokens} primitive, \tl_rescan:nn tokenizes the whole string in the same category code regime rather than one token at a time, so that directives such as \texttt{\verb} that rely on changing category codes will not function properly.

### 15.7 Constant token lists

\texttt{\c_empty_tl}

Constant that is always empty.

\texttt{\c_novaluel}\t

A marker for the absence of an argument. This constant \texttt{\tl} can safely be typeset (cf. \texttt{\q-nil}), with the result being \texttt{-NoValue-}. It is important to note that \texttt{\c_novaluel} is constructed such that it will \textit{not} match the simple text input \texttt{-NoValue-}, i.e. that

\begin{verbatim}
\tl_if_eq:NnTF \c_novaluel \{ -NoValue- \}
\end{verbatim}

is logically \texttt{false}. The \texttt{\c_novaluel} marker is intended for use in creating document-level interfaces, where it serves as an indicator that an (optional) argument was omitted. In particular, it is distinct from a simple empty \texttt{\tl}.

\texttt{\c_space_tl}

An explicit space character contained in a token list (compare this with \texttt{\c_space_token}).

For use where an explicit space is required.

### 15.8 Scratch token lists

\texttt{\l_tmpa_tl} \texttt{\l_tmpb_tl}

Scratch token lists for local assignment. These are never used by the kernel code, and so are safe for use with any \texttt{\Verb}X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
\g_tmpa_tl Scratch token lists for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
Chapter 16

The \texttt{l3str} package: Strings

\LaTeX{} associates each character with a category code: as such, there is no concept of a “string” as commonly understood in many other programming languages. However, there are places where we wish to manipulate token lists while in some sense “ignoring” category codes: this is done by treating token lists as strings in a \LaTeX{} sense.

A \LaTeX{} string (and thus an \texttt{expl3} string) is a series of characters which have category code 12 (“other”) with the exception of space characters which have category code 10 (“space”). Thus at a technical level, a \LaTeX{} string is a token list with the appropriate category codes. In this documentation, these are simply referred to as strings.

String variables are simply specialised token lists, but by convention should be named with the suffix \texttt{...str}. Such variables should contain characters with category code 12 (other), except spaces, which have category code 10 (blank space). All the functions in this module which accept a token list argument first convert it to a string using \texttt{\tl_to_str:n} for internal processing, and do not treat a token list or the corresponding string representation differently.

As a string is a subset of the more general token list, it is sometimes unclear when one should be used over the other. Use a string variable for data that isn’t primarily intended for typesetting and for which a level of protection from unwanted expansion is suitable. This data type simplifies comparison of variables since there are no concerns about expansion of their contents.

The functions \texttt{\cs_to_str:N, \tl_to_str:n, \tl_to_str:N} and \texttt{\token_to_str:N} (and variants) generate strings from the appropriate input: these are documented in \texttt{l3basics, l3tl} and \texttt{l3token}, respectively.

Most expandable functions in this module come in three flavours:

- \texttt{\str_...:N}, which expect a token list or string variable as their argument;
- \texttt{\str_...:n}, taking any token list (or string) as an argument;
- \texttt{\str_..._ignore_spaces:n}, which ignores any space encountered during the operation: these functions are typically faster than those which take care of escaping spaces appropriately.
16.1 Creating and initialising string variables

\texttt{\textbackslash str\_new:N} \hspace{1em} \texttt{\textbackslash str\_new:N \{str\ var\}}

Creates a new \texttt{\{str\ var\}} or raises an error if the name is already taken. The declaration is global. The \texttt{\{str\ var\}} is initially empty.

\texttt{\textbackslash str\_new:c} \hspace{1em} \texttt{\textbackslash str\_new:n \{str\ var\}}

\texttt{\textbackslash str\_const:Nn} \hspace{1em} \texttt{\textbackslash str\_const:n \{str\ var\} \{\{token\ list\}\}}

Creates a new constant \texttt{\{str\ var\}} or raises an error if the name is already taken. The value of the \texttt{\{str\ var\}} is set globally to the \texttt{\{token\ list\}}, converted to a string.

\texttt{\textbackslash str\_clear:N} \hspace{1em} \texttt{\textbackslash str\_clear:c} \hspace{1em} \texttt{\textbackslash str\_gclear:N} \hspace{1em} \texttt{\textbackslash str\_gclear:c}

Clears the content of the \texttt{\{str\ var\}}.

\texttt{\textbackslash str\_clear\_new:N} \hspace{1em} \texttt{\textbackslash str\_clear\_new:c}

Ensures that the \texttt{\{str\ var\}} exists globally by applying \texttt{\textbackslash str\_new:N} if necessary, then applies \texttt{\textbackslash str\_\{g\}clear:N} to leave the \texttt{\{str\ var\}} empty.

\texttt{\textbackslash str\_set\_eq:NN} \hspace{1em} \texttt{\textbackslash str\_set\_eq:Nn \{str\ var\}_{1} \{str\ var\}_{2}}

Sets the content of \texttt{\{str\ var\}_{1}} equal to that of \texttt{\{str\ var\}_{2}}.

\texttt{\textbackslash str\_concat:NNN} \hspace{1em} \texttt{\textbackslash str\_concat:nnc} \hspace{1em} \texttt{\textbackslash str\_gconcat:NNN} \hspace{1em} \texttt{\textbackslash str\_gconcat:nnc}

Concatenates the content of \texttt{\{str\ var\}_{2}} and \texttt{\{str\ var\}_{3}} together and saves the result in \texttt{\{str\ var\}_{1}}. The \texttt{\{str\ var\}_{1}} is placed at the left side of the new string variable. The \texttt{\{str\ var\}_{2}} and \texttt{\{str\ var\}_{3}} must indeed be strings, as this function does not convert their contents to a string.

\texttt{\textbackslash str\_if\_exist:p:N} \hspace{1em} \texttt{\textbackslash str\_if\_exist:p:n \{str\ var\}}

Tests whether the \texttt{\{str\ var\}} is currently defined. This does not check that the \texttt{\{str\ var\}} really is a string.
16.2 Adding data to string variables

\str_set:Nn \str_set:\(NV\mid Nx\mid cn\mid cV\mid cx\)
\str_gset:Nn \str_gset:\(NV\mid Nx\mid cn\mid cV\mid cx\)

Converts the \(\langle\)token list\(\rangle\) to a \(\langle\)string\(\rangle\), and stores the result in \(\langle\)str var\(\rangle\).

\str_put_left:Nn \str_put_left:\(NV\mid Nx\mid cn\mid cV\mid cx\)
\str_gput_left:Nn \str_gput_left:\(NV\mid Nx\mid cn\mid cV\mid cx\)

Converts the \(\langle\)token list\(\rangle\) to a \(\langle\)string\(\rangle\), and prepends the result to \(\langle\)str var\(\rangle\). The current contents of the \(\langle\)str var\(\rangle\) are not automatically converted to a string.

\str_put_right:Nn \str_put_right:\(NV\mid Nx\mid cn\mid cV\mid cx\)
\str_gput_right:Nn \str_gput_right:\(NV\mid Nx\mid cn\mid cV\mid cx\)

Converts the \(\langle\)token list\(\rangle\) to a \(\langle\)string\(\rangle\), and appends the result to \(\langle\)str var\(\rangle\). The current contents of the \(\langle\)str var\(\rangle\) are not automatically converted to a string.

16.3 String conditionals

\str_if_empty_p:N \str_if_empty_p:c \str_if_empty:n
\str_if_empty:p:N \str_if_empty:p:c \str_if_empty:n
\str_if_empty:NTF \str_if_empty:NTF \str_if_empty:nNTF

Tests if the \(\langle\)string variable\(\rangle\) is entirely empty \(i.e.\) contains no characters at all).

\str_if_eq_p:NN \str_if_eq:p:NN
\str_if_eq:p:NN \str_if_eq:p:cN \str_if_eq:p:cc
\str_if_eq:NN \str_if_eq:NN \str_if_eq:p:cc

Compares the content of two \(\langle\)str variables\(\rangle\) and is logically true if the two contain the same characters in the same order. See \tl_if_eq\(\langle\)token\(\rangle\) to compare tokens (including their category codes) rather than characters.
\str_if_eq_p:nn * \str_if_eq_p:nn \{tl_1\} \{tl_2\} \\
\str_if_eq_p:(Vn|on|no|nV|vn|nv|ee) * \str_if_eq:nnTF \{tl_1\} \{tl_2\} \{true code\} \{false code\} \\
\str_if_eq:nnTF * \\
\str_if_eq:(Vn|on|no|nV|VV|vn|nv|ee)TF *

Updated: 2018-06-18

Compares the two \langle \text{token lists} \rangle on a character by character basis (namely after converting them to strings), and is true if the two \langle \text{strings} \rangle contain the same characters in the same order. Thus for example

\str_if_eq_p:no \{ abc \} \{ \tl_to_str:n \{ abc \} \}

is logically true. See \tl_if_eq:nnTF to compare tokens (including their category codes) rather than characters.

\str_if_in:NnTF \str_if_in:cnTF

New: 2017-10-08

\str_if_in:NnTF \{ str var \} \{ \langle token list \rangle \} \{ true code \} \{ false code \}

Converses the \langle token list \rangle to a \langle string \rangle and tests if that \langle string \rangle is found in the content of the \langle str var \rangle.

\str_if_in:nnTF

Rev: 2017-10-08

\str_if_in:nnTF \{tl_1\} \{tl_2\} \{true code\} \{false code\}

Converses both \langle token lists \rangle to \langle strings \rangle and tests whether \langle string_2 \rangle is found inside \langle string_1 \rangle.

\str_case:nn * \str_case:nnTF \{ test string \} \\
\str_case:(Vn|on|no|nV) * \{ \\
\str_case:mm * \{string case_1\} \{code case_1\} \\
\str_case:mmTF * \{string case_2\} \{code case_2\} \\
\str_case:Nn * \{ \\
\str_case:NnTF * \{string case_n\} \{code case_n\} \\
\str_case_e:nn(TF) *

Rev: 2013-07-24

Updated: 2022-03-21

Compares the \langle test string \rangle in turn with each of the \langle string cases \rangle (all token lists are converted to strings). If the two are equal (as described for \str_if_eq:nnTF) then the associated \langle code \rangle is left in the input stream and other cases are discarded. If any of the cases are matched, the \langle true code \rangle is also inserted into the input stream (after the code for the appropriate case), while if none match then the \langle false code \rangle is inserted. The function \str_case:nn, which does nothing if there is no match, is also available.

This set of functions performs no expansion on each \langle string case \rangle argument, so any variable in there will be compared as a string. If expansion is needed in the \langle string cases \rangle, then \str_case_e:nn(TF) should be used instead.
\texttt{\textbackslash str\_case\_e:nn} * \texttt{\textbackslash str\_case\_e:nnTF \{(test string)\}}
\texttt{\textbackslash str\_case\_e:nnTF} * \texttt{\{(string case\_1)\} \{(code case\_1)\}}
\texttt{\{(string case\_2)\} \{(code case\_2)\}} ...
\texttt{\{(string case\_n)\} \{(code case\_n)\}}
\texttt{\{(true code)\}}
\texttt{\{(false code)\}}

Compares the full expansion of the \textit{(test string)} in turn with the full expansion of the \textit{(string cases)} (all token lists are converted to strings). If the two full expansions are equal (as described for \texttt{\textbackslash str\_if\_eq:nnTF}) then the associated \textit{(code)} is left in the input stream and other cases are discarded. If any of the cases are matched, the \textit{(true code)} is also inserted into the input stream (after the code for the appropriate case), while if none match then the \textit{(false code)} is inserted. The function \texttt{\textbackslash str\_case\_e:nn}, which does nothing if there is no match, is also available. The \textit{(test string)} is expanded in each comparison, and must always yield the same result: for example, random numbers must not be used within this string.

\texttt{\textbackslash str\_compare\_p:nNn} * \texttt{\textbackslash str\_compare\_p:eNe} * \texttt{\textbackslash str\_compare:nNnTF} * \texttt{\textbackslash str\_compare:eNeTF} *

\texttt{\textbackslash str\_compare\_p:nNn \{(tl\_1)\} \{relation\} \{(tl\_2)\}}
\texttt{\textbackslash str\_compare:nNnTF \{(tl\_1)\} \{relation\} \{(tl\_2)\} \{(true code)\} \{(false code)\}}

Compares the two \textit{(token lists)} on a character by character basis (namely after converting them to strings) in a lexicographic order according to the character codes of the characters. The \textit{(relation)} can be \texttt{<}, \texttt{=} or \texttt{>} and the test is \textbf{true} under the following conditions:
\begin{itemize}
  \item for \texttt{<}, if the first string is earlier than the second in lexicographic order;
  \item for \texttt{=} , if the two strings have exactly the same characters;
  \item for \texttt{>}, if the first string is later than the second in lexicographic order.
\end{itemize}

Thus for example the following is logically \textbf{true}:
\texttt{\textbackslash str\_compare\_p:nNn \{ ab \} < \{ abc \}}

\texttt{\textbackslash TikZ\textbackslash h\textbackslash a\textbackslash c\textbackslash k\textbackslash e\textbackslash r\textbackslash s\textbackslash n\textbackslash t\textbackslash e: This is a wrapper around the \textbackslash TikZ primitive \textbackslash (pdf)\textbackslash str\textbackslash cmp. It is meant for programming and not for sorting textual contents, as it simply considers character codes and not more elaborate considerations of grapheme clusters, locale, etc.}

\subsection{Mapping over strings}

All mappings are done at the current group level, \textit{i.e.} any local assignments made by the \textit{(function)} or \textit{(code)} discussed below remain in effect after the loop.

\texttt{\textbackslash str\_function:nN} * \texttt{\textbackslash str\_function:nN} * \texttt{\textbackslash str\_function:NN} * \texttt{\textbackslash str\_function:NN} * \texttt{\textbackslash str\_function:cl} * \texttt{\textbackslash str\_function:cl} *

\texttt{\textbackslash str\_function:nN \{(token list)\} \{function\}}
\texttt{\textbackslash str\_function:NN \{str var\} \{function\}}

Converts the \textit{(token list)} to a \textit{(string)} then applies \textit{(function)} to every \textit{(character)} in the \textit{(string)} including spaces.
\str_map_inline:nn \str_map_inline:nn \{\textit{token list}\} \{\textit{inline function}\}
\str_map_inline:Nn \str_map_inline:Nn \str_map_inline:cn \str_map_inline:cn
Converts the \textit{token list} to a \textit{string} then applies the \textit{inline function} to every \textit{character} in the \textit{str var} including spaces. The \textit{inline function} should consist of code which receives the \textit{character} as \#1.

\str_map_tokens:nn \str_map_tokens:nn \textasteriskcentered \str_map_tokens:nn \str_map_tokens:nn
\str_map_tokens:Nn \str_map_tokens:Nn \textasteriskcentered \str_map_tokens:cn \str_map_tokens:cn
Converts the \textit{token list} to a \textit{string} then applies \textit{code} to every \textit{character} in the \textit{string} including spaces. The \textit{code} receives each character as a trailing brace group. This is equivalent to \str_map_function:nN if the \textit{code} consists of a single function.

\str_map_variable:nNn \str_map_variable:nNn \textasteriskcentered \str_map_variable:NNn \str_map_variable:NNn \str_map_variable:cnNn \str_map_variable:cnNn
Converts the \textit{token list} to a \textit{string} then stores each \textit{character} in the \textit{string} (including spaces) in turn in the \textit{string or token list} \textit{variable} and applies the \textit{code}. The \textit{code} will usually make use of the \textit{variable}, but this is not enforced. The assignments to the \textit{variable} are local. Its value after the loop is the last \textit{character} in the \textit{string}, or its original value if the \textit{string} is empty. See also \str_map_inline:Nn.

\str_map_break: \textasteriskcentered \str_map_break: \textasteriskcentered \str_map_break:
used to terminate a \str_map_... function before all characters in the \textit{string} have been processed. This normally takes place within a conditional statement, for example
\str_map_inline:Nn \texttt{\_my\_str}
\{\str_if_eq:nnT { #1 } { bingo } \{ \str_map_break: \}
% Do something useful
\}
See also \str_map_break:n. Use outside of a \str_map_... scenario leads to low level \TeX{} errors.

\TeX{}hackers note: When the mapping is broken, additional tokens may be inserted before continuing with the code that follows the loop. This depends on the design of the mapping function.
\texttt{\textbackslash str\_map\_break:n}

\texttt{\textbackslash str\_map\_break:n \{\textit{code}\}}

Used to terminate a \texttt{\textbackslash str\_map\ldots} function before all characters in the \textit{string} have been processed, inserting the \textit{code} after the mapping has ended. This normally takes place within a conditional statement, for example

\begin{verbatim}
\str_map_inline:Nn \l_my_str
{\str_if_eq:nnT { \#1 } { bingo }%
\str_map_break:n { <code> }
% Do something useful
}
\end{verbatim}

Use outside of a \texttt{\textbackslash str\_map\ldots} scenario leads to low level \TeX{} errors.

\textbf{\texttt{\textbackslash TeX}hackers note:} When the mapping is broken, additional tokens may be inserted before the \textit{code} is inserted into the input stream. This depends on the design of the mapping function.

### 16.5 Working with the content of strings

\texttt{\textbackslash str\_use:N} *

\texttt{\textbackslash str\_use:N \{\textit{str\ var}\}}

Recovers the content of a \textit{str\ var} and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Note that it is possible to use a \textit{str} directly without an accessor function.

\texttt{\textbackslash str\_count:n}{\{token list\}}

\texttt{\textbackslash str\_count:n} *

\texttt{\textbackslash str\_count:n \{\textit{token list}\}}

\texttt{\textbackslash str\_count:n *}

\texttt{\textbackslash str\_count\_ignore\_spaces:n}

Leaves in the input stream the number of characters in the string representation of \textit{token list}, as an integer denotation. The functions differ in their treatment of spaces. In the case of \texttt{\textbackslash str\_count:n} and \texttt{\textbackslash str\_count:n}, all characters including spaces are counted. The \texttt{\textbackslash str\_count\_ignore\_spaces:n} function leaves the number of non-space characters in the input stream.

\texttt{\textbackslash str\_count\_spaces:n}{\{token list\}}

\texttt{\textbackslash str\_count\_spaces:n} *

\texttt{\textbackslash str\_count\_spaces:n \{\textit{token list}\}}

Leaves in the input stream the number of space characters in the string representation of \textit{token list}, as an integer denotation. Of course, this function has no \texttt{_ignore\_spaces} variant.
Converts the ⟨token list⟩ into a ⟨string⟩. The first character in the ⟨string⟩ is then left in the input stream, with category code “other”. The functions differ if the first character is a space: \str_head:N and \str_head:n return a space token with category code 10 (blank space), while the \str_head_ignore_spaces:n function ignores this space character and leaves the first non-space character in the input stream. If the ⟨string⟩ is empty (or only contains spaces in the case of the _ignore_spaces function), then nothing is left on the input stream.

Converts the ⟨token list⟩ to a ⟨string⟩, removes the first character, and leaves the remaining characters (if any) in the input stream, with category codes 12 and 10 (for spaces). The functions differ in the case where the first character is a space: \str_tail:N and \str_tail:n only trim that space, while \str_tail.ignore_spaces:n removes the first non-space character and any space before it. If the ⟨token list⟩ is empty (or blank in the case of the _ignore_spaces variant), then nothing is left on the input stream.

Converts the ⟨token list⟩ to a ⟨string⟩, and leaves in the input stream the character in position ⟨integer expression⟩ of the ⟨string⟩, starting at 1 for the first (left-most) character. In the case of \str_item:Nn and \str_item:nn, all characters including spaces are taken into account. The \str_item.ignore_spaces:nn function skips spaces when counting characters. If the ⟨integer expression⟩ is negative, characters are counted from the end of the ⟨string⟩. Hence, −1 is the right-most character, etc.
\str_range:nnn \* \str_range:nnn \{\langle token list\rangle\} \{\langle start index\rangle\} \{\langle end index\rangle\}
\str_range:nnn \* \str_range:nnn \* \str_range_ignore_spaces:nnn \*

New: 2015-09-18

Converts the \langle token list\rangle to a \langle string\rangle, and leaves in the input stream the characters from the \langle start index\rangle to the \langle end index\rangle inclusive. Spaces are preserved and counted as items (contrast this with \tl_range:nnn where spaces are not counted as items and are possibly discarded from the output).

Here \langle start index\rangle and \langle end index\rangle should be integer denotations. For describing in detail the functions’ behavior, let \( m \) and \( n \) be the start and end index respectively. If either is 0, the result is empty. A positive index means ‘start counting from the left end’, a negative index means ‘start counting from the right end’. Let \( l \) be the count of the token list.

The actual start point is determined as \( M = m \) if \( m > 0 \) and as \( M = l + m + 1 \) if \( m < 0 \). Similarly the actual end point is \( N = n \) if \( n > 0 \) and \( N = l + n + 1 \) if \( n < 0 \). If \( M > N \), the result is empty. Otherwise it consists of all items from position \( M \) to position \( N \) inclusive; for the purpose of this rule, we can imagine that the token list extends at infinity on either side, with void items at positions \( s \) for \( s \leq 0 \) or \( s > l \). For instance,

\begin{verbatim}
\iow_term:x \{ \str_range:nnn \{ abcdef \} \{ 2 \} \{ 5 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdef \} \{ -4 \} \{ -1 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdef \} \{ -2 \} \{ -1 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdef \} \{ 0 \} \{ -1 \} \}
\end{verbatim}

prints bcde, cdef, ef, and an empty line to the terminal. The \langle start index\rangle must always be smaller than or equal to the \langle end index\rangle: if this is not the case then no output is generated. Thus

\begin{verbatim}
\iow_term:x \{ \str_range:nnn \{ abcdef \} \{ 5 \} \{ 2 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdef \} \{ -1 \} \{ -4 \} \}
\end{verbatim}

both yield empty strings.

The behavior of \str_range_ignore_spaces:nnn is similar, but spaces are removed before starting the job. The input

\begin{verbatim}
\iow_term:x \{ \str_range:nnn \{ abcdefg \} \{ 2 \} \{ 5 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdefg \} \{ 2 \} \{ -3 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdefg \} \{ -6 \} \{ 5 \} \}
\iow_term:x \{ \str_range:nnn \{ abcdefg \} \{ -6 \} \{ -3 \} \}
\end{verbatim}

\begin{verbatim}
\iow_term:x \{ \str_range:nnn \{ abc-efg \} \{ 2 \} \{ 5 \} \}
\iow_term:x \{ \str_range:nnn \{ abc-efg \} \{ 2 \} \{ -3 \} \}
\iow_term:x \{ \str_range:nnn \{ abc-efg \} \{ -6 \} \{ 5 \} \}
\end{verbatim}

\begin{verbatim}
\iow_term:x \{ \str_range:nnn \{ abc-efg \} \{ -6 \} \{ -3 \} \}
\iow_term:x \{ \str_range_ignore_spaces:nnn \{ abcdefg \} \{ 2 \} \{ 5 \} \}
\iow_term:x \{ \str_range_ignore_spaces:nnn \{ abcdefg \} \{ 2 \} \{ -3 \} \}
\iow_term:x \{ \str_range_ignore_spaces:nnn \{ abcdefg \} \{ -6 \} \{ 5 \} \}
\end{verbatim}

129
will print four instances of bcde, four instances of bcde and eight instances of bcde.

16.6 Modifying string variables

\str_replace_once:Nnn
\str_replace_once:cnn
\str_greplace_once:Nnn
\str_greplace_once:cnn

\str_replace_all:Nnn
\str_replace_all:cnn
\str_greplace_all:Nnn
\str_greplace_all:cnn

\str_remove_once:Nn
\str_remove_once:cn
\str_gremove_once:Nn
\str_gremove_once:cn

\str_remove_all:Nn
\str_remove_all:cn
\str_gremove_all:Nn
\str_gremove_all:cn

\str_set:Nn \l_tmpa_str {abbccd} \str_remove_all:Nn \l_tmpa_str
\{bc\}

results in \l_tmpa_str containing abcd.
16.7 String manipulation

\str_lowercase:n \str_lowercase:f \str_uppercase:n \str_uppercase:f

Converts the input (tokens) to their string representation, as described for \tl_to_str:n, and then to the lower or upper case representation using a one-to-one mapping as described by the Unicode Consortium file UnicodeData.txt.

These functions are intended for case changing programmatic data in places where upper/lower case distinctions are meaningful. One example would be automatically generating a function name from user input where some case changing is needed. In this situation the input is programmatic, not textual, case does have meaning and a language-independent one-to-one mapping is appropriate. For example

\cs_new_protected:Npn \myfunc:nn #1#2
{\cs_set_protected:cpn
 { user
   \str_uppercase:f { \tl_head:n {#1} }
   \str_lowercase:f { \tl_tail:n {#1} }
 } { \#2 }
}

would be used to generate a function with an auto-generated name consisting of the upper case equivalent of the supplied name followed by the lower case equivalent of the rest of the input.

These functions should not be used for

• Caseless comparisons: use \str_casefold:n for this situation (case folding is distinct from lower casing).

• Case changing text for typesetting: see the \text_lowercase:n(n), \text_uppercase:n(n) and \text_titlecase:n(n) functions which correctly deal with context-dependence and other factors appropriate to text case changing.
\str_casefold:n ∗ \str_casefold:V ∗ New: 2022-10-16

Converts the input \langle tokens \rangle to their string representation, as described for \tl_to_str:n, and then folds the case of the resulting \langle string \rangle to remove case information. The result of this process is left in the input stream.

String folding is a process used for material such as identifiers rather than for “text”. The folding provided by \str_casefold:n follows the mappings provided by the Unicode Consortium, who state:

Case folding is primarily used for caseless comparison of text, such as identifiers in a computer program, rather than actual text transformation. Case folding in Unicode is based on the lowercase mapping, but includes additional changes to the source text to help make it language-insensitive and consistent. As a result, case-folded text should be used solely for internal processing and generally should not be stored or displayed to the end user.

The folding approach implemented by \str_casefold:n follows the “full” scheme defined by the Unicode Consortium (\textit{e.g.} SSfolds to SS). As case-folding is a language-insensitive process, there is no special treatment of Turkic input (\textit{i.e.} İ always folds to ĭ and not to ı).

16.8 Viewing strings

\str_show:N \str_show:c \str_show:n New: 2015-09-18 Updated: 2021-04-29

\str_show:N \langle str var \rangle Displays the content of the \langle str var \rangle on the terminal.

\str_log:N \langle str var \rangle Writes the content of the \langle str var \rangle in the log file.
16.9 Constant strings

\c_\text{ampersand\_str} \c_\text{at\_sign\_str} \c_\text{backslash\_str} \c_\text{left\_brace\_str} \c_\text{right\_brace\_str} \c_\text{circumflex\_str} \c_\text{colon\_str} \c_\text{dollar\_str} \c_\text{hash\_str} \c_\text{percent\_str} \c_\text{tilde\_str} \c_\text{underscore\_str} \c_\text{zero\_str}

Updated: 2020-12-22

16.10 Scratch strings

\l_\text{tmpa\_str} \l_\text{tmpb\_str}

Scratch strings for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_\text{tmpa\_str} \g_\text{tmpb\_str}

Scratch strings for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

16.11 Deprecated functions

\texttt{\textbackslash str\_foldcase:n} \texttt{\textbackslash str\_foldcase:n \{\texttt{tokens}\}} \texttt{\textbackslash str\_foldcase:V}

A previous name for the functionally-identical \texttt{\textbackslash str\_casefold:n}.

New: 2019-11-26
Chapter 17

The \texttt{l3str-convert} package: string encoding conversions

17.1 Encoding and escaping schemes

Traditionally, string encodings only specify how strings of characters should be stored as bytes. However, the resulting lists of bytes are often to be used in contexts where only a restricted subset of bytes are permitted (\textit{e.g.}, PDF string objects, URLs). Hence, storing a string of characters is done in two steps.

- The code points (“character codes”) are expressed as bytes following a given “encoding”. This can be \texttt{utf-16}, \texttt{iso 8859-1}, \textit{etc}. See Table 1 for a list of supported encodings.\footnote{Encodings and escapings will be added as they are requested.}

- Bytes are translated to \TeX tokens through a given “escaping”. Those are defined for the most part by the \texttt{pdf} file format. See Table 2 for a list of escaping methods supported.\footnote{Encodings and escapings will be added as they are requested.}
Table 1: Supported encodings. Non-alphanumeric characters are ignored, and capital letters are lower-cased before searching for the encoding in this list.

</tbody>
</table>
17.2 Conversion functions

This function converts the ⟨string⟩ from the encoding given by ⟨name 1⟩ to the encoding given by ⟨name 2⟩, and stores the result in the ⟨str var⟩. Each ⟨name⟩ can have the form ⟨encoding⟩ or ⟨encoding⟩/⟨escaping⟩, where the possible values of ⟨encoding⟩ and ⟨escaping⟩ are given in Tables 1 and 2, respectively. The default escaping is to input and output bytes directly. The special case of an empty ⟨name⟩ indicates the use of “native” strings, 8-bit for pdfTeX, and Unicode strings for the other two engines.

For example,

\str_set_convert:Nnnn \l_foo_str { Hello! } { } { utf16/hex }

results in the variable \l_foo_str holding the string FEFF00480065006C006C006F0021. This is obtained by converting each character in the (native) string Hello! to the UTF-16 encoding, and expressing each byte as a pair of hexadecimal digits. Note the presence of a (big-endian) byte order mark "FEFF, which can be avoided by specifying the encoding utf16be/hex.

An error is raised if the ⟨string⟩ is not valid according to the ⟨encoding 1⟩ and ⟨escaping 1⟩, or if it cannot be reencoded in the ⟨encoding 2⟩ and ⟨escaping 2⟩ (for instance, if a character does not exist in the ⟨encoding 2⟩). Erroneous input is replaced by the Unicode replacement character \texttt{FFFD}, and characters which cannot be reencoded are replaced by either the replacement character \texttt{FFFD} if it exists in the ⟨encoding 2⟩, or an encoding-specific replacement character, or the question mark character.

17.3 Conversion by expansion (for PDF contexts)

A small number of expandable functions are provided for use in PDF string/name contexts. These assume UTF-8 and no escaping in the input.

As \str_convert_pdfname:n, converts the ⟨string⟩ on a byte-by-byte basis with non-ASCII codepoints escaped using hashes.

17.4 Possibilities, and things to do

Encoding/escaping-related tasks.
• In Xe\TeX/Lua\TeX, would it be better to use the \ldots\ldots approach to build a string from a given list of character codes? Namely, within a group, assign 0-9a-f and all characters we want to category “other”, then assign ~ the category superscript, and use \texttt{\textbackslash scantokens}.

• Change \texttt{\textbackslash str_set_convert:Nnnn} to expand its last two arguments.

• Describe the internal format in the code comments. Refuse code points in \texttt{[\textasciitilde\textasciitilde D800, \textasciitilde\textasciitilde DFFF]} in the internal representation?

• Add documentation about each encoding and escaping method, and add examples.

• The \texttt{hex} unescaping should raise an error for odd-token count strings.

• Decide what bytes should be escaped in the \texttt{url} escaping. Perhaps the characters \texttt{!’()*-./0123456789_} are safe, and all other characters should be escaped?

• Automate generation of 8-bit mapping files.

• Change the framework for 8-bit encodings: for decoding from 8-bit to Unicode, use 256 integer registers; for encoding, use a tree-box.

• More encodings (see Heiko’s \texttt{stringenc}). CESU?

• More escapings: \texttt{ASCII85}, shell escapes, lua escapes, etc.?
Chapter 18

The \texttt{l3quark} package

Quarks

Two special types of constants in \LaTeX{}3 are “quarks” and “scan marks”. By convention all constants of type quark start out with \texttt{\textbackslash q\_}, and scan marks start with \texttt{\textbackslash s\_}.

18.1 Quarks

Quarks are control sequences (and in fact, token lists) that expand to themselves and should therefore \textit{never} be executed directly in the code. This would result in an endless loop!

They are meant to be used as delimiter in weird functions, the most common use case being the ‘stop token’ (i.e. \texttt{\textbackslash q\_stop}). For example, when writing a macro to parse a user-defined date

\begin{verbatim}
\date_parse:n {19/June/1981}
\end{verbatim}

one might write a command such as

\begin{verbatim}
\cs_new:Npn \date_parse:n #1 { \date_parse_aux:w #1 \q_stop }
\cs_new:Npn \date_parse_aux:w #1 / #2 / #3 \q_stop
{ <do something with the date> }
\end{verbatim}

Quarks are sometimes also used as error return values for functions that receive erroneous input. For example, in the function \texttt{\prop_get:NnN} to retrieve a value stored in some key of a property list, if the key does not exist then the return value is the quark \texttt{\q_no_value}. As mentioned above, such quarks are extremely fragile and it is imperative when using such functions that code is carefully written to check for pathological cases to avoid leakage of a quark into an uncontrolled environment.

Quarks also permit the following ingenious trick when parsing tokens: when you pick up a token in a temporary variable and you want to know whether you have picked up a particular quark, all you have to do is compare the temporary variable to the quark using \texttt{\tl_if_eq:NNTF}. A set of special quark testing functions is set up below. All the quark testing functions are expandable although the ones testing only single tokens are much faster.
18.2 Defining quarks

\quark_new:N \quark_new:N ⟨quark⟩
Creates a new ⟨quark⟩ which expands only to ⟨quark⟩. The ⟨quark⟩ is defined globally, and an error message is raised if the name was already taken.

\q_stop
Used as a marker for delimited arguments, such as
\cs_set:Npn \tmp:w #1\#2 \q_stop {#1}

\q_mark
Used as a marker for delimited arguments when \q_stop is already in use.

\q_nil
Quark to mark a null value in structured variables or functions. Used as an end delimiter when this may itself need to be tested (in contrast to \q_stop, which is only ever used as a delimiter).

\q_no_value
A canonical value for a missing value, when one is requested from a data structure. This is therefore used as a “return” value by functions such as \prop_get:NnN if there is no data to return.

18.3 Quark tests

The method used to define quarks means that the single token (N) tests are faster than the multi-token (n) tests. The latter should therefore only be used when the argument can definitely take more than a single token.

\quark_if_nil_p:N \quark_if_nil:p:N ⟨token⟩
Tests if the ⟨token⟩ is equal to \q_nil.

\quark_if_nil:nTF \quark_if_nil:p:TF ⟨token list⟩
Tests if the ⟨token list⟩ contains only \q_nil (distinct from ⟨token list⟩ being empty or containing \q_nil plus one or more other tokens).
18.4 Recursion

This module provides a uniform interface to intercepting and terminating loops as when one is doing tail recursion. The building blocks follow below and an example is shown in Section 18.4.1.

\q_recursion_tail

This quark is appended to the data structure in question and appears as a real element there. This means it gets any list separators around it.

\q_recursion_stop

This quark is added after the data structure. Its purpose is to make it possible to terminate the recursion at any point easily.

\quark_if_recursion_tail_stop:N \token

Tests if \token contains only the marker \q_recursion_tail, and if so uses \use_i_delimit_by_q_recursion_stop:w to terminate the recursion that this belongs to. The recursion input must include the marker tokens \q_recursion_tail and \q_recursion_stop as the last two items.

\quark_if_recursion_tail_stop:n \langle \token list \rangle
\quark_if_recursion_tail_stop:o *

Tests if the \token list contains only \q_recursion_tail, and if so uses \use_i_delimit_by_q_recursion_stop:w to terminate the recursion that this belongs to. The recursion input must include the marker tokens \q_recursion_tail and \q_recursion_stop as the last two items. The \langle insertion \rangle code is then added to the input stream after the recursion has ended.

\quark_if_recursion_tail_stop_do:Nn \langle \token \rangle \{ \langle insertion \rangle \}

Tests if \langle token \rangle contains only \q_recursion_tail, and if so uses \use_i_delimit_by_q_recursion_stop:w to terminate the recursion that this belongs to. The recursion input must include the marker tokens \q_recursion_tail and \q_recursion_stop as the last two items. The \langle insertion \rangle code is then added to the input stream after the recursion has ended.

\quark_if_recursion_tail_stop_do:nn \langle \token list \rangle \{ \langle insertion \rangle \}
\quark_if_recursion_tail_stop_do:on *

Tests if the \langle token list \rangle contains only \q_recursion_tail, and if so uses \use_i_delimit_by_q_recursion_stop:w to terminate the recursion that this belongs to. The recursion input must include the marker tokens \q_recursion_tail and \q_recursion_stop as the last two items. The \langle insertion \rangle code is then added to the input stream after the recursion has ended.
Tests if \texttt{token list} contains only \texttt{q_recursion_tail}, and if so terminates the recursion using \texttt{\langle\texttt{type}\rangle\_map\_break:}. The recursion end should be marked by \texttt{\prg\_break\_point:Nn \texttt{\langle\texttt{type}\rangle\_map\_break:}}.

18.4.1 An example of recursion with quarks

Quarks are mainly used internally in the \texttt{expl3} code to define recursion functions such as \texttt{\tl\_map\_inline:nn} and so on. Here is a small example to demonstrate how to use quarks in this fashion. We shall define a command called \texttt{\my\_map\_dbl:nn} which takes a token list and applies an operation to every pair of tokens. For example, \texttt{\my\_map\_dbl:nn \{abcd\} \{[--\texttt{#1}\--\texttt{#2}\--]\--\}} would produce “[–a–b–] [–c–d–]”. Using quarks to define such functions simplifies their logic and ensures robustness in many cases.

Here’s the definition of \texttt{\my\_map\_dbl:nn}. First of all, define the function that does the processing based on the inline function argument \texttt{#2}. Then initiate the recursion using an internal function. The token list \texttt{#1} is terminated using \texttt{\q\_recursion\_tail}, with delimiters according to the type of recursion (here a pair of \texttt{\q\_recursion\_tail}), concluding with \texttt{\q\_recursion\_stop}. These quarks are used to mark the end of the token list being operated upon.

\begin{verbatim}
\cs_new:Npn \my\_map\_dbl:nn #1#2
{\cs_set:Npn __my\_map\_dbl\_fn:nn ##1 ##2 {#2}
__my\_map\_dbl:nn #1 \q\_recursion\_tail \q\_recursion\_tail
\q\_recursion\_stop}
\end{verbatim}

The definition of the internal recursion function follows. First check if either of the input tokens are the termination quarks. Then, if not, apply the inline function to the two arguments.

\begin{verbatim}
\cs_new:Nn __my\_map\_dbl:nn
{\quark\_if\_recursion\_tail\_stop:n \#1
\quark\_if\_recursion\_tail\_stop:n \#1
__my\_map\_dbl\_fn:nn \#1 \#2}
\end{verbatim}

Finally, recurse:

\begin{verbatim}
__my\_map\_dbl:nn
\end{verbatim}

Note that contrarily to \texttt{\exp\_3} built-in mapping functions, this mapping function cannot be nested, since the second map would overwrite the definition of \texttt{__my\_map\_dbl\_fn:nn}.
18.5 Scan marks

Scan marks are control sequences set equal to \texttt{\textbackslash scan\_stop}; hence never expand in an expansion context and are (largely) invisible if they are encountered in a typesetting context.

Like quarks, they can be used as delimiters in weird functions and are often safer to use for this purpose. Since they are harmless when executed by \TeX{} in non-expandable contexts, they can be used to mark the end of a set of instructions. This allows to skip to that point if the end of the instructions should not be performed (see \texttt{l3regex}).

\begin{verbatim}
\scan_new:N \scan_new:N \{scan mark\}
\end{verbatim}

Creates a new \texttt{\{scan mark\}} which is set equal to \texttt{\textbackslash scan\_stop}: The \texttt{\{scan mark\}} is defined globally, and an error message is raised if the name was already taken by another scan mark.

\begin{verbatim}
\s_stop
\end{verbatim}

Used at the end of a set of instructions, as a marker that can be jumped to using \texttt{\use\_none\_delimit\_by\_s\_stop:w}.

\begin{verbatim}
\use\_none\_delimit\_by\_s\_stop:w + \use\_none\_delimit\_by\_s\_stop:w \{tokens\} \s_stop
\end{verbatim}

Removes the \texttt{\{tokens\}} and \texttt{\s_stop} from the input stream. This leads to a low-level \TeX{} error if \texttt{\s_stop} is absent.
Chapter 19

The \texttt{l3seq} package
Sequences and stacks

\texttt{l3seq} implements a “sequence” data type, which contain an ordered list of entries which may contain any \textit{(balanced text)}. It is possible to map functions to sequences such that the function is applied to every item in the sequence.

Sequences are also used to implement stack functions in \texttt{l3seq}. This is achieved using a number of dedicated stack functions.

19.1 Creating and initialising sequences

\begin{verbatim}
\seq_new:N \seq_new:N \seq_new:c \seq_new:cs
\seq_clear:N \seq_clear:N \seq_clear:c \seq_clear:cs
\seq_gclear:N \seq_gclear:N \seq_gclear:c \seq_gclear:cs
\seq_set_eq:NN \seq_set_eq:N \seq_set_eq:cc \seq_set_eq:cc
\seq_gset_eq:NN \seq_gset_eq:N \seq_gset_eq:cc \seq_gset_eq:cc
\end{verbatim}

\begin{itemize}
\item \texttt{\seq_new:N} \texttt{\seq_new:N} \texttt{\seq_new:c} \texttt{\seq_new:cs}
\end{itemize}

Creates a new \texttt{(sequence)} or raises an error if the name is already taken. The declaration is global. The \texttt{(sequence)} initially contains no items.

\begin{itemize}
\item \texttt{\seq_clear:N} \texttt{\seq_clear:N} \texttt{\seq_clear:c} \texttt{\seq_clear:cs}
\end{itemize}

Clears all items from the \texttt{(sequence)}.

\begin{itemize}
\item \texttt{\seq_gclear:N} \texttt{\seq_gclear:N} \texttt{\seq_gclear:c} \texttt{\seq_gclear:cs}
\end{itemize}

Ensures that the \texttt{(sequence)} exists globally by applying \texttt{\seq_new:N} if necessary, then applies \texttt{\seq_(g)clear:N} to leave the \texttt{(sequence)} empty.

\begin{itemize}
\item \texttt{\seq_set_eq:NN} \texttt{\seq_set_eq:N} \texttt{\seq_set_eq:cc} \texttt{\seq_set_eq:cc}
\end{itemize}

Sets the content of \texttt{(sequence\textsubscript{1})} equal to that of \texttt{(sequence\textsubscript{2})}.
Converts the data in the \texttt{comma list} into a \texttt{sequence}: the original \texttt{comma list} is unchanged.

\begin{itemize}
\item \texttt{\seq_set_from_clist:Nn} \texttt{(comma list)} \texttt{sequence} \texttt{\{comma list\}}
\item \texttt{\seq_set_from_clist:Nn} \texttt{\{comma list\}} \texttt{\{comma list\}} \texttt{sequence}
\item \texttt{\seq_set_from_clist:Nn} \texttt{\{comma list\}} \texttt{\{comma list\}} \texttt{sequence}
\item \texttt{\seq_gset_from_clist:Nn} \texttt{\{comma list\}} \texttt{\{comma list\}} \texttt{sequence}
\end{itemize}

\begin{itemize}
\item \texttt{\seq_const_from_clist:Nn} \texttt{\{comma list\}} \texttt{\{comma list\}} \texttt{sequence}
\item \texttt{\seq_set_split:Nnn} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\item \texttt{\seq_set_split:NnV} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\item \texttt{\seq_gset_split:Nnn} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\item \texttt{\seq_gset_split:NnV} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\end{itemize}

\begin{itemize}
\item \texttt{\seq_set_split_keep_spaces:Nnn} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\item \texttt{\seq_set_split_keep_spaces:NnV} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\item \texttt{\seq_gset_split_keep_spaces:Nnn} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\item \texttt{\seq_gset_split_keep_spaces:NnV} \texttt{\{token list\}} \texttt{\{delimiter\}} \texttt{sequence}
\end{itemize}

Concatenates the content of \texttt{sequence}_2 and \texttt{sequence}_3 together and saves the result in \texttt{sequence}_1. The items in \texttt{sequence}_2 are placed at the left side of the new sequence.
Tests whether the \textit{sequence} is currently defined. This does not check that the \textit{sequence} really is a sequence variable.

### 19.2 Appending data to sequences

\seq_put_left:Nn \textit{sequence} \{\textit{item}\}
\seq_put_left:(NV|Nv|No|Nx|cn|cV|co|cx)
\seq_gput_left:Nn \textit{sequence} \{\textit{item}\}
\seq_gput_left:(NV|Nv|No|Nx|cn|cV|co|cx)

Appends the \textit{item} to the left of the \textit{sequence}.

\seq_put_right:Nn \textit{sequence} \{\textit{item}\}
\seq_put_right:(NV|Nv|No|Nx|cn|cV|co|cx)
\seq_gput_right:Nn \textit{sequence} \{\textit{item}\}
\seq_gput_right:(NV|Nv|No|Nx|cn|cV|co|cx)

Appends the \textit{item} to the right of the \textit{sequence}.

### 19.3 Recovering items from sequences

Items can be recovered from either the left or the right of sequences. For implementation reasons, the actions at the left of the sequence are faster than those acting on the right. These functions all assign the recovered material locally, i.e. setting the \textit{token list variable} used with \texttt{\tl_set:Nn} and never \texttt{\tl_gset:Nn}.

\seq_get_left:NN \textit{sequence} \textit{token list variable}
\seq_get_left:ch

Stores the left-most item from a \textit{sequence} in the \textit{token list variable} without removing it from the \textit{sequence}. The \textit{token list variable} is assigned locally. If \textit{sequence} is empty the \textit{token list variable} is set to the special marker \texttt{\q_no_value}.

\seq_get_right:NN \textit{sequence} \textit{token list variable}
\seq_get_right:ch

Stores the right-most item from a \textit{sequence} in the \textit{token list variable} without removing it from the \textit{sequence}. The \textit{token list variable} is assigned locally. If \textit{sequence} is empty the \textit{token list variable} is set to the special marker \texttt{\q_no_value}.

\seq_pop_left:NN \textit{sequence} \textit{token list variable}
\seq_pop_left:ch

Pops the left-most item from a \textit{sequence} into the \textit{token list variable}, i.e. removes the item from the sequence and stores it in the \textit{token list variable}. Both of the variables are assigned locally. If \textit{sequence} is empty the \textit{token list variable} is set to the special marker \texttt{\q_no_value}.
Pops the left-most item from a ⟨sequence⟩ into the ⟨token list variable⟩, i.e. removes the item from the sequence and stores it in the ⟨token list variable⟩. The ⟨sequence⟩ is modified globally, while the assignment of the ⟨token list variable⟩ is local. If ⟨sequence⟩ is empty the ⟨token list variable⟩ is set to the special marker \q_no_value.

Pops the right-most item from a ⟨sequence⟩ into the ⟨token list variable⟩, i.e. removes the item from the sequence and stores it in the ⟨token list variable⟩. Both of the variables are assigned locally. If ⟨sequence⟩ is empty the ⟨token list variable⟩ is set to the special marker \q_no_value.

Pops the right-most item from a ⟨sequence⟩ into the ⟨token list variable⟩, i.e. removes the item from the sequence and stores it in the ⟨token list variable⟩. The ⟨sequence⟩ is modified globally, while the assignment of the ⟨token list variable⟩ is local. If ⟨sequence⟩ is empty the ⟨token list variable⟩ is set to the special marker \q_no_value.

Indexing items in the ⟨sequence⟩ from 1 at the top (left), this function evaluates the ⟨integer expression⟩ and leaves the appropriate item from the sequence in the input stream. If the ⟨integer expression⟩ is negative, indexing occurs from the bottom (right) of the sequence. If the ⟨integer expression⟩ is larger than the number of items in the ⟨sequence⟩ (as calculated by \seq_count:N) then the function expands to nothing.

\textbf{TeXhackers note:} The result is returned within the \texttt{\unexpanded} primitive (\exp_not:n), which means that the ⟨item⟩ does not expand further when appearing in an x-type or e-type argument expansion.

Selects a pseudo-random item of the ⟨sequence⟩. If the ⟨sequence⟩ is empty the result is empty. This is not available in older versions of Xe\TeX.

\textbf{TeXhackers note:} The result is returned within the \texttt{\unexpanded} primitive (\exp_not:n), which means that the ⟨item⟩ does not expand further when appearing in an x-type or e-type argument expansion.

### 19.4 Recovering values from sequences with branching

The functions in this section combine tests for non-empty sequences with recovery of an item from the sequence. They offer increased readability and performance over separate testing and recovery phases.

If the \langle \textit{sequence} \rangle is empty, leaves the \langle \textit{false code} \rangle in the input stream. The value of the \langle \textit{token list variable} \rangle is not defined in this case and should not be relied upon. If the \langle \textit{sequence} \rangle is non-empty, pops the right-most item from the \langle \textit{sequence} \rangle in the \langle \textit{token list variable} \rangle, i.e. removes the item from the \langle \textit{sequence} \rangle, then leaves the \langle \textit{true code} \rangle in the input stream. The \langle \textit{sequence} \rangle is modified globally, while the \langle \textit{token list variable} \rangle is assigned locally.
19.5 Modifying sequences

While sequences are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update sequences, while retaining the order of the unaffected entries.

\seq_remove_duplicates:N (sequence)
\seq_remove_duplicates:c
\seq_gremove_duplicates:N
\seq_gremove_duplicates:c

Removes duplicate items from the (sequence), leaving the left most copy of each item in the (sequence). The (item) comparison takes place on a token basis, as for \tl_if_eq:nnTF.

**TEXhackers note:** This function iterates through every item in the (sequence) and does a comparison with the (items) already checked. It is therefore relatively slow with large sequences.

\seq_remove_all:Nn (sequence) {(item)}
\seq_remove_all:cn
\seq_gremove_all:Nn
\seq_gremove_all:cn

Removes every occurrence of (item) from the (sequence). The (item) comparison takes place on a token basis, as for \tl_if_eq:nnTF.

\seq_reverse:N (sequence)
\seq_reverse:c
\seq_greverse:N
\seq_greverse:c

Reverses the order of the items stored in the (sequence).

\seq_sort:Nn (sequence) {(comparison code)}
\seq_sort:cn
\seq_gsort:Nn
\seq_gsort:cn

Sorts the items in the (sequence) according to the (comparison code), and assigns the result to (sequence). The details of sorting comparison are described in Section 6.1.

\seq_shuffle:N (seq var)
\seq_shuffle:c
\seq_gshuffle:N
\seq_gshuffle:c

Sets the (seq var) to the result of placing the items of the (seq var) in a random order. Each item is (roughly) as likely to end up in any given position.

**TEXhackers note:** For sequences with more than 13 items or so, only a small proportion of all possible permutations can be reached, because the random seed \sys_rand_seed: only has 28-bits. The use of \toks internally means that sequences with more than 32767 or 65535 items (depending on the engine) cannot be shuffled.

19.6 Sequence conditionals

\seq_if_empty_p:N (sequence)
\seq_if_empty_p:c
\seq_if_empty:NTF (sequence) {(true code)} {(false code)}
\seq_if_empty:cTF

Tests if the (sequence) is empty (containing no items).
Tests if the \langle item \rangle is present in the \langle sequence \rangle.

19.7 Mapping over sequences

All mappings are done at the current group level, \textit{i.e.} any local assignments made by the \langle function \rangle or \langle code \rangle discussed below remain in effect after the loop.

\texttt{\seq_map_function:NN} \texttt{\star} \texttt{\seq_map_function:cN} \texttt{\star} \texttt{Updated: 2012-06-29}

\texttt{\seq_map_function:NN \langle sequence \rangle \langle function \rangle}

Applies \langle function \rangle to every \langle item \rangle stored in the \langle sequence \rangle. The \langle function \rangle will receive one argument for each iteration. The \langle items \rangle are returned from left to right. To pass further arguments to the \langle function \rangle, see \texttt{\seq_map_tokens:Nn}. The function \texttt{\seq_map_inline:Nn} is faster than \texttt{\seq_map_function:NN} for sequences with more than about 10 items.

\texttt{\seq_map_inline:Nn} \texttt{\seq_map_inline:cN} \texttt{\star} \texttt{Updated: 2012-06-29}

\texttt{\seq_map_inline:Nn \langle sequence \rangle \langle inline function \rangle}

Applies \langle inline function \rangle to every \langle item \rangle stored within the \langle sequence \rangle. The \langle inline function \rangle should consist of code which will receive the \langle item \rangle as \#1. The \langle items \rangle are returned from left to right.

\texttt{\seq_map_tokens:Nn} \texttt{\star} \texttt{\seq_map_tokens:cN} \texttt{\star} \texttt{New: 2019-08-30}

\texttt{\seq_map_tokens:Nn \langle sequence \rangle \langle code \rangle}

Analogue of \texttt{\seq_map_function:NN} which maps several tokens instead of a single function. The \langle code \rangle receives each item in the \langle sequence \rangle as a trailing brace group. For instance,

\texttt{\seq_map_tokens:Nn \l_my_seq \{ \prg_replicate:nn \{ 2 \} \}}

expands to twice each item in the \langle sequence \rangle: for each item in \texttt{\l_my_seq} the function \texttt{\prg_replicate:nn} receives 2 and \langle item \rangle as its two arguments. The function \texttt{\seq_map_inline:Nn} is typically faster but it is not expandable.

\texttt{\seq_map_variable:NNn} \texttt{\seq_map_variable:ccNn} \texttt{\seq_map_variable:ccNn} \texttt{\star} \texttt{\seq_map_variable:NNn} \texttt{\star} \texttt{Updated: 2012-06-29}

\texttt{\seq_map_variable:NNn \langle sequence \rangle \langle variable \rangle \langle code \rangle}

Stores each \langle item \rangle of the \langle sequence \rangle in turn in the (token list) \langle variable \rangle and applies the \langle code \rangle. The \langle code \rangle will usually make use of the \langle variable \rangle, but this is not enforced. The assignments to the \langle variable \rangle are local. Its value after the loop is the last \langle item \rangle in the \langle sequence \rangle, or its original value if the \langle sequence \rangle is empty. The \langle items \rangle are returned from left to right.

\texttt{\seq_map_indexed_function:NN} \texttt{\star} \texttt{\seq_map_indexed_function:NN \langle sequence \rangle \langle var \rangle \langle function \rangle} \texttt{\star} \texttt{New: 2018-05-03}

Applies \langle function \rangle to every entry in the \langle sequence variable \rangle. The \langle function \rangle should have signature :nn. It receives two arguments for each iteration: the \langle index \rangle (namely 1 for the first entry, then 2 and so on) and the \langle item \rangle.
Applies \(\text{inline function}\) to every entry in the \(\text{sequence variable}\). The \(\text{inline function}\) should consist of code which receives the \(\text{index}\) (namely 1 for the first entry, then 2 and so on) as \#1 and the \(\text{item}\) as \#2.

\(\text{seq}_\text{map}_\text{break}\): Used to terminate a \(\text{seq}_\text{map}\)\_\ldots function before all entries in the \(\text{sequence}\) have been processed. This normally takes place within a conditional statement, for example

\[
\text{seq}_\text{map}_\text{inline}:\text{Nn} \ \text{l}_\text{my}_\text{seq}
\{
\text{str}_\text{if}_\text{eq}:\text{nnTF} \ {#1} \ {bingo}
{ \text{seq}_\text{map}_\text{break}:}
{\% \text{ Do something useful}}
\}
\]

Use outside of a \(\text{seq}_\text{map}\)\_\ldots scenario leads to low level \TeX\ errors.

\TeXhackers note: When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

\(\text{seq}_\text{map}_\text{break}:\text{n}\): Used to terminate a \(\text{seq}_\text{map}\)\_\ldots function before all entries in the \(\text{sequence}\) have been processed, inserting the \(\text{code}\) after the mapping has ended. This normally takes place within a conditional statement, for example

\[
\text{seq}_\text{map}_\text{inline}:\text{Nn} \ \text{l}_\text{my}_\text{seq}
\{
\text{str}_\text{if}_\text{eq}:\text{nnTF} \ {#1} \ {bingo}
{ \text{seq}_\text{map}_\text{break}:\text{n} \ {<\text{code}>}}
{\% \text{ Do something useful}}
\}
\]

Use outside of a \(\text{seq}_\text{map}\)\_\ldots scenario leads to low level \TeX\ errors.

\TeXhackers note: When the mapping is broken, additional tokens may be inserted before the \(\text{code}\) is inserted into the input stream. This depends on the design of the mapping function.
\seq_set_map:NNn \seq_gset_map:NNn \seq_set_map_x:NNn \seq_gset_map_x:NNn

Applies \texttt{inline function} to every \texttt{item} stored within the \texttt{sequence}. The \texttt{inline function} should consist of code which will receive the \texttt{item} as \#1. The sequence resulting applying \texttt{inline function} to each \texttt{item} is assigned to \texttt{sequence}. The \texttt{sequence} resulting from \texttt{x}-expanding \texttt{inline function} applied to each \texttt{item} is assigned to \texttt{sequence}. As such, the code in \texttt{inline function} should be expandable.

\textbf{TeXHackers note:} Contrarily to other mapping functions, \seq_map_break: cannot be used in this function, and would lead to low-level \TeX errors.

\seq_count:N \seq_count:c

Leaves the number of items in the \texttt{sequence} in the input stream as an \texttt{integer denotation}. The total number of items in a \texttt{sequence} includes those which are empty and duplicates, i.e. every item in a \texttt{sequence} is unique.

19.8 Using the content of sequences directly

\seq_use:Nnnn \seq_use:cnnn

Places the contents of the \texttt{seq var} in the input stream, with the appropriate \texttt{separator} between the items. Namely, if the sequence has more than two items, the \texttt{separator between more than two} is placed between each pair of items except the last, for which the \texttt{separator between final two} is used. If the sequence has exactly two items, then they are placed in the input stream separated by the \texttt{separator between two}. If the sequence has a single item, it is placed in the input stream, and an empty sequence produces no output. An error is raised if the variable does not exist or if it is invalid.

For example,

\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | \{de\} | f } \seq_use:Nnnn \l_tmpa_seq { -and- } { , - } { , -and- }

inserts “a, b, c, de, and f” in the input stream. The first separator argument is not used in this case because the sequence has more than 2 items.

\textbf{TeXHackers note:} The result is returned within the \texttt{unexpanded} primitive \texttt{\exp_not:n}, which means that the \texttt{items} do not expand further when appearing in an \texttt{x}-type or \texttt{e}-type argument expansion.
\seq_use:Nn \seq_use:cn
\new:2013-05-26
\seq_use:Nn \seq_use:cn
\new:2013-05-26

\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | \{de\} | f }
\seq_use:Nn \l_tmpa_seq { ~and~ }

inserts “a and b and c and de and f” in the input stream.

\textbf{\TeXhackers note:} The result is returned within the \texttt{\unexpanded} primitive (\exp_not:n), which means that the \texttt{\items} do not expand further when appearing in an \texttt{x}-type or \texttt{e}-type argument expansion.

\section*{19.9 Sequences as stacks}

Sequences can be used as stacks, where data is pushed to and popped from the top of the sequence. (The left of a sequence is the top, for performance reasons.) The stack functions for sequences are not intended to be mixed with the general ordered data functions detailed in the previous section: a sequence should either be used as an ordered data type or as a stack, but not in both ways.

\seq_get:NN \seq_get:cN
\updated:2012-05-14
\seq_pop:NN \seq_pop:cN
\updated:2012-05-14
\seq_gpop:NN \seq_gpop:cN

\seq_get:NNTF \seq_get:cN
\new:2012-05-19
\seq_get:NNTF \seq_get:cN
\updated:2012-05-19

\textbf{\LaTeXhackers note:} If the \texttt{\sequence} is empty, leaves the \texttt{\falsecode} in the input stream. The value of the \texttt{\tokenlistvariable} is not defined in this case and should not be relied upon. If the \texttt{\sequence} is non-empty, stores the top item from a \texttt{\sequence} in the \texttt{\tokenlistvariable} without removing it from the \texttt{\sequence}. The \texttt{\tokenlistvariable} is assigned locally.
If the \langle sequence \rangle is empty, leaves the \langle false code \rangle in the input stream. The value of the \langle token list variable \rangle is not defined in this case and should not be relied upon. If the \langle sequence \rangle is non-empty, pops the top item from the \langle sequence \rangle in the \langle token list variable \rangle, i.e. removes the item from the \langle sequence \rangle. Both the \langle sequence \rangle and the \langle token list variable \rangle are assigned locally.

\seq_pop:NN \seq_pop:cN
\seq_gpop:NN \seq_gpop:cN

If the \langle sequence \rangle is empty, leaves the \langle false code \rangle in the input stream. The value of the \langle token list variable \rangle is not defined in this case and should not be relied upon. If the \langle sequence \rangle is non-empty, pops the top item from the \langle sequence \rangle in the \langle token list variable \rangle, i.e. removes the item from the \langle sequence \rangle. The \langle sequence \rangle is modified globally, while the \langle token list variable \rangle is assigned locally.

\seq_push:Nn \seq_gpush:Nn
\seq_push:(NV|Nv|NoNx|cnV|cv|co|cx) \seq_gpush:(NV|Nv|NoNx|cnV|cv|co|cx)

Adds the \{item\} to the top of the \langle sequence \rangle.

19.10 Sequences as sets

Sequences can also be used as sets, such that all of their items are distinct. Usage of sequences as sets is not currently widespread, hence no specific set function is provided. Instead, it is explained here how common set operations can be performed by combining several functions described in earlier sections. When using sequences to implement sets, one should be careful not to rely on the order of items in the sequence representing the set.

Sets should not contain several occurrences of a given item. To make sure that a \langle sequence variable \rangle only has distinct items, use \seq_remove_duplicates:N \langle sequence variable \rangle. This function is relatively slow, and to avoid performance issues one should only use it when necessary.

Some operations on a set \langle seq var \rangle are straightforward. For instance, \seq_count:N \langle seq var \rangle expands to the number of items, while \seq_if_in:NnTF \langle seq var \rangle \{\langle item \rangle\} tests if the \langle item \rangle is in the set.

Adding an \langle item \rangle to a set \langle seq var \rangle can be done by appending it to the \langle seq var \rangle if it is not already in the \langle seq var \rangle:

\seq_if_in:NnF \langle seq var \rangle \{\langle item \rangle\}
{ \seq_put_right:Nn \langle seq var \rangle \{\langle item \rangle\} }

Removing an \langle item \rangle from a set \langle seq var \rangle can be done using \seq_remove_all:Nn,

\seq_remove_all:Nn \langle seq var \rangle \{\langle item \rangle\}

The intersection of two sets \langle seq var_1 \rangle and \langle seq var_2 \rangle can be stored into \langle seq var_3 \rangle by collecting items of \langle seq var_1 \rangle which are in \langle seq var_2 \rangle.
\seq_clear:N \seq_var_3
\seq_map_inline:Nn \seq_var_1
{ \seq_if_in:NnT \seq_var_2 \{#1\}
\seq_put_right:Nn \seq_var_3 \{#1\} }

The code as written here only works if \seq_var_3 is different from the other two sequence variables. To cover all cases, items should first be collected in a sequence \l_{\text{pkg\_internal\_seq}}, then \seq_var_3 should be set equal to this internal sequence. The same remark applies to other set functions.

The union of two sets \seq_var_1 and \seq_var_2 can be stored into \seq_var_3 through
\seq_concat:NNN \seq_var_3 \seq_var_1 \seq_var_2
\seq_remove_duplicates:N \seq_var_3
or by adding items to (a copy of) \seq_var_1 one by one
\seq_set_eq:NN \seq_var_3 \seq_var_1
\seq_map_inline:Nn \seq_var_2
{ \seq_if_in:NnF \seq_var_3 \{#1\}
\seq_put_right:Nn \seq_var_3 \{#1\} }

The second approach is faster than the first when the \seq_var_2 is short compared to \seq_var_1.

The difference of two sets \seq_var_1 and \seq_var_2 can be stored into \seq_var_3 by removing items of the \seq_var_2 from (a copy of) the \seq_var_1 one by one.
\seq_set_eq:NN \seq_var_3 \seq_var_1
\seq_map_inline:Nn \seq_var_2
{ \seq_remove_all:Nn \seq_var_3 \{#1\} }

The symmetric difference of two sets \seq_var_1 and \seq_var_2 can be stored into \seq_var_3 by computing the difference between \seq_var_1 and \seq_var_2 and storing the result as \l_{\text{pkg\_internal\_seq}}, then the difference between \seq_var_2 and \seq_var_1, and finally concatenating the two differences to get the symmetric differences.
\seq_set_eq:NN \l_{\text{pkg\_internal\_seq}} \seq_var_1
\seq_map_inline:Nn \seq_var_2
{ \seq_remove_all:Nn \l_{\text{pkg\_internal\_seq}} \{#1\} }
\seq_set_eq:NN \seq_var_3 \seq_var_2
\seq_map_inline:Nn \seq_var_1
{ \seq_remove_all:Nn \seq_var_3 \{#1\} }
\seq_concat:NNN \seq_var_3 \seq_var_3 \l_{\text{pkg\_internal\_seq}}

19.11 Constant and scratch sequences

\c_empty_seq Constant that is always empty.

Rev: 2012-07-02 154
Scratch sequences for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

Scratch sequences for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

19.12 Viewing sequences

\seq_show:N \langle sequence \rangle
\seq_show:N \langle sequence \rangle
Displays the entries in the \langle sequence \rangle in the terminal.

\seq_log:N \langle sequence \rangle
\seq_log:N \langle sequence \rangle
Writes the entries in the \langle sequence \rangle in the log file.
Chapter 20

The l3int package
Integers

Calculation and comparison of integer values can be carried out using literal numbers, int registers, constants and integers stored in token list variables. The standard operators +, −, / and * and parentheses can be used within such expressions to carry arithmetic operations. This module carries out these functions on integer expressions (“intexpr”).

20.1 Integer expressions

Throughout this module, (almost) all n-type argument allow for an ⟨intexpr⟩ argument with the following syntax. The ⟨integer expression⟩ should consist, after expansion, of +, −, *, /, ( ) and of course integer operands. The result is calculated by applying standard mathematical rules with the following peculiarities:

- / denotes division rounded to the closest integer with ties rounded away from zero;
- there is an error and the overall expression evaluates to zero whenever the absolute value of any intermediate result exceeds \(2^{31} - 1\), except in the case of scaling operations \(a \times b/c\), for which \(a \times b\) may be arbitrarily large (but the operands \(a, b, c\) are still constrained to an absolute value at most \(2^{31} - 1\));
- parentheses may not appear after unary + or −, namely placing +( or −( at the start of an expression or after +, −, *, / or ( leads to an error.

Each integer operand can be either an integer variable (with no need for \texttt{\int_use:N}) or an integer denotation. For example both

\begin{verbatim}
\int_show:n \{ 5 + 4 * 3 - ( 3 + 4 * 5 ) \}
\end{verbatim}

and

\begin{verbatim}
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl \{ 5 \}
\int_new:N \l_my_int
\int_set:Nn \l_my_int \{ 4 \}
\int_show:n \{ \l_my_tl + \l_my_int * 3 - ( 3 + 4 * 5 ) \}
\end{verbatim}
show the same result \(-6\) because \(\_my\_tl\) expands to the integer denotation \(5\) while the integer variable \(\_my\_int\) takes the value \(4\). As the \(\langle\text{integer expression}\rangle\) is fully expanded from left to right during evaluation, fully expandable and restricted-expandable functions can both be used, and \texttt{\exp_not:n} and its variants have no effect while \texttt{\exp_not:N} may incorrectly interrupt the expression.

\textbf{\texttt{\TeX}hackers note:} Exactly two expansions are needed to evaluate \texttt{\int_eval:n}. The result is \textit{not} an \(\langle\text{internal integer}\rangle\), and therefore should be terminated by a space if used in \texttt{\int_value:w} or in a \TeX{}-style integer assignment.

As all \TeX{} integers, integer operands can also be: \texttt{\value{\langle\text{LATEX2ε counter}\rangle}}; dimension or skip variables, converted to integers in \texttt{sp}; the character code of some character given as \texttt{\langle\text{char}\rangle} or \texttt{\char}\langle\text{char}\rangle; octal numbers given as \texttt{\char} followed by digits from \(0\) to \(7\); or hexadecimal numbers given as \texttt{\string} followed by digits and upper case letters from \(A\) to \(F\).

\begin{verbatim}
\int_eval:n \int_eval:w \int_sign:n \int_abs:n \int_div_round:nn \int_div_truncate:nn
\end{verbatim}

\texttt{\int_eval:n} \(\langle\text{integer expression}\rangle\)

Evaluates the \(\langle\text{integer expression}\rangle\) and leaves the result in the input stream as an integer denotation: for positive results an explicit sequence of decimal digits not starting with \(0\), for negative results \(-\) followed by such a sequence, and \(0\) for zero.

\texttt{\int_eval:w} \(\langle\text{integer expression}\rangle\)

Revised: 2018-03-30

Evaluates the \(\langle\text{integer expression}\rangle\) as described for \texttt{\int_eval:n}. The end of the expression is the first token encountered that cannot form part of such an expression. If that token is \texttt{\scan_stop}: it is removed, otherwise not. \texttt{Sp} spaces do not terminate the expression. However, spaces terminate explicit integers, and this may terminate the expression: for instance, \texttt{\int_eval:w 1 1 + 1 9} (with explicit space tokens inserted using \texttt{~} in a code setting) expands to \(29\) since the digit \(9\) is not part of the expression.

\texttt{\int_sign:n} \(\langle\text{intexpr}\rangle\)

Revised: 2018-11-03

Evaluates the \(\langle\text{integer expression}\rangle\) then leaves \(1\) or \(0\) or \(-1\) in the input stream according to the sign of the result.

\texttt{\int_abs:n} \(\langle\text{integer expression}\rangle\)

Updated: 2012-09-26

Evaluates the \(\langle\text{integer expression}\rangle\) as described for \texttt{\int_eval:n} and leaves the absolute value of the result in the input stream as an \(\langle\text{integer denotation}\rangle\) after two expansions.

\texttt{\int_div_round:nn} \(\langle\text{intexpr}_1\rangle \langle\text{intexpr}_2\rangle\)

Updated: 2012-09-26

Evaluates the two \(\langle\text{integer expressions}\rangle\) as described earlier, then divides the first value by the second, and rounds the result to the closest integer. Ties are rounded away from zero. Note that this is identical to using \texttt{/} directly in an \(\langle\text{integer expression}\rangle\). The result is left in the input stream as an \(\langle\text{integer denotation}\rangle\) after two expansions.

\texttt{\int_div_truncate:nn} \(\langle\text{intexpr}_1\rangle \langle\text{intexpr}_2\rangle\)

Updated: 2012-02-09

Evaluates the two \(\langle\text{integer expressions}\rangle\) as described earlier, then divides the first value by the second, and rounds the result towards zero. Note that division using \texttt{/} rounds to the closest integer instead. The result is left in the input stream as an \(\langle\text{integer denotation}\rangle\) after two expansions.
\int_max:nn \int_min:nn
\int_mod:nn

Evaluates the (integer expressions) as described for \int_eval:n and leaves either the larger or smaller value in the input stream as an (integer denotation) after two expansions.

Evaluates the two (integer expressions) as described earlier, then calculates the integer remainder of dividing the first expression by the second. This is obtained by subtracting \int_div_truncate:nn \times \langle integer expr \rangle from \langle integer expr \rangle. Thus, the result has the same sign as \langle integer expr \rangle and its absolute value is strictly less than that of \langle integer expr \rangle. The result is left in the input stream as an (integer denotation) after two expansions.

20.2 Creating and initialising integers

\int_new:N \int_new:c
\int_const:Nn \int_const:cn
\int_zero:N \int_zero:c \int_gzero:N \int_gzero:c
\int_zero_new:N \int_zero_new:c \int_gzero_new:N \int_gzero_new:c
\int_set_eq:NN \int_set_eq:c \int_gset_eq:NN \int_gset_eq:c
\int_if_exist_p:N \int_if_exist_p:c \int_if_exist:NTF \int_if_exist:TF

Creates a new (integer) or raises an error if the name is already taken. The declaration is global. The (integer) is initially equal to 0.

Creates a new constant (integer) or raises an error if the name is already taken. The value of the (integer) is set globally to the (integer expression).

Sets (integer) to 0.

Ensures that the (integer) exists globally by applying \int_new:N if necessary, then applies \int_(g)zero:N to leave the (integer) set to zero.

Sets the content of (integer1) equal to that of (integer2).

Tests whether the (int) is currently defined. This does not check that the (int) really is an integer variable.
20.3 Setting and incrementing integers

\texttt{\int_add:Nn} \hspace{1em} \texttt{\int_add:Nn \langle integer \rangle \{\langle integer expression \rangle\}}
Adds the result of the \langle integer expression \rangle to the current content of the \langle integer \rangle.

\texttt{\int_decr:N} \hspace{1em} \texttt{\int_decr:N \langle integer \rangle}
Decreases the value stored in \langle integer \rangle by 1.

\texttt{\int_incr:N} \hspace{1em} \texttt{\int_incr:N \langle integer \rangle}
Increases the value stored in \langle integer \rangle by 1.

\texttt{\int_set:Nn} \hspace{1em} \texttt{\int_set:Nn \langle integer \rangle \{\langle integer expression \rangle\}}
Sets \langle integer \rangle to the value of \langle integer expression \rangle, which must evaluate to an integer (as described for \texttt{\int_eval:n}).

\texttt{\int_sub:Nn} \hspace{1em} \texttt{\int_sub:Nn \langle integer \rangle \{\langle integer expression \rangle\}}
Subtracts the result of the \langle integer expression \rangle from the current content of the \langle integer \rangle.

20.4 Using integers

\texttt{\int_use:N} \hspace{1em} \texttt{\int_use:N \langle integer \rangle}
Recovers the content of an \langle integer \rangle and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where an \langle integer \rangle is required (such as in the first and third arguments of \texttt{\int_compare:nNnTF}).

\texttt{\int_use:c} \hspace{1em} \texttt{\int_use:c \langle integer \rangle}

\texttt{\TeXhackers note}: \texttt{\int_use:N} is the \TeX primitive \texttt{\the}: this is one of several \LaTeX3 names for this primitive.
20.5 Integer expression conditionals

\begin{align*}
\int\text{compare}:p:nNn & = \{\text{intexpr}_1\} \ {\text{relation}} \ {\text{intexpr}_2}\) \\
\int\text{compare}:nNnTF & = \{\text{intexpr}_1\} \ {\text{relation}} \ {\text{intexpr}_2}\) \\
& \{\{\text{true code}\}\} \ {\{\text{false code}\}\}
\end{align*}

This function first evaluates each of the \textit{(integer expressions)} as described for \texttt{\textbackslash int.eval:n}. The two results are then compared using the \textit{(relation)}:

\begin{align*}
\text{Equal} & = \\
\text{Greater than} & > \\
\text{Less than} & < 
\end{align*}

This function is less flexible than \texttt{\textbackslash int\_compare:nTF} but around 5 times faster.

\begin{align*}
\int\text{compare}:p:n & = \{\text{intexpr}_1\} \ {\text{relation}_1}\} \\
& \ldots \\
& \{\text{intexpr}_N\} \ {\text{relation}_N}\) \\
& \{\text{intexpr}_{N+1}\}
\end{align*}

\texttt{\textbackslash int\_compare:nTF}

\begin{align*}
& \{\text{intexpr}_1\} \ {\text{relation}_1}\} \\
& \ldots \\
& \{\text{intexpr}_N\} \ {\text{relation}_N}\) \\
& \{\text{intexpr}_{N+1}\}
\end{align*}

\{\{\text{true code}\}\} \ {\{\text{false code}\}\}

This function evaluates the \textit{(integer expressions)} as described for \texttt{\textbackslash int.eval:n} and compares consecutive result using the corresponding \textit{(relation)}, namely it compares \{\textit{intexpr}_1\} and \{\textit{intexpr}_2\} using the \textit{(relation)_1}, then \{\textit{intexpr}_2\} and \{\textit{intexpr}_3\} using the \textit{(relation)_2}, until finally comparing \{\textit{intexpr}_N\} and \{\textit{intexpr}_{N+1}\} using the \textit{(relation)_N}. The test yields \textit{true} if all comparisons are \textit{true}. Each \textit{(integer expression)} is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is \textit{false}, then no other \textit{(integer expression)} is evaluated and no other comparison is performed. The \textit{(relations)} can be any of the following:

\begin{align*}
\text{Equal} = \text{or} == \\
\text{Greater than or equal to} & \geq \\
\text{Greater than} & > \\
\text{Less than or equal to} & \leq \\
\text{Less than} & < \\
\text{Not equal} & \neq
\end{align*}

This function is more flexible than \texttt{\textbackslash int\_compare:nNnTF} but around 5 times slower.
This function evaluates the \textit{(test integer expression)} and compares this in turn to each of the \textit{(integer expression cases)}. If the two are equal then the associated \textit{(code)} is left in the input stream and other cases are discarded. If any of the cases are matched, the \textit{(true code)} is also inserted into the input stream (after the code for the appropriate case), while if none match then the \textit{(false code)} is inserted. The function \texttt{\textbackslash int\_case:nn}, which does nothing if there is no match, is also available. For example

\texttt{\textbackslash int\_case:nnF}
\{
    \{ 2 \ast 5 \} \quad \{ \textit{Small} \}
    \{ 4 + 6 \} \quad \{ \textit{Medium} \}
    \{ -2 \ast 10 \} \quad \{ \textit{Negative} \}
\}
\{ \textit{No idea!} \}

leaves “Medium” in the input stream.

\texttt{\textbackslash int\_if\_even\_p:n} \quad \texttt{\textbackslash int\_odd\_p:n} \quad \texttt{\textbackslash int\_eval:n}
\texttt{\textbackslash int\_if\_even:n} \quad \texttt{\textbackslash int\_odd:n} \quad \texttt{\textbackslash int\_compare:nNnTF}

This function first evaluates the \textit{(integer expression)} as described for \texttt{\textbackslash int\_eval:n}. It then evaluates if this is odd or even, as appropriate.

\subsection{20.6 Integer expression loops}

\texttt{\textbackslash int\_do\_until:nNnn} \quad \texttt{\textbackslash int\_do\_while:nNnn}

Places the \textit{(code)} in the input stream for \texttt{\textbackslash LaTeX} to process, and then evaluates the relationship between the two \textit{(integer expressions)} as described for \texttt{\textbackslash int\_compare:nNnTF}. If the test is \texttt{false} then the \textit{(code)} is inserted into the input stream again and a loop occurs until the \textit{(relation)} is \texttt{true}.

Places the \textit{(code)} in the input stream for \texttt{\textbackslash LaTeX} to process, and then evaluates the relationship between the two \textit{(integer expressions)} as described for \texttt{\textbackslash int\_compare:nNnTF}. If the test is \texttt{true} then the \textit{(code)} is inserted into the input stream again and a loop occurs until the \textit{(relation)} is \texttt{false}.
\int_until_do:nn \  \int_until_do:nn \ \{\text{intexpr}_1\} \ \{\text{relation}\} \ \{\text{intexpr}_2\} \ \{\text{code}\}

Evaluates the relationship between the two \textit{integer expressions} as described for \texttt{\int_compare:nTF}, and then places the \texttt{\{code\}} in the input stream if the \texttt{\{relation\}} is \texttt{false}. After the \texttt{\{code\}} has been processed by \TeX{} the test is repeated, and a loop occurs until the test is \texttt{true}.

\int_while_do:nn \  \int_while_do:nn \ \{\text{intexpr}_1\} \ \{\text{relation}\} \ \{\text{intexpr}_2\} \ \{\text{code}\}

Evaluates the relationship between the two \textit{integer expressions} as described for \texttt{\int_compare:nTF}, and then places the \texttt{\{code\}} in the input stream if the \texttt{\{relation\}} is \texttt{true}. After the \texttt{\{code\}} has been processed by \TeX{} the test is repeated, and a loop occurs until the test is \texttt{false}.

\int_do_until:nn \  \int_do_until:nn \ \{\text{integer relation}\} \ \{\text{code}\}

Places the \texttt{\{code\}} in the input stream for \TeX{} to process, and then evaluates the \texttt{\{integer relation\}} as described for \texttt{\int_compare:nTF}. If the test is \texttt{false} then the \texttt{\{code\}} is inserted into the input stream again and a loop occurs until the \texttt{\{relation\}} is \texttt{true}.

\int_do_while:nn \  \int_do_while:nn \ \{\text{integer relation}\} \ \{\text{code}\}

Places the \texttt{\{code\}} in the input stream for \TeX{} to process, and then evaluates the \texttt{\{integer relation\}} as described for \texttt{\int_compare:nTF}. If the test is \texttt{true} then the \texttt{\{code\}} is inserted into the input stream again and a loop occurs until the \texttt{\{relation\}} is \texttt{false}.

\int_until_do:nn \  \int_until_do:nn \ \{\text{integer relation}\} \ \{\text{code}\}

Updated: 2013-01-13

Evaluates the \texttt{\{integer relation\}} as described for \texttt{\int_compare:nTF}, and then places the \texttt{\{code\}} in the input stream if the \texttt{\{relation\}} is \texttt{false}. After the \texttt{\{code\}} has been processed by \TeX{} the test is repeated, and a loop occurs until the test is \texttt{true}.

\int_while_do:nn \  \int_while_do:nn \ \{\text{integer relation}\} \ \{\text{code}\}

Updated: 2013-01-13

Evaluates the \texttt{\{integer relation\}} as described for \texttt{\int_compare:nTF}, and then places the \texttt{\{code\}} in the input stream if the \texttt{\{relation\}} is \texttt{true}. After the \texttt{\{code\}} has been processed by \TeX{} the test is repeated, and a loop occurs until the test is \texttt{false}. 

162
20.7 Integer step functions

\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{function\}}
\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{initial \texttt{value}\}} \texttt{\{final \texttt{value}\}} \texttt{\{function\}}
\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{step\}} \texttt{\{final \texttt{value}\}} \texttt{\{function\}}

This function first evaluates the \langle initial value \rangle, \langle step \rangle and \langle final value \rangle, all of which should be integer expressions. The \langle function \rangle is then placed in front of each \langle value \rangle from the \langle initial value \rangle to the \langle final value \rangle in turn (using \langle step \rangle between each \langle value \rangle). The \langle step \rangle must be non-zero. If the \langle step \rangle is positive, the loop stops when the \langle value \rangle becomes larger than the \langle final value \rangle. If the \langle step \rangle is negative, the loop stops when the \langle value \rangle becomes smaller than the \langle final value \rangle. The \langle function \rangle should absorb one numerical argument. For example

\texttt{\cs_set:Npn \my_func:n #1 \{ [I saw #1] \quad \}}
\texttt{\int_stop} \{ 1 \} \{ 1 \} \{ 5 \} \texttt{\my_func:n}

would print

\[ I \text{ saw } 1 \quad I \text{ saw } 2 \quad I \text{ saw } 3 \quad I \text{ saw } 4 \quad I \text{ saw } 5 \]

The functions \texttt{\int_stop} \texttt{\{final value\}} \texttt{\{function\}} and \texttt{\int_stop} \texttt{\{initial value\}} \texttt{\{final value\}} \texttt{\{function\}} both use a fixed \langle step \rangle of 1, and in the case of \texttt{\int_stop} \texttt{\{final value\}} the \langle initial value \rangle is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{code\}}
\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{final value\}} \texttt{\{code\}}
\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{step\}} \texttt{\{final value\}} \texttt{\{code\}}

This function first evaluates the \langle initial value \rangle, \langle step \rangle and \langle final value \rangle, all of which should be integer expressions. Then for each \langle value \rangle from the \langle initial value \rangle to the \langle final value \rangle in turn (using \langle step \rangle between each \langle value \rangle), the \langle code \rangle is inserted into the input stream with \#1 replaced by the current \langle value \rangle. Thus the \langle code \rangle should define a function of one argument (\#1).

The functions \texttt{\int_stop} \texttt{\{code\}} and \texttt{\int_stop} \texttt{\{code\}} both use a fixed \langle step \rangle of 1, and in the case of \texttt{\int_stop} \texttt{\{code\}} the \langle initial value \rangle is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{tl var\}} \texttt{\{code\}}
\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{final value\}} \texttt{\{tl var\}} \texttt{\{code\}}
\texttt{\textasciitilde \texttt{\int_stop}} \{ initial \texttt{value} \} \texttt{\{step\}} \texttt{\{final value\}} \texttt{\{tl var\}} \texttt{\{code\}}

This function first evaluates the \langle initial value \rangle, \langle step \rangle and \langle final value \rangle, all of which should be integer expressions. Then for each \langle value \rangle from the \langle initial value \rangle to the \langle final value \rangle in turn (using \langle step \rangle between each \langle value \rangle), the \langle code \rangle is inserted into the input stream, with the \langle tl var \rangle defined as the current \langle value \rangle. Thus the \langle code \rangle should make use of the \langle tl var \rangle.

The functions \texttt{\int_stop} \texttt{\{code\}} and \texttt{\int_stop} \texttt{\{code\}} both use a fixed \langle step \rangle of 1, and in the case of \texttt{\int_stop} \texttt{\{code\}} the \langle initial value \rangle is also fixed as 1. These functions are provided as simple short-cuts for code clarity.
20.8 Formatting integers

Integers can be placed into the output stream with formatting. These conversions apply to any integer expressions.

\int_to_arabic:n \{integer expression\}
\int_to_arabic:n

Places the value of the \(\text{integer expression}\) in the input stream as digits, with category code 12 (other).

\int_to_alph:n \{integer expression\}
\int_to_Alph:n

Evaluates the \(\text{integer expression}\) and converts the result into a series of letters, which are then left in the input stream. The conversion rule uses the 26 letters of the English alphabet, in order, adding letters when necessary to increase the total possible range of representable numbers. Thus

\int_to_alph:n \{ 1 \}
places a in the input stream,

\int_to_alph:n \{ 26 \}
is represented as z and

\int_to_alph:n \{ 27 \}
is converted to aa. For conversions using other alphabets, use \int_to_symbols:nnn to define an alphabet-specific function. The basic \int_to_alph:n and \int_to_Alph:n functions should not be modified. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

\int_to_symbols:nnn \{\text{integer expression}\} \{(total symbols)\}
\int_to_symbols:nnn

This is the low-level function for conversion of an \(\text{integer expression}\) into a symbolic form (often letters). The \(\text{total symbols}\) available should be given as an integer expression. Values are actually converted to symbols according to the \(\text{value to symbol mapping}\). This should be given as \(\text{total symbols}\) pairs of entries, a number and the appropriate symbol. Thus the \int_to_alph:n function is defined as

\cs_new:Npn \int_to_alph:n #1
{\int_to_symbols:nnn \{#1\} \{ 26 \}
 \{ 1 \} \{ a \}
 \{ 2 \} \{ b \}
 ...
 \{ 26 \} \{ z \}
\texttt{\texttt{\textbackslash int\_to\_bin:n}} \hspace{1em} \texttt{\textbackslash int\_to\_bin:n \{\textit{integer expression}\}}

\texttt{\textit{New: 2014-02-11}}

Calculates the value of the \textit{\texttt{\textit{\textit{integer expression}}}} and places the binary representation of the result in the input stream.

\texttt{\texttt{\textbackslash int\_to\_hex:n} \star} \hspace{1em} \texttt{\texttt{\textbackslash int\_to\_hex:n \{\textit{integer expression}\}}

\texttt{\textit{New: 2014-02-11}}

Calculates the value of the \textit{\texttt{\textit{\textit{integer expression}}}} and places the hexadecimal (base 16) representation of the result in the input stream. Letters are used for digits beyond 9: lower case letters for \texttt{\texttt{\textbackslash int\_to\_hex:n}} and upper case ones for \texttt{\texttt{\textbackslash int\_to\_Hex:n}}. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

\texttt{\texttt{\textbackslash int\_to\_oct:n} \star} \hspace{1em} \texttt{\texttt{\textbackslash int\_to\_oct:n \{\textit{integer expression}\}}

\texttt{\textit{New: 2014-02-11}}

Calculates the value of the \textit{\texttt{\textit{\textit{integer expression}}}} and places the octal (base 8) representation of the result in the input stream. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

\texttt{\texttt{\textbackslash int\_to\_base:nn} \star} \hspace{1em} \texttt{\texttt{\textbackslash int\_to\_base:nn \{\textit{integer expression}\} \{\textit{base}\}}

\texttt{\textit{Updated: 2014-02-11}}

Calculates the value of the \textit{\texttt{\textit{\textit{integer expression}}}} and converts it into the appropriate representation in the \textit{\texttt{\textit{\textit{base}}}}; the latter may be given as an integer expression. For bases greater than 10 the higher “digits” are represented by letters from the English alphabet: lower case letters for \texttt{\texttt{\textbackslash int\_to\_base:n}} and upper case ones for \texttt{\texttt{\textbackslash int\_to\_Base:n}}. The maximum \textit{\texttt{\textit{\textit{base}}}} value is 36. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

\texttt{\texttt{\textbackslash int\_to\_roman:n} \star} \hspace{1em} \texttt{\texttt{\textbackslash int\_to\_roman:n \{\textit{integer expression}\}}

\texttt{\texttt{\textit{Updated: 2011-10-22}}}

Places the value of the \textit{\texttt{\textit{\textit{integer expression}}}} in the input stream as Roman numerals, either lower case \texttt{\texttt{\textbackslash int\_to\_roman:n}} or upper case \texttt{\texttt{\textbackslash int\_to\_Roman:n}}. If the value is negative or zero, the output is empty. The Roman numerals are letters with category code 11 (letter). The letters used are \texttt{mdclxvi}, repeated as needed: the notation with bars (such as \texttt{\textbar{v} for 5000}) is \texttt{not used}. For instance \texttt{\texttt{\textbar{\texttt{\textbackslash int\_to\_roman:n}} \{ 8249 \}}} expands to \texttt{mmmmmmccxlix}.

\texttt{\texttt{\texttt{\textbackslash int\_from\_alph:n} \star}} \hspace{1em} \texttt{\texttt{\textbackslash int\_from\_alph:n \{\textit{letters}\}}

\texttt{\texttt{\textit{Updated: 2014-08-25}}}

Converts the \textit{\texttt{\textit{\textit{letters}}}} into the integer (base 10) representation and leaves this in the input stream. The \textit{\texttt{\textit{\textit{letters}}}} are first converted to a string, with no expansion. Lower and upper case letters from the English alphabet may be used, with “a” equal to 1 through to “z” equal to 26. The function also accepts a leading sign, made of \texttt{+} and \texttt{−}. This is the inverse function of \texttt{\texttt{\textbackslash int\_to\_alph:n}} and \texttt{\texttt{\textbackslash int\_to\_Alph:n}}.

\texttt{\texttt{\texttt{\texttt{\textbackslash int\_from\_oct:n}} \star}} \hspace{1em} \texttt{\texttt{\textbackslash int\_from\_oct:n \{\textit{octal expression}\}}

\texttt{\texttt{\textit{Updated: 2014-08-25}}}

Converts the \textit{\texttt{\textit{\textit{octal expression}}}} into the integer (base 10) representation and leaves this in the input stream. The \textit{\texttt{\textit{\textit{octal expression}}}} is first converted to a string, with no expansion. Lower and upper case digits from the English alphabet may be used, with “0” equal to 0 through to “7” equal to 7. The function also accepts a leading sign, made of \texttt{+} and \texttt{−}. This is the inverse function of \texttt{\texttt{\textbackslash int\_to\_oct:n}}.
\int_from_bin:n  \{\langle\text{binary number}\rangle\}

Converts the \langle\text{binary number}\rangle into the integer (base 10) representation and leaves this in the input stream. The \langle\text{binary number}\rangle is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by binary digits. This is the inverse function of \int_to_bin:n.

\int_from_hex:n  \{\langle\text{hexadecimal number}\rangle\}

Converts the \langle\text{hexadecimal number}\rangle into the integer (base 10) representation and leaves this in the input stream. Digits greater than 9 may be represented in the \langle\text{hexadecimal number}\rangle by upper or lower case letters. The \langle\text{hexadecimal number}\rangle is first converted to a string, with no expansion. The function also accepts a leading sign, made of + and -. This is the inverse function of \int_to_hex:n and \int_to_Hex:n.

\int_from_oct:n  \{\langle\text{octal number}\rangle\}

Converts the \langle\text{octal number}\rangle into the integer (base 10) representation and leaves this in the input stream. The \langle\text{octal number}\rangle is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by octal digits. This is the inverse function of \int_to_oct:n.

\int_from_roman:n  \{\langle\text{roman numeral}\rangle\}

Converts the \langle\text{roman numeral}\rangle into the integer (base 10) representation and leaves this in the input stream. The \langle\text{roman numeral}\rangle is first converted to a string, with no expansion. The \langle\text{roman numeral}\rangle may be in upper or lower case; if the numeral contains characters besides mdclxvi or MDCLXVI then the resulting value is -1. This is the inverse function of \int_to_roman:n and \int_to_Roman:n.

\int_from_base:nn  \{\langle\text{number}\rangle\} \{\langle\text{base}\rangle\}

Converts the \langle\text{number}\rangle expressed in \langle\text{base}\rangle into the appropriate value in base 10. The \langle\text{number}\rangle is first converted to a string, with no expansion. The \langle\text{number}\rangle should consist of digits and letters (either lower or upper case), plus optionally a leading sign. The maximum \langle\text{base}\rangle value is 36. This is the inverse function of \int_to_base:nn and \int_to_Base:nn.

20.10 Random integers

\int_rand:nn  \{\langle\text{intexpr}\rangle\} \{\langle\text{intexpr}\rangle\}

Evaluates the two \langle\text{integer expressions}\rangle and produces a pseudo-random number between the two (with bounds included). This is not available in older versions of Xe\TeX.

\int_rand:n  \{\langle\text{intexpr}\rangle\}

Evaluates the \langle\text{integer expression}\rangle then produces a pseudo-random number between 1 and the \langle\text{intexpr}\rangle (included). This is not available in older versions of Xe\TeX.
20.11 Viewing integers

\int_show:N \int_show:N ⟨integer⟩
\int_show:c
Displays the value of the ⟨integer⟩ on the terminal.

\int_show:n \int_show:n {⟨integer expression⟩}
\int_show:n Updated: 2015-08-07
Displays the result of evaluating the ⟨integer expression⟩ on the terminal.

\int_log:N \int_log:N ⟨integer⟩
\int_log:c
\int_log:n {⟨integer expression⟩}
\int_log:n Updated: 2015-08-07
\int_log:n New: 2014-08-22
\int_log:n Updated: 2015-08-03
Writes the value of the ⟨integer⟩ in the log file.

\int_log:n New: 2014-08-22
\int_log:n Updated: 2015-08-07
Writes the result of evaluating the ⟨integer expression⟩ in the log file.

20.12 Constant integers

\c_zero_int \c_one_int
New: 2018-05-07
Integer values used with primitive tests and assignments: their self-terminating nature makes these more convenient and faster than literal numbers.

\c_max_int
The maximum value that can be stored as an integer.

\c_max_register_int
Maximum number of registers.

\c_max_char_int
Maximum character code completely supported by the engine.

20.13 Scratch integers

\l_tmpa_int \l_tmpb_int
Scratch integer for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_int \g_tmpb_int
Scratch integer for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
20.14 Direct number expansion

\texttt{\textbackslash int\_value:w \ast} \texttt{int\_value:w \{integer\}}
\texttt{\textbackslash int\_value:w \{integer\ denotation\} \{optional space\}}

Expands the following tokens until an \{integer\} is formed, and leaves a normalized form
(no leading sign except for negative numbers, no leading digit 0 except for zero) in the
input stream as category code 12 (other) characters. The \{integer\} can consist of any
number of signs (with intervening spaces) followed by

- an integer variable (in fact, any \TeX{} register except \texttt{\toks{}}) or
- explicit digits (or by \texttt{'\{octal digits\}} or \texttt{"\{hexadecimal digits\}} or \texttt{'\{character\}}).

In this last case expansion stops once a non-digit is found; if that is a space it is removed
as in f-expansion, and so \texttt{\exp\_stop\_f:} may be employed as an end marker. Note that
protected functions are expanded by this process.

This function requires exactly one expansion to produce a value, and so is suitable
for use in cases where a number is required “directly”. In general, \texttt{\int\_eval:n} is the
preferred approach to generating numbers.

\TeX{}hackers note: This is the \TeX{} primitive \texttt{\number{}}.

20.15 Primitive conditionals

\texttt{\if\_int\_compare:w \ast} \texttt{\if\_int\_compare:w \{integer\1} \{relation\} \{integer\2\}}
\texttt{\{true code\}}
\texttt{\else:}
\texttt{\{false code\}}
\texttt{\fi:}

Compare two integers using \{relation\}, which must be one of \texttt{=} \texttt{<} or \texttt{>} with category code
12. The \texttt{\else:} branch is optional.

\TeX{}hackers note: These are both names for the \TeX{} primitive \texttt{\ifnum}.

\texttt{\if\_case:w \ast} \texttt{\if\_case:w \{integer\} \{case\0\}}
\texttt{\or: \{case\1\}}
\texttt{\or: \ldots}
\texttt{\else: \{default\}}
\texttt{\fi:}

Selects a case to execute based on the value of the \{integer\}. The first case ((\{case\0\}) is
executed if \{integer\} is 0, the second ((\{case\1\}) if the \{integer\} is 1, \texttt{etc}. The \{integer\}
may be a literal, a constant or an integer expression (\texttt{e.g.} using \texttt{\int\_eval:n}).

\TeX{}hackers note: These are the \TeX{} primitives \texttt{\ifcase} and \texttt{\or}.
\if_int_odd:w \if_int_odd:w \token \space \true \else: \true \fi:

Expands \token until a non-numeric token or a space is found, and tests whether the resulting \integer is odd. If so, \true is executed. The \else: branch is optional.

\TeXhackers note: This is the \TeX primitive \ifodd.
Chapter 21

The l3flag package: Expandable flags

Flags are the only data-type that can be modified in expansion-only contexts. This module is meant mostly for kernel use: in almost all cases, booleans or integers should be preferred to flags because they are very significantly faster.

A flag can hold any non-negative value, which we call its \( \langle \text{height} \rangle \). In expansion-only contexts, a flag can only be “raised”: this increases the \( \langle \text{height} \rangle \) by 1. The \( \langle \text{height} \rangle \) can also be queried expandably. However, decreasing it, or setting it to zero requires non-expandable assignments.

Flag variables are always local. They are referenced by a \( \langle \text{name} \rangle \) such as \texttt{str\_missing}. The \( \langle \text{name} \rangle \) is used as part of \texttt{\use:c} constructions hence is expanded at point of use. It must expand to character tokens only, with no spaces.

A typical use case of flags would be to keep track of whether an exceptional condition has occurred during expandable processing, and produce a meaningful (non-expandable) message after the end of the expandable processing. This is exemplified by \texttt{l3str-convert}, which for performance reasons performs conversions of individual characters expandably and for readability reasons produces a single error message describing incorrect inputs that were encountered.

Flags should not be used without carefully considering the fact that raising a flag takes a time and memory proportional to its height. Flags should not be used unless unavoidable.

21.1 Setting up flags

\begin{verbatim}
\flag_new:n \{flag name\}
\end{verbatim}

Creates a new flag with a name given by \( \langle \text{flag name} \rangle \), or raises an error if the name is already taken. The \( \langle \text{flag name} \rangle \) may not contain spaces. The declaration is global, but flags are always local variables. The \( \langle \text{flag} \rangle \) initially has zero height.

\begin{verbatim}
\flag_clear:n \{flag name\}
\end{verbatim}

The \( \langle \text{flag} \rangle \)'s height is set to zero. The assignment is local.
\flag_clear_new:n \flag_clear_new:n {(\flag \ name)}
Ensures that the \(\flag\) exists globally by applying \flag_new:n if necessary, then applies \flag_clear:n, setting the height to zero locally.

\flag_show:n \flag_show:n {(\flag \ name)}
Displays the \(\flag\)'s height in the terminal.

\flag_log:n \flag_log:n {(\flag \ name)}
Writes the \(\flag\)'s height to the log file.

## 21.2 Expandable flag commands

\flag_if_exist:n \flag_if_exist:n {(\flag \ name)}
This function returns \texttt{true} if the \(\flag \ name\) references a flag that has been defined previously, and \texttt{false} otherwise.

\flag_if_raised:n \flag_if_raised:n {(\flag \ name)}
This function returns \texttt{true} if the \(\flag\) has non-zero height, and \texttt{false} if the \(\flag\) has zero height.

\flag_height:n \flag_height:n {(\flag \ name)}
Expands to the height of the \(\flag\) as an integer denotation.

\flag_raise:n \flag_raise:n {(\flag \ name)}
The \(\flag\)'s height is increased by 1 locally.
Chapter 22

The \texttt{l3clist} package

Comma separated lists

Comma lists (in short, \texttt{clist}) contain ordered data where items can be added to the left or right end of the list. This data type allows basic list manipulations such as adding/removing items, applying a function to every item, removing duplicate items, extracting a given item, using the comma list with specified separators, and so on. Sequences (defined in \texttt{l3seq}) are safer, faster, and provide more features, so they should often be preferred to comma lists. Comma lists are mostly useful when interfacing with \LaTeX{} or other code that expects or provides items separated by commas.

Several items can be added at once. To ease input of comma lists from data provided by a user outside an \texttt{\ExplSyntaxOn ... \ExplSyntaxOff} block, spaces are removed from both sides of each comma-delimited argument upon input. Blank arguments are ignored, to allow for trailing commas or repeated commas (which may otherwise arise when concatenating comma lists “by hand”). In addition, a set of braces is removed if the result of space-trimming is braced: this allows the storage of any item in a comma list. For instance,

\begin{verbatim}
\clist_new:N \l_my_clist
\clist_put_left:Nn \l_my_clist { -a- , -\{b\}- , c\{d\} }
\clist_put_right:Nn \l_my_clist { -\{e\} , , \{f\} , }
\end{verbatim}

results in \texttt{\l_my_clist} containing \texttt{a}, \texttt{b}, \texttt{c\{d\}}, \texttt{\{e\}}, \texttt{\{f\}} namely the five items \texttt{a}, \texttt{b}, \texttt{c\{d\}}, \texttt{\{e\}} and \texttt{\{f\}}. Comma lists normally do not contain empty or blank items so the following gives an empty comma list:

\begin{verbatim}
\clist_clear_new:N \l_my_clist
\clist_set:Nn \l_my_clist { - , - , }
\clist_if_empty:NTF \l_my_clist { true } { false }
\end{verbatim}

and it leaves \texttt{true} in the input stream. To include an “unsafe” item (empty, or one that contains a comma, or starts or ends with a space, or is a single brace group), surround it with braces.

Any \texttt{n}-type token list is a valid comma list input for \texttt{l3clist} functions, which will split the token list at every comma and process the items as described above. On the other hand, \texttt{N}-type functions expect comma list variables, which are particular token list variables in which this processing of items (and removal of blank items) has already
occurred. Because comma list variables are token list variables, expanding them once yields their items separated by commas, and i3tl functions such as \texttt{tl\_show:N} can be applied to them. (These functions often have \texttt{i3list} analogues, which should be preferred.)

Almost all operations on comma lists are noticeably slower than those on sequences so converting the data to sequences using \texttt{\seq\_set\_from\_clist:Nn} (see \texttt{i3seq}) may be advisable if speed is important. The exception is that \texttt{\clist\_if\_in:NnTF} and \texttt{\clist\_remove\_duplicates:N} may be faster than their sequence analogues for large lists. However, these functions work slowly for “unsafe” items that must be braced, and may produce errors when their argument contains \{, \} or \# (assuming the usual \TeX{} category codes apply). The sequence data type should thus certainly be preferred to comma lists to store such items.

### 22.1 Creating and initialising comma lists

\begin{Verbatim}
\clist\_new:N \clist\_new:N \langle comma\ list \rangle
\end{Verbatim}

Creates a new \langle comma\ list \rangle or raises an error if the name is already taken. The declaration is global. The \langle comma\ list \rangle initially contains no items.

\begin{Verbatim}
\clist\_const:Nn \clist\_const:(N|x|cn|cx)
\end{Verbatim}

New: 2014-07-05

Creates a new constant \langle\ list\ var\ \rangle or raises an error if the name is already taken. The value of the \langle\ list\ var\ \rangle is set globally to the \langle comma\ list \rangle.

\begin{Verbatim}
\clist\_clear:N \clist\_clear:c \clist\_gclear:N \clist\_gclear:c
\end{Verbatim}

Clears all items from the \langle comma\ list \rangle.

\begin{Verbatim}
\clist\_clear\_new:N \clist\_clear\_new:c \clist\_gclear\_new:N \clist\_gclear\_new:c
\end{Verbatim}

Ensures that the \langle comma\ list \rangle exists globally by applying \texttt{\clist\_new:N} if necessary, then applies \texttt{\clist\_\(g\)clear:N} to leave the list empty.

\begin{Verbatim}
\clist\_set\_eq:NN \clist\_set\_eq:(cN|Nc|cc) \clist\_gset\_eq:NN \clist\_gset\_eq:(cN|Nc|cc)
\end{Verbatim}

Sets the content of \langle comma\ list\_1 \rangle equal to that of \langle comma\ list\_2 \rangle. To set a token list variable equal to a comma list variable, use \texttt{\tl\_set\_eq:NN}. Conversely, setting a comma list variable to a token list is unadvisable unless one checks space-trimming and related issues.

\begin{Verbatim}
\clist\_set\_from\_seq:NN \clist\_set\_from\_seq:(cN|Nc|cc) \clist\_gset\_from\_seq:NN \clist\_gset\_from\_seq:(cN|Nc|cc)
\end{Verbatim}

New: 2014-07-17

Converts the data in the \langle sequence \rangle into a \langle comma\ list \rangle: the original \langle sequence \rangle is unchanged. Items which contain either spaces or commas are surrounded by braces.
22.2 Adding data to comma lists

\clist_set:Nn \clist_set:N \clist_gset:N \clist_set:NV \clist_set:No \clist_set:Nx \clist_set:cn \clist_set:cV \clist_set:co \clist_set:cx

Sets \langle comma list \rangle to contain the \langle items \rangle, removing any previous content from the variable. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To store some \langle tokens \rangle as a single \langle item \rangle even if the \langle tokens \rangle contain commas or spaces, add a set of braces: \clist_set:Nn \langle comma list \rangle \{ \langle tokens \rangle \}.

\clist_put_left:Nn \clist_put_left:N \clist_gput_left:N \clist_put_left:NV \clist_put_left:No \clist_put_left:Nx \clist_put_left:cn \clist_put_left:cV \clist_put_left:co \clist_put_left:cx

Appends the \langle items \rangle to the left of the \langle comma list \rangle. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To append some \langle tokens \rangle as a single \langle item \rangle even if the \langle tokens \rangle contain commas or spaces, add a set of braces: \clist_put_left:Nn \langle comma list \rangle \{ \langle tokens \rangle \}.

\clist_put_right:Nn \clist_put_right:N \clist_gput_right:N \clist_put_right:NV \clist_put_right:No \clist_put_right:Nx \clist_put_right:cn \clist_put_right:cV \clist_put_right:co \clist_put_right:cx

Appends the \langle items \rangle to the right of the \langle comma list \rangle. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To append some \langle tokens \rangle as a single \langle item \rangle even if the \langle tokens \rangle contain commas or spaces, add a set of braces: \clist_put_right:Nn \langle comma list \rangle \{ \langle tokens \rangle \}.

174
22.3 Modifying comma lists

While comma lists are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update comma lists, while retaining the order of the unaffected entries.

\clist_remove_duplicates:N \clist_remove_duplicates:N ⟨comma list⟩
\clist_remove_duplicates:c
\clist_gremove_duplicates:N
\clist_gremove_duplicates:c

Removes duplicate items from the ⟨comma list⟩, leaving the left most copy of each item in the ⟨comma list⟩. The ⟨item⟩ comparison takes place on a token basis, as for \tl_if_eq:nnTF.

**TEXhackers note:** This function iterates through every item in the ⟨comma list⟩ and does a comparison with the ⟨items⟩ already checked. It is therefore relatively slow with large comma lists. Furthermore, it may fail if any of the items in the ⟨comma list⟩ contains ⟨{}, or # (assuming the usual \TeX category codes apply).

\clist_remove_all:Nn \clist_remove_all:Nn ⟨comma list⟩ ⟨⟨item⟩⟩
\clist_remove_all:cn \clist_remove_all:cn ⟨⟨item⟩⟩
\clist_gremove_all:Nn \clist_gremove_all:Nn ⟨⟨item⟩⟩
\clist_gremove_all:cn \clist_gremove_all:cn ⟨⟨item⟩⟩

Updated: 2011–09–06

Removes every occurrence of ⟨item⟩ from the ⟨comma list⟩. The ⟨item⟩ comparison takes place on a token basis, as for \tl_if_eq:nnTF.

**TEXhackers note:** The function may fail if the ⟨item⟩ contains ⟨{}, or # (assuming the usual \TeX category codes apply).

\clist_reverse:N \clist_reverse:N ⟨comma list⟩
\clist_reverse:c
\clist_greverse:N \clist_greverse:c

New: 2014–07–18

Reverses the order of items stored in the ⟨comma list⟩.

\clist_reverse:n \clist_reverse:n ⟨⟨comma list⟩⟩

New: 2014–07–18

Leaves the items in the ⟨comma list⟩ in the input stream in reverse order. Contrarily to other what is done for other n-type ⟨comma list⟩ arguments, braces and spaces are preserved by this process.

**TEXhackers note:** The result is returned within \unexpanded, which means that the comma list does not expand further when appearing in an x-type or e-type argument expansion.
\clist_sort:Nn \clist_sort:cn \clist_gsort:Nn \clist_gsort:cn

Rev: 2017-02-06

\clist_sort:Nn \clist_var \langle \textit{comparison code} \rangle

Sorts the items in the \langle \textit{clist var} \rangle according to the \langle \textit{comparison code} \rangle, and assigns the result to \langle \textit{clist var} \rangle. The details of sorting comparison are described in Section 6.1.

\clist_sort:cn \clist_gsort:cn

22.4 Comma list conditionals

\clist_if_empty_p:N * \clist_if_empty_p:n \langle \textit{comma list} \rangle
\clist_if_empty_p:c * \clist_if_empty:NTF \langle \textit{comma list} \rangle \langle \textit{true code} \rangle \langle \textit{false code} \rangle
\clist_if_empty:NTF * \clist_if_empty:n \langle \textit{comma list} \rangle \langle \textit{true code} \rangle \langle \textit{false code} \rangle

Tests if the \langle \textit{comma list} \rangle is empty (containing no items).

\clist_if_empty_p:n * \clist_if_empty:n \langle \textit{comma list} \rangle \langle \textit{true code} \rangle \langle \textit{false code} \rangle

Tests if the \langle \textit{comma list} \rangle is empty (containing no items). The rules for space trimming are as for other \textit{n}-type comma-list functions, hence the comma list \{\textit{-,-,}\} \textit{(without outer braces)} is empty, while \{-,\}, \textit{(without outer braces)} contains one element, which happens to be empty: the comma-list is not empty.

\clist_if_in:NnTF \clist_if_in:nn \langle \textit{comma list} \rangle \langle \textit{item} \rangle \langle \textit{true code} \rangle \langle \textit{false code} \rangle
\clist_if_in:TNTF \langle \textit{item} \rangle \langle \textit{false code} \rangle \langle \textit{true code} \rangle

Tests if the \langle \textit{item} \rangle is present in the \langle \textit{comma list} \rangle. In the case of an \textit{n}-type \langle \textit{comma list} \rangle, the usual rules of space trimming and brace stripping apply. Hence,

\clist_if_in:n \langle \textit{item} \rangle \langle \textit{false code} \rangle \langle \textit{true code} \rangle
\clist_if_in:n \langle \textit{item} \rangle \langle \textit{true code} \rangle \langle \textit{false code} \rangle

yields \textit{true}.

\textbf{\TeXhackers note:} The function may fail if the \langle \textit{item} \rangle contains \{,\}, or \# (assuming the usual \TeX\ category codes apply).

22.5 Mapping over comma lists

The functions described in this section apply a specified function to each item of a comma list. All mappings are done at the current group level, \textit{i.e.} any local assignments made by the \langle \textit{function} \rangle or \langle \textit{code} \rangle discussed below remain in effect after the loop.

When the comma list is given explicitly, as an \textit{n}-type argument, spaces are trimmed around each item. If the result of trimming spaces is empty, the item is ignored. Otherwise, if the item is surrounded by braces, one set is removed, and the result is passed to the mapped function. Thus, if the comma list that is being mapped is \{\textit{a,}, \{\textit{b}\}, \{\textit{c}\},\}, then the arguments passed to the mapped function are \textit{a}, \textit{b}, an empty argument, and \textit{c}.
When the comma list is given as an \texttt{-type} argument, spaces have already been trimmed on input, and items are simply stripped of one set of braces if any. This case is more efficient than using \texttt{-type} comma lists.

\begin{verbatim}
\clist_map_function:NN ⟨comma list⟩ ⟨function⟩
\end{verbatim}
Applies \texttt{⟨function⟩} to every \texttt{⟨item⟩} stored in the \texttt{⟨comma list⟩}. The \texttt{⟨function⟩} receives one argument for each iteration. The \texttt{⟨items⟩} are returned from left to right. The function \texttt{\clist_map_inline:Nn} is in general more efficient than \texttt{\clist_map_function:NN}.

\begin{verbatim}
\clist_map_inline:Nn ⟨comma list⟩ \{⟨inline function⟩\}
\end{verbatim}
Applies \texttt{⟨inline function⟩} to every \texttt{⟨item⟩} stored within the \texttt{⟨comma list⟩}. The \texttt{⟨inline function⟩} should consist of code which receives the \texttt{⟨item⟩} as \texttt{#1}. The \texttt{⟨items⟩} are returned from left to right.

\begin{verbatim}
\clist_map_variable:NNn ⟨comma list⟩ ⟨variable⟩ \{⟨code⟩\}
\end{verbatim}
Stores each \texttt{⟨item⟩} of the \texttt{⟨comma list⟩} in turn in the \texttt{(token list) ⟨variable⟩} and applies the \texttt{⟨code⟩}. The \texttt{⟨code⟩} will usually make use of the \texttt{⟨variable⟩}, but this is not enforced. The assignments to the \texttt{⟨variable⟩} are local. Its value after the loop is the last \texttt{⟨item⟩} in the \texttt{⟨comma list⟩}, or its original value if there were no \texttt{⟨item⟩}. The \texttt{⟨items⟩} are returned from left to right.

\begin{verbatim}
\clist_map_tokens:Nn ⟨clist var⟩ \{⟨code⟩\}
\clist_map_tokens:nn \{⟨comma list⟩\} \{⟨code⟩\}
\end{verbatim}
Calls \texttt{⟨code⟩} \{\texttt{⟨item⟩}\} for every \texttt{⟨item⟩} stored in the \texttt{⟨comma list⟩}. The \texttt{⟨code⟩} receives each \texttt{⟨item⟩} as a trailing brace group. If the \texttt{⟨code⟩} consists of a single function this is equivalent to \texttt{\clist_map_function:nN}.

\begin{verbatim}
\clist_map_break:
\end{verbatim}
Used to terminate a \texttt{\clist_map...} function before all entries in the \texttt{⟨comma list⟩} have been processed. This normally takes place within a conditional statement, for example

\begin{verbatim}
\clist_map_inline:Nn \l_my_clist
{ \str_if_eq:nnTF { #1 } { bingo }{ \clist_map_break: }
{% Do something useful }
}
\end{verbatim}

Use outside of a \texttt{\clist_map...} scenario leads to low level \TeX{} errors.

\textbf{\TeX{}Xhackers note:} When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.
\clist_map_break:n \clist_map_break:n \{\langle\text{code}\rangle\}

Used to terminate a \clist_map... function before all entries in the \langle\text{comma list}\rangle have been processed, inserting the \langle\text{code}\rangle after the mapping has ended. This normally takes place within a conditional statement, for example

\clist_map_inline:Nn \l_my_clist
{\str_if_eq:nnTF { #1 } { bingo } { \clist_map_break:n \{\langle\text{code}\rangle\} } { % Do something useful } }

Use outside of a \clist_map... scenario leads to low level \TeX errors.

\textbf{\TeXhackers note:} When the mapping is broken, additional tokens may be inserted before the \langle\text{code}\rangle is inserted into the input stream. This depends on the design of the mapping function.

\clist_count:N \clist_count:N \langle\text{comma list}\rangle
Leaves the number of items in the \langle\text{comma list}\rangle in the input stream as an \langle\text{integer denotation}\rangle. The total number of items in a \langle\text{comma list}\rangle includes those which are duplicates, i.e. every item in a \langle\text{comma list}\rangle is counted.

\section{22.6 Using the content of comma lists directly}

\clist_use:Nnnn \clist_use:Nnnn \clist_use:Nnnn \clist_use:Nnnn \langle\text{clist var}\rangle \{\langle\text{separator between two}\rangle\}
\langle\text{separator between more than two}\rangle \{\langle\text{separator between final two}\rangle\}

Places the contents of the \langle\text{clist var}\rangle in the input stream, with the appropriate \langle\text{separator}\rangle between the items. Namely, if the comma list has more than two items, the \langle\text{separator between more than two}\rangle is placed between each pair of items except the last, for which the \langle\text{separator between final two}\rangle is used. If the comma list has exactly two items, then they are placed in the input stream separated by the \langle\text{separator between two}\rangle. If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error is raised if the variable does not exist or if it is invalid.

For example,

\clist_set:Nn \l_tmpa_clist { a , b , , c , \{de\} , f }
\clist_use:Nnnn \l_tmpa_clist { -and- } { , - } { , -and- }

inserts “a, b, c, de, and f” in the input stream. The first separator argument is not used in this case because the comma list has more than 2 items.

\textbf{\TeXhackers note:} The result is returned within the \langle\text{unexpanded primitive}\rangle \langle\text{\exp_not:n}\rangle, which means that the \langle\text{items}\rangle do not expand further when appearing in an \langle\text{x-type}\rangle or \langle\text{e-type}\rangle argument expansion.
\clist_use:Nn \clist_use:Nn \clist_use:Nn \clist_use:Nn
\clist_use:Nnnn \clist_use:nnn
\clist_use:nn \clist_use:nc \clist_use:nnn \clist_use:nn

\clist_use:Nn \clist_var \langle \text{separator} \rangle
Places the contents of the \langle \text{clist var} \rangle in the input stream, with the \langle \text{separator} \rangle between the items. If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error is raised if the variable does not exist or if it is invalid.

For example,
\clist_set:Nn \l_tmpa_clist \{ a, b, c, \{de\}, f \}
\clist_use:Nn \l_tmpa_clist \{ -and- \}

inserts “a and b and c and de and f” in the input stream.

\textbf{TeXhackers note:} The result is returned within the \texttt{\unexpanded} primitive (\texttt{\exp_not:n}), which means that the \langle \text{items} \rangle do not expand further when appearing in an \texttt{x}-type or \texttt{e}-type argument expansion.

\clist_use:nnnn \clist_use:nn \clist_use:nn
\clist_use:nn
Places the contents of the \langle \text{comma list} \rangle in the input stream, with the appropriate \langle \text{separator} \rangle between the items. As for \clist_set:Nn, blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. The \langle \text{separators} \rangle are then inserted in the same way as for \clist_use:nnnn and \clist_use:Nn, respectively.

\textbf{TeXhackers note:} The result is returned within the \texttt{\unexpanded} primitive (\texttt{\exp_not:n}), which means that the \langle \text{items} \rangle do not expand further when appearing in an \texttt{x}-type or \texttt{e}-type argument expansion.

\subsection{Comma lists as stacks}

Comma lists can be used as stacks, where data is pushed to and popped from the top of the comma list. (The left of a comma list is the top, for performance reasons.) The stack functions for comma lists are not intended to be mixed with the general ordered data functions detailed in the previous section: a comma list should either be used as an ordered data type or as a stack, but not in both ways.

\clist_get:N  \clist_get:Nn  \clist_get:NnF  \clist_get:cN  \clist_get:NN  \clist_get:cNN  \clist_get:cNF
\clist_get:NN  \langle \text{comma list} \rangle \langle \text{token list variable} \rangle
Stores the left-most item from a \langle \text{comma list} \rangle in the \langle \text{token list variable} \rangle without removing it from the \langle \text{comma list} \rangle. The \langle \text{token list variable} \rangle is assigned locally. In the non-branching version, if the \langle \text{comma list} \rangle is empty the \langle \text{token list variable} \rangle is set to the marker value \texttt{\q_no_value}.

\clist_pop:N  \clist_pop:Nn  \clist_pop:NnF  \clist_pop:cN  \clist_pop:NN  \clist_pop:cNN  \clist_pop:cNF
\clist_pop:N \langle \text{comma list} \rangle \langle \text{token list variable} \rangle
Pops the left-most item from a \langle \text{comma list} \rangle into the \langle \text{token list variable} \rangle, \textit{i.e.} removes the item from the comma list and stores it in the \langle \text{token list variable} \rangle. Both of the variables are assigned locally.
\clist_gpop:NN \clist_gpop:CN
Pops the left-most item from a ⟨comma list⟩ into the ⟨token list variable⟩, i.e. removes the item from the comma list and stores it in the ⟨token list variable⟩. The ⟨comma list⟩ is modified globally, while the assignment of the ⟨token list variable⟩ is local.

\clist_pop:NN \clist_pop:cN
\clist_pop:NNTF ⟨comma list⟩ ⟨token list variable⟩ {⟨true code⟩} {⟨false code⟩}
If the ⟨comma list⟩ is empty, leaves the ⟨false code⟩ in the input stream. The value of the ⟨token list variable⟩ is not defined in this case and should not be relied upon. If the ⟨comma list⟩ is non-empty, pops the top item from the ⟨comma list⟩ in the ⟨token list variable⟩, i.e. removes the item from the ⟨comma list⟩. Both the ⟨comma list⟩ and the ⟨token list variable⟩ are assigned locally.

\clist_gpop:NNTF \clist_gpop:cNTF
\clist_gpop:NNTF ⟨comma list⟩ ⟨token list variable⟩ {⟨true code⟩} {⟨false code⟩}
If the ⟨comma list⟩ is empty, leaves the ⟨false code⟩ in the input stream. The value of the ⟨token list variable⟩ is not defined in this case and should not be relied upon. If the ⟨comma list⟩ is non-empty, pops the top item from the ⟨comma list⟩ in the ⟨token list variable⟩, i.e. removes the item from the ⟨comma list⟩. Both the ⟨comma list⟩ and the ⟨token list variable⟩ are assigned locally.

\clist_push:Nn \clist_push:nn
\clist_push:cn \clist_gpush:Nn \clist_gpush:nn
\clist_push:Nn ⟨comma list⟩ {⟨items⟩} \clist_gpush:Nn ⟨comma list⟩ {⟨items⟩}
Adds the ⟨items⟩ to the top of the ⟨comma list⟩. Spaces are removed from both sides of each item as for any n-type comma list.

22.8 Using a single item

\clist_item:Nn \clist_item:nn \clist_item:cn
\clist_item:Nn ⟨comma list⟩ {⟨integer expression⟩} \clist_item:nn
Indexing items in the ⟨comma list⟩ from 1 at the top (left), this function evaluates the ⟨integer expression⟩ and leaves the appropriate item from the comma list in the input stream. If the ⟨integer expression⟩ is negative, indexing occurs from the bottom (right) of the comma list. When the ⟨integer expression⟩ is larger than the number of items in the ⟨comma list⟩ (as calculated by \clist_count:N) then the function expands to nothing.

\TeXhackers note: The result is returned within the \unexpanded primitive (\exp_not:n), which means that the ⟨item⟩ does not expand further when appearing in an x-type or e-type argument expansion.
\clist_rand_item:N \clist_rand_item:c \clist_rand_item:n
Selects a pseudo-random item of the \textit{(comma list)}. If the \textit{(comma list)} has no item, the result is empty.

\textbf{\LaTeX}hacker\textit{s note:} The result is returned within the \texttt{\unexpanded} primitive (\texttt{\exp_not:n}), which means that the \textit{(item)} does not expand further when appearing in an \texttt{x-type} or \texttt{e-type} argument expansion.

### 22.9 Viewing comma lists

\clist_show:N \clist_show:c
Displays the entries in the \textit{(comma list)} in the terminal.

\clist_show:n
Displays the entries in the comma list in the terminal.

\clist_log:N \clist_log:c
Writes the entries in the \textit{(comma list)} in the log file. See also \clist_show:N which displays the result in the terminal.

\clist_log:n
Writes the entries in the comma list in the log file. See also \clist_show:n which displays the result in the terminal.

### 22.10 Constant and scratch comma lists

\c_empty_clist
Constant that is always empty.

\l_tmpa_clist \l_tmpb_clist
Scratch comma lists for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX{}3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_clist \g_tmpb_clist
Scratch comma lists for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX{}3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
Chapter 23

The l3token package
Token manipulation

This module deals with tokens. Now this is perhaps not the most precise description so let’s try with a better description: When programming in \TeX, it is often desirable to know just what a certain token is: is it a control sequence or something else. Similarly one often needs to know if a control sequence is expandable or not, a macro or a primitive, how many arguments it takes etc. Another thing of great importance (especially when it comes to document commands) is looking ahead in the token stream to see if a certain character is present and maybe even remove it or disregard other tokens while scanning. This module provides functions for both and as such has two primary function categories: \texttt{\token} for anything that deals with tokens and \texttt{\peek} for looking ahead in the token stream.

Most functions we describe here can be used on control sequences, as those are tokens as well.

It is important to distinguish two aspects of a token: its “shape” (for lack of a better word), which affects the matching of delimited arguments and the comparison of token lists containing this token, and its “meaning”, which affects whether the token expands or what operation it performs. One can have tokens of different shapes with the same meaning, but not the converse.

For instance, \texttt{\if:w}, \texttt{\if_charcode:w}, and \texttt{\tex_if:D} are three names for the same internal operation of \TeX, namely the primitive testing the next two characters for equality of their character code. They have the same meaning hence behave identically in many situations. However, \TeX distinguishes them when searching for a delimited argument. Namely, the example function \texttt{\show_until_if:w} defined below takes everything until \texttt{\if:w} as an argument, despite the presence of other copies of \texttt{\if:w} under different names.

\begin{verbatim}
\cs_new:Npn \show_until_if:w #1 \if:w { \tl_show:n {#1} }
\show_until_if:w \tex_if:D \if_charcode:w \if:w
\end{verbatim}

A list of all possible shapes and a list of all possible meanings are given in section 23.7.
23.1 Creating character tokens

\char_set_active_eq:NN \char_set_active_eq:Nc \char_gset_active_eq:NN \char_gset_active_eq:Nc
Updated: 2015-11-12

\char_generate:nn \char_generate:nc
New: 2015-09-09
Updated: 2019-01-16

\c_catcode_other_space_tl
New: 2011-09-05

\char_set_active_eq:NN \char_set_active_eq:NC \char_gset_active_eq:NN \char_gset_active_eq:Nc
Updated: 2015-11-12

\char_set_active_eq:nN \char_set_active_eq:nc \char_gset_active_eq:nN \char_gset_active_eq:nc
New: 2015-11-12

\char_generate:nn {\charcode} {\catcode}
New: 2015-09-09
Updated: 2019-01-16

\regex_replace:nnN {.*} {⟨replacement⟩} {⟨tl var⟩}
New: 2011-09-05

\c_catcode_other_space_tl
New: 2011-09-05

Sets the behaviour of the \textlangle char \textrangle in situations where it is active (category code 13) to be equivalent to that of the \textlangle function \textrangle. The category code of the \textlangle char \textrangle is unchanged by this process. The \textlangle function \textrangle may itself be an active character.

Sets the behaviour of the \textlangle char \textrangle which has character code as given by the \textlangle integer expression \textrangle in situations where it is active (category code 13) to be equivalent to that of the \textlangle function \textrangle. The category code of the \textlangle char \textrangle is unchanged by this process. The \textlangle function \textrangle may itself be an active character.

Generates a character token of the given \textlangle charcode \textrangle and \textlangle catcode \textrangle (both of which may be integer expressions). The \textlangle catcode \textrangle may be one of

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 10 (space)
- 11 (letter)
- 12 (other)
- 13 (active)

and other values raise an error. The \textlangle charcode \textrangle may be any one valid for the engine in use, except that for \textlangle catcode \textrangle 10, \textlangle charcode \textrangle 0 is not allowed. Active characters cannot be generated in older versions of X\LaTeX{}. Another way to build token lists with unusual category codes is \textbackslash \texttt{\regex_replace:nnN}{\.*}{⟨replacement⟩}{⟨tl var⟩}.

\textbf{\TeX{}hackers note:} Exactly two expansions are needed to produce the character.

Token list containing one character with category code 12, (“other”), and character code 32 (space).
23.2 Manipulating and interrogating character tokens

\char_set_catcode_escape:N \char_set_catcode_letter:N \langle \text{character} \rangle
\char_set_catcode_group_begin:N \char_set_catcode_group_end:N \char_set_catcode_math_toggle:N
\char_set_catcode_alignment:N \char_set_catcode_end_line:N \char_set_catcode_parameter:N
\char_set_catcode_math_superscript:N \char_set_catcode_math_subscript:N \char_set_catcode_ignore:N
\char_set_catcode_space:N \char_set_catcode_letter:N \char_set_catcode_other:N
\char_set_catcode_comment:N \char_set_catcode_invalid:N

Sets the category code of the \langle character \rangle to that indicated in the function name. Depending on the current category code of the \langle token \rangle the escape token may also be needed:

\char_set_catcode_other:N \%\char_set_catcode_letter:N

The assignment is local.

\char_set_catcode_escape:n \char_set_catcode_letter:n \langle \text{integer expression} \rangle
\char_set_catcode_group_begin:n \char_set_catcode_group_end:n \char_set_catcode_math_toggle:n
\char_set_catcode_alignment:n \char_set_catcode_end_line:n \char_set_catcode_parameter:n
\char_set_catcode_math_superscript:n \char_set_catcode_math_subscript:n \char_set_catcode_ignore:n
\char_set_catcode_space:n \char_set_catcode_letter:n \char_set_catcode_other:n
\char_set_catcode_comment:n \char_set_catcode_active:n

Sets the category code of the \langle character \rangle which has character code as given by the \langle integer expression \rangle. This version can be used to set up characters which cannot otherwise be given (cf. the N-type variants). The assignment is local.
\char_set_catcode:nn \char_set_catcode:nn \{(intexpr_1)\} \{(intexpr_2)\} \char_value_catcode:n \char_value_catcode:n \{(integer expression)\} \char_show_value_catcode:n \char_show_value_catcode:n \{(integer expression)\} \char_set_lccode:nn \char_set_lccode:nn \{(intexpr_1)\} \{(intexpr_2)\} \char_value_lccode:n \char_value_lccode:n \{(integer expression)\} \char_show_value_lccode:n \char_show_value_lccode:n \{(integer expression)\} \char_set_uccode:nn \char_set_uccode:nn \{(intexpr_1)\} \{(intexpr_2)\} \char_value_uccode:n \char_value_uccode:n \{(integer expression)\} \char_show_value_uccode:n \char_show_value_uccode:n \{(integer expression)\} These functions set the category code of the \langle character \rangle which has character code as given by the \langle integer expression \rangle. The first \langle integer expression \rangle is the character code and the second is the category code to apply. The setting applies within the current \text{TEx} group. In general, the symbolic functions \char_set_catcode \langle type \rangle should be preferred, but there are cases where these lower-level functions may be useful.

\char_set_lccode:nn \char_set_lccode:nn \{(intexpr_1)\} \{(intexpr_2)\} \char_value_lccode:n \char_value_lccode:n \{(integer expression)\} \char_show_value_lccode:n \char_show_value_lccode:n \{(integer expression)\} Sets up the behaviour of the \langle character \rangle when found inside \text{\text_lowercase:n}, such that \langle character_1 \rangle will be converted into \langle character_2 \rangle. The two \langle characters \rangle may be specified using an \langle integer expression \rangle for the character code concerned. This may include the \text{TEx} \langle character \rangle method for converting a single character into its character code:

\char_set_lccode:nn \char_set_lccode:nn \{(intexpr_1)\} \{(intexpr_2)\} \char_value_lccode:n \char_value_lccode:n \{(integer expression)\} \char_show_value_lccode:n \char_show_value_lccode:n \{(integer expression)\} \char_set_uccode:nn \char_set_uccode:nn \{(intexpr_1)\} \{(intexpr_2)\} \char_value_uccode:n \char_value_uccode:n \{(integer expression)\} \char_show_value_uccode:n \char_show_value_uccode:n \{(integer expression)\} The setting applies within the current \text{TEx} group.
\char_value_uccode:n \char_value_uccode:n \{integer expression\}
Expands to the current upper case code of the \langle character \rangle with character code given by the \langle integer expression \rangle.

\char_show_value_uccode:n \char_show_value_uccode:n \{integer expression\}
Displays the current upper case code of the \langle character \rangle with character code given by the \langle integer expression \rangle on the terminal.

\char_set_mathcode:nn \char_set_mathcode:nn \{intexpr\} \{intexpr\}
This function sets up the math code of \langle character \rangle. The \langle character \rangle is specified as an \langle integer expression \rangle which will be used as the character code of the relevant character. The setting applies within the current \TeX{} group.

\char_value_mathcode:n \char_value_mathcode:n \{integer expression\}
Expands to the current math code of the \langle character \rangle with character code given by the \langle integer expression \rangle.

\char_show_value_mathcode:n \char_show_value_mathcode:n \{integer expression\}
Displays the current math code of the \langle character \rangle with character code given by the \langle integer expression \rangle on the terminal.

\char_set_sfcode:nn \char_set_sfcode:nn \{intexpr\} \{intexpr\}
This function sets up the space factor for the \langle character \rangle. The \langle character \rangle is specified as an \langle integer expression \rangle which will be used as the character code of the relevant character. The setting applies within the current \TeX{} group.

\char_value_sfcode:n \char_value_sfcode:n \{integer expression\}
Expands to the current space factor for the \langle character \rangle with character code given by the \langle integer expression \rangle.

\char_show_value_sfcode:n \char_show_value_sfcode:n \{integer expression\}
Displays the current space factor for the \langle character \rangle with character code given by the \langle integer expression \rangle on the terminal.

\l_char_active_seq
Used to track which tokens may require special handling at the document level as they are (or have been at some point) of category \langle active \rangle (catcode 13). Each entry in the sequence consists of a single escaped token, for example \texttt{\~}. Active tokens should be added to the sequence when they are defined for general document use.

\l_char_special_seq
Used to track which tokens will require special handling when working with verbatim-like material at the document level as they are not of categories \langle letter \rangle (catcode 11) or \langle other \rangle (catcode 12). Each entry in the sequence consists of a single escaped token, for example \texttt{\\textbackslash} for the backslash or \texttt{\{ for an opening brace. Escaped tokens should be added to the sequence when they are defined for general document use.
23.3 Generic tokens

These are implicit tokens which have the category code described by their name. They are used internally for test purposes but are also available to the programmer for other uses.

\c_group_begin_token
\c_group_end_token
\c_math_toggle_token
\c_alignment_token
\c_parameter_token
\c_math_superscript_token
\c_math_subscript_token
\c_space_token

These are implicit tokens which have the category code described by their name. They are used internally for test purposes and should not be used other than for category code tests.

\c_catcode_letter_token
\c_catcode_other_token

A token list containing an active token. This is used internally for test purposes and should not be used other than in appropriately-constructed category code tests.

23.4 Converting tokens

\token_to_meaning:N
\token_to_meaning:c

Inserts the current meaning of the \langle token \rangle into the input stream as a series of characters of category code 12 (other). This is the primitive \TeX description of the \langle token \rangle, thus for example both functions defined by \cs_set_nopar:Npn and token list variables defined using \tl_new:N are described as macros.

\TeXhackers note: This is the \TeX primitive \meaning. The \langle token \rangle can thus be an explicit space tokens or an explicit begin-group or end-group character token (\{ or \}) when normal \TeX category codes apply) even though these are not valid \N-type arguments.

\token_to_str:N
\token_to_str:c

Converts the given \langle token \rangle into a series of characters with category code 12 (other). If the \langle token \rangle is a control sequence, this will start with the current escape character with category code 12 (the escape character is part of the \langle token \rangle). This function requires only a single expansion.

\TeXhackers note: \token_to_str:N is the \TeX primitive \string renamed. The \langle token \rangle can thus be an explicit space tokens or an explicit begin-group or end-group character token (\{ or \}) when normal \TeX category codes apply) even though these are not valid \N-type arguments.
23.5 Token conditionals

\token_if_group_begin_p:N */ \token_if_group_begin_p:N \token \\token_if_group_begin:NTF */ \token_if_group_begin:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of a begin group token (\{ when normal \TeX\ category codes are in force). Note that an explicit begin group token cannot be tested in this way, as it is not a valid \texttt{N}-type argument.

\token_if_group_end_p:N */ \token_if_group_end_p:N \token \\token_if_group_end:NTF */ \token_if_group_end:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of an end group token (\} when normal \TeX\ category codes are in force). Note that an explicit end group token cannot be tested in this way, as it is not a valid \texttt{N}-type argument.

\token_if_math_toggle_p:N */ \token_if_math_toggle_p:N \token \\token_if_math_toggle:NTF */ \token_if_math_toggle:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of a math shift token ($ when normal \TeX\ category codes are in force).

\token_if_alignment_p:N */ \token_if_alignment_p:N \token \\token_if_alignment:NTF */ \token_if_alignment:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of an alignment token (& when normal \TeX\ category codes are in force).

\token_if_parameter_p:N */ \token_if_parameter_p:N \token \\token_if_parameter:NTF */ \token_if_parameter:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of a macro parameter token (# when normal \TeX\ category codes are in force).

\token_if_math_superscript_p:N */ \token_if_math_superscript_p:N \token \\token_if_math_superscript:NTF */ \token_if_math_superscript:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of a superscript token (^ when normal \TeX\ category codes are in force).

\token_if_math_subscript_p:N */ \token_if_math_subscript_p:N \token \\token_if_math_subscript:NTF */ \token_if_math_subscript:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of a subscript token (_ when normal \TeX\ category codes are in force).

\token_if_space_p:N */ \token_if_space_p:N \token \\token_if_space:NTF */ \token_if_space:NTF \token \{true code\} \{false code\}

Tests if \textit{(token)} has the category code of a space token. Note that an explicit space token with character code 32 cannot be tested in this way, as it is not a valid \texttt{N}-type argument.
\texttt{\token_if_letter_p:NN} \texttt{\token_if_letter_NTF} \texttt{\token_if_letter:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if \texttt{(token)} has the category code of a letter token.

\texttt{\token_if_other_p:NN} \texttt{\token_if_other_NTF} \texttt{\token_if_other:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if \texttt{(token)} has the category code of an “other” token.

\texttt{\token_if_active_p:NN} \texttt{\token_if_active_NTF} \texttt{\token_if_active:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if \texttt{(token)} has the category code of an active character.

\texttt{\token_if_eq_catcode_p:NN} \texttt{\token_if_eq_catcode_NTF} \texttt{\token_if_eq_catcode:NN \{\text{true code}\} \{\text{false code}\}}

Tests if the two \texttt{(tokens)} have the same category code.

\texttt{\token_if_eq_charcode_p:NN} \texttt{\token_if_eq_charcode_NTF} \texttt{\token_if_eq_charcode:NN \{\text{true code}\} \{\text{false code}\}}

Tests if the two \texttt{(tokens)} have the same character code.

\texttt{\token_if_eq_meaning_p:NN} \texttt{\token_if_eq_meaning_NTF} \texttt{\token_if_eq_meaning:NN \{\text{true code}\} \{\text{false code}\}}

Tests if the two \texttt{(tokens)} have the same meaning when expanded.

\texttt{\token_if_macro_p:NN} \texttt{\token_if_macro_NTF} \texttt{\token_if_macro:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if the \texttt{(token)} is a TeX macro.

\texttt{\token_if_cs_p:NN} \texttt{\token_if_cs_NTF} \texttt{\token_if_cs:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if the \texttt{(token)} is a control sequence.

\texttt{\token_if_expandable_p:NN} \texttt{\token_if_expandable_NTF} \texttt{\token_if_expandable:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if the \texttt{(token)} is expandable. This test returns \texttt{false} for an undefined token.

\texttt{\token_if_long_macro_p:NN} \texttt{\token_if_long_macro_NTF} \texttt{\token_if_long_macro:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if the \texttt{(token)} is a long macro.

\texttt{\token_if_protected_macro_p:NN} \texttt{\token_if_protected_macro_NTF} \texttt{\token_if_protected_macro:NTF \{\text{true code}\} \{\text{false code}\}}

Tests if the \texttt{(token)} is a protected macro: for a macro which is both protected and long this returns \texttt{false}.

189
Tests if the \textit{token} is a protected long macro.

Tests if the \textit{token} is defined to be a chardef.

\textbf{TeXhackers note:} Booleans, boxes and small integer constants are implemented as \texttt{chardef}s.

Tests if the \textit{token} is defined to be a mathchardef.

Tests if the \textit{token} is defined to be a font selection command.

Tests if the \textit{token} is defined to be a dimension register.

Tests if the \textit{token} is defined to be a integer register.

\textbf{TeXhackers note:} Constant integers may be implemented as integer registers, \texttt{chardef}s, or \texttt{mathchardef}s depending on their value.

Tests if the \textit{token} is defined to be a muskip register.
Tests if the \langle token \rangle is defined to be a skip register.

Tests if the \langle token \rangle is defined to be a toks register (not used by \LaTeX3).

Tests if the \langle token \rangle is an engine primitive. In \LuaTEX this includes primitive-like commands defined using \{token.set_lua\}.

This function compares the \langle test token \rangle in turn with each of the \langle token cases \rangle. If the two are equal (as described for \texttt{\token_if_eq_catcode:NNTF}, \texttt{\token_if_eq_charcode:NNTF} and \texttt{\token_if_eq_meaning:NNTF}, respectively) then the associated \langle code \rangle is left in the input stream and other cases are discarded. If any of the cases are matched, the \langle true code \rangle is also inserted into the input stream (after the code for the appropriate case), while if none match then the \langle false code \rangle is inserted. The functions \texttt{\token_case_catcode:Nn}, \texttt{\token_case_charcode:Nn}, and \texttt{\token_case_meaning:Nn}, which do nothing if there is no match, are also available.

23.6 Peeking ahead at the next token

There is often a need to look ahead at the next token in the input stream while leaving it in place. This is handled using the “peek” functions. The generic \texttt{\peek_after:Nw} is provided along with a family of predefined tests for common cases. As peeking ahead does not skip spaces the predefined tests include both a space-respecting and space-skipping version. In addition, using \texttt{\peek_analysis_map_inline:n}, one can map through the following tokens in the input stream and repeatedly perform some tests.
\peek_gafter:Nw \peek_gafter:Nw \peek_gafter:Nw \token
Globally sets the test variable \gpeek_token equal to \token (as an implicit token, not as a token list), and then expands the \token. The \token remains in the input stream as the next item after the \token. The \token here may be \, \{ or \} (assuming normal \TeX category codes), i.e. it is not necessarily the next argument which would be grabbed by a normal function.

\lpeek_token Token set by \peek_after:Nw and available for testing as described above.

\gpeek_token Token set by \peek_gafter:Nw and available for testing as described above.

\peek_catcode:NTF \peek_catcode:NTF \peek_catcode:NTF \token \token \token \{\true code\} \{\false code\}
Tests if the next \token in the input stream has the same category code as the \token (as defined by the test \token_if_eq_catcode:NTF). Spaces are respected by the test and the \token is left in the input stream after the \true code or \false code (as appropriate to the result of the test).

\peek_catcode_remove:NTF \peek_catcode_remove:NTF \peek_catcode_remove:NTF \token \token \token \{\true code\} \{\false code\}
Tests if the next \token in the input stream has the same category code as the \token (as defined by the test \token_if_eq_catcode:NTF). Spaces are respected by the test and the \token is removed from the input stream if the test is true. The function then places either the \true code or \false code in the input stream (as appropriate to the result of the test).

\peek_charcode:NTF \peek_charcode:NTF \peek_charcode:NTF \token \token \token \{\true code\} \{\false code\}
Tests if the next \token in the input stream has the same character code as the \token (as defined by the test \token_if_eq_charcode:NTF). Spaces are respected by the test and the \token is left in the input stream after the \true code or \false code (as appropriate to the result of the test).

\peek_charcode_remove:NTF \peek_charcode_remove:NTF \peek_charcode_remove:NTF \token \token \token \{\true code\} \{\false code\}
Tests if the next \token in the input stream has the same character code as the \token (as defined by the test \token_if_eq_charcode:NTF). Spaces are respected by the test and the \token is removed from the input stream if the test is true. The function then places either the \true code or \false code in the input stream (as appropriate to the result of the test).

\peek_meaning:NTF \peek_meaning:NTF \peek_meaning:NTF \token \token \token \{\true code\} \{\false code\}
Tests if the next \token in the input stream has the same meaning as the \token (as defined by the test \token_if_eq_meaning:NTF). Spaces are respected by the test and the \token is left in the input stream after the \true code or \false code (as appropriate to the result of the test).
\peek_meaning_remove:NTF \peek_meaning_remove:NTF (test token) {(true code)} {(false code)}

Tests if the next \langle token \rangle in the input stream has the same meaning as the \langle test token \rangle (as defined by the test \token_if_eq_meaning:NNTF). Spaces are respected by the test and the \langle token \rangle is removed from the input stream if the test is true. The function then places either the \langle true code \rangle or \langle false code \rangle in the input stream (as appropriate to the result of the test).

\peek_remove_spaces:n \peek_remove_spaces:n {\langle code \rangle}

Peeks ahead and detect if the following token is a space (category code 10 and character code 32). If so, removes the token and checks the next token. Once a non-space token is found, the \langle code \rangle will be inserted into the input stream. Typically this will contain a \peek operation, but this is not required.

\peek_remove_filler:n \peek_remove_filler:n {\langle code \rangle}

Peeks ahead and detect if the following token is a space (category code 10) or has meaning equal to \scan_stop:. If so, removes the token and checks the next token. If neither of these cases apply, expands the next token using f-type expansion, then checks the resulting leading token in the same way. If after expansion the next token is neither of the two test cases, the \langle code \rangle will be inserted into the input stream. Typically this will contain a \peek operation, but this is not required.

\TeXhackers note: This is essentially a macro-based implementation of how \TeXX handles the search for a left brace after for example \everypar, except that any non-expandable token cleanly ends the \langle filler \rangle (i.e. it does not lead to a \TeXX error).

In contrast to \TeXX's filler removal, a construct \exp_not:N \foo will be treated in the same way as \foo.

\peek_N_type:TF \peek_N_type:TF {(true code)} {(false code)}

Tests if the next \langle token \rangle in the input stream can be safely grabbed as an \texttt{N}-type argument. The test is \langle false \rangle if the next \langle token \rangle is either an explicit or implicit begin-group or end-group token (with any character code), or an explicit or implicit space character (with character code 32 and category code 10), or an outer token (never used in \LaTeXX) and \langle true \rangle in all other cases. Note that a \langle true \rangle result ensures that the next \langle token \rangle is a valid \texttt{N}-type argument. However, if the next \langle token \rangle is for instance \c_space_token, the test takes the \langle false \rangle branch, even though the next \langle token \rangle is in fact a valid \texttt{N}-type argument. The \langle token \rangle is left in the input stream after the \langle true code \rangle or \langle false code \rangle (as appropriate to the result of the test).
Repetedly removes one (token) from the input stream and applies the (inline function) to it, until \peek_analysis_map_break: is called. The (inline function) receives three arguments for each (token) in the input stream:

- (tokens), which both o-expand and x-expand to the (token). The detailed form of (tokens) may change in later releases.
- (char code), a decimal representation of the character code of the (token), −1 if it is a control sequence.
- (catcode), a capital hexadecimal digit which denotes the category code of the (token) (0: control sequence, 1: begin-group, 2: end-group, 3: math shift, 4: alignment tab, 6: parameter, 7: superscript, 8: subscript, A: space, B: letter, C: other, D: active).

This can be converted to an integer by writing “(catcode).

These arguments are the same as for \tl_analysis_map_inline:nn defined in l3tl-analysis. The (char code) and (catcode) do not take the meaning of a control sequence or active character into account: for instance, upon encountering the token \c_group_begin_token in the input stream, \peek_analysis_map_inline:n calls the (inline function) with #1 being \exp_not:n { \c_group_begin_token } (with the current implementation), #2 being −1, and #3 being 0, as for any other control sequence. In contrast, upon encountering an explicit begin-group token {, the (inline function) is called with arguments \exp_after:wN { \if_false: } \fi:, 123 and 1.

The mapping is done at the current group level, i.e. any local assignments made by the (inline function) remain in effect after the loop. Within the code, \l_peek_token is set equal (as a token, not a token list) to the token under consideration.

\peek_analysis_map_break: \peek_analysis_map_break:n { ... \peek_analysis_map_break:n {〈code} } stops the \peek_analysis_map_inline:n loop from seeking more tokens, and inserts (code) in the input stream (empty for \peek_analysis_map_break:).

\peek_regex:nTF \peek_regex:nTF tests if the (tokens) that follow in the input stream match the (regular expression). Any (tokens) that have been read are left in the input stream after the (true code) or (false code) (as appropriate to the result of the test). See l3regex for documentation of the syntax of regular expressions. The (regular expression) is implicitly anchored at the start, so for instance \peek_regex:nTF { a } is essentially equivalent to \peek_charcode:nTF a.

\textbf{\TeX}X hackers note: Implicit character tokens are correctly considered by \peek_regex:nTF as control sequences, while functions that inspect individual tokens (for instance \peek_charcode:nTF) only take into account their meaning.

The \peek_regex:nTF function only inspects as few tokens as necessary to determine whether the regular expression matches. For instance \peek_regex:nTF { abc \textbackslash{} [a-z] } { } { } abc will only inspect the first token \textbackslash{}a even though the first branch abc of the alternative is preferred in functions such as \peek_regex_remove_once:n. This may have an effect on tokenization if the input stream has not yet been tokenized and category codes are changed.
Tests if the ⟨tokens⟩ that follow in the input stream match the ⟨regex⟩. If the test is true, the ⟨tokens⟩ are removed from the input stream and the ⟨true code⟩ is inserted, while if the test is false, the ⟨false code⟩ is inserted followed by the ⟨tokens⟩ that were originally in the input stream. See l3regex for documentation of the syntax of regular expressions. The ⟨regular expression⟩ is implicitly anchored at the start, so for instance \peek_regex_remove_once:nTF { a } is essentially equivalent to \peek_charcode_remove:NTF a.

\TeXhackers note: Implicit character tokens are correctly considered by \peek_regex_remove_once:nTF as control sequences, while functions that inspect individual tokens (for instance \peek_charcode:NTF) only take into account their meaning.

If the ⟨tokens⟩ that follow in the input stream match the ⟨regex⟩, replaces them according to the ⟨replacement⟩ as for \regex_replace_once:nnN, and leaves the result in the input stream, after the ⟨true code⟩. Otherwise, leaves ⟨false code⟩ followed by the ⟨tokens⟩ that were originally in the input stream, with no modifications. See l3regex for documentation of the syntax of regular expressions and of the ⟨replacement⟩: for instance \0 in the ⟨replacement⟩ is replaced by the tokens that were matched in the input stream. The ⟨regular expression⟩ is implicitly anchored at the start. In contrast to \regex_replace_once:nnN, no error arises if the ⟨replacement⟩ leads to an unbalanced token list: the tokens are inserted into the input stream without issue.

\TeXhackers note: Implicit character tokens are correctly considered by \peek_regex_replace_once:nnTF as control sequences, while functions that inspect individual tokens (for instance \peek_charcode:NTF) only take into account their meaning.

### 23.7 Description of all possible tokens

Let us end by reviewing every case that a given token can fall into. This section is quite technical and some details are only meant for completeness. We distinguish the meaning of the token, which controls the expansion of the token and its effect on \TeX’s state, and its shape, which is used when comparing token lists such as for delimited arguments. Two tokens of the same shape must have the same meaning, but the converse does not hold.

A token has one of the following shapes:

- A control sequence, characterized by the sequence of characters that constitute its name: for instance, \use:n is a five-letter control sequence.
• An active character token, characterized by its character code (between 0 and 1114111 for Lua\TeX{} and X\TeX{} and less for other engines) and category code 13.

• A character token, characterized by its character code and category code (one of 1, 2, 3, 4, 6, 7, 8, 10, 11 or 12 whose meaning is described below).

There are also a few internal tokens. The following list may be incomplete in some engines.

• Expanding \texttt{\textbackslash the\textbackslash font} results in a token that looks identical to the command that was used to select the current font (such as \texttt{\textbackslash tenrm}) but it differs from it in shape.

• A “frozen” \texttt{\textbackslash relax}, which differs from the primitive in shape (but has the same meaning), is inserted when the closing \texttt{\textbackslash fi} of a conditional is encountered before the conditional is evaluated.

• Expanding \texttt{\textbackslash noexpand \{token\}} (when the \langle token\rangle is expandable) results in an internal token, displayed (temporarily) as \texttt{\textbackslash notexpanded: \{token\}}, whose shape coincides with the \langle token\rangle and whose meaning differs from \texttt{\textbackslash relax}.

• An \texttt{\textbackslash outer endtemplate:} can be encountered when peeking ahead at the next token; this expands to another internal token, \texttt{end of alignment template}.

• Tricky programming might access a frozen \texttt{\textbackslash endwrite}.

• Some frozen tokens can only be accessed in interactive sessions: \texttt{\textbackslash cr, \textbackslash right, \textbackslash endgroup, \textbackslash fi, \textbackslash inaccessible}.

• In Lua\TeX{}, there is also the strange case of “bytes” \texttt{\textbackslash^{1100xy}} where \texttt{x,y} are any two lowercase hexadecimal digits, so that the hexadecimal number ranges from \texttt{\textbackslash text{0000}=1114112$ to~$1100ff = 1114367}. These are used to output individual bytes to files, rather than UTF-8. For the purposes of token comparisons they behave like non-expandable primitive control sequences (\textit{not characters}) whose \texttt{\meaning} \textit{is the character} followed by the given byte. If this byte is in the range 80–ff this gives an “invalid utf-8 sequence” error: applying \texttt{\token_to_str:N} or \texttt{\token_to_meaning:N} to these tokens is unsafe. Unfortunately, they don’t seem to be detectable safely by any means except perhaps Lua code.

The meaning of a (non-active) character token is fixed by its category code (and character code) and cannot be changed. We call these tokens \textit{explicit} character tokens. Category codes that a character token can have are listed below by giving a sample output of the \TeX{} primitive \texttt{\meaning}, together with their \LaTeX{} names and most common example:

1 begin-group character (\texttt{\textbackslash group\_begin}, often {),
2 end-group character (\texttt{\textbackslash group\_end}, often }),
3 math shift character (\texttt{\textbackslash math\_toggle}, often $),
4 alignment tab character (\texttt{\textbackslash alignment}, often &),
5 macro parameter character (\texttt{\textbackslash parameter}, often #),
6 superscript character (\texttt{\textbackslash math\_superscript}, often ^),
8 subscript character (math_subscript, often _),
10 blank space (space, often character code 32),
11 the letter (letter, such as A),
12 the character (other, such as 0).

Category code 13 (active) is discussed below. Input characters can also have several other category codes which do not lead to character tokens for later processing: 0 (escape), 5 (end_line), 9 (ignore), 14 (comment), and 15 (invalid).

The meaning of a control sequence or active character can be identical to that of any character token listed above (with any character code), and we call such tokens implicit character tokens. The meaning is otherwise in the following list:

- a macro, used in \LaTeX{} for most functions and some variables (tl, fp, seq, ...),
- a primitive such as \def or \topmark, used in \LaTeX{} for some functions,
- a register such as \count123, used in \LaTeX{} for the implementation of some variables (int, dim, ...),
- a constant integer such as \char"56 or \mathchar"121,
- a font selection command,
- undefined.

Macros can be \protected or not, \long or not (the opposite of what \LaTeX{} calls nopar), and \outer or not (unused in \LaTeX{}). Their \meaning takes the form

\begin{verbatim}
(prefix) macro:(argument)->(replacement)
\end{verbatim}

where (prefix) is among \protected\long\outer, \argument describes parameters that the macro expects, such as #1#2#3, and \replacement describes how the parameters are manipulated, such as \int_eval:n{#2+#1*#3}.

Now is perhaps a good time to mention some subtleties relating to tokens with category code 10 (space). Any input character with this category code (normally, space and tab characters) becomes a normal space, with character code 32 and category code 10.

When a macro takes an undelimited argument, explicit space characters (with character code 32 and category code 10) are ignored. If the following token is an explicit character token with category code 1 (begin-group) and an arbitrary character code, then \TeX{} scans ahead to obtain an equal number of explicit character tokens with category code 1 (begin-group) and 2 (end-group), and the resulting list of tokens (with outer braces removed) becomes the argument. Otherwise, a single token is taken as the argument for the macro: we call such single tokens “N-type”, as they are suitable to be used as an argument for a function with the signature :N.

When a macro takes a delimited argument \TeX{} scans ahead until finding the delimiter (outside any pairs of begin-group/end-group explicit characters), and the resulting list of tokens (with outer braces removed) becomes the argument. Note that explicit space characters at the start of the argument are not ignored in this case (and they prevent brace-stripping).
23.8 Deprecated functions

\char_lowercase:N \star \char_uppercase:N \star \char_titlecase:N \star \char_foldcase:N \star \char_str_lowercase:N \star \char_str_uppercase:N \star \char_str_titlecase:N \star \char_str_foldcase:N \star

\char_lowercase:N \ (\texttt{char})

Converts the \texttt{char} to the equivalent case-changed character as detailed by the function name (see \texttt{str_foldcase:n} and \texttt{text_titlecase:n} for details of these terms). The case mapping is carried out with no context-dependence (cf. \texttt{text_uppercase:n}, \texttt{etc}.) The \texttt{str} versions always generate “other” (category code 12) characters, whilst the standard versions generate characters with the category code of the \texttt{char} (i.e. only the character code changes).
Chapter 24

The l3prop package

Property lists

expl3 implements a ⟨property list⟩ data type, which contain an unordered list of entries each of which consists of a ⟨key⟩ and an associated ⟨value⟩. The ⟨key⟩ and ⟨value⟩ may both be any ⟨balanced text⟩, the ⟨key⟩ is processed using \tl_to_str:n, meaning that category codes are ignored. It is possible to map functions to property lists such that the function is applied to every key–value pair within the list.

Each entry in a property list must have a unique ⟨key⟩: if an entry is added to a property list which already contains the ⟨key⟩ then the new entry overwrites the existing one. The ⟨keys⟩ are compared on a string basis, using the same method as \str_if_eq:nn.

Property lists are intended for storing key-based information for use within code. This is in contrast to key–value lists, which are a form of input parsed by the l3keys module.

24.1 Creating and initialising property lists

\prop_new:N \prop_new:N \prop_new:c
\prop_new:N \prop_new:c

Creates a new ⟨property list⟩ or raises an error if the name is already taken. The declaration is global. The ⟨property list⟩ initially contains no entries.

\prop_clear:N \prop_clear:N \prop_clear:N \prop_clear:N \prop_clear:N \prop_clear:N
\prop_clear:c \prop_gclear:N \prop_gclear:N \prop_gclear:c
\prop_gclear:c
\prop_gclear:c
\prop_gclear:c
\prop_gclear:c

Clears all entries from the ⟨property list⟩.

\prop_clear_new:N \prop_clear_new:N \prop_clear_new:N \prop_clear_new:N \prop_clear_new:N
\prop_clear_new:c \prop_gclear_new:N \prop_gclear_new:N \prop_gclear_new:c
\prop_gclear_new:c
\prop_gclear_new:c
\prop_gclear_new:c
\prop_gclear_new:c

Ensures that the ⟨property list⟩ exists globally by applying \prop_new:N if necessary, then applies \prop_(g)clear:N to leave the list empty.

199
\prop_set_eq:NN \prop_set_eq: \{property list\}_1 \{property list\}_2

Sets the content of \{property list\}_1 equal to that of \{property list\}_2.

\begin{verbatim}
\prop_set_from_keyval:Nn \prop_set_from_keyval:cn \prop_gset_from_keyval:Nn \prop_gset_from_keyval:cn
\end{verbatim}

\begin{verbatim}
\prop_const_from_keyval:Nn \prop_const_from_keyval:cn
\end{verbatim}

\begin{verbatim}
\prop_put:Nnn \prop_put: \prop_gput:Nnn \prop_gput:cn
\end{verbatim}

\textbf{24.2 Adding and updating property list entries}

\begin{verbatim}
\prop_set_eq:NN \prop_set_eq: \{property list\}_1 \{property list\}_2
\prop_set_eq: \{cN|Nc|cc\}
\prop_gset_eq:NN \prop_gset_eq: \{cN|Nc|cc\}
\prop_set_from_keyval:Nn \prop_set_from_keyval:cn \prop_gset_from_keyval:Nn \prop_gset_from_keyval:cn
\end{verbatim}

Sets \{property list\} to contain key–value pairs given in the second argument. If duplicate keys appear only the last of the values is kept.

Spaces are trimmed around every \langle key \rangle and every \langle value \rangle, and if the result of trimming spaces consists of a single brace group then a set of outer braces is removed. This enables both the \langle key \rangle and the \langle value \rangle to contain spaces, commas or equal signs. The \langle key \rangle is then processed by \tl_to_str:n. This function correctly detects the \texttt{=} and \texttt{,} signs provided they have the standard category code \texttt{12} or they are active.

Notice that in contrast to most keyval lists (e.g. those in \texttt{l3keys}), each key here \textbf{must} be followed with an \texttt{=} sign.

\begin{verbatim}
\prop_const_from_keyval:Nn \prop_const_from_keyval:cn
\end{verbatim}

\begin{verbatim}
\prop_put:Nnn \prop_put: \prop_gput:Nnn \prop_gput:cn
\end{verbatim}

\textbf{24.2 Adding and updating property list entries}

\begin{verbatim}
\end{verbatim}

Adds an entry to the \{property list\} which may be accessed using the \langle key \rangle and which has \langle value \rangle. If the \langle key \rangle is already present in the \{property list\}, the existing entry is overwritten by the new \langle value \rangle. Both the \langle key \rangle and \langle value \rangle may contain any \langle balanced text \rangle. The \langle key \rangle is stored after processing with \tl_to_str:n, meaning that category codes are ignored.

\textit{Updated: 2012-07-09}
\prop_put_if_new:Nnn \prop_put_if_new:Nnn \prop_gput_if_new:Nnn
\prop_put_if_new:cnn \prop_gput_if_new:cnn
\prop_concat:NNN \prop_concat:ccc \prop_gconcat:NNN \prop_gconcat:ccc

If the \langle key \rangle is present in the \langle property list \rangle then no action is taken. Otherwise, a new entry is added as described for \prop_put:Nnn.

\prop_put_from_keyval:Nn \prop_put_from_keyval:cn \prop_gput_from_keyval:Nn \prop_gput_from_keyval:cn

Updates the \langle property list \rangle by adding entries for each key–value pair given in the second argument. The addition is done through \prop_put:Nnn, hence if the \langle property list \rangle already contains some of the keys, the corresponding values are discarded and replaced by those given in the key–value list. If duplicate keys appear in the key–value list then only the last of the values is kept.

The function is equivalent to storing the key–value pairs in a temporary property list using \prop_set_from_keyval:Nn, then combining \langle property list \rangle with the temporary variable using \prop_concat:NNN. In particular, the \langle keys \rangle and \langle values \rangle are space-trimmed and unbraced as described in \prop_set_from_keyval:Nn. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

24.3 Recovering values from property lists

\prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN \prop_get:NnN

Recover the \langle value \rangle stored with \langle key \rangle from the \langle property list \rangle, and places this in the \langle token list variable \rangle. If the \langle key \rangle is not found in the \langle property list \rangle then the \langle token list variable \rangle is set to the special marker \q_no_value. The \langle token list variable \rangle is set within the current \TeX group. See also \prop_get:NnNTF.

\prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN \prop_pop:NnN

Recover the \langle value \rangle stored with \langle key \rangle from the \langle property list \rangle, and places this in the \langle token list variable \rangle. If the \langle key \rangle is not found in the \langle property list \rangle then the \langle token list variable \rangle is set to the special marker \q_no_value. The \langle key \rangle and \langle value \rangle are then deleted from the property list. Both assignments are local. See also \prop_pop:NnNTF.
\prop_gpop:NnN
\prop_gpop:{(NoN|cnN|coN)}
\prop_gpop:⟨property list⟩{(key)} ⟨tl var⟩
Recovers the ⟨value⟩ stored with ⟨key⟩ from the ⟨property list⟩, and places this in the ⟨token list variable⟩. If the ⟨key⟩ is not found in the ⟨property list⟩ then the ⟨token list variable⟩ is set to the special marker \q_no_value. The ⟨key⟩ and ⟨value⟩ are then deleted from the property list. The ⟨property list⟩ is modified globally, while the assignment of the ⟨token list variable⟩ is local. See also \prop_gpop:NnNTF.

\prop_item:Nn
\prop_item:cn *
\prop_item:⋆
\prop_item:cn *
\prop_item:⋆
Expands to the ⟨value⟩ corresponding to the ⟨key⟩ in the ⟨property list⟩. If the ⟨key⟩ is missing, this has an empty expansion.

\prop_count:N
\prop_count:⋆
\prop_count:c *
Leaves the number of key–value pairs in the ⟨property list⟩ in the input stream as an ⟨integer denotation⟩.

\prop_to_keyval:N
\prop_to_keyval:⋆
\prop_to_keyval:⋆
Expands to the ⟨property list⟩ in a key–value notation. Keep in mind that a ⟨property list⟩ is unordered, while key–value interfaces don’t necessarily are, so this can’t be used for arbitrary interfaces.

\TeXhackers note: The result is returned within the \unexpanded primitive (\exp_not:n), which means that the ⟨value⟩ does not expand further when appearing in an x-type or e-type argument expansion. It also needs exactly two steps of expansion.

24.4 Modifying property lists

\prop_remove:Nn
\prop_remove:(NV|cn|cV)
\prop_gremove:Nn
\prop_gremove:(NV|cn|cV)
\prop_remove:Nn ⟨property list⟩ {(key)}
Removes the entry listed under ⟨key⟩ from the ⟨property list⟩. If the ⟨key⟩ is not found in the ⟨property list⟩ no change occurs, i.e there is no need to test for the existence of a key before deleting it.

24.5 Property list conditionals

\prop_if_exist_p:N
\prop_if_exist_p:c
\prop_if_exist:NTF
\prop_if_exist:cTF *
\prop_if_exist_p:N
\prop_if_exist_p:c
\prop_if_exist:NTF ⟨property list⟩ (⟨true code⟩) ⟨⟨false code⟩}
Tests whether the ⟨property list⟩ is currently defined. This does not check that the ⟨property list⟩ really is a property list variable.
Tests if the \( \text{property list} \) is empty (containing no entries).

\[
\text{prop_if_empty_p:N} \quad \text{prop_if_empty_p:c} \quad \text{prop_if_empty:NTF} \quad \text{prop_if_empty:N} \quad \text{prop_if_empty:c} \quad \star
\]

\[
\text{prop_if_empty_p:c} \quad \star \quad \text{prop_if_empty:N} \quad \star \quad \text{prop_if_empty:c} \quad \star
\]

\[
\text{prop_if_in:NnTF} \quad \langle \text{key} \rangle \quad \langle \text{token list variable} \rangle \quad \text{(true code)} \quad \text{(false code)}
\]

\[
\text{prop_if_in_p:Nn} \quad \star \quad \text{prop_if_in_p:} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \star \quad \text{prop_if_in:NnTF} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \star \quad \text{prop_if_in:} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \star \quad \text{prop_if_in:NnTF}
\]

\[
\text{prop_get:NnNTF} \quad \langle \text{property list} \rangle \quad \langle \text{key} \rangle \quad \langle \text{token list variable} \rangle \quad \text{(true code)} \quad \text{(false code)}
\]

\[
\text{prop_get:NnN} \quad \text{prop_get:} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \text{prop_get:NnNTF} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \text{prop_get:} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \text{prop_get:NnNTF}
\]

\[
\text{prop_pop:NnNTF} \quad \langle \text{property list} \rangle \quad \langle \text{key} \rangle \quad \langle \text{token list variable} \rangle \quad \text{(true code)} \quad \text{(false code)}
\]

\[
\text{prop_pop:NnN} \quad \text{prop_pop:cnN} \quad \text{prop_pop:NnNTF} \quad (\text{false code}) \quad \text{prop_pop:cnN} \quad \text{prop_pop:NnN}
\]

### 24.6 Recovering values from property lists with branching

The functions in this section combine tests for the presence of a key in a property list with recovery of the associated value. This makes them useful for cases where different cases follow dependent on the presence or absence of a key in a property list. They offer increased readability and performance over separate testing and recovery phases.

The \textsf{prop_get} function iterates through every key–value pair in the \( \text{property list} \) and is therefore slower than using the non-expandable \textsf{prop_get:NnNTF}.

\[
\text{prop_get:NnNTF} \quad \langle \text{property list} \rangle \quad \langle \text{key} \rangle \quad \langle \text{token list variable} \rangle \quad \text{(true code)} \quad \text{(false code)}
\]

\[
\text{prop_get:NnN} \quad \text{prop_get:} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \text{prop_get:NnNTF} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \text{prop_get:} \quad (\text{NV}|\text{No}|\text{cn}|\text{cV}|\text{co}) \quad \text{prop_get:NnNTF}
\]

\[
\text{prop_pop:NnNTF} \quad \langle \text{property list} \rangle \quad \langle \text{key} \rangle \quad \langle \text{token list variable} \rangle \quad \text{(true code)} \quad \text{(false code)}
\]

\[
\text{prop_pop:NnN} \quad \text{prop_pop:cnN} \quad \text{prop_pop:NnNTF} \quad (\text{false code}) \quad \text{prop_pop:cnN} \quad \text{prop_pop:NnN}
\]

203
If the ⟨key⟩ is not present in the ⟨property list⟩, leaves the ⟨false code⟩ in the input stream. The value of the ⟨token list variable⟩ is not defined in this case and should not be relied upon. If the ⟨key⟩ is present in the ⟨property list⟩, pops the corresponding ⟨value⟩ in the ⟨token list variable⟩, i.e. removes the item from the ⟨property list⟩. The ⟨property list⟩ is modified globally, while the ⟨token list variable⟩ is assigned locally.

24.7 Mapping over property lists

All mappings are done at the current group level, i.e. any local assignments made by the ⟨function⟩ or ⟨code⟩ discussed below remain in effect after the loop.

\prop_map_function:NN \prop_map_function:cn

Applies ⟨function⟩ to every ⟨entry⟩ stored in the ⟨property list⟩. The ⟨function⟩ receives two arguments for each iteration: the ⟨key⟩ and associated ⟨value⟩. The order in which ⟨entries⟩ are returned is not defined and should not be relied upon. To pass further arguments to the ⟨function⟩, see \prop_map_tokens:Nn.

\prop_map_inline:Nn \prop_map_inline:cn

Applies ⟨inline function⟩ to every ⟨entry⟩ stored within the ⟨property list⟩. The ⟨inline function⟩ should consist of code which receives the ⟨key⟩ as #1 and the ⟨value⟩ as #2. The order in which ⟨entries⟩ are returned is not defined and should not be relied upon.

\prop_map_tokens:Nn \prop_map_tokens:cn

Analogue of \prop_map_function:NN which maps several tokens instead of a single function. The ⟨code⟩ receives each key–value pair in the ⟨property list⟩ as two trailing brace groups. For instance,

\prop_map_tokens:Nn \l_my_prop \str_if_eq:nnT \mykey

expands to the value corresponding to mykey: for each pair in \l_my_prop the function \str_if_eq:nnT receives mykey, the ⟨key⟩ and the ⟨value⟩ as its three arguments. For that specific task, \prop_item:Nn is faster.
Used to terminate a \prop_map... function before all entries in the \langle property list \rangle have been processed. This normally takes place within a conditional statement, for example

\prop_map_inline:Nn \l_my_prop
    { \str_if_eq:nnTF { #1 } { bingo } { \prop_map_break: } { % Do something useful } }

Use outside of a \prop_map... scenario leads to low level \TeX errors.

\textbf{\TeX hackers note:} When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

Used to terminate a \prop_map... function before all entries in the \langle property list \rangle have been processed, inserting the \langle code \rangle after the mapping has ended. This normally takes place within a conditional statement, for example

\prop_map_inline:Nn \l_my_prop
    { \str_if_eq:nnTF { #1 } { bingo } { \prop_map_break:n { \langle code \rangle } } { % Do something useful } }

Use outside of a \prop_map... scenario leads to low level \TeX errors.

\textbf{\TeX hackers note:} When the mapping is broken, additional tokens may be inserted before the \langle code \rangle is inserted into the input stream. This depends on the design of the mapping function.

24.8 Viewing property lists

\prop_show:N \langle property list \rangle
\prop_show:c
Displays the entries in the \langle property list \rangle in the terminal.
24.9 Scratch property lists

\l_tmpa_prop \l_tmpb_prop
Scratch property lists for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_prop \g_tmpb_prop
Scratch property lists for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

24.10 Constants

\c_empty_prop
A permanently-empty property list used for internal comparisons.
Chapter 25

The l3skip package
Dimensions and skips

\LaTeXe{} provides two general length variables: \texttt{dim} and \texttt{skip}. Lengths stored as \texttt{dim} variables have a fixed length, whereas \texttt{skip} lengths have a rubber (stretch/shrink) component. In addition, the \texttt{muskip} type is available for use in math mode: this is a special form of \texttt{skip} where the lengths involved are determined by the current math font (in \texttt{mu}). There are common features in the creation and setting of length variables, but for clarity the functions are grouped by variable type.

### 25.1 Creating and initialising \texttt{dim} variables

\texttt{\dim_new:N} \langle dimension \rangle

\texttt{\dim_new:c} \langle dimension \rangle

\texttt{\dim_const:Nn} \langle dimension \rangle \{ \langle dimension expression \rangle \}

\texttt{\dim_const:cn} \langle dimension \rangle \{ \langle dimension expression \rangle \}

\texttt{\dim_zero:N} \langle dimension \rangle

\texttt{\dim_zero:c}

\texttt{\dim_gzero:N}

\texttt{\dim_gzero:c}

\texttt{\dim_zero_new:N} \langle dimension \rangle

\texttt{\dim_zero_new:c}

\texttt{\dim_gzero_new:N}

\texttt{\dim_gzero_new:c}

Creates a new \langle dimension \rangle or raises an error if the name is already taken. The declaration is global. The \langle dimension \rangle is initially equal to 0 pt.

Creates a new constant \langle dimension \rangle or raises an error if the name is already taken. The value of the \langle dimension \rangle is set globally to the \langle dimension expression \rangle.

Sets \langle dimension \rangle to 0 pt.

Ensures that the \langle dimension \rangle exists globally by applying \texttt{\dim_new:N} if necessary, then applies \texttt{\dim_{(g)zero:N}} to leave the \langle dimension \rangle set to zero.

New: 2012-03-05

New: 2012-01-07

207
25.2 Setting dim variables

\dim_add:Nn \dim_add:Nn \langle \text{dimension} \rangle \{\langle \text{dimension expression} \rangle\}
Adds the result of the \langle \text{dimension expression} \rangle to the current content of the \langle \text{dimension} \rangle.

\dim_set:Nn \dim_set:Nn \langle \text{dimension} \rangle \{\langle \text{dimension expression} \rangle\}
Sets \langle \text{dimension} \rangle to the value of \langle \text{dimension expression} \rangle, which must evaluate to a length with units.

\dim_set_eq:NN \dim_set_eq:NN \langle \text{dimension} \rangle_1 \langle \text{dimension} \rangle_2
Sets the content of \langle \text{dimension} \rangle_1 equal to that of \langle \text{dimension} \rangle_2.

\dim_sub:Nn \dim_sub:Nn \langle \text{dimension} \rangle \{\langle \text{dimension expression} \rangle\}
Subtracts the result of the \langle \text{dimension expression} \rangle from the current content of the \langle \text{dimension} \rangle.

25.3 Utilities for dimension calculations

\dim_abs:n \dim_abs:n \{\langle \text{dimexpr} \rangle\}
Converts the \langle \text{dimexpr} \rangle to its absolute value, leaving the result in the input stream as a \langle \text{dimension denotation} \rangle.

\dim_max:nn \dim_max:nn \{\langle \text{dimexpr}_1 \rangle\} \{\langle \text{dimexpr}_2 \rangle\}
\dim_min:nn \dim_min:nn \{\langle \text{dimexpr}_1 \rangle\} \{\langle \text{dimexpr}_2 \rangle\}
Evaluates the two \langle \text{dimension expressions} \rangle and leaves either the maximum or minimum value in the input stream as appropriate, as a \langle \text{dimension denotation} \rangle.
\texttt{\texttt{\textbackslash dim\_ratio:nn}} \texttt{\texttt{\{\texttt{dimexpr}_1\}\{\texttt{dimexpr}_2\}}}

 Parses the two \textit{dimension expressions} and converts the ratio of the two to a form suitable for use inside a \textit{dimension expression}. This ratio is then left in the input stream, allowing syntax such as

\begin{verbatim}
\dim_set:Nn \l_my_dim \{ 10 \text{ pt} \* \dim\_ratio:nn { 5 \text{ pt} } { 10 \text{ pt} } \}
\end{verbatim}

The output of \texttt{\texttt{\textbackslash dim\_ratio:nn}} on full expansion is a ratio expression between two integers, with all distances converted to scaled points. Thus

\begin{verbatim}
\tl_set:Nx \l_my_tl { \dim\_ratio:nn { 5 \text{ pt} } { 10 \text{ pt} } }
\tl_show:N \l_my_tl
\end{verbatim}

displays 327680/655360 on the terminal.

\section*{25.4 Dimension expression conditionals}

\begin{verbatim}
\texttt{\texttt{\textbackslash dim\_compare:p:nn}} \texttt{\texttt{\textbackslash dim\_compare:p:nn}} \texttt{(\texttt{\textbackslash dimexpr}_1)} \texttt{(\texttt{relation})} \texttt{(\texttt{\textbackslash dimexpr}_2)} \texttt{\texttt{\textbackslash dim\_compare:nNnTF}} \texttt{\texttt{\textbackslash dim\_compare:nNnTF}} \texttt{(\texttt{\textbackslash dimexpr}_1)} \texttt{(\texttt{relation})} \texttt{(\texttt{\textbackslash dimexpr}_2)} \texttt{(\texttt{true code})} \texttt{(\texttt{false code})}
\end{verbatim}

This function first evaluates each of the \textit{dimension expressions} as described for \texttt{\textbackslash dim\_eval:n}. The two results are then compared using the \textit{relation}:

\begin{itemize}
  \item Equal =
  \item Greater than >
  \item Less than <
\end{itemize}

This function is less flexible than \texttt{\texttt{\textbackslash dim\_compare:nTF}} but around 5 times faster.
This function evaluates the \textit{dimension expressions} as described for \texttt{\dim_eval:n} and compares consecutive result using the corresponding \textit{relation}, namely it compares \texttt{\dimexpr\texttt{1} \relation\texttt{1}} and \texttt{\dimexpr\texttt{2} \relation\texttt{1}}, then \texttt{\dimexpr\texttt{2} \relation\texttt{2}} using the \textit{relation}, until finally comparing \texttt{\dimexpr\texttt{N} \relation\texttt{N}} and \texttt{\dimexpr\texttt{N+1}} using the \textit{relation}. The test yields \texttt{true} if all comparisons are \texttt{true}. Each \textit{dimension expression} is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is \texttt{false}, then no other \textit{dimension expression} is evaluated and no other comparison is performed. The \textit{relations} can be any of the following:

\begin{itemize}
  \item Equal \quad = \text{ or } ==
  \item Greater than or equal to \quad >=
  \item Greater than \quad >
  \item Less than or equal to \quad <=
  \item Less than \quad <
  \item Not equal \quad !=
\end{itemize}

This function is more flexible than \texttt{\dim_compare:nNnTF} but around 5 times slower.
This function evaluates the \emph{test dimension expression} and compares this in turn to each of the \emph{dimension expression cases}. If the two are equal then the associated \emph{(code)} is left in the input stream and other cases are discarded. If any of the cases are matched, the \emph{(true code)} is also inserted into the input stream (after the code for the appropriate case), while if none match then the \emph{(false code)} is inserted. The function \texttt{\dim_case:nn}, which does nothing if there is no match, is also available. For example

\begin{verbatim}
\dim_set:Nn \l_tmpa_dim \{ 5 pt \}
\dim_case:nnF { 2 \l_tmpa_dim } {
  { 5 pt } \{ Small \}
  { 4 pt + 6 pt } \{ Medium \}
  { - 10 pt } \{ Negative \}
}{ No idea! }
\end{verbatim}

leaves “Medium” in the input stream.

\section{Dimension expression loops}

\begin{verbatim}
\dim_do_until:nNnn { \dimexpr case_1 \} \{ code_1 \}
\dim_do_until:nNnn { \dimexpr case_2 \} \{ code_2 \}
\end{verbatim}

Places the \emph{(code)} in the input stream for \TeX{} to process, and then evaluates the relationship between the two \emph{(dimension expressions)} as described for \texttt{\dim_compare:nNnTF}. If the test is \emph{false} then the \emph{(code)} is inserted into the input stream again and a loop occurs until the \emph{(relation)} is \emph{true}.

\begin{verbatim}
\dim_do_while:nNnn { \dimexpr case_1 \} \{ code_1 \}
\dim_do_while:nNnn { \dimexpr case_2 \} \{ code_2 \}
\end{verbatim}

Places the \emph{(code)} in the input stream for \TeX{} to process, and then evaluates the relationship between the two \emph{(dimension expressions)} as described for \texttt{\dim_compare:nNnTF}. If the test is \emph{true} then the \emph{(code)} is inserted into the input stream again and a loop occurs until the \emph{(relation)} is \emph{false}.

\begin{verbatim}
\dim_until_do:nNnn { \dimexpr case_1 \} \{ code_1 \}
\dim_until_do:nNnn { \dimexpr case_2 \} \{ code_2 \}
\end{verbatim}

Evaluates the relationship between the two \emph{(dimension expressions)} as described for \texttt{\dim_compare:nNnTF}, and then places the \emph{(code)} in the input stream if the \emph{(relation)} is \emph{false}. After the \emph{(code)} has been processed by \TeX{} the test is repeated, and a loop occurs until the test is \emph{true}. 

211
\texttt{\textbackslash dim\_while\_do:nNnn} \texttt{\textbackslash dim\_while\_do:nNnn \{\textit{dimexpr}_1\} \{relat\_ion\} \{\textit{dimexpr}_2\} \{\textit{code}\}}

Evaluates the relationship between the two \textit{\textit{dimension expressions}} as described for \texttt{\textbackslash dim\_compare:nNnTF}, and then places the \textit{\textit{code}} in the input stream if the \textit{\textit{relation}} is \texttt{true}. After the \textit{\textit{code}} has been processed by \TeX the test is repeated, and a loop occurs until the test is \texttt{false}.

\texttt{\textbackslash dim\_do\_until:nn} \texttt{\textbackslash dim\_do\_until:nn \{\textit{dimension relation}\} \{\textit{code}\}}

\texttt{\textbackslash dim\_do\_until:nn} \texttt{\textbackslash dim\_do\_until:nn \{\textit{dimension relation}\} \{\textit{code}\}}

Places the \textit{\textit{code}} in the input stream for \TeX to process, and then evaluates the \textit{\textit{dimension relation}} as described for \texttt{\textbackslash dim\_compare:nNnTF}. If the test is \texttt{false} then the \textit{\textit{code}} is inserted into the input stream again and a loop occurs until the \textit{\textit{relation}} is \texttt{true}.

\texttt{\textbackslash dim\_while\_do:nn} \texttt{\textbackslash dim\_while\_do:nn \{\textit{dimension relation}\} \{\textit{code}\}}

Places the \textit{\textit{code}} in the input stream for \TeX to process, and then evaluates the \textit{\textit{dimension relation}} as described for \texttt{\textbackslash dim\_compare:nNnTF}. If the test is \texttt{true} then the \textit{\textit{code}} is inserted into the input stream again and a loop occurs until the \textit{\textit{relation}} is \texttt{false}.

\texttt{\textbackslash dim\_until\_do:nn} \texttt{\textbackslash dim\_until\_do:nn \{\textit{dimension relation}\} \{\textit{code}\}}

\texttt{\textbackslash dim\_until\_do:nn} \texttt{\textbackslash dim\_until\_do:nn \{\textit{dimension relation}\} \{\textit{code}\}}

Evaluates the \textit{\textit{dimension relation}} as described for \texttt{\textbackslash dim\_compare:nNnTF}, and then places the \textit{\textit{code}} in the input stream if the \textit{\textit{relation}} is \texttt{false}. After the \textit{\textit{code}} has been processed by \TeX the test is repeated, and a loop occurs until the test is \texttt{true}.

\texttt{\textbackslash dim\_while\_do:nn} \texttt{\textbackslash dim\_while\_do:nn \{\textit{dimension relation}\} \{\textit{code}\}}

\texttt{\textbackslash dim\_while\_do:nn} \texttt{\textbackslash dim\_while\_do:nn \{\textit{dimension relation}\} \{\textit{code}\}}

Evaluates the \textit{\textit{dimension relation}} as described for \texttt{\textbackslash dim\_compare:nNnTF}, and then places the \textit{\textit{code}} in the input stream if the \textit{\textit{relation}} is \texttt{true}. After the \textit{\textit{code}} has been processed by \TeX the test is repeated, and a loop occurs until the test is \texttt{false}.

### 25.6 Dimension step functions

\texttt{\textbackslash dim\_step\_function:nnn} \texttt{\textbackslash dim\_step\_function:nnn \{\textit{initial value}\} \{\textit{step}\} \{\textit{final value}\} \{\textit{function}\}}

\texttt{\textbackslash dim\_step\_function:nnn} \texttt{\textbackslash dim\_step\_function:nnn \{\textit{initial value}\} \{\textit{step}\} \{\textit{final value}\} \{\textit{function}\}}

This function first evaluates the \textit{\textit{initial value}}, \textit{\textit{step}} and \textit{\textit{final value}}, all of which should be dimension expressions. The \textit{\textit{function}} is then placed in front of each \textit{\textit{value}} from the \textit{\textit{initial value}} to the \textit{\textit{final value}} in turn (using \textit{\textit{step}} between each \textit{\textit{value}}). The \textit{\textit{step}} must be non-zero. If the \textit{\textit{step}} is positive, the loop stops when the \textit{\textit{value}} becomes larger than the \textit{\textit{final value}}. If the \textit{\textit{step}} is negative, the loop stops when the \textit{\textit{value}} becomes smaller than the \textit{\textit{final value}}. The \textit{\textit{function}} should absorb one argument.

\texttt{\textbackslash dim\_step\_inline:nnn} \texttt{\textbackslash dim\_step\_inline:nnn \{\textit{initial value}\} \{\textit{step}\} \{\textit{final value}\} \{\textit{code}\}}

\texttt{\textbackslash dim\_step\_inline:nnn} \texttt{\textbackslash dim\_step\_inline:nnn \{\textit{initial value}\} \{\textit{step}\} \{\textit{final value}\} \{\textit{code}\}}

This function first evaluates the \textit{\textit{initial value}}, \textit{\textit{step}} and \textit{\textit{final value}}, all of which should be dimension expressions. Then for each \textit{\textit{value}} from the \textit{\textit{initial value}} to the \textit{\textit{final value}} in turn (using \textit{\textit{step}} between each \textit{\textit{value}}), the \textit{\textit{code}} is inserted into the input stream with \#1 replaced by the current \textit{\textit{value}}. Thus the \textit{\textit{code}} should define a function of one argument (\#1).
This function first evaluates the \textit{(initial value)}, \textit{(step)} and \textit{(final value)}, all of which should be dimension expressions. Then for each \textit{(value)} from the \textit{(initial value)} to the \textit{(final value)} in turn (using \textit{(step)} between each \textit{(value)}), the \textit{(code)} is inserted into the input stream, with the \textit{(tl var)} defined as the current \textit{(value)}. Thus the \textit{(code)} should make use of the \textit{(tl var)}.

### 25.7 Using dim expressions and variables

\begin{verbatim}
\dim_eval:n \{ \langle \text{dimension expression} \rangle \}
\end{verbatim}

Evaluates the \textit{(dimension expression)}, expanding any dimensions and token list variables within the \textit{(expression)} to their content (without requiring \texttt{\dim_use:N/\tl_use:N}) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a \textit{(dimension denotation)} after two expansions. This is expressed in points (pt), and requires suitable termination if used in a \TeX{}-style assignment as it is not an \textit{(internal dimension)}.

\begin{verbatim}
\dim_sign:n \{ \langle \text{dimexpr} \rangle \}
\end{verbatim}

Evaluates the \textit{(dimexpr)} then leaves 1 or 0 or \(-1\) in the input stream according to the sign of the result.

\begin{verbatim}
\dim_use:N \{ \langle \text{dimension} \rangle \}
\end{verbatim}

Recovers the content of a \textit{(dimension)} and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a \textit{(dimension)} is required (such as in the argument of \texttt{\dim_eval:n}).

\TeX{}hackers note: \texttt{\dim_use:N} is the \TeX{} primitive \texttt{\the}: this is one of several \LaTeX{} names for this primitive.

\begin{verbatim}
\dim_to_decimal:n \{ \langle \text{dimexpr} \rangle \}
\end{verbatim}

Evaluates the \textit{(dimension expression)}, and leaves the result, expressed in points (pt) in the input stream, with \textit{no units}. The result is rounded by \TeX{} to four or five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

\begin{verbatim}
\dim_to_decimal:n \{ 1bp \}
\end{verbatim}

leaves 1.00374 in the input stream, \textit{i.e.} the magnitude of one “big point” when converted to (\TeX{}) points.
\dim_to_decimal_in_bp:n \dim_to_decimal_in_sp:n \dim_to_decimal_in_unit:nn

\dim_to_decimal_in_bp:n\dim_to_decimal_in_sp:n\dim_to_decimal_in_unit:nn

\dim_to_fp:n

\dim_show:N

\dim_show:N\dim_show:c

25.8 Viewing dim variables
\dim_show:n \{\langle\text{dimension expression}\rangle\}

Displays the result of evaluating the \langle\text{dimension expression}\rangle on the terminal.

\dim_log:N \dim_log:c \langle\text{dimension}\rangle

Writes the value of the \langle\text{dimension}\rangle in the log file.

\dim_log:n \langle\text{dimension expression}\rangle

Writes the result of evaluating the \langle\text{dimension expression}\rangle in the log file.

\dim_log:n \{\langle\text{dimension expression}\rangle\}

New: 2014-08-22
Updated: 2015-08-03

25.9 Constant dimensions

\c_max_dim

The maximum value that can be stored as a dimension. This can also be used as a component of a skip.

\c_zero_dim

A zero length as a dimension. This can also be used as a component of a skip.

25.10 Scratch dimensions

\l_tmpa_dim \l_tmpb_dim

Scratch dimension for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_dim \g_tmpb_dim

Scratch dimension for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

25.11 Creating and initialising skip variables

\skip_new:N \langle\text{skip}\rangle

Creates a new \langle\text{skip}\rangle or raises an error if the name is already taken. The declaration is global. The \langle\text{skip}\rangle is initially equal to 0pt.
\skip_const:Nn \skip_const:cn
\New: 2012-03-05
\skip_const:cn (\skip) \{\skip expression\}
Creates a new constant \(\skip\) or raises an error if the name is already taken. The value of the \(\skip\) is set globally to the \(\skip\) expression.

\skip_zero:N \skip_zero:c \skip_gzero:N \skip_gzero:c
\skip_zero: N \{\skip\}
Sets \(\skip\) to 0 pt.

\skip_zero_new:N \skip_zero_new:c \skip_gzero_new:N \skip_gzero_new:c
\skip_zero_new: N \{\skip\}
Ensures that the \(\skip\) exists globally by applying \skip_new:N if necessary, then applies \skip_(g)zero:N to leave the \(\skip\) set to zero.

\skip_if_exist_p:N \skip_if_exist_p:c \skip_if_exist:N \skip_if_exist:c
\skip_if_exist: P \{\true code\} \{\false code\}
Tests whether the \(\skip\) is currently defined. This does not check that the \(\skip\) really is a skip variable.

\skip_add:Nn \skip_add:cn \skip_gadd:Nn \skip_gadd:cn
\skip_add: N \{\skip\}
Adds the result of the \(\skip\) expression to the current content of the \(\skip\).

\skip_set:Nn \skip_set:cn \skip_gset:Nn \skip_gset:cn
\skip_set: N \{\skip\}
Sets \(\skip\) to the value of \(\skip\) expression, which must evaluate to a length with units and may include a rubber component (for example 1 cm plus 0.5 cm).

\skip_set_eq:NN \skip_set_eq:(cN|Nc|cc) \skip_gset_eq:NN \skip_gset_eq:(cN|Nc|cc)
\skip_set_eq: P \{\skip_1\} \{\skip_2\}
Sets the content of \(\skip_1\) equal to that of \(\skip_2\).

\skip_sub:Nn \skip_sub:cn \skip_gsub:Nn \skip_gsub:cn
\skip_sub: N \{\skip\}
Subtracts the result of the \(\skip\) expression from the current content of the \(\skip\).

\textbf{25.12 Setting skip variables}
25.13 Skip expression conditionals

\skip_if_eq_p:nn \{\langle \text{skipexpr}_1 \rangle \} \{\langle \text{skipexpr}_2 \rangle \}
\skip_if_eq:nnTF \{\langle \text{skipexpr}_1 \rangle \} \{\langle \text{skipexpr}_2 \rangle \}
\{\langle \text{true code} \rangle \} \{\langle \text{false code} \rangle \}

This function first evaluates each of the \langle \text{skip expressions} \rangle as described for \skip_eval:n. The two results are then compared for exact equality, \text{i.e.} both the fixed and rubber components must be the same for the test to be true.

\skip_if_finite_p:n \{\langle \text{skipexpr} \rangle \}
\skip_if_finite:nTF \{\langle \text{skipexpr} \rangle \} \{\langle \text{true code} \rangle \} \{\langle \text{false code} \rangle \}

Evaluates the \langle \text{skip expression} \rangle as described for \skip_eval:n, and then tests if all of its components are finite.

25.14 Using skip expressions and variables

\skip_eval:n \{\langle \text{skip expression} \rangle \}

Updated: 2011-10-22

Evaluates the \langle \text{skip expression} \rangle, expanding any skips and token list variables within the \langle \text{expression} \rangle to their content \text{(without requiring \skip_use:N/\tl_use:N)} and applying the standard mathematical rules. The result of the calculation is left in the input stream as a \langle \text{glue denotation} \rangle after two expansions. This is expressed in points (pt), and requires suitable termination if used in a \TeX-style assignment as it is \textit{not} an \langle \text{internal glue} \rangle.

\skip_use:N \{\langle \text{skip} \rangle \}
\skip_use:c \{\langle \text{skip} \rangle \}

ReCOVERs the content of a \langle \text{skip} \rangle and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a \langle \text{dimension} \rangle or \langle \text{skip} \rangle is required \text{(such as in the argument of \skip_eval:n)}.

\TeXhackers note: \skip_use:N is the \TeX primitive \texttt{\the}: this is one of several \TeXeX names for this primitive.

25.15 Viewing skip variables

\skip_show:N \{\langle \text{skip} \rangle \}
\skip_show:c

Displays the value of the \langle \text{skip} \rangle on the terminal.

\skip_show:n \{\langle \text{skip expression} \rangle \}

Updated: 2011-11-22
Updated: 2015-08-07

Displays the result of evaluating the \langle \text{skip expression} \rangle on the terminal.
\skip_log:N \skip_log:c
\skip_log:n \skip_log:n \{\langleskip\ expression\}\}

W rites the value of the \langleskip\rangle in the log file.
W rites the result of evaluating the \langleskip\ expression\rangle in the log file.

25.16 Constant skips

\c_max_skip
\c_zero_skip

The maximum value that can be stored as a skip (equal to \c_max_dim in length), with
no stretch nor shrink component.
A zero length as a skip, with no stretch nor shrink component.

25.17 Scratch skips

\l_tmpa_skip \l_tmpb_skip
\g_tmpa_skip \g_tmpb_skip

Scratch skip for local assignment. These are never used by the kernel code, and so are
safe for use with any \LaTeX3-defined function. However, they may be overwritten by
other non-kernel code and so should only be used for short-term storage.
Scratch skip for global assignment. These are never used by the kernel code, and so are
safe for use with any \LaTeX3-defined function. However, they may be overwritten by
other non-kernel code and so should only be used for short-term storage.

25.18 Inserting skips into the output

\skip_horizontal:N \skip_horizontal:c \skip_horizontal:n \{\langleskip\ expr\}\}

 Inserts a horizontal \langleskip\rangle into the current list. The argument can also be a \langledim\rangle.
\TeXhackers note: \skip_horizontal:N is the \TeX primitive \hskip renamed.

\skip_vertical:N \skip_vertical:c \skip_vertical:n

Inserts a vertical \textit{skip} into the current list. The argument can also be a \textit{dim}.

\textbf{\LaTeX\ hackers note:} \textbackslash skip_vertical:N is the \LaTeX\ primitive \textbackslash skip renamed.

### 25.19 Creating and initialising \texttt{muskip} variables

\texttt{\muskip_new:N \muskip_new:c}

Creates a new \texttt{muskip} or raises an error if the name is already taken. The declaration is global. The \texttt{muskip} is initially equal to 0 mu.

\texttt{\muskip_const:Nn \muskip_const:cn}

Creates a new constant \texttt{muskip} or raises an error if the name is already taken. The value of the \texttt{muskip} is set globally to the \texttt{muskip expression}.

\texttt{\muskip_zero:N \muskip_zero:c \muskip_gzero:N \muskip_gzero:c}

Sets \texttt{muskip} to 0 mu.

\texttt{\muskip_zero_new:N \muskip_zero_new:c \muskip_gzero_new:N \muskip_gzero_new:c}

Ensures that the \texttt{muskip} exists globally by applying \texttt{\muskip_new:N} if necessary, then applies \texttt{\muskip_(g)zero:N} to leave the \texttt{muskip} set to zero.

\texttt{\muskip_if_exist_p:N \muskip_if_exist_p:cn \muskip_if_exist:NTF \muskip_if_exist:TF}

Tests whether the \texttt{muskip} is currently defined. This does not check that the \texttt{muskip} really is a muskip variable.

### 25.20 Setting \texttt{muskip} variables

\texttt{\muskip_add:Nn \muskip_add:cn \muskip_gadd:Nn \muskip_gadd:cn}

Adds the result of the \texttt{muskip expression} to the current content of the \texttt{muskip}.
\muskip_set:Nn \muskip_set:cn \muskip_gset:Nn \muskip_gset:cn
Updated: 2011-10-22
\muskip_set_eq:NN \muskip_set_eq:cn \muskip_gset_eq:NN
\muskip_sub:Nn \muskip_sub:cn \muskip_gsub:Nn \muskip_gsub:cn
Updated: 2011-10-22
\muskip_eval:n \muskip_eval:n \muskip_use:N \muskip_use:c
Updated: 2011-10-22
\muskip_show:N \muskip_show:c
Updated: 2015-08-03

\muskip_set:Nn \muskip \{ \muskip expression \}
Sets $\langle \text{muskip} \rangle$ to the value of $\langle \text{muskip expression} \rangle$, which must evaluate to a math length with units and may include a rubber component (for example 1 \text{mu} plus 0.5 \text{mu}).

\muskip_set_eq:NN \langle \text{muskip} \rangle \langle \text{muskip} \rangle}
Sets the content of $\langle \text{muskip} \rangle_1$ equal to that of $\langle \text{muskip} \rangle_2$.

\muskip_sub:Nn \{ \muskip expression \}
Subtracts the result of the $\langle \text{muskip expression} \rangle$ from the current content of the $\langle \text{muskip} \rangle$.

\muskip_eval:n \{ \muskip expression \}
Evaluates the $\langle \text{muskip expression} \rangle$, expanding any skips and token list variables within the $\langle \text{expression} \rangle$ to their content (without requiring $\texttt{\muskip_use:N}$/$\texttt{tl_use:N}$) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a $\langle \text{muglue denotation} \rangle$ after two expansions. This is expressed in \text{mu}, and requires suitable termination if used in a \TeX-style assignment as it is not an $\langle \text{internal muglue} \rangle$.

\muskip_use:N \{ \muskip \}
Recovers the content of a $\langle \text{skip} \rangle$ and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a $\langle \text{dimension} \rangle$ is required (such as in the argument of $\texttt{\muskip_eval:n}$).

\TeXhackers note: \texttt{\muskip_use:N} is the \TeX primitive \texttt{\the}: this is one of several \LaTeX\ names for this primitive.

\muskip_show:N \muskip_show:c
Displays the value of the $\langle \text{muskip} \rangle$ on the terminal.

\section{25.21 Using muskip expressions and variables}

\section{25.22 Viewing muskip variables}
\texttt{\textbackslash muskip\_show:n} \texttt{\textbackslash muskip\_show:n \{muskip expression\}}

Displays the result of evaluating the \textit{muskip expression} on the terminal.

\texttt{\textbackslash muskip\_log:N} \texttt{\textbackslash muskip\_log:N \langle muskip \rangle}

Writes the value of the \textit{muskip} in the log file.

\texttt{\textbackslash muskip\_log:n} \texttt{\textbackslash muskip\_log:n \{muskip expression\}}

Writes the result of evaluating the \textit{muskip expression} in the log file.

25.23 Constant muskips

\texttt{\textbackslash c\_max\_muskip} The maximum value that can be stored as a muskip, with no stretch nor shrink component.

\texttt{\textbackslash c\_zero\_muskip} A zero length as a muskip, with no stretch nor shrink component.

25.24 Scratch muskips

\texttt{\textbackslash l\_tmpa\_muskip} \texttt{\textbackslash l\_tmpb\_muskip} Scratch muskip for local assignment. These are never used by the kernel code, and so are safe for use with any \TeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\texttt{\textbackslash g\_tmpa\_muskip} \texttt{\textbackslash g\_tmpb\_muskip} Scratch muskip for global assignment. These are never used by the kernel code, and so are safe for use with any \TeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

25.25 Primitive conditional

\texttt{\textbackslash if\_dim:w} \texttt{\textbackslash if\_dim:w \{dimen\} \{relation\} \{dimen\}} \texttt{\{true code\}} \texttt{\textbackslash else:} \texttt{\{false\}} \texttt{\textbackslash fi:}

Compare two dimensions. The \textit{relation} is one of $<$, $=$ or $>$ with category code 12.

\TeX\text{hackers note:} This is the \TeX primitive \texttt{\textbackslash ifdim}.
Chapter 26

The \texttt{l3keys} package

Key–value interfaces

The key–value method is a popular system for creating large numbers of settings for controlling function or package behaviour. The system normally results in input of the form

\begin{verbatim}
\MyModuleSetup{
  key-one = value one,
  key-two = value two
}
\end{verbatim}

or

\begin{verbatim}
\MyModuleMacro[
  key-one = value one,
  key-two = value two
]{argument}
\end{verbatim}

for the user.

The high level functions here are intended as a method to create key–value controls. Keys are themselves created using a key–value interface, minimising the number of functions and arguments required. Each key is created by setting one or more \texttt{properties} of the key:

\begin{verbatim}
\keys_define:nn { mymodule }
  {
    key-one .code:n = code including parameter #1,
    key-two .tl_set:N = \l_mymodule_store_tl
  }
\end{verbatim}

These values can then be set as with other key–value approaches:

\begin{verbatim}
\keys_set:nn { mymodule }
  {
    key-one = value one,
    key-two = value two
  }
\end{verbatim}
As illustrated, keys are created inside a ⟨module⟩: a set of related keys, typically those for a single module/\LaTeX{} package. See Section for suggestions on how to divide large numbers of keys for a single module.

At a document level, \texttt{\keys_set:nn} is used within a document function, for example

\begin{verbatim}
\DeclareDocumentCommand \MyModuleSetup { m } { \keys_set:nn { mymodule } { #1 } }
\DeclareDocumentCommand \MyModuleMacro { o m } { \group_begin: \keys_set:nn { mymodule } { #1 } \% Main code for \MyModuleMacro \group_end: }
\end{verbatim}

Key names may contain any tokens, as they are handled internally using \texttt{\tl_to_str:n}. As discussed in section 26.2, it is suggested that the character / is reserved for sub-division of keys into logical groups. Functions and variables are not expanded when creating key names, and so

\begin{verbatim}
\tl_set:Nn \l__mymodule_tmp_tl { key }
\keys_define:nn { mymodule } { \l__mymodule_tmp_tl .code:n = code }
\end{verbatim}

creates a key called \texttt{\l__mymodule_tmp_tl}, and not one called key.

### 26.1 Creating keys

\begin{verbatim}
\keys_define:nn \keys_define:nn { (module) } { (keyval list) }
\end{verbatim}

```
Parses the \texttt{(keyval list)} and defines the keys listed there for \texttt{(module)}. The \texttt{(module)} name is treated as a string. In practice the \texttt{(module)} should be chosen to be unique to the module in question (unless deliberately adding keys to an existing module).

The \texttt{(keyval list)} should consist of one or more key names along with an associated key \textit{property}. The properties of a key determine how it acts. The individual properties are described in the following text; a typical use of \texttt{\keys_define:nn} might read

\begin{verbatim}
\keys_define:nn { mymodule } { 
    \texttt{keyname .code:n = Some-code-using-#1},
    \texttt{keyname .value_required:n = true}
}
\end{verbatim}

where the properties of the key begin from the . after the key name.

The various properties available take either no arguments at all, or require one or more arguments. This is indicated in the name of the property using an argument specification. In the following discussion, each property is illustrated attached to an arbitrary \texttt{(key)}, which when used may be supplied with a \texttt{(value)}. All key \textit{definitions} are local.

223
Key properties are applied in the reading order and so the ordering is significant. Key properties which define “actions”, such as `.code:n`, `.tl_set:N`, etc., override one another. Some other properties are mutually exclusive, notably `.value_required:n` and `.value_forbidden:n`, and so they replace one another. However, properties covering non-exclusive behaviours may be given in any order. Thus for example the following definitions are equivalent.

\keys_define:nn { mymodule }
\{ 
    keyname .code:n = Some-code-using-#1,
    keyname .value_required:n = true
\}
\keys_define:nn { mymodule }
\{ 
    keyname .value_required:n = true,
    keyname .code:n = Some-code-using-#1
\}

Note that with the exception of the special `.undefine:` property, all key properties define the key within the current \TeX{} scope.

\bool_set:N \bool_set:c \bool_gset:N \bool_gset:c
\begin{verbatim}
(key) \bool_set:N = \langle boolean variable\rangle
\end{verbatim}

Defines ⟨key⟩ to set ⟨boolean variable⟩ to ⟨value⟩ (which must be either “true” or “false”). If the variable does not exist, it will be created globally at the point that the key is set up.

\bool_set_inverse:N \bool_set_inverse:c \bool_gset_inverse:N \bool_gset_inverse:c
\begin{verbatim}
(key) \bool_set_inverse:N = \langle boolean variable\rangle
\end{verbatim}

Defines ⟨key⟩ to set ⟨boolean variable⟩ to the logical inverse of ⟨value⟩ (which must be either “true” or “false”). If the ⟨boolean variable⟩ does not exist, it will be created globally at the point that the key is set up.

\choice:
\begin{verbatim}
(key) \choice:
\end{verbatim}

Sets ⟨key⟩ to act as a choice key. Each valid choice for ⟨key⟩ must then be created, as discussed in section 26.3.

\choices:nn \choices:(Vn|on|xn)
\begin{verbatim}
(key) \choices:nn = \{\langle choices\rangle\} \{(\langle code\rangle)\}
\end{verbatim}

Sets ⟨key⟩ to act as a choice key, and defines a series ⟨choices⟩ which are implemented using the ⟨code⟩. Inside ⟨code⟩, \textbackslash{l\_keys\_choice\_tl} will be the name of the choice made, and \textbackslash{l\_keys\_choice\_int} will be the position of the choice in the list of ⟨choices⟩ (indexed from 1). Choices are discussed in detail in section 26.3.

\clist_set:N \clist_set:c \clist_gset:N \clist_gset:c
\begin{verbatim}
(key) \clist_set:N = \langle comma list variable\rangle
\end{verbatim}

Defines ⟨key⟩ to set ⟨comma list variable⟩ to ⟨value⟩. Spaces around commas and empty items will be stripped. If the variable does not exist, it is created globally at the point that the key is set up.

\begin{verbatim}
\end{verbatim}
Stores the \texttt{(code)} for execution when \texttt{(key)} is used. The \texttt{(code)} can include one parameter (\#1), which will be the \texttt{(value)} given for the \texttt{(key)}.

\texttt{(key)}\ .\texttt{code:n} = \{(\texttt{code})\}

Updated: 2013-07-10

\texttt{(key)}\ .\texttt{cs_set:Np} = \{(\texttt{control sequence})\ \{(\texttt{arg. spec.})\}

Defines \texttt{(key)} to set \texttt{(control sequence)} to have \texttt{(arg. spec.)} and replacement text \texttt{(value)}.

\texttt{(key)}\ .\texttt{cs_set:Np} \ .\texttt{cs_set:cp} \ .\texttt{cs_set_protected:Np} \ .\texttt{cs_set_protected:cp} \ .\texttt{cs_gset:Np} \ .\texttt{cs_gset:cp} \ .\texttt{cs_gset_protected:Np} \ .\texttt{cs_gset_protected:cp}

New: 2020-01-11

\texttt{(key)}\ .\texttt{default:n} = \{(\texttt{default})\}

Creates a \texttt{(default)} value for \texttt{(key)}, which is used if no value is given. This will be used if only the key name is given, but not if a blank \texttt{(value)} is given:

\begin{verbatim}
\keys_define:nn { mymodule } 
{ 
  key .code:n = Hello-#1, 
  key .default:n = World 
}
\keys_set:nn { mymodule } 
{ 
  key = Fred, % Prints 'Hello Fred'
  key, % Prints 'Hello World'
  key = , % Prints 'Hello '
}
\end{verbatim}

The default does not affect keys where values are required or forbidden. Thus a required value cannot be supplied by a default value, and giving a default value for a key which cannot take a value does not trigger an error.

\texttt{(key)}\ .\texttt{dim_set:N} = \{(\texttt{dimension})\}

Defines \texttt{(key)} to set \texttt{(dimension)} to \texttt{(value)} (which must a dimension expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

\texttt{(key)}\ .\texttt{dim_set:N} \ .\texttt{dim_set:c} \ .\texttt{dim_gset:N} \ .\texttt{dim_gset:c}

Updated: 2020-01-17

\texttt{(key)}\ .\texttt{fp_set:N} = \{(\texttt{floating point})\}

Defines \texttt{(key)} to set \texttt{(floating point)} to \texttt{(value)} (which must a floating point expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

\texttt{(key)}\ .\texttt{fp_set:N} \ .\texttt{fp_set:c} \ .\texttt{fp_gset:N} \ .\texttt{fp_gset:c}

Updated: 2020-01-17

\texttt{(key)}\ .\texttt{groups:n} = \{(\texttt{groups})\}

Defines \texttt{(key)} as belonging to the \texttt{(groups)} declared. Groups provide a “secondary axis” for selectively setting keys, and are described in Section 26.7.
\inherit:n  \{key\} .inherit:n = \{(parents)\}

Specifies that the \{key\} path should inherit the keys listed as any of the \{parents\} (a comma list), which can be a module or a subgroup. For example, after setting

\keys_define:nn { foo } { test .code:n = \tl_show:n {#1} }
\keys_define:nn { } { bar .inherit:n = foo }

setting

\keys_set:nn { bar } { test = a }

will be equivalent to

\keys_set:nn { foo } { test = a }

Inheritance applies at point of use, not at definition, thus keys may be added to the \{parent\} after the use of \inherit:n and will be active. If more than one \{parent\} is specified, the presence of the \{key\} will be tested for each in turn, with the first successful hit taking priority.

\initial:n
\initial:Vo|x

Initialises the \{key\} with the \{value\}, equivalent to

\keys_set:nn \{\langle module\rangle\} \{(key) = \langle value\rangle\}

\int_set:N
\int_set:c
\int_gset:N
\int_gset:c

Defines \{key\} to set \{integer\} to \{value\} (which must be an integer expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

\legacy_if_set:n
\legacy_if_gset:n
\legacy_if_set_inverse:n
\legacy_if_gset_inverse:n

Defines \{key\} to set legacy \texttt{\textbackslash if (switch)} to \{value\} (which must be either “true” or “false”). The \{switch\} is the name of the switch without the leading \texttt{\textbackslash if}.

The inverse versions will set the \{switch\} to the logical opposite of the \{value\}.

\meta:n
\meta:nn

Makes \{key\} a meta-key, which will set \{keyval list\} in one go. The \{keyval list\} can refer as \#1 to the value given at the time the \{key\} is used (or, if no value is given, the \{key\}’s default value).

\meta:nn

Makes \{key\} a meta-key, which will set \{keyval list\} in one go using the \{path\} in place of the current one. The \{keyval list\} can refer as \#1 to the value given at the time the \{key\} is used (or, if no value is given, the \{key\}’s default value).
Sets ⟨key⟩ to act as a multiple choice key. Each valid choice for ⟨key⟩ must then be created, as discussed in section 26.3.

Sets ⟨key⟩ to act as a multiple choice key, and defines a series ⟨choices⟩ which are implemented using the ⟨code⟩. Inside ⟨code⟩, \l_keys_choice_tl will be the name of the choice made, and \l_keys_choice_int will be the position of the choice in the list of ⟨choices⟩ (indexed from 1). Choices are discussed in detail in section 26.3.

Defines ⟨key⟩ to set ⟨muskip⟩ to ⟨value⟩ (which must be a muskip expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

Defines ⟨key⟩ to put the ⟨value⟩ onto the ⟨property list⟩ stored under the ⟨key⟩. If the variable does not exist, it is created globally at the point that the key is set up.

Defines ⟨key⟩ to set ⟨skip⟩ to ⟨value⟩ (which must be a skip expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

Defines ⟨key⟩ to set ⟨string variable⟩ to ⟨value⟩. If the variable does not exist, it is created globally at the point that the key is set up.

Defines ⟨key⟩ to set ⟨string variable⟩ to ⟨value⟩, which will be subjected to an x-type expansion (i.e. using \str_set:Nx). If the variable does not exist, it is created globally at the point that the key is set up.

Defines ⟨key⟩ to set ⟨token list variable⟩ to ⟨value⟩. If the variable does not exist, it is created globally at the point that the key is set up.
Define \( \text{tl_set}_x: \text{N} \) to set \( \text{token list variable} \) to \( \text{value} \), which will be subjected to an \( x \)-type expansion (i.e. using \( \text{tl_set}_x: \text{N} \)). If the variable does not exist, it is created globally at the point that the key is set up.

Remove the definition of the \( \text{key} \) within the current scope.

Specifies that \( \text{key} \) cannot receive a \( \text{value} \) when used. If a \( \text{value} \) is given then an error will be issued. Setting the property “false” cancels the restriction.

Specifies that \( \text{key} \) must receive a \( \text{value} \) when used. If a \( \text{value} \) is not given then an error will be issued. Setting the property “false” cancels the restriction.

### 26.2 Sub-dividing keys

When creating large numbers of keys, it may be desirable to divide them into several sub-groups for a given module. This can be achieved either by adding a sub-division to the module name:

\[
\text{\textbackslash keys_define:nn \{ mymodule / subgroup \}}
\{ \text{key} .\text{code}:n = \text{code} \}
\]

or to the key name:

\[
\text{\textbackslash keys_define:nn \{ mymodule \}}
\{ \text{subgroup} / \text{key} .\text{code}:n = \text{code} \}
\]

As illustrated, the best choice of token for sub-dividing keys in this way is \( / \). This is because of the method that is used to represent keys internally. Both of the above code fragments set the same key, which has full name \( \text{mymodule/subgroup/key} \).

As illustrated in the next section, this subdivision is particularly relevant to making multiple choices.

### 26.3 Choice and multiple choice keys

The \text{l3keys} system supports two types of choice key, in which a series of pre-defined input values are linked to varying implementations. Choice keys are usually created so that the various values are mutually-exclusive: only one can apply at any one time. “Multiple” choice keys are also supported: these allow a selection of values to be chosen at the same time.

Mutually-exclusive choices are created by setting the \( \text{.choice:} \) property:

\[
\text{\textbackslash keys_define:nn \{ mymodule \}}
\{ \text{key} .\text{choice:} \}
\]
For keys which are set up as choices, the valid choices are generated by creating sub-keys of the choice key. This can be carried out in two ways.

In many cases, choices execute similar code which is dependent only on the name of the choice or the position of the choice in the list of all possibilities. Here, the keys can share the same code, and can be rapidly created using the `.choices:nn` property.

\keys_define:nn { mymodule } {  
  key .choices:nn =  
  { choice-a, choice-b, choice-c }  
  {  
    You-gave-choice-'\tl_use:N \l_keys_choice_tl',-  
    which-is-in-position-\int_use:N \l_keys_choice_int \c_space_tl  
    in-the-list.  
  }  
}

The index \l_keys_choice_int in the list of choices starts at 1.

Inside the code block for a choice generated using `.choices:nn`, the variables \l_keys_choice_tl and \l_keys_choice_int are available to indicate the name of the current choice, and its position in the comma list. The position is indexed from 1. Note that, as with standard key code generated using `.code:n`, the value passed to the key (i.e. the choice name) is also available as #1.

On the other hand, it is sometimes useful to create choices which use entirely different code from one another. This can be achieved by setting the `.choice:` property of a key, then manually defining sub-keys.

\keys_define:nn { mymodule } {  
  key .choice:,  
  key / choice-a .code:n = code-a,  
  key / choice-b .code:n = code-b,  
  key / choice-c .code:n = code-c,  
}

It is possible to mix the two methods, but manually-created choices should not use \l_keys_choice_tl or \l_keys_choice_int. These variables do not have defined behaviour when used outside of code created using `.choices:nn` (i.e. anything might happen).

It is possible to allow choice keys to take values which have not previously been defined by adding code for the special `unknown` choice. The general behavior of the `unknown` key is described in Section 26.6. A typical example in the case of a choice would be to issue a custom error message:

\keys_define:nn { mymodule } {  
  key .choice:,  
  key / choice-a .code:n = code-a,  
  key / choice-b .code:n = code-b,  
  key / choice-c .code:n = code-c,  
}
Multiple choices are created in a very similar manner to mutually-exclusive choices, using the properties .multichoice: and .multichoices:nn. As with mutually exclusive choices, multiple choices are define as sub-keys. Thus both

\keys_define:nn { mymodule } { ...
  key .multichoices:nn =
  { choice-a, choice-b, choice-c }
  { \msg_error:nnxxx { mymodule } { unknown-choice }
    { key } % Name of choice key
    { choice-a , choice-b , choice-c } % Valid choices
    { \exp_not:n {#1} } % Invalid choice given
    ...
  }
}

and

\keys_define:nn { mymodule } { ...
  key .multichoice:,
  key / choice-a .code:n = code-a,
  key / choice-b .code:n = code-b,
  key / choice-c .code:n = code-c,
}

are valid.

When a multiple choice key is set

\keys_set:nn { mymodule } { ...
  key = { a , b , c } % 'key' defined as a multiple choice
}

each choice is applied in turn, equivalent to a clist mapping or to applying each value individually:

\keys_set:nn { mymodule } { ...
  key = a ,
  key = b ,
  key = c ,
}

Thus each separate choice will have passed to it the \l_keys_choice_tl and \l_keys_choice_int in exactly the same way as described for .choices:nn.

230
26.4 Key usage scope

Some keys will be used as settings which have a strictly limited scope of usage. Some will be only available once, others will only be valid until typesetting begins. To allow formats to support this in a structured way, l3keys allows this information to be specified using the \texttt{.usage:n} property.

\begin{verbatim}
\texttt{.usage:n \langle key\rangle .usage:n = \langle scope\rangle}
\end{verbatim}

Defines the \langle key\rangle to have usage within the \langle scope\rangle, which should be one of general, preamble or load.

\l_keys_usage_load_prop
\l_keys_usage_preamble_prop

l3keys itself does not attempt to redefine keys based on the usage scope. Rather, this information is made available with these two property lists. These hold an entry for each module (prefix); the value of each entry is a comma-separated list of the usage-restricted key(s).

26.5 Setting keys

\begin{verbatim}
\texttt{\keys_set:nn {\langle module\rangle} {\langle keyval list\rangle}}
\end{verbatim}

Parses the \langle keyval list\rangle, and sets those keys which are defined for \langle module\rangle. The behaviour on finding an unknown key can be set by defining a special \texttt{unknown} key: this is illustrated later.

\begin{verbatim}
\l_keys_key_str
\l_keys_path_str
\l_keys_value_tl
\end{verbatim}

Updated: 2020-02-08

For each key processed, information of the full \textit{path} of the key, the \textit{name} of the key and the \textit{value} of the key is available within three token list variables. These may be used within the code of the key.

The \textit{value} is everything after the =, which may be empty if no value was given. This is stored in \l_keys_value_tl and is not processed in any way by \keys_set:nn.

The \textit{path} of the key is a “full” description of the key, and is unique for each key. It consists of the module and full key name, thus for example

\begin{verbatim}
\keys_set:nn {mymodule} {key-a = some-value}
\end{verbatim}

has path mymodule/key-a while

\begin{verbatim}
\keys_set:nn {mymodule} {subset / key-a = some-value}
\end{verbatim}

has path mymodule/subset/key-a. This information is stored in \l_keys_path_str.

The \textit{name} of the key is the part of the path after the last /, and thus is not unique. In the preceding examples, both keys have name key-a despite having different paths. This information is stored in \l_keys_key_str.
26.6 Handling of unknown keys

If a key has not previously been defined (is unknown), `\keys_set:nn` looks for a special unknown key for the same module, and if this is not defined raises an error indicating that the key name was unknown. This mechanism can be used for example to issue custom error texts.

```latex
\keys_define:nn { mymodule }
{
    unknown .code:n =
    You-tried-to-set-key-'\l_keys_key_str'-to-#'1'.
}
```

These functions set keys which are known for the ⟨module⟩, and simply ignore other keys. The `\keys_set_known:nn` function parses the ⟨keyval list⟩, and sets those keys which are defined for ⟨module⟩. Any keys which are unknown are not processed further by the parser. In addition, `\keys_set_known:nnN` stores the key–value pairs in the ⟨tl⟩ in comma-separated form (i.e. an edited version of the ⟨keyval list⟩). When a ⟨root⟩ is given (\keys_set_known:nnnN), the key–value entries are returned relative to this point in the key tree. When it is absent, only the key name and value are provided. The correct list is returned by nested calls.

26.7 Selective key setting

In some cases it may be useful to be able to select only some keys for setting, even though these keys have the same path. For example, with a set of keys defined using

```latex
\keys_define:nn { mymodule }
{
    key-one .code:n = { \my_func:n {#1} } ,
    key-two .tl_set:N = \l_my_a_tl ,
    key-three .tl_set:N = \l_my_b_tl ,
    key-four .fp_set:N = \l_my_a_fp ,
}
```

the use of `\keys_set:nn` attempts to set all four keys. However, in some contexts it may only be sensible to set some keys, or to control the order of setting. To do this, keys may be assigned to groups: arbitrary sets which are independent of the key tree. Thus modifying the example to read
\keys_define:nn { mymodule }
{
  key-one .code:n = { \my_func:n {#1} },
  key-one .groups:n = { first },
  key-two .tl_set:N = \l_my_a_tl,
  key-two .groups:n = { first },
  key-three .tl_set:N = \l_my_b_tl,
  key-three .groups:n = { second },
  key-four .fp_set:N = \l_my_a_fp,
}
assigns key-one and key-two to group first, key-three to group second, while key-four is not assigned to a group.

Selective key setting may be achieved either by selecting one or more groups to be made “active”, or by marking one or more groups to be ignored in key setting.

\keys_set_filter:nnn
\keys_set_filter:nnnN
\keys_set_filter:nnnN
\keys_set_filter:nnnnN

Activates key filtering in an “opt-out” sense: keys assigned to any of the \langle groups \rangle specified are ignored. The \langle groups \rangle are given as a comma-separated list. Unknown keys are not assigned to any group and are thus always set. The key–value pairs for each key which is filtered out are stored in the \langle tl \rangle in a comma-separated form (i.e. an edited version of the \langle keyval list \rangle). The \keys_set_filter:nnn version skips this stage.

Use of \keys_set_filter:nnnN can be nested, with the correct residual \langle keyval list \rangle returned at each stage. In the version which takes a \langle root \rangle argument, the key list is returned relative to that point in the key tree. In the cases without a \langle root \rangle argument, only the key names and values are returned.

\keys_set_groups:nnn
\keys_set_groups:nnn
\keys_set_groups:nnn
\keys_set_groups:nnnN
\keys_set_groups:nnnN

Activates key filtering in an “opt-in” sense: only keys assigned to one or more of the \langle groups \rangle specified are set. The \langle groups \rangle are given as a comma-separated list. Unknown keys are not assigned to any group and are thus never set.

\keys_precompile:nnn
\keys_precompile:nnn
\keys_precompile:nnn
\keys_precompile:nnnN
\keys_precompile:nnn

Parses the \langle keyval list \rangle as for \keys_set:nn, placing the resulting code for those which set variables or functions into the \langle tl \rangle. Thus this function “precompiles” the keyval list into a set of results which can be applied rapidly.

26.8 Digesting keys
26.9 Utility functions for keys

\texttt{\textbackslash keys\_if\_exist\_p:nn} * \texttt{\textbackslash keys\_if\_exist\_p:nn} \{\texttt{\langle module\rangle}\} \{\texttt{\langle key\rangle}\}

\texttt{\textbackslash keys\_if\_exist\_p:me} * \texttt{\textbackslash keys\_if\_exist\_mnTF} \{\texttt{\langle module\rangle}\} \{\texttt{\langle key\rangle}\} \{\texttt{\langle true\ code\rangle}\} \{\texttt{\langle false\ code\rangle}\}

Tests if the \langle key\rangle exists for \langle module\rangle, \textit{i.e.} if any code has been defined for \langle key\rangle.

\texttt{\textbackslash keys\_if\_choice\_exist\_p:nnn} * \texttt{\textbackslash keys\_if\_choice\_exist\_p:nnn} \{\texttt{\langle module\rangle}\} \{\texttt{\langle key\rangle}\} \{\texttt{\langle choice\rangle}\}

\texttt{\textbackslash keys\_if\_choice\_exist\_nnnTF} * \texttt{\textbackslash keys\_if\_choice\_exist\_nnnTF} \{\texttt{\langle module\rangle}\} \{\texttt{\langle key\rangle}\} \{\texttt{\langle choice\rangle}\} \{\texttt{\langle true\ code\rangle}\} \{\texttt{\langle false\ code\rangle}\}

Tests if the \langle choice\rangle is defined for the \langle key\rangle within the \langle module\rangle, \textit{i.e.} if any code has been defined for \langle key\rangle/\langle choice\rangle. The test is \texttt{false} if the \langle key\rangle itself is not defined.

\texttt{\textbackslash keys\_show\nn} \texttt{\textbackslash keys\_show\nn} \{\texttt{\langle module\rangle}\} \{\texttt{\langle key\rangle}\}

Displays in the terminal the information associated to the \langle key\rangle for a \langle module\rangle, including the function which is used to actually implement it.

\texttt{\textbackslash keys\_log\nn} \texttt{\textbackslash keys\_log\nn} \{\texttt{\langle module\rangle}\} \{\texttt{\langle key\rangle}\}

Writes in the log file the information associated to the \langle key\rangle for a \langle module\rangle. See also \texttt{\textbackslash keys\_show\nn} which displays the result in the terminal.

26.10 Low-level interface for parsing key–val lists

To re-cap from earlier, a key–value list is input of the form

\begin{verbatim}
KeyOne = ValueOne , 
KeyTwo = ValueTwo , 
KeyThree
\end{verbatim}

where each key–value pair is separated by a comma from the rest of the list, and each key–value pair does not necessarily contain an equals sign or a value! Processing this type of input correctly requires a number of careful steps, to correctly account for braces, spaces and the category codes of separators.

While the functions described earlier are used as a high-level interface for processing such input, in special circumstances you may wish to use a lower-level approach. The low-level parsing system converts a \langle key–value list\rangle into \langle keys\rangle and associated \langle values\rangle. After the parsing phase is completed, the resulting keys and values (or keys alone) are available for further processing. This processing is not carried out by the low-level parser itself, and so the parser requires the names of two functions along with the key–value list. One function is needed to process key–value pairs (it receives two arguments), and a second function is required for keys given without any value (it is called with a single argument).

The parser does not double # tokens or expand any input. Active tokens = and , appearing at the outer level of braces are converted to category “other” (12) so that the
The parser does not “miss” any due to category code changes. Spaces are removed from the ends of the keys and values. Keys and values which are given in braces have exactly one set removed (after space trimming), thus

\begin{align*}
\text{key} = \{\text{value here}\}, \\
\text{and} \\
\text{key} = \text{value here},
\end{align*}

are treated identically.

\begin{verbatim}
\keyval_parse:nnn \langle code_1 \rangle \{ \langle key-value list \rangle \}
\use_none:nn { code 1 } \\
\{ \langle key-value list \rangle \}
\use_none:nn { code 2 } \\
\{ key1 = value1, key2 = value2, key3 = , key4 \}
\end{verbatim}

is converted into an input stream

\begin{verbatim}
\use_none:nnn { code 2 } { key1 } { value1 } \\
\use_none:nnn { code 2 } { key2 } { value2 } \\
\use_none:nnn { code 2 } { key3 } { } \\
\use_none:nnn { code 1 } { key4 }
\end{verbatim}

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the \langle key \rangle and \langle value \rangle, then one outer set of braces is removed from the \langle key \rangle and \langle value \rangle as part of the processing. If you need exactly the output shown above, you’ll need to either x-type or e-type expand the function.

\textbf{TeXhackers note:} The result of each list element is returned within \texttt{\exp_not:n}, which means that the converted input stream does not expand further when appearing in an x-type or e-type argument expansion.
parses the ⟨key–value list⟩ into a series of ⟨keys⟩ and associated ⟨values⟩, or keys alone (if no ⟨value⟩ was given). ⟨function₁ ⟩ should take one argument, while ⟨function₂ ⟩ should absorb two arguments. After \texttt{\keyval_parse:NNn} has parsed the ⟨key–value list⟩, ⟨function₁ ⟩ is used to process keys given with no value and ⟨function₂ ⟩ is used to process keys given with a value. The order of the ⟨keys⟩ in the ⟨key–value list⟩ is preserved. Thus

\begin{verbatim}
\keyval_parse:NNn \function:n \function:nn
  { key1 = value1 , key2 = value2, key3 = , key4 }
\end{verbatim}

is converted into an input stream

\begin{verbatim}
\function:nn { key1 } { value1 }
\function:nn { key2 } { value2 }
\function:nn { key3 } { }
\function:n { key4 }
\end{verbatim}

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the ⟨key⟩ and ⟨value⟩, then one outer set of braces is removed from the ⟨key⟩ and ⟨value⟩ as part of the processing.

This shares the implementation of \texttt{\keyval_parse:nnn}, the difference is only semantically.

\TeXHackersnote: The result is returned within \texttt{\exp_not:n}, which means that the converted input stream does not expand further when appearing in an \texttt{x}-type or \texttt{e}-type argument expansion.
Chapter 27

The \texttt{l3intarray} package: fast global integer arrays

\section*{27.1 \texttt{l3intarray} documentation}

For applications requiring heavy use of integers, this module provides arrays which can be accessed in constant time (contrast \texttt{l3seq}, where access time is linear). These arrays have several important features

- The size of the array is fixed and must be given at point of initialisation
- The absolute value of each entry has maximum $2^{30} - 1$ (i.e. one power lower than the usual \texttt{c_max_int} ceiling of $2^{31} - 1$)

The use of \texttt{intarray} data is therefore recommended for cases where the need for fast access is of paramount importance.

\begin{verbatim}
\intarray_new:Nn \intarray_new:cn
\intarray_count:N \intarray_count:c
\intarray_gset:Nnn \intarray_gset:cnn
\end{verbatim}

Evaluated the integer expression \texttt{(size)} and allocates an \texttt{(integer array variable)} with that number of (zero) entries. The variable name should start with \texttt{g} because assignments are always global.

\begin{verbatim}
\intarray_count:N \intarray_count:c
\end{verbatim}

Expands to the number of entries in the \texttt{(integer array variable)}. Contrarily to \texttt{seq_count:N} this is performed in constant time.

\begin{verbatim}
\intarray_gset:Nnn \intarray_gset:cnn
\end{verbatim}

Stores the result of evaluating the integer expression \texttt{(value)} into the \texttt{(integer array variable)} at the (integer expression) \texttt{(position)}. If the \texttt{(position)} is not between 1 and the \texttt{intarray_count:N}, or the \texttt{(value)}'s absolute value is bigger than $2^{30} - 1$, an error occurs. Assignments are always global.
\texttt{\textbackslash intarray\_const\_from\_clist:Nn} \hspace{1em} \texttt{\textbackslash intarray\_const\_from\_clist:Nn} \hspace{1em} \texttt{\textbackslash intarray\_const\_from\_clist:cn}

\textit{New: 2018-05-04}

Creates a new constant \textit{(integer array variable)} or raises an error if the name is already taken. The \textit{(integer array variable)} is set (globally) to contain as its items the results of evaluating each \textit{(integer expression)} in the \textit{(comma list)}.

\texttt{\textbackslash intarray\_gzero:N} \hspace{1em} \texttt{\textbackslash intarray\_gzero:N} \hspace{1em} \texttt{\textbackslash intarray\_gzero:c}

\textit{New: 2018-05-04}

Sets all entries of the \textit{(integer array variable)} to zero. Assignments are always global.

\texttt{\textbackslash intarray\_item:Nn} \hspace{1em} \texttt{\textbackslash intarray\_item:Nn} \hspace{1em} \texttt{\textbackslash intarray\_item:cn} \hspace{1em} \texttt{\textbackslash intarray\_item:cn}

\textit{New: 2018-03-29}

Expands to the integer entry stored at the \textit{(integer expression) \langle position \rangle} in the \textit{(integer array variable)}. If the \textit{(position)} is not between 1 and the \texttt{\textbackslash intarray\_count:N}, an error occurs.

\texttt{\textbackslash intarray\_rand\_item:N} \hspace{1em} \texttt{\textbackslash intarray\_rand\_item:N} \hspace{1em} \texttt{\textbackslash intarray\_rand\_item:c} \hspace{1em} \texttt{\textbackslash intarray\_rand\_item:c}

\textit{New: 2018-05-05}

Selects a pseudo-random item of the \textit{(integer array)}. If the \textit{(integer array)} is empty, produce an error.

\texttt{\textbackslash intarray\_show:N} \hspace{1em} \texttt{\textbackslash intarray\_show:N} \hspace{1em} \texttt{\textbackslash intarray\_show:c} \hspace{1em} \texttt{\textbackslash intarray\_show:c}

\texttt{\textbackslash intarray\_log:N} \hspace{1em} \texttt{\textbackslash intarray\_log:N} \hspace{1em} \texttt{\textbackslash intarray\_log:c} \hspace{1em} \texttt{\textbackslash intarray\_log:c}

\textit{New: 2018-05-04}

Displays the items in the \textit{(integer array variable)} in the terminal or writes them in the log file.

### 27.1.1 Implementation notes

It is a wrapper around the \texttt{\textbackslash fontdimen} primitive, used to store arrays of integers (with a restricted range: absolute value at most $2^{30} - 1$). In contrast to \texttt{l3seq} sequences the access to individual entries is done in constant time rather than linear time, but only integers can be stored. More precisely, the primitive \texttt{\fontdimen} stores dimensions but the \texttt{l3intarray} package transparently converts these from/to integers. Assignments are always global.

While Lua\TeX{}’s memory is extensible, other engines can “only” deal with a bit less than $4 \times 10^6$ entries in all \texttt{\fontdimen} arrays combined (with default \TeX{} Live settings).
Chapter 28

The l3fp package: Floating points

A decimal floating point number is one which is stored as a significand and a separate exponent. The module implements expandably a wide set of arithmetic, trigonometric, and other operations on decimal floating point numbers, to be used within floating point expressions. Floating point expressions support the following operations with their usual precedence.

- Basic arithmetic: addition \( x + y \), subtraction \( x - y \), multiplication \( x \ast y \), division \( x/y \), square root \( \sqrt{x} \), and parentheses.
- Comparison operators: \( x < y \), \( x <= y \), \( x > y \), \( x != y \) etc.
- Boolean logic: sign \( \text{sign} \ x \), negation \( !x \), conjunction \( x \&\& y \), disjunction \( x || y \), ternary operator \( x ? y : z \).
- Exponentials: \( \text{exp} \ x \), \( \text{ln} \ x \), \( x^y \), \( \log_2 \ x \).
- Integer factorial: \( \text{fact} \ x \).
- Trigonometry: \( \sin \ x \), \( \cos \ x \), \( \tan \ x \), \( \cot \ x \), \( \sec \ x \), \( \csc \ x \) expecting their arguments in radians, and \( \sinh \ x \), \( \cosh \ x \), \( \tanh \ x \), \( \coth \ x \), \( \sech \ x \), \( \csch \ x \), and \( \text{asinh} \ x \), \( \text{acosh} \ x \), \( \text{atanh} \ x \), \( \text{acoth} \ x \), \( \text{asech} \ x \), \( \text{acsch} \ x \) giving a result in radians, and \( \sin^\circ \ x \), \( \cos^\circ \ x \), \( \tan^\circ \ x \), \( \cot^\circ \ x \), \( \sec^\circ \ x \), \( \csc^\circ \ x \) expecting their arguments in degrees.
- Inverse trigonometric functions: \( \text{asin} \ x \), \( \text{acos} \ x \), \( \text{atan} \ x \), \( \text{acsc} \ x \), \( \text{asec} \ x \), \( \text{cot} \ x \), \( \text{asecp} \ x \), \( \text{acosp} \ x \), \( \text{tand} \ x \), \( \text{cotd} \ x \), \( \text{secd} \ x \), \( \text{cscd} \ x \), \( \text{asecd} \ x \), \( \text{acsed} \ x \) giving a result in degrees.

(not yet) Hyperbolic functions and their inverse functions: \( \sinh \ x \), \( \cosh \ x \), \( \tanh \ x \), \( \coth \ x \), \( \sech \ x \), \( \csch \ x \), and \( \text{asinh} \ x \), \( \text{acosh} \ x \), \( \text{atanh} \ x \), \( \text{acoth} \ x \), \( \text{asech} \ x \), \( \text{acsch} \ x \).
- Extrema: \( \text{max}(x_1, x_2, \ldots) \), \( \text{min}(x_1, x_2, \ldots) \), \( \text{abs}(x) \).
- Rounding functions, controlled by two optional values, \( n \) (number of places, 0 by default) and \( t \) (behavior on a tie, \( \text{nan} \) by default):
  - \( \text{trunc}(x, n) \) rounds towards zero,
  - \( \text{floor}(x, n) \) rounds towards \(-\infty\),

239
- \( \text{ceil}(x, n) \) rounds towards \(+\infty\),
- \( \text{round}(x, n, t) \) rounds to the closest value, with ties rounded to an even value by default, towards zero if \( t = 0 \), towards \(+\infty\) if \( t > 0 \) and towards \(-\infty\) if \( t < 0 \).

And \( \text{(not yet)} \) modulo, and “quantize”.

- Random numbers: \( \text{rand}(), \text{randint}(m, n) \).
- Constants: \( \pi, \text{deg} \) (one degree in radians).
- Dimensions, automatically expressed in points, \( \text{e.g.}, \text{pc} \) is 12.
- Automatic conversion \( \text{(no need for \langle type\rangle\_use:N)} \) of integer, dimension, and skip variables to floating point numbers, expressing dimensions in points and ignoring the stretch and shrink components of skips.
- Tuples: \( (x_1, \ldots, x_n) \) that can be stored in variables, added together, multiplied or divided by a floating point number, and nested.

Floating point numbers can be given either explicitly (in a form such as \(1.234e-34\), or \(-.0001\)), or as a stored floating point variable, which is automatically replaced by its current value. A “floating point” is a floating point number or a tuple thereof. See section 28.9.1 for a description of what a floating point is, section 28.9.2 for details about how an expression is parsed, and section 28.9.3 to know what the various operations do. Some operations may raise exceptions (error messages), described in section 28.7.

An example of use could be the following.

\[ \LaTeX{} \text{ can now compute: } \frac{\sin (3.5)}{2} + 2\cdot 10^{-3} = \ExplSyntaxOn \fp_to_decimal:n {\sin(3.5)/2 + 2e-3} \ExplSyntaxOff. \]

The operation \( \text{round} \) can be used to limit the result’s precision. Adding \( +0 \) avoids the possibly undesirable output \(-0\), replacing it by \(+0\). However, the \l3fp\ module is mostly meant as an underlying tool for higher-level commands. For example, one could provide a function to typeset nicely the result of floating point computations.

\[ \text{LaTeX}{} \text{ cq now compute: } \frac{\sin (3.5)}{2} + 2\cdot 10^{-3} = \text{\ExplSyntaxOn \fp_to_decimal:n {\sin(3.5)/2 + 2e-3} \ExplSyntaxOff.} \]

\documentclass{article}
\usepackage{xparse, siunitx}
\ExplSyntaxOn
\NewDocumentCommand { \calcnum } { m }{
um {\fp_to_scientific:n {#1}}}
\ExplSyntaxOff
\begin{document}
\calcnum { 2 \pi \times \sin ( 2.3 ^ 5 ) }
\end{document}

See the documentation of \texttt{siunitx} for various options of \texttt{\num}.
28.1 Creating and initialising floating point variables

\fp_new:N \langle fp var \rangle
Creates a new \langle fp var \rangle or raises an error if the name is already taken. The declaration is global. The \langle fp var \rangle is initially +0.

\fp_new:c
Updated: 2012-05-08

\fp_const:Nn \langle fp var \rangle {\langle floating point expression \rangle}
Creates a new constant \langle fp var \rangle or raises an error if the name is already taken. The \langle fp var \rangle is set globally equal to the result of evaluating the \langle floating point expression \rangle.

\fp_const:cn
Updated: 2012-05-08

\fp_zero:N \langle fp var \rangle
Sets the \langle fp var \rangle to +0.

\fp_zero:c
\fp_gzero:N
\fp_gzero:c
Updated: 2012-05-08

\fp_zero_new:N \langle fp var \rangle
\fp_zero_new:c \fp_gzero_new:N \fp_gzero_new:c
Ensures that the \langle fp var \rangle exists globally by applying \fp_new:N if necessary, then applies \fp_(g)zero:N to leave the \langle fp var \rangle set to +0.

28.2 Setting floating point variables

\fp_set:Nn \langle fp var \rangle {\langle floating point expression \rangle}
Sets \langle fp var \rangle equal to the result of computing the \langle floating point expression \rangle.

\fp_set:cn \fp_gset:Nn \fp_gset:cn
Updated: 2012-05-08

\fp_set_eq:NN \langle fp var \rangle_1 \langle fp var \rangle_2
Sets the floating point variable \langle fp var_1 \rangle equal to the current value of \langle fp var_2 \rangle.

\fp_set_eq:NN (cN|Nc|cc) \fp_gset_eq:NN (cN|Nc|cc)
Updated: 2012-05-08

\fp_add:Nn \langle fp var \rangle {\langle floating point expression \rangle}
Adds the result of computing the \langle floating point expression \rangle to the \langle fp var \rangle. This also applies if \langle fp var \rangle and \langle floating point expression \rangle evaluate to tuples of the same size.

\fp_add:cn \fp_gadd:Nn \fp_gadd:cn
Updated: 2012-05-08
Subtracts the result of computing the \textit{floating point expression} from the \textit{fp var}. This also applies if \textit{fp var} and \textit{floating point expression} evaluate to tuples of the same size.

\subsection{Using floating points}

Evaluates the \textit{floating point expression} and expresses the result as a decimal number with no exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values ±\infty and \texttt{nan} trigger an “invalid operation” exception. For a tuple, each item is converted using $\mathbf{fp\_eval:n}$ and they are combined as $⟨⟨fp_1⟩,⟨fp_2⟩,...⟨fp_n⟩⟩$ if $n > 1$ and $⟨⟨fp_1⟩⟩$ or $⟨⟩$ for fewer items. This function is identical to $\mathbf{fp\_to\_decimal:n}$.

Evaluates the \textit{fpexpr} and leaves its sign in the input stream using $\mathbf{fp\_eval:n}$ \{sign(⟨result⟩)}: $+1$ for positive numbers and for $+\infty$, $−1$ for negative numbers and for $−\infty$, ±0 for ±0. If the operand is a tuple or is \texttt{nan}, then “invalid operation” occurs and the result is 0.

Evaluates the \textit{floating point expression} and expresses the result as a dimension (in pt) suitable for use in dimension expressions. The output is identical to $\mathbf{fp\_to\_decimal:n}$ with an additional trailing pt (both letter tokens). In particular, the result may be outside the range $[−2^{14} + 2^{−17}, 2^{14} − 2^{−17}]$ of valid \TeX\ dimensions, leading to overflow errors if used as a dimension. Tuples, as well as the values ±\infty and \texttt{nan}, trigger an “invalid operation” exception.

Evaluates the \textit{floating point expression}, and rounds the result to the closest integer, rounding exact ties to an even integer. The result may be outside the range $[−2^{31} + 1, 2^{31} − 1]$ of valid \TeX\ integers, leading to overflow errors if used in an integer expression. Tuples, as well as the values ±\infty and \texttt{nan}, trigger an “invalid operation” exception.
\fp_to_scientific:N \fp_to_scientific:c \fp_to_scientific:n

Evaluates the \textit{floating point expression} and expresses the result in scientific notation:

\textit{(optional -)}\textit{digit}.\textit{(15 digits)}e\textit{(optional sign)}\textit{exponent}

The leading \textit{digit} is non-zero except in the case of ±0. The values ±∞ and \texttt{nan} trigger an “invalid operation” exception. Normal category codes apply: thus the \texttt{e} is category code 11 (a letter). For a tuple, each item is converted using \texttt{\fp_to_scientific:n} and they are combined as \texttt{(⟨fp1⟩,⟨fp2⟩,⟨fp3⟩...⟨fp_n⟩)} if \texttt{n > 1} and \texttt{(⟨fp1⟩,)} or \texttt{()} for fewer items.

\fp_to_tl:N \fp_to_tl:c \fp_to_tl:n

Evaluates the \textit{floating point expression} and expresses the result in (almost) the shortest possible form. Numbers in the ranges \((0,10^{-3})\) and \([10^{16}, \infty)\) are expressed in scientific notation with trailing zeros trimmed and no decimal separator when there is a single significant digit (this differs from \texttt{\fp_to_scientific:n}). Numbers in the range \([10^{-3},10^{16}]\) are expressed in a decimal notation without exponent, with trailing zeros trimmed, and no decimal separator for integer values (see \texttt{\fp_to_decimal:n}). Negative numbers start with \texttt{-}. The special values ±0, ±∞ and \texttt{nan} are rendered as 0, -0, \texttt{inf}, \texttt{-inf}, and \texttt{nan} respectively. Normal category codes apply and thus \texttt{inf} or \texttt{nan}, if produced, are made up of letters. For a tuple, each item is converted using \texttt{\fp_to_tl:n} and they are combined as \texttt{(⟨fp1⟩,⟨fp2⟩,⟨fp3⟩...⟨fp_n⟩)} if \texttt{n > 1} and \texttt{(⟨fp1⟩,)} or \texttt{()} for fewer items. This function is identical to \texttt{\fp_to_decimal:N}.

\fp_use:N \fp_use:c

Inserts the value of the \textit{fp var} into the input stream as a decimal number with no exponent. Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed. Integers are expressed without a decimal separator. The values ±∞ and \texttt{nan} trigger an “invalid operation” exception. For a tuple, each item is converted using \texttt{\fp_to_decimal:n} and they are combined as \texttt{(⟨fp1⟩,⟨fp2⟩,⟨fp3⟩...⟨fp_n⟩)} if \texttt{n > 1} and \texttt{(⟨fp1⟩,)} or \texttt{()} for fewer items. This function is identical to \texttt{\fp_to_decimal:N}.

28.4 Floating point conditionals

\fp_if_exist_p:N \fp_if_exist_p:c \fp_if_exist:N \fp_if_exist:c

Tests whether the \textit{fp var} is currently defined. This does not check that the \textit{fp var} really is a floating point variable.
\fp_compare:nNn * \fp_compare:nNn \{\textit{fexpr}_1\} \{\textit{relation}\} \{\textit{fexpr}_2\} \\fp_compare:nNnTF * \fp_compare:nNnTF \{\textit{fexpr}_1\} \{\textit{relation}\} \{\textit{fexpr}_2\} \{\text{true code}\} \{\text{false code}\}

Updated: 2012-05-08

Compares the \textit{fexpr}_1 and the \textit{fexpr}_2, and returns \texttt{true} if the \textit{relation} is obeyed. Two floating points \textit{x} and \textit{y} may obey four mutually exclusive relations: \textit{x} < \textit{y}, \textit{x} = \textit{y}, \textit{x} > \textit{y}, or \textit{x}?\textit{y} ("not ordered"). The last case occurs exactly if one or both operands is \texttt{nan} or is a tuple, unless they are equal tuples. Note that a \texttt{nan} is distinct from any value, even another \texttt{nan}, hence \textit{x} = \textit{x} is not true for a \texttt{nan}. To test if a value is \texttt{nan}, compare it to an arbitrary number with the "not ordered" relation.

\begin{verbatim}
\fp_compare:nNnTF { <value> } ? { 0 }
    { } % <value> is nan
    { } % <value> is not nan
\end{verbatim}

Tuples are equal if they have the same number of items and items compare equal (in particular there must be no \texttt{nan}). At present any other comparison with tuples yields ? (not ordered). This is experimental.

This function is less flexible than \texttt{\fp_compare:nTF} but slightly faster. It is provided for consistency with \texttt{\int_compare:nNnTF} and \texttt{\dim_compare:nNnTF}.
\fp_compare_p:n \fp_compare:nTF
\fp_compare_p:n
{ (fpexpr_1) (relation_1)
  ...
  (fpexpr_N) (relation_N)
  (fpexpr_{N+1})
}
\fp_compare:nTF
{ (fpexpr_1) (relation_1)
  ...
  (fpexpr_N) (relation_N)
  (fpexpr_{N+1})
}
{ (true code) } { (false code) }

Evaluates the \textit{(floating point expressions)} as described for \texttt{\fp_eval:n} and compares consecutive result using the corresponding \textit{(relation)}, namely it compares \texttt{(fpexpr_1)} and \texttt{(fpexpr_2)} using the \texttt{(relation_1)}, then \texttt{(fpexpr_2)} and \texttt{(fpexpr_3)} using the \texttt{(relation_2)}, until finally comparing \texttt{(fpexpr_N)} and \texttt{(fpexpr_{N+1})} using the \texttt{(relation_N)}. The test yields \texttt{true} if all comparisons are \texttt{true}. Each \textit{(floating point expression)} is evaluated only once. Contrarily to \texttt{\int_compare:nTF}, all \textit{(floating point expressions)} are computed, even if one comparison is \texttt{false}. Two floating points \(x\) and \(y\) may obey four mutually exclusive relations: \(x < y\), \(x = y\), \(x > y\), or \(x \not\equiv y\) (“not ordered”). The last case occurs exactly if one or both operands is \texttt{nan} or is a tuple, unless they are equal tuples. Each \textit{(relation)} can be any \texttt{(non-empty)} combination of <, \(\equiv\), >, and ?, plus an optional leading \texttt{!} (which negates the \textit{(relation)}), with the restriction that the \textit{(relation)} may not start with ?, as this symbol has a different meaning (in combination with \\texttt{:}) within floating point expressions. The comparison \(x \langle \textit{(relation)} \rangle y\) is then \texttt{true} if the \textit{(relation)} does not start with \texttt{!} and the actual relation (<, \(\equiv\), >, or ?) between \(x\) and \(y\) appears within the \textit{(relation)}, or on the contrary if the \textit{(relation)} starts with \texttt{!} and the relation between \(x\) and \(y\) does not appear within the \textit{(relation)}. Common choices of \textit{(relation)} include \texttt{\geq} (greater or equal), \texttt{\neq} (not equal), \texttt{\neq} 或 \texttt{\<=>} (comparable).

This function is more flexible than \texttt{\fp_compare:nNnTF} and only slightly slower.

### 28.5 Floating point expression loops

\fp_do_until:nNnn \fp_do_until:nNn \{(fpexpr_1) \langle (relation) \rangle \{(fpexpr_2)\}\}{(code)}
\fp_do_until:nNnn \{(fpexpr_1)\} \langle (relation) \rangle \{(fpexpr_2)\}\{\langle code\rangle\}

Places the \texttt{(code)} in the input stream for \TeX\ to process, and then evaluates the relationship between the two \textit{(floating point expressions)} as described for \texttt{\fp_compare:nNnTF}. If the test is \texttt{false} then the \texttt{(code)} is inserted into the input stream again and a loop occurs until the \textit{(relation)} is \texttt{true}.

\fp_do_while:nNnn \fp_do_while:nNn \{(fpexpr_1) \langle (relation) \rangle \{(fpexpr_2)\}\}{(code)}
\fp_do_while:nNnn \{(fpexpr_1)\} \langle (relation) \rangle \{(fpexpr_2)\} \{\langle code\rangle\}

Places the \texttt{(code)} in the input stream for \TeX\ to process, and then evaluates the relationship between the two \textit{(floating point expressions)} as described for \texttt{\fp_compare:nNnTF}. If the test is \texttt{true} then the \texttt{(code)} is inserted into the input stream again and a loop occurs until the \textit{(relation)} is \texttt{false}.
\fp_until_do:nNnn \{ \fpexpr1 \} \{ \relation \} \{ \fpexpr2 \} \{ \code \}

Evaluates the relationship between the two (floating point expressions) as described for \fp_compare:nNnTF, and then places the (code) in the input stream if the (relation) is false. After the (code) has been processed by \TeX{} the test is repeated, and a loop occurs until the test is true.

\fp_while_do:nNnn \{ \fpexpr1 \} \{ \relation \} \{ \fpexpr2 \} \{ \code \}

Evaluates the relationship between the two (floating point expressions) as described for \fp_compare:nNnTF, and then places the (code) in the input stream if the (relation) is true. After the (code) has been processed by \TeX{} the test is repeated, and a loop occurs until the test is false.

\fp_do_until:nn \{ \fpexpr1 \} \{ \relation \} \{ \fpexpr2 \} \{ \code \}

Places the (code) in the input stream for \TeX{} to process, and then evaluates the relationship between the two (floating point expressions) as described for \fp_compare:nNnTF. If the test is false then the (code) is inserted into the input stream again and a loop occurs until the (relation) is true.

\fp_do_while:nn \{ \fpexpr1 \} \{ \relation \} \{ \fpexpr2 \} \{ \code \}

Places the (code) in the input stream for \TeX{} to process, and then evaluates the relationship between the two (floating point expressions) as described for \fp_compare:nNnTF. If the test is true then the (code) is inserted into the input stream again and a loop occurs until the (relation) is false.

\fp_until_do:nn \{ \fpexpr1 \} \{ \relation \} \{ \fpexpr2 \} \{ \code \}

Evaluates the relationship between the two (floating point expressions) as described for \fp_compare:nNnTF, and then places the (code) in the input stream if the (relation) is false. After the (code) has been processed by \TeX{} the test is repeated, and a loop occurs until the test is true.

\fp_while_do:nn \{ \fpexpr1 \} \{ \relation \} \{ \fpexpr2 \} \{ \code \}

Evaluates the relationship between the two (floating point expressions) as described for \fp_compare:nNnTF, and then places the (code) in the input stream if the (relation) is true. After the (code) has been processed by \TeX{} the test is repeated, and a loop occurs until the test is false.
This function first evaluates the \textlangle initial value \textrangle, \textlangle step \textrangle and \textlangle final value \textrangle, each of which should be a floating point expression evaluating to a floating point number, not a tuple. The \textlangle function \textrangle is then placed in front of each \textlangle value \textrangle from the \textlangle initial value \textrangle to the \textlangle final value \textrangle in turn (using \textlangle step \textrangle between each \textlangle value \textrangle). The \textlangle step \textrangle must be non-zero. If the \textlangle step \textrangle is positive, the loop stops when the \textlangle value \textrangle becomes larger than the \textlangle final value \textrangle. If the \textlangle step \textrangle is negative, the loop stops when the \textlangle value \textrangle becomes smaller than the \textlangle final value \textrangle. The \textlangle function \textrangle should absorb one numerical argument. For example

\begin{verbatim}
\cs_set:Npn \my_func:n #1 { [I saw #1] \quad } \fp_step_function:nnnN { 1.0 } { 0.1 } { 1.5 } \my_func:n
\end{verbatim}

would print

\begin{verbatim}
[I saw 1.0] [I saw 1.1] [I saw 1.2] [I saw 1.3] [I saw 1.4] [I saw 1.5]
\end{verbatim}

\textbf{\LaTeX{\textregistered}}hackers note: Due to rounding, it may happen that adding the \textlangle step \textrangle to the \textlangle value \textrangle does not change the \textlangle value \textrangle; such cases give an error, as they would otherwise lead to an infinite loop.

\section*{28.6 Some useful constants, and scratch variables}

\texttt{\textbackslash c\_zero_fp}

Zero, with either sign.

\texttt{\textbackslash c\_minus\_zero_fp}

\texttt{\textbackslash c\_one_fp}

One as an \texttt{fp}: useful for comparisons in some places.
Infinity, with either sign. These can be input directly in a floating point expression as \texttt{inf} and \texttt{-inf}.

\texttt{c_inf_fp} \texttt{c_minus_inf_fp} \texttt{Nov: 2012-05-08}

The value of the base of the natural logarithm, \( e = \exp(1) \).

\texttt{c_e_fp} \texttt{Updated: 2012-05-08}

The value of \( \pi \). This can be input directly in a floating point expression as \texttt{pi}.

\texttt{c_pi_fp} \texttt{Updated: 2013-11-17}

The value of 1° in radians. Multiply an angle given in degrees by this value to obtain a result in radians. Note that trigonometric functions expecting an argument in radians or in degrees are both available. Within floating point expressions, this can be accessed as \texttt{deg}.

\texttt{c_one_degree_fp} \texttt{Nov: 2012-05-08} \texttt{Updated: 2013-11-17}

Scratch floating points for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\texttt{l_tmpa_fp} \texttt{l_tmpb_fp}

Scratch floating points for global assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\texttt{g_tmpa_fp} \texttt{g_tmpb_fp}

28.7 Floating point exceptions

The functions defined in this section are experimental, and their functionality may be altered or removed altogether.

“Exceptions” may occur when performing some floating point operations, such as \( 0 / 0 \), or \( 10 ** 1e9999 \). The relevant IEEE standard defines 5 types of exceptions, of which we implement 4.

- **Overflow** occurs whenever the result of an operation is too large to be represented as a normal floating point number. This results in \( \pm \infty \).
- **Underflow** occurs whenever the result of an operation is too close to 0 to be represented as a normal floating point number. This results in \( \pm 0 \).
- **Invalid operation** occurs for operations with no defined outcome, for instance \( 0/0 \) or \( \sin(\infty) \), and results in a \texttt{nan}. It also occurs for conversion functions whose target type does not have the appropriate infinite or \texttt{nan} value (e.g., \texttt{fp_to_dim:n}).
- **Division by zero** occurs when dividing a non-zero number by 0, or when evaluating functions at poles, e.g., \( \ln(0) \) or \( \cot(0) \). This results in \( \pm \infty \).
(not yet) *Inexact* occurs whenever the result of a computation is not exact, in other words, almost always. At the moment, this exception is entirely ignored in \LaTeX3.

To each exception we associate a “flag”: `fp_overflow`, `fp_underflow`, `fp_invalid_operation` and `fp_division_by_zero`. The state of these flags can be tested and modified with commands from `\l3flag`

By default, the “invalid operation” exception triggers an (expandable) error, and raises the corresponding flag. Other exceptions raise the corresponding flag but do not trigger an error. The behaviour when an exception occurs can be modified (using `\fp_trap:nn`) to either produce an error and raise the flag, or only raise the flag, or do nothing at all.

\begin{verbatim}
default: 2012-07-19
\end{verbatim}

\begin{verbatim}
default: 2017-02-13
\end{verbatim}

All occurrences of the `{\textless}exception{\textgreater}` (overflow, underflow, invalid_operation or division_by_zero) within the current group are treated as `{\textless}trap type{\textgreater}`, which can be

- **none**: the `{\textless}exception{\textgreater}` will be entirely ignored, and leave no trace;
- **flag**: the `{\textless}exception{\textgreater}` will turn the corresponding flag on when it occurs;
- **error**: additionally, the `{\textless}exception{\textgreater}` will halt the \TeX{} run and display some information about the current operation in the terminal.

*This function is experimental, and may be altered or removed.*

Flags denoting the occurrence of various floating-point exceptions.

\begin{verbatim}
\fp_trap:nn
\end{verbatim}

\begin{verbatim}
\fp_trap:an \{\langle exception\rangle\} \{\langle trap type\rangle\}
\end{verbatim}

28.8 **Viewing floating points**

\begin{verbatim}
default: 2021-04-29
\end{verbatim}

\begin{verbatim}
default: 2021-04-29
\end{verbatim}

Evaluates the `{\textless}floating point expression{\textgreater}` and displays the result in the terminal.

\begin{verbatim}
default: 2021-04-29
\end{verbatim}

Evaluates the `{\textless}floating point expression{\textgreater}` and writes the result in the log file.
28.9 Floating point expressions

28.9.1 Input of floating point numbers

We support four types of floating point numbers:

- $\pm m \cdot 10^n$, a floating point number, with integer $1 \leq m \leq 10^{16}$, and $-10000 \leq n \leq 10000$;
- $\pm 0$, zero, with a given sign;
- $\pm \infty$, infinity, with a given sign;
- \texttt{nan}, is “not a number”, and can be either quiet or signalling (\emph{not yet}: this distinction is currently unsupported);

Normal floating point numbers are stored in base 10, with up to 16 significant figures. On input, a normal floating point number consists of:

- \langle \text{sign} \rangle: a possibly empty string of $+$ and $-$ characters;
- \langle \text{significand} \rangle: a non-empty string of digits together with zero or one dot;
- \langle \text{exponent} \rangle optionally: the character $e$ or $E$, followed by a possibly empty string of $+$ and $-$ tokens, and a non-empty string of digits.

The sign of the resulting number is $+$ if \langle \text{sign} \rangle contains an even number of $-$, and $-$ otherwise, hence, an empty \langle \text{sign} \rangle denotes a non-negative input. The stored significand is obtained from \langle \text{significand} \rangle by omitting the decimal separator and leading zeros, and rounding to 16 significant digits, filling with trailing zeros if necessary. In particular, the value stored is exact if the input \langle \text{significand} \rangle has at most 16 digits. The stored \langle \text{exponent} \rangle is obtained by combining the input \langle \text{exponent} \rangle (0 if absent) with a shift depending on the position of the significand and the number of leading zeros.

A special case arises if the resulting \langle \text{exponent} \rangle is either too large or too small for the floating point number to be represented. This results either in an overflow (the number is then replaced by $\pm \infty$), or an underflow (resulting in $\pm 0$).

The result is thus $\pm 0$ if and only if \langle \text{significand} \rangle contains no non-zero digit (\emph{i.e.}, consists only in characters 0, and an optional period), or if there is an underflow. Note that a single dot is currently a valid floating point number, equal to $+0$, but that is not guaranteed to remain true.

The \langle \text{significand} \rangle must be non-empty, so \texttt{e1} and \texttt{e-1} are not valid floating point numbers. Note that the latter could be mistaken with the difference of \texttt{“e”} and 1. To avoid confusions, the base of natural logarithms cannot be input as \texttt{e} and should be input as \texttt{exp(1)} or \texttt{\c_e_fp} (which is faster).

Special numbers are input as follows:

- \texttt{inf} represents $+\infty$, and can be preceded by any \langle \text{sign} \rangle, yielding $\pm \infty$ as appropriate.
- \texttt{nan} represents a (quiet) non-number. It can be preceded by any sign, but that sign is ignored.
- Any unrecognizable string triggers an error, and produces a \texttt{nan}.
- Note that commands such as \texttt{\infy}, \texttt{\pi}, or \texttt{\sin} do not work in floating point expressions. They may silently be interpreted as completely unexpected numbers, because integer constants (allowed in expressions) are commonly stored as mathematical characters.
28.9.2 Precedence of operators

We list here all the operations supported in floating point expressions, in order of decreasing precedence: operations listed earlier bind more tightly than operations listed below them.

- Function calls (\texttt{sin}, \texttt{ln}, \texttt{etc}).
- Binary \texttt{**} and \texttt{^} (right associative).
- Unary \texttt{+}, \texttt{-}, \texttt{!}.
- Implicit multiplication by juxtaposition (2pi) when neither factor is in parentheses.
- Binary \texttt{*} and \texttt{/}, implicit multiplication by juxtaposition with parentheses (for instance 3(4+5)).
- Binary \texttt{+} and \texttt{-}.
- Comparisons \texttt{>=}, \texttt{!=}, \texttt{?}, \texttt{etc}.
- Logical \texttt{and}, denoted by \texttt{&&}.
- Logical \texttt{or}, denoted by \texttt{||}.
- Ternary operator \texttt{?:} (right associative).
- Comma (to build tuples).

The precedence of operations can be overridden using parentheses. In particular, the precedence of juxtaposition implies that

\[
\frac{1}{2\pi} = \frac{1}{(2\pi)}, \\
\frac{1}{2\pi}(\pi + \pi) = (2\pi)^{-1}(\pi + \pi) \approx 1, \\
\sin(2\pi) = \sin(2\pi) \neq 0, \\
2^{\text{max}(3, 5)} = 2^{\text{max}(3, 5)} = 20, \\
\frac{1\text{in}}{1\text{cm}} = (1\text{in})/(1\text{cm}) = 2.54.
\]

Functions are called on the value of their argument, contrarily to \LaTeX macros.

28.9.3 Operations

We now present the various operations allowed in floating point expressions, from the lowest precedence to the highest. When used as a truth value, a floating point expression is \texttt{false} if it is \pm 0, and \texttt{true} otherwise, including when it is \texttt{nan} or a tuple such as (0, 0). Tuples are only supported to some extent by operations that work with truth values (\texttt{?:}, \texttt{||}, \texttt{&&}, \texttt{!}), by comparisons (!\texttt{<=}?), and by \texttt{+, -, *, /}. Unless otherwise specified, providing a tuple as an argument of any other operation yields the “invalid operation” exception and a \texttt{nan} result.

251
The ternary operator `?:` results in \( \langle \text{operand}2 \rangle \) if \( \langle \text{operand}1 \rangle \) is true (not ±0), and \( \langle \text{operand}3 \rangle \) if \( \langle \text{operand}1 \rangle \) is false (±0). All three \( \langle \text{operands} \rangle \) are evaluated in all cases; they may be tuples. The operator is right associative, hence

\[
\text{\texttt{\texttt{fp\_eval\_n \{ (operand_1) ? (operand_2) : (operand_3) \}}}\]

first tests whether \( 1 + 3 > 4 \); since this isn’t true, the branch following : is taken, and \( 2 + 4 > 5 \) is compared; since this is true, the branch before : is taken, and everything else is (evaluated then) ignored. That allows testing for various cases in a concise manner, with the drawback that all computations are made in all cases.

\[
\text{\texttt{\texttt{fp\_eval\_n \{ (operand_1) \|\| (operand_2) \}}}\]

If \( \langle \text{operand}_1 \rangle \) is true (not ±0), use that value, otherwise the value of \( \langle \text{operand}_2 \rangle \). Both \( \langle \text{operands} \rangle \) are evaluated in all cases; they may be tuples. In \( \langle \text{operand}_1 \rangle \|\| \ldots \|\| \langle \text{operands}_n \rangle \), the first true (nonzero) \( \langle \text{operand} \rangle \) is used and if all are zero the last one (±0) is used.

\[
\text{\texttt{\texttt{fp\_eval\_n \{ (operand_1) \&\& (operand_2) \}}}\]

If \( \langle \text{operand}_1 \rangle \) is false (equal to ±0), use that value, otherwise the value of \( \langle \text{operand}_2 \rangle \). Both \( \langle \text{operands} \rangle \) are evaluated in all cases; they may be tuples. In \( \langle \text{operand}_1 \rangle \&\& \ldots \&\& \langle \text{operands}_n \rangle \), the first false (±0) \( \langle \text{operand} \rangle \) is used and if none is zero the last one is used.

Each \( \langle \text{relation} \rangle \) consists of a non-empty string of \(<\>, =\), or \(?\), optionally preceded by \(!\), and may not start with \(\?\). This evaluates to +1 if all comparisons \( \langle \text{operand}_1 \rangle \langle \text{relation}_1 \rangle \langle \text{operand}_{N+1} \rangle \) are true, and +0 otherwise. All \( \langle \text{operands} \rangle \) are evaluated (once) in all cases. See \texttt{fp\_compare\_nTF} for details.

\[
\text{\texttt{\texttt{fp\_eval\_n \{ (operand_1) + (operand_2) \}}}\]
\[
\text{\texttt{\texttt{fp\_eval\_n \{ (operand_1) - (operand_2) \}}}\]

Computes the sum or the difference of its two \( \langle \text{operands} \rangle \). The “invalid operation” exception occurs for \( -\infty - \infty \). “Underflow” and “overflow” occur when appropriate. These operations supports the itemwise addition or subtraction of two tuples, but if they have a different number of items the “invalid operation” exception occurs and the result is \texttt{nan}. 

252
\[ \text{ Computes the product or the ratio of its two operands. The “invalid operation” exception occurs for } \infty/\infty, 0/0, \text{ or } 0 \times \infty. \text{ “Division by zero” occurs when dividing a finite non-zero number by } \pm 0. \text{ “Underflow” and “overflow” occur when appropriate. When } \langle \text{operand}_1 \rangle \text{ is a tuple and } \langle \text{operand}_2 \rangle \text{ is a floating point number, each item of } \langle \text{operand}_1 \rangle \text{ is multiplied or divided by } \langle \text{operand}_2 \rangle. \text{ Other combinations yield an “invalid operation” exception and a nan result.} \]

\[ \text{ The unary } + \text{ does nothing, the unary } - \text{ changes the sign of the } \langle \text{operand} \rangle \text{ (for a tuple, of all its components), and } ! \langle \text{operand} \rangle \text{ evaluates to } 1 \text{ if } \langle \text{operand} \rangle \text{ is false (is } \pm 0 \text{) and } 0 \text{ otherwise (this is the not boolean function). Those operations never raise exceptions.} \]

\[ \text{ Raises } \langle \text{operand}_1 \rangle \text{ to the power } \langle \text{operand}_2 \rangle. \text{ This operation is right associative, hence } 2^{2^3} = 256. \text{ If } \langle \text{operand}_1 \rangle \text{ is negative or } -0 \text{ then: the result’s sign is } + \text{ if the } \langle \text{operand}_2 \rangle \text{ is infinite and } (-1)^p \text{ if the } \langle \text{operand}_2 \rangle \text{ is } p/5^q \text{ with } p, q \text{ integers; the result is } +0 \text{ if } \text{abs}(\langle \text{operand}_1 \rangle)^{\langle \text{operand}_2 \rangle} \text{ evaluates to zero; in other cases the “invalid operation” exception occurs because the sign cannot be determined. “Division by zero” occurs when raising } \pm 0 \text{ to a finite strictly negative power. “Underflow” and “overflow” occur when appropriate. If either operand is a tuple, “invalid operation” occurs.} \]

\[ \text{ Computes the absolute value of the } \langle \text{fpexpr} \rangle. \text{ If the operand is a tuple, “invalid operation” occurs. This operation does not raise exceptions in other cases. See also } \text{abs}. \]

\[ \text{ Computes the exponential of the } \langle \text{fpexpr} \rangle. \text{ “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.} \]

\[ \text{ Computes the factorial of the } \langle \text{fpexpr} \rangle. \text{ If the } \langle \text{fpexpr} \rangle \text{ is an integer between } -0 \text{ and } 3248 \text{ included, the result is finite and correctly rounded. Larger positive integers give } +\infty \text{ with “overflow”, while } \text{fact}(+\infty) = +\infty \text{ and } \text{fact(nan)} = \text{nan} \text{ with no exception. All other inputs give nan with the “invalid operation” exception.} \]

\[ \text{ Computes the natural logarithm of the } \langle \text{fpexpr} \rangle. \text{ Negative numbers have no (real) logarithm, hence the “invalid operation” is raised in that case, including for } \ln(-0). \text{ “Division by zero” occurs when evaluating } \ln(0) = -\infty. \text{ “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.} \]

253
Determines the exponent of the ⟨fpexpr⟩, namely the floor of the base-10 logarithm of its absolute value. “Division by zero” occurs when evaluating \( \log_{10}(\pm 0) = -\infty \). Other special values are \( \log_{10}(\pm \infty) = +\infty \) and \( \log_{10}(\text{nan}) = \text{nan} \). If the operand is a tuple or is \text{nan}, then “invalid operation” occurs and the result is \text{nan}.

Evaluates each ⟨fpexpr⟩ and computes the largest (smallest) of those. If any of the ⟨fpexpr⟩ is a \text{nan} or tuple, the result is \text{nan}. If any operand is a tuple, “invalid operation” occurs; these operations do not raise exceptions in other cases.

Only \text{round} accepts a third argument. Evaluates \( \langle \text{fpexpr}_1 \rangle = x \) and \( \langle \text{fpexpr}_2 \rangle = n \) and \( \langle \text{fpexpr}_3 \rangle = t \) then rounds \( x \) to \( n \) places. If \( n \) is an integer, this rounds \( x \) to a multiple of \( 10^{-n} \); if \( n = +\infty \), this always yields \( x \); if \( n = -\infty \), this yields one of \( \pm 0 \), \( \pm \infty \), or \text{nan}; if \( n = \text{nan} \), this yields \text{nan}; if \( n \) is neither \( \pm \infty \) nor an integer, then an “invalid operation” exception is raised. When \( \langle \text{fpexpr}_2 \rangle \) is omitted, \( n = 0 \), i.e., \( \langle \text{fpexpr}_1 \rangle \) is rounded to an integer. The rounding direction depends on the function.

- \text{round} yields the multiple of \( 10^{-n} \) closest to \( x \), with ties (\( x \) half-way between two such multiples) rounded as follows. If \( t \) is \text{nan} (or not given) the even multiple is chosen (“ties to even”), if \( t = \pm 0 \) the multiple closest to \( 0 \) is chosen (“ties to zero”), if \( t \) is positive/negative the multiple closest to \( \infty/\infty \) is chosen (“ties towards positive/negative infinity”).
- \text{floor} yields the largest multiple of \( 10^{-n} \) smaller or equal to \( x \) (“round towards negative infinity”);
- \text{ceil} yields the smallest multiple of \( 10^{-n} \) greater or equal to \( x \) (“round towards positive infinity”);
- \text{trunc} yields a multiple of \( 10^{-n} \) with the same sign as \( x \) and with the largest absolute value less than that of \( x \) (“round towards zero”).

“Overflow” occurs if \( x \) is finite and the result is infinite (this can only happen if \( \langle \text{fpexpr}_2 \rangle < -9984 \)). If any operand is a tuple, “invalid operation” occurs.

Evaluates the ⟨fpexpr⟩ and determines its sign: \(+1\) for positive numbers and for \(+\infty\), \(-1\) for negative numbers and for \(-\infty\), \(\pm 0\) for \(\pm 0\), and \text{nan} for \text{nan}. If the operand is a tuple, “invalid operation” occurs. This operation does not raise exceptions in other cases.
Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the \(<\text{fpexpr}>\) given in radians. For arguments given in degrees, see sind, cosd, etc. Note that since π is irrational, \(\sin(8\pi)\) is not quite zero, while its analogue sind\((8 \times 180)\) is exactly zero. The trigonometric functions are undefined for an argument of ±∞, leading to the “invalid operation” exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a “division by zero” exception. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

Computes the arcsine, arccosine, arccosecant, or arccoscent of the \(<\text{fpexpr}>\) and returns the result in radians, in the range \([-\pi/2, \pi/2]\) for asin and acsc and \([0, \pi]\) for acos and asec. For a result in degrees, use asind, etc. If the argument of asin or acos lies outside the range \([-1, 1]\), or the argument of acsc or asec inside the range \((-1, 1)\), an “invalid operation” exception is raised. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

Computes the arcsine, arccosine, arccosecant, or arccosent of the \(<\text{fpexpr}>\) and returns the result in degrees, in the range \([-90, 90]\) for asin and acsc and \([0, 180]\) for acos and asec. For a result in radians, use asind, etc. If the argument of asin or acos lies outside the range \([-1, 1]\), or the argument of acsc or asec inside the range \((-1, 1)\), an “invalid operation” exception is raised. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.
\[\texttt{atan} \quad \texttt{fp_eval:n \{ atan( \langle fpexpr \rangle ) \}}\]
\[\texttt{acot} \quad \texttt{fp_eval:n \{ acot( \langle fpexpr \rangle ) \}}\]
\[\texttt{atand} \quad \texttt{fp_eval:n \{ atand( \langle fpexpr \rangle ) \}}\]
\[\texttt{acotd} \quad \texttt{fp_eval:n \{ acotd( \langle fpexpr \rangle ) \}}\]
\[\texttt{atan} \quad \texttt{fp_eval:n \{ atan( \langle fpexpr \rangle \), \langle fpexpr2 \rangle ) \}}\]
\[\texttt{acot} \quad \texttt{fp_eval:n \{ acot( \langle fpexpr \rangle \), \langle fpexpr2 \rangle ) \}}\]

Those functions yield an angle in radians: \texttt{atand} and \texttt{acotd} are their analogs in degrees.

The one-argument versions compute the arctangent or arccotangent of the \(\langle fpexpr \rangle\): arctangent takes values in the range \([-\pi/2, \pi/2]\), and arccotangent in the range \([0, \pi]\). The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates \((\langle fpexpr2 \rangle, \langle fpexpr1 \rangle)\): this is the arctangent of \(\langle fpexpr1 \rangle / \langle fpexpr2 \rangle\), possibly shifted by \(\pi\) depending on the signs of \(\langle fpexpr1 \rangle\) and \(\langle fpexpr2 \rangle\). The two-argument arccotangent computes the angle in polar coordinates of the point \((\langle fpexpr1 \rangle, \langle fpexpr2 \rangle)\), equal to the arccotangent of \(\langle fpexpr1 \rangle / \langle fpexpr2 \rangle\), possibly shifted by \(\pi\). Both two-argument functions take values in the wider range \([-\pi, \pi]\). The ratio \(\langle fpexpr1 \rangle / \langle fpexpr2 \rangle\) need not be defined for the two-argument arctangent: when both expressions yield \(\pm 0\), or when both yield \(\pm \infty\), the resulting angle is one of \(\{\pm \pi/4, \pm 3\pi/4\}\) depending on signs. The “underflow” exception can occur. If any operand is a tuple, “invalid operation” occurs.

\[\texttt{atand} \quad \texttt{fp_eval:n \{ atand( \langle fpexpr \rangle ) \}}\]
\[\texttt{acotd} \quad \texttt{fp_eval:n \{ acotd( \langle fpexpr \rangle ) \}}\]
\[\texttt{atan} \quad \texttt{fp_eval:n \{ atan( \langle fpexpr \rangle \), \langle fpexpr2 \rangle ) \}}\]
\[\texttt{acot} \quad \texttt{fp_eval:n \{ acot( \langle fpexpr \rangle \), \langle fpexpr2 \rangle ) \}}\]

Those functions yield an angle in degrees: \texttt{atand} and \texttt{acotd} are their analogs in radians. The one-argument versions compute the arctangent or arccotangent of the \(\langle fpexpr \rangle\): arctangent takes values in the range \([-90, 90]\), and arccotangent in the range \([0, 180]\). The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates \((\langle fpexpr2 \rangle, \langle fpexpr1 \rangle)\): this is the arctangent of \(\langle fpexpr1 \rangle / \langle fpexpr2 \rangle\), possibly shifted by 180 depending on the signs of \(\langle fpexpr1 \rangle\) and \(\langle fpexpr2 \rangle\). The two-argument arccotangent computes the angle in polar coordinates of the point \((\langle fpexpr1 \rangle, \langle fpexpr2 \rangle)\), equal to the arccotangent of \(\langle fpexpr1 \rangle / \langle fpexpr2 \rangle\), possibly shifted by 180. Both two-argument functions take values in the wider range \([-180, 180]\). The ratio \(\langle fpexpr1 \rangle / \langle fpexpr2 \rangle\) need not be defined for the two-argument arctangent: when both expressions yield \(\pm 0\), or when both yield \(\pm \infty\), the resulting angle is one of \(\{\pm 45, \pm 135\}\) depending on signs. The “underflow” exception can occur. If any operand is a tuple, “invalid operation” occurs.

\[\texttt{sqrt} \quad \texttt{fp_eval:n \{ sqrt( \langle fpexpr \rangle ) \}}\]

Computes the square root of the \(\langle fpexpr \rangle\). The “invalid operation” is raised when the \(\langle fpexpr \rangle\) is negative or is a tuple; no other exception can occur. Special values yield \(\sqrt{-0} = -0\), \(\sqrt{+0} = +0\), \(\sqrt{-\infty} = +\infty\) and \(\sqrt{\text{nan}} = \text{nan}\).
\fp_eval:n { rand() }  

Prodces a pseudo-random floating-point number (multiple of $10^{-16}$) between 0 included and 1 excluded. This is not available in older versions of Xe\TeX. The random seed can be queried using \sys_rand_seed: and set using \sys_gset_rand_seed:n.

\TeXhackers note: This is based on pseudo-random numbers provided by the engine's primitive \pdfuniformdeviate in pdf\TeX, \pdfL\TeX, up\TeX and \uniformdeviate in Lua\TeX and Xe\TeX. The underlying code is based on MetaPost, which follows an additive scheme recommended in Section 3.6 of “The Art of Computer Programming, Volume 2”.

While we are more careful than \uniformdeviate to preserve uniformity of the underlying stream of 28-bit pseudo-random integers, these pseudo-random numbers should of course not be relied upon for serious numerical computations nor cryptography.

\fp_eval:n { randint(⟨fpexpr⟩) }  
\fp_eval:n { randint(⟨fpexpr⟩, ⟨fpexpr⟩) }

Produce a pseudo-random integer between 1 and ⟨fpexpr⟩ or between ⟨fpexpr₁⟩ and ⟨fpexpr₂⟩ inclusive. The bounds must be integers in the range ($-10^{16}, 10^{16}$) and the first must be smaller or equal to the second. See \rand for important comments on how these pseudo-random numbers are generated.

\inf The special values $+\infty$, $-\infty$, and \nan are represented as \inf, \minus\inf and \nan (see \c_\inf_fp, \c_minus_inf_fp and \c_nan_fp).

\Pi The value of $\pi$ (see \c_pi_fp).

\deg The value of $1^\circ$ in radians (see \c_one_degree_fp).
Those units of measurement are equal to their values in pt, namely
\[ 1 \text{ in} = 72.27 \text{ pt} \]
\[ 1 \text{ pt} = 1 \text{ pt} \]
\[ 1 \text{ pc} = 12 \text{ pt} \]
\[ 1 \text{ cm} = \frac{1}{25.4} \text{ in} = 28.45275590551181 \text{ pt} \]
\[ 1 \text{ mm} = \frac{1}{25.4} \text{ in} = 2.845275590551181 \text{ pt} \]
\[ 1 \text{ dd} = 0.376065 \text{ mm} = 1.07000856496063 \text{ pt} \]
\[ 1 \text{ cc} = 12 \text{ dd} = 12.84010277952756 \text{ pt} \]
\[ 1 \text{ nd} = 0.375 \text{ mm} = 1.066978346456693 \text{ pt} \]
\[ 1 \text{ nc} = 12 \text{ nd} = 12.80374015748031 \text{ pt} \]
\[ 1 \text{ bp} = \frac{1}{72} \text{ in} = 1.00375 \text{ pt} \]
\[ 1 \text{ sp} = 2^{-16} \text{ pt} = 1.52587890625 \times 10^{-5} \text{ pt}. \]

The values of the (font-dependent) units \texttt{em} and \texttt{ex} are gathered from \TeXX when the surrounding floating point expression is evaluated.

\begin{verbatim}
\texttt{true} \texttt{false}
\end{verbatim}

\begin{verbatim}
\texttt{\fp_abs:n} \texttt{\fp_abs:n} \{\texttt{(floating point expression)}\}
\end{verbatim}

Evaluates the \texttt{(floating point expression)} as described for \texttt{\fp_eval:n} and leaves the absolute value of the result in the input stream. If the argument is \( \pm \infty \), \texttt{nan} or a tuple, “invalid operation” occurs. Within floating point expressions, \texttt{abs()} can be used; it accepts \( \pm \infty \) and \texttt{nan} as arguments.

\begin{verbatim}
\texttt{\fp_max:nn} \texttt{\fp_min:nn} \{\texttt{(fp expression 1)}\} \{\texttt{(fp expression 2)}\}
\end{verbatim}

Evaluates the \texttt{(floating point expressions)} as described for \texttt{\fp_eval:n} and leaves the resulting larger \texttt{(max)} or smaller \texttt{(min)} value in the input stream. If the argument is a tuple, “invalid operation” occurs, but no other case raises exceptions. Within floating point expressions, \texttt{max()} and \texttt{min()} can be used.

### 28.10 Disclaimer and roadmap

The package may break down if the escape character is among \texttt{0123456789+}, or if it receives a \TeX\ primitive conditional affected by \texttt{\exp_not:N}.

The following need to be done. I’ll try to time-order the items.

- Function to count items in a tuple (and to determine if something is a tuple).
- Decide what exponent range to consider.
• Support signalling \texttt{nan}.

• Modulo and remainder, and rounding function \texttt{quantize} (and its friends analogous to \texttt{trunc}, \texttt{ceil}, \texttt{floor}).

\begin{verbatim}
\fp_format:nn \{fexpr\} \{format\}, but what should \texttt{format} be? More general pretty printing?
\end{verbatim}

• Add \texttt{and}, \texttt{or}, \texttt{xor}? Perhaps under the names \texttt{all}, \texttt{any}, and \texttt{xor}?

• Add $\log(x,b)$ for logarithm of $x$ in base $b$.

• \texttt{hypot} (Euclidean length). Cartesian-to-polar transform.

• Hyperbolic functions \texttt{cosh}, \texttt{sinh}, \texttt{tanh}.

• Inverse hyperbolics.

• Base conversion, input such as \texttt{0xAB.CDEF}.

• Factorial (not with \texttt{!}), gamma function.

• Improve coefficients of the \texttt{sin} and \texttt{tan} series.

• Treat upper and lower case letters identically in identifiers, and ignore underscores.

• Add an \texttt{array(1,2,3)} and \texttt{i=complex(0,1)}.

• Provide an experimental \texttt{map} function? Perhaps easier to implement if it is a single character, \texttt{@sin(1,2)}?

• Provide an \texttt{isnan} function analogue of \texttt{\fp_if_nan:nTF}?

• Support keyword arguments?

\texttt{Pgfmath} also provides box-measurements (depth, height, width), but boxes are not possible expandably.

Bugs, and tests to add.

• Check that functions are monotonic when they should.

• Add exceptions to ?, !<=>?, &&, ||, and !.

• Logarithms of numbers very close to 1 are inaccurate.

• When rounding towards $-\infty$, \texttt{\dim_to_fp:n \{0pt\}} should return $-0$, not $+0$.

• The result of $(\pm 0) + (\pm 0)$, of $x + (-x)$, and of $(-x) + x$ should depend on the rounding mode.

• \texttt{0e9999999999} gives a \TeX{} “number too large” error.

• Subnormals are not implemented.

Possible optimizations/improvements.

• Document that \texttt{l3trial/l3fp-types} introduces tools for adding new types.

• In subsection 28.9.1, write a grammar.
• It would be nice if the \texttt{parse} auxiliaries for each operation were set up in the 
corresponding module, rather than centralizing in \texttt{l3fp-parse}.

• Some functions should get an \_o ending to indicate that they expand after their 
result.

• More care should be given to distinguish expandable/restricted expandable (auxil-
iary and internal) functions.

• The code for the \texttt{ternary} set of functions is ugly.

• There are many - missing in the doc to avoid bad line-breaks.

• The algorithm for computing the logarithm of the significand could be made to use 
a 5 terms Taylor series instead of 10 terms by taking \( c = 2000/(\lfloor 200x \rfloor + 1) \in [10, 95] \) 
instead of \( c \in [1, 10] \). Also, it would then be possible to simplify the computation 
of \( t \). However, we would then have to hard-code the logarithms of 44 small integers 
instead of 9.

• Improve notations in the explanations of the division algorithm (\texttt{l3fp-basics}).

• Understand and document \texttt{\_\_fp_basics_pack_weird_low:NNNNw} and \texttt{\_\_fp_-} 
\texttt{basics_pack_weird_high:NNNNNNNNNw} better. Move the other \texttt{basics_pack} auxil-
iaries to \texttt{l3fp-aux} under a better name.

• Find out if underflow can really occur for trigonometric functions, and redoc as 
appropriate.

• Add bibliography. Some of Kahan’s articles, some previous \texttt{TEX fp} packages, the 
international standards,\ldots

• Also take into account the “inexact” exception?

• Support multi-character prefix operators (\textit{e.g.}, \texttt{@/} or whatever)?
Chapter 29

The \texttt{l3fparray} package: fast global floating point arrays

29.1 \texttt{l3fparray} documentation

For applications requiring heavy use of floating points, this module provides arrays which can be accessed in constant time (contrast \texttt{l3seq}, where access time is linear). The interface is very close to that of \texttt{l3intarray}. The size of the array is fixed and must be given at point of initialisation

\begin{verbatim}
\fparray_new:Nn \fparray_new:Nn \fparray \langle \text{size} \rangle
\end{verbatim}

Evaluates the integer expression \texttt{(size)} and allocates an \texttt{(floating point array variable)} with that number of (zero) entries. The variable name should start with \texttt{\g_} because assignments are always global.

\begin{verbatim}
\fparray_count:N \fparray_count:N \fparray \langle \text{floating point array variable} \rangle
\end{verbatim}

Expands to the number of entries in the \texttt{(floating point array variable)}. This is performed in constant time.

\begin{verbatim}
\fparray_gset:Nnn \fparray_gset:Nnn \fparray \langle \text{position} \rangle \langle \text{value} \rangle
\end{verbatim}

Stores the result of evaluating the floating point expression \texttt{(value)} into the \texttt{(floating point array variable)} at the \texttt{(integer expression) (position)}. If the \texttt{(position)} is not between 1 and the \texttt{\fparray_count:N}, an error occurs. Assignments are always global.

\begin{verbatim}
\fparray_gzero:N \fparray_gzero:N \fparray \langle \text{floating point array variable} \rangle
\end{verbatim}

Sets all entries of the \texttt{(floating point array variable)} to +0. Assignments are always global.

\begin{verbatim}
\fparray_item:Nn \fparray_item:Nn \fparray \langle \text{position} \rangle
\fparray_item_to_tl:Nn \fparray_item_to_tl:Nn \fparray \langle \text{position} \rangle
\end{verbatim}

Applies \texttt{\fp_use:N} or \texttt{\fp_to_tl:N} (respectively) to the floating point entry stored at the \texttt{(integer expression) (position)} in the \texttt{(floating point array variable)}. If the \texttt{(position)} is not between 1 and the \texttt{\fparray_count:N}, an error occurs.
Chapter 30

The \texttt{l3cctab} package

Category code tables

A category code table enables rapid switching of all category codes in one operation. For \LaTeX{}, this is possible over the entire Unicode range. For other engines, only the 8-bit range (0–255) is covered by such tables.

30.1 Creating and initialising category code tables

\begin{verbatim}
\cctab_new:N \cctab_new:Nn \cctab_new:c \cctab_const:Nn \cctab_const:cn \cctab_gset:Nn \cctab_gset:cn
\end{verbatim}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\cctab_new:N</td>
<td>Creates a new \langle category code table \rangle variable or raises an error if the name is already taken. The declaration is global. The \langle category code table \rangle is initialised with the codes as used by ini\TeX{}.</td>
</tr>
<tr>
<td>\cctab_new:c</td>
<td></td>
</tr>
<tr>
<td>\cctab_const:Nn</td>
<td>Creates a new \langle category code table \rangle, applies (in a group) the \langle category code set up \rangle on top of ini\TeX{} settings, then saves them globally as a constant table. The \langle category code set up \rangle can include a call to \cctab_select:N.</td>
</tr>
<tr>
<td>\cctab_const:cn</td>
<td></td>
</tr>
<tr>
<td>\cctab_gset:Nn</td>
<td>Starting from the ini\TeX{} category codes, applies (in a group) the \langle category code set up \rangle, then saves them globally in the \langle category code table \rangle. The \langle category code set up \rangle can include a call to \cctab_select:N.</td>
</tr>
<tr>
<td>\cctab_gset:cn</td>
<td></td>
</tr>
</tbody>
</table>

30.2 Using category code tables

\begin{verbatim}
\cctab_begin:N \cctab_begin:c
\end{verbatim}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\cctab_begin:N</td>
<td>Switches locally the category codes in force to those stored in the \langle category code table \rangle. The prevailing codes before the function is called are added to a stack, for use with \cctab_end:. This function does not start a \TeX{} group.</td>
</tr>
<tr>
<td>\cctab_begin:c</td>
<td></td>
</tr>
</tbody>
</table>
\cctab_end: \cctab_end:  
Updated: 2020-07-02

Ends the scope of a \langle category code table \rangle started using \cctab_begin:N, returning the codes to those in force before the matching \cctab_begin:N was used. This must be used within the same TeX group (and at the same TeX group level) as the matching \cctab_begin:N.

\cctab_select:N \cctab_select:N \langle category code table \rangle  
Updated: 2020-06-19

\cctab_select: \cctab_select:c  \langle category code table \rangle

Selects the \langle category code table \rangle for the scope of the current group. This is in particular useful in the \langle setup \rangle arguments of \tl_set_rescan:Nnn, \tl_rescan:nn, \cctab_const:Nn, and \cctab_gset:Nn.

\cctab_item:Nn \cctab_item:Nn \langle category code table \rangle \{\langle integer expression \rangle\}  
Updated: 2021-06-10

\cctab_item:Nn \cctab_item:cn \star \cctab_item:cn \star  
\cctab_item:Nn \cctab_item:cn \star  

Determines the \langle character \rangle with character code given by the \langle integer expression \rangle and expands to its category code specified by the \langle category code table \rangle.

### 30.3 Category code table conditionals

\cctab_if_exist_p:N \cctab_if_exist_p:N \langle category code table \rangle  
Updated: 2020-07-02

\cctab_if_exist_p:c \star \cctab_if_exist_p:c \star  
\cctab_if_exist:NTF \cctab_if_exist:NTF \langle category code table \rangle \{\langle true code \rangle\} \{\langle false code \rangle\}  
\cctab_if_exist:c \cctab_if_exist:c \star

Tests whether the \langle category code table \rangle is currently defined. This does not check that the \langle category code table \rangle really is a category code table.

### 30.4 Constant category code tables

\c_code_cctab  \c_code_cctab  
Updated: 2020-07-10

Category code table for the expl3 code environment; this does not include $\Phi$, which is retained as an “other” character.

\c_document_cctab \c_document_cctab  
Updated: 2020-07-08

Category code table for a standard LaTeX document, as set by the LaTeX kernel. In particular, the upper-half of the 8-bit range will be set to “active” with pdfTeX only. No babel shorthands will be activated.

\c_initex_cctab \c_initex_cctab  
Updated: 2020-07-02

Category code table as set up by initex.

\c_other_cctab \c_other_cctab  
Updated: 2020-07-02

Category code table where all characters have category code 12 (other).

\c_str_cctab \c_str_cctab  
Updated: 2020-07-02

Category code table where all characters have category code 12 (other) with the exception of spaces, which have category code 10 (space).
Part V
Text manipulation
Chapter 31

The \texttt{l3unicode} package: Unicode support functions

This module provides Unicode-specific functions along with loading data from a range of Unicode Consortium files. Most of the code here is internal, but there are a small set of public functions. These work with Unicode (\textit{codepoints}) and are designed to give useable results with both Unicode-aware and 8-bit engines.
\codepoint_generate:nn \codepoint_generate:nn {⟨codepoint⟩} {⟨catcode⟩}

Generates one or more character tokens representing the ⟨codepoint⟩. With Unicode engines, exactly one character token will be generated, and this will have the ⟨catcode⟩ specified as the second argument:

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 10 (space)
- 11 (letter)
- 12 (other)
- 13 (active)

For 8-bit engines, between one and four character tokens will be produced: these will be the bytes of the UTF-8 representation of the ⟨codepoint⟩. For all codepoints outside of the classical ASCII range, the generated character tokens will be active (category code 13); for codepoints in the ASCII range, the given ⟨catcode⟩ will be used. To allow the result of this function to be used inside a expansion context, the result is protected by \exp_not:n.

\codepoint_str_generate:n \codepoint_str_generate:n {⟨codepoint⟩}

Generates one or more character tokens representing the ⟨codepoint⟩. With Unicode engines, exactly one character token will be generated. For 8-bit engines, between one and four character tokens will be produced: these will be the bytes of the UTF-8 representation of the ⟨codepoint⟩. All of the generated character tokens will be of category code 12, except any spaces (codepoint 32), which will be category code 10.

\codepoint_to_nfd:n \codepoint_to_nfd:n {⟨codepoint⟩}

Converts the ⟨codepoint⟩ to the Unicode Normalization Form Canonical Decomposition. The generated character(s) will have the current category code as they would if typed in directly for Unicode engines; for 8-bit engines, active characters are used for all codepoints outside of the ASCII range.
Chapter 32

The \texttt{l3text} package: text processing

This module deals with manipulation of (formatted) text; such material is comprised of a restricted set of token list content. The functions provided here concern conversion of textual content for example in case changing, generation of bookmarks and extraction to tags. All of the major functions operate by expansion. Begin-group and end-group tokens in the \langle \text \rangle are normalized and become \{ and \}, respectively.

### 32.1 Expanding text

\texttt{\textexpand:n} \* \texttt{\textexpand:n \{\text\}}

Takes user input \langle \text \rangle and expands the content. Protected commands (typically formatting) are left in place, and no processing takes place of math mode material (as delimited by pairs given in \texttt{l_text_math_delims_tl} or as the argument to commands listed in \texttt{l_text_math_arg_tl}). Commands which are neither engine- nor \LaTeX{} protected are expanded exhaustively. Any commands listed in \texttt{l_textexpand_exclude_tl}, \texttt{l_text_accents_tl} and \texttt{l_text_letterlike_tl} are excluded from expansion.

\texttt{\textdeclareexpandequivalent:Nn} \texttt{\textdeclareexpandequivalent:cn}

\texttt{\textdeclareexpandequivalent:Nn \textdeclareexpandequivalent:cn \{\cmd\} \{\replacement\}}

\texttt{New: 2020-01-02}

Declares that the \langle \replacement \rangle tokens should be used whenever the \langle \cmd \rangle (a single token) is encountered. The \langle \replacement \rangle tokens should be expandable.
32.2 Case changing

Takes user input \textit{(text)} first applies \texttt{\texttt{text_expand}}, then transforms the case of character tokens as specified by the function name. The category code of letters are not changed by this process when Unicode engines are used; in 8-bit engines, case changed charters in the ASCII range will have the current prevailing category code, while those outside of it will be represented by active characters.

Upper- and lowercase have the obvious meanings. Titlecasing may be regarded informally as converting the first character of the (tokens) to uppercase and the rest to lowercase. However, the process is more complex than this as there are some situations where a single lowercase character maps to a special form, for example ij in Dutch which becomes IJ. The titlecase\_first variant does not attempt any case changing at all after the first letter has been processed.

Importantly, notice that these functions are intended for working with user text for typesetting. For case changing programmatic data see the l3str module and discussion there of \texttt{\texttt{str_lowercase:n}}, \texttt{\texttt{str_uppercase:n}} and \texttt{\texttt{str_casefold:n}}.

Case changing does not take place within math mode material so for example

\begin{verbatim}
\texttt{\texttt{text_uppercase:n \{ Some-text-$y = mx + c$-with\{Braces\} \}}}
\end{verbatim}

becomes

\texttt{\texttt{SOME TEXT$y = mx + c$ \text{WITH} \{BRACES\}}}

The first mandatory argument of commands listed in \texttt{l_text_cancel_exclude_arg-tl} is excluded from case changing; the latter are entirely non-textual content (such as labels).

The standard mappings here follow those defined by the Unicode Consortium in UnicodeData.txt and SpecialCasing.txt. For \TeX, only the ASCII range is covered as the engine treats input outside of this range as east Asian.

Language-sensitive conversions are enabled using the (language) argument, and follow Unicode Consortium guidelines. Currently, the languages recognised for special handling are as follows.

- **Armenian** (hy and hy-x-yiwn) The setting hy maps the codepoint U+0587, the ligature of letters ech and yiw, to the codepoints for capital ech and vew when uppercasing: this follows the spelling reform which is used in Armenia. The alternative hy-x-yiwn maps U+0587 to capital ech and yiwn on uppercasing (also the output if Armenian is not selected at all).

- **Azeri and Turkish** (az and tr). The case pairs l/i-dotless and I-dot/i are activated for these languages. The combining dot mark is removed when lowercasing I-dot and introduced when upper casing i-dotless.

- **German** (de-x-eszett). An alternative mapping for German in which the lowercase \textit{Eszett} maps to a \textit{großes Eszett}. Since there is a T1 slot for the \textit{großes Eszett} in T1, this tailoring \textit{is} available with pdFTeX as well as in the Unicode TeX engines.
• Greek (el). Removes accents from Greek letters when uppercasing; titlecasing leaves accents in place. A variant el-x-iota is available which retains the _syggrammeni_ (subscript muted iota) when uppercasing: the standard version converts these to a following capital iota.

• Lithuanian (lt). The lowercase letters i and j should retain a dot above when the accents grave, acute or tilde are present. This is implemented for lowercasing of the relevant uppercase letters both when input as single Unicode codepoints and when using combining accents. The combining dot is removed when uppercasing in these cases. Note that only the accents used in Lithuanian are covered: the behaviour of other accents are not modified.

• Medieval Latin (la-xmedieval). The characters u and V are interchanged on case changing.

• Dutch (nl). Capitalisation of iJ at the beginning of titlecased input produces IJ rather than Ij. The output retains two separate letters, thus this transformation is available using pdftex.

For titlecasing, note that there are two functions available. The function \text_titlecase:n applies (broadly) uppercasing to the first letter of the input, then lowercasing to the remainder. In contrast, \text_titlecase_first:n only carries out the uppercasing operation, and leaves the balance of the input unchanged. Determining whether non-letter characters at the start of text should switch from upper- to lowercasing is controllable. When \_l_text_titlecase_check_letter_bool is true, characters which are not letters (category code 11) are left unchanged and “skipped”: the first letter is uppercased. (With 8-bit engines, this is extended to active characters which form part of a multi-byte letter codepoint.) When \_l_text_titlecase_check_letter_bool is false, the first character is uppercased, and the rest lowercased, irrespective of the nature of the character.

\text_declare_case_equivalent:Nn \text_declare_case_equivalent:Nn ⟨cmd⟩ {⟨replacement⟩}
\text_declare_case_equivalent:cn

Declares that the ⟨replacement⟩ tokens should be used whenever the ⟨cmd⟩ (a single token) is encountered during case changing.

\text_case_switch:nnnn * \text_case_switch:nnnn {⟨normal⟩} {⟨upper⟩} {⟨lower⟩} {⟨title⟩}

Context-sensitive function which will expand to one of the ⟨normal⟩, ⟨upper⟩, ⟨lower⟩ or ⟨title⟩ tokens depending on the current case changing operation. Outside of case changing, the ⟨normal⟩ tokens are produced. Within case changing, the appropriate mapping tokens are inserted.
32.3 Removing formatting from text

\text_purify:n \text_purify:n \langle\textrangle

Takes user input \langle\textrangle and expands as described for \text_expand:n, then removes all functions from the resulting text. Math mode material (as delimited by pairs given in \l_text_math_delims_tl or as the argument to commands listed in \l_text_math_arg_tl) is left contained in a pair of $ delimiters. Non-expandable functions present in the \langle\textrangle must either have a defined equivalent (see \text_declare_purify_equivalent:Nn) or will be removed from the result. Implicit tokens are converted to their explicit equivalent.

\text_declare_purify_equivalent:Nn \text_declare_purify_equivalent:Nn (cmd) \langle replacement\rangle

\text_declare_purify_equivalent:Nx

Declares that the \langle replacement\rangle tokens should be used whenever the \langle cmd\rangle (a single token) is encountered. The \langle replacement\rangle tokens should be expandable.

32.4 Control variables

\l_text_accents_tl

Lists commands which represent accents, and which are left unchanged by expansion. (Defined only for the \LaTeX2ε package.)

\l_text_letterlike_tl

Lists commands which represent letters; these are left unchanged by expansion. (Defined only for the \LaTeX2ε package.)

\l_text_math_arg_tl

Lists commands present in the \langle text\rangle where the argument of the command should be treated as math mode material. The treatment here is similar to \l_text_math_delims_tl but for a command rather than paired delimiters.

\l_text_math_delims_tl

Lists pairs of tokens which delimit (in-line) math mode content; such content may be excluded from processing.

\l_text_case_exclude_arg_tl

Lists commands where the first mandatory argument is excluded from case changing.

\l_text_expand_exclude_tl

Lists commands which are excluded from expansion. This protection includes everything up to and including their first braced argument.

\l_text_titlecase_check_letter_bool

Controls how the start of titlecasing is handled: when true, the first letter in text is considered. The standard setting is true.

270
32.5 Mapping to graphemes

Grapheme splitting is implemented using the algorithm described in Unicode Standard Annex #29. This includes support for extended grapheme clusters. Text starting with a line feed or carriage return character will drop this due to standard TeX processing. At present extended pictograms are not supported: these may be added in a future release.

\text_map_function:nN \{function\}

New: 2022-08-04

Takes user input \langle text \rangle and expands as described for \text_expand:n, then maps over the graphemes within the result, passing each grapheme to the \langle function \rangle. Broadly a grapheme is a “user perceived character”: the Unicode Consortium describe the decomposition of input to graphemes in depth, and the approach used here implements that algorithm. The \langle function \rangle should accept one argument as \langle balanced text \rangle: this may be comprise codepoints or may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also \text_map_inline:nn.

\text_map_inline:nn \{\langle inline function \rangle\}

New: 2022-08-04

Takes user input \langle text \rangle and expands as described for \text_expand:n, then maps over the graphemes within the result, passing each grapheme to the \langle inline function \rangle. Broadly a grapheme is a “user perceived character”: the Unicode Consortium describe the decomposition of input to graphemes in depth, and the approach used here implements that algorithm. The \langle inline function \rangle should consist of code which receives the grapheme as \langle balanced text \rangle: this may be comprise codepoints or may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also \text_map_function:nN.

\text_map_break: \{code\}

New: 2022-08-04

Used to terminate a \text_map_... function before all entries in the \langle text \rangle have been processed. This normally takes place within a conditional statement.
Part VI
Typesetting
Chapter 33

The l3box package

Boxes

Box variables contain typeset material that can be inserted on the page or in other boxes. Their contents cannot be converted back to lists of tokens. There are three kinds of box operations: horizontal mode denoted with prefix \hbox_, vertical mode with prefix \vbox_, and the generic operations working in both modes with prefix \box_. For instance, a new box variable containing the words “Hello, world!” (in a horizontal box) can be obtained by the following code.

\box_new:N \l_hello_box
\hbox_set:Nn \l_hello_box { Hello, ~ world! }

The argument is typeset inside a TEX group so that any variables assigned during the construction of this box restores its value afterwards.

Box variables from l3box are compatible with those of L\LaTeX{}2ε and plain \TeX{} and can be used interchangeably. The l3box commands to construct boxes, such as \hbox:n or \hbox_set:Nn, are “color-safe”, meaning that

\hbox:n { \color_select:n { blue } Hello, } ~ world!

will result in “Hello,” taking the color blue, but “world!” remaining with the prevailing color outside the box.

33.1 Creating and initialising boxes

\box_new:N \box_new:c
\box_clear:N \box_clear:c
\box_gclear:N \box_gclear:c

Creates a new \langle box\rangle or raises an error if the name is already taken. The declaration is global. The \langle box\rangle is initially void.

Clears the content of the \langle box\rangle by setting the box equal to \c_empty_box.
\box_clear_new:N \box_clear_new:c \box_gclear_new:N \box_gclear_new:c

\box_set_eq:NN \box_set_eq:(cN|Nc|cc) \box_gset_eq:NN \box_gset_eq:(cN|Nc|cc)

\box_if_exist_p:N \box_if_exist:NTF \box_if_exist:c \box_if_exist:c

Ensures that the \textit{box} exists globally by applying \texttt{\box_new:N} if necessary, then applies \texttt{\box_(g)clear:N} to leave the \textit{box} empty.

\box_set_eq:NN \box_set_eq:(cN|Nc|cc)

Sets the content of \textit{box1} equal to that of \textit{box2}.

\box_if_exist_p:N \box_if_exist:NTF \box_if_exist:c

Tests whether the \textit{box} is currently defined. This does not check that the \textit{box} really is a box.

\textbf{33.2 Using boxes}

\box_use:N \box_use:c

Inserts the current content of the \textit{box} onto the current list for typesetting. An error is raised if the variable does not exist or if it is invalid.

\TeXhackers note: This is the \TeX\ primitive \texttt{\copy}.

\box_move_right:nn \box_move_left:nn

This function operates in vertical mode, and inserts the material specified by the \textit{box function} such that its reference point is displaced horizontally by the given \texttt{dimexpr} from the reference point for typesetting, to the right or left as appropriate. The \textit{box function} should be a box operation such as \texttt{\box_use:N \box} or a “raw” box specification such as \texttt{\vbox:n \{ xyz \}}.

\box_move_up:nn \box_move_down:nn

This function operates in horizontal mode, and inserts the material specified by the \textit{box function} such that its reference point is displaced vertically by the given \texttt{dimexpr} from the reference point for typesetting, up or down as appropriate. The \textit{box function} should be a box operation such as \texttt{\box_use:N \box} or a “raw” box specification such as \texttt{\vbox:n \{ xyz \}}.
Measuring and setting box dimensions

\texttt{\box_dp:N} \box_dp:N \langle box \rangle

Calculates the depth (below the baseline) of the \langle box \rangle in a form suitable for use in a \langle dimension expression \rangle.

\textbf{TeXhackers note:} This is the \TeX{} primitive \texttt{dp}.

\texttt{\box_ht:N} \box_ht:N \langle box \rangle

Calculates the height (above the baseline) of the \langle box \rangle in a form suitable for use in a \langle dimension expression \rangle.

\textbf{TeXhackers note:} This is the \TeX{} primitive \texttt{ht}.

\texttt{\box_wd:N} \box_wd:N \langle box \rangle

Calculates the width of the \langle box \rangle in a form suitable for use in a \langle dimension expression \rangle.

\textbf{TeXhackers note:} This is the \TeX{} primitive \texttt{wd}.

\texttt{\box_ht_plus_dp:N} \box_ht_plus_dp:N \langle box \rangle

Calculates the total vertical size (height plus depth) of the \langle box \rangle in a form suitable for use in a \langle dimension expression \rangle.

\texttt{\box_set_dp:Nn} \box_set_dp:Nn \langle box \rangle \{ \langle \text{dimension expression} \rangle \}

Set the depth (below the baseline) of the \langle box \rangle to the value of the \{ \langle \text{dimension expression} \rangle \}.

\texttt{\box_set_ht:Nn} \box_set_ht:Nn \langle box \rangle \{ \langle \text{dimension expression} \rangle \}

Set the height (above the baseline) of the \langle box \rangle to the value of the \{ \langle \text{dimension expression} \rangle \}.

\texttt{\box_set_wd:Nn} \box_set_wd:Nn \langle box \rangle \{ \langle \text{dimension expression} \rangle \}

Set the width of the \langle box \rangle to the value of the \{ \langle \text{dimension expression} \rangle \}.
33.4 Box conditionals

\box_if_empty_p:N \box_if_empty_p:c \box_if_empty:N \box_if_empty:c
Tests if \textit{\textlangle box\textrangle} is a empty (equal to \texttt{\c_empty_box}).

\box_if_horizontal_p:N \box_if_horizontal_p:c \box_if_horizontal:N \box_if_horizontal:c
Tests if \textit{\textlangle box\textrangle} is a horizontal box.

\box_if_vertical_p:N \box_if_vertical_p:c \box_if_vertical:N \box_if_vertical:c
Tests if \textit{\textlangle box\textrangle} is a vertical box.

33.5 The last box inserted

\box_set_to_last:N \box_set_to_last:c \box_gset_to_last:N \box_gset_to_last:c
Sets the \textit{\textlangle box\textrangle} equal to the last item (box) added to the current partial list, removing the item from the list at the same time. When applied to the main vertical list, the \textit{\textlangle box\textrangle} is always void as it is not possible to recover the last added item.

33.6 Constant boxes

\c_empty_box
This is a permanently empty box, which is neither set as horizontal nor vertical.

\TeXhackers note: At the \TeX{} level this is a void box.

33.7 Scratch boxes

\l_tmpa_box \l_tmpb_box
Scratch boxes for local assignment. These are never used by the kernel code, and so are safe for use with any \EMTeX{}-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g_tmpa_box \g_tmpb_box
Scratch boxes for global assignment. These are never used by the kernel code, and so are safe for use with any \EMTeX{}-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
33.8 Viewing box contents

\texttt{\textbackslash box\_show:\textbackslash N} \smallskip
\texttt{\textbackslash box\_show:\textbackslash C}

Shows full details of the content of the \texttt{(box)} in the terminal.

\texttt{\textbackslash box\_show:Nn} \smallskip
\texttt{\textbackslash box\_show:cn}

Display the contents of \texttt{(box)} in the terminal, showing the first \texttt{(intexpr)} items of the box, and descending into \texttt{(intexpr)} group levels.

\texttt{\textbackslash box\_log:\textbackslash N} \smallskip
\texttt{\textbackslash box\_log:\textbackslash C}

Writes full details of the content of the \texttt{(box)} to the log.

\texttt{\textbackslash box\_log:Nn} \smallskip
\texttt{\textbackslash box\_log:cn}

Writes the contents of \texttt{(box)} to the log, showing the first \texttt{(intexpr)} items of the box, and descending into \texttt{(intexpr)} group levels.

33.9 Boxes and color

All \LaTeX{} boxes are “color safe”: a color set inside the box stops applying after the end of the box has occurred.

33.10 Horizontal mode boxes

\texttt{\textbackslash hbox:n} \smallskip
\texttt{\textbackslash hbox:n \{\texttt{\textbackslash contents}\}}

Typesets the \texttt{(contents)} into a horizontal box of natural width and then includes this box in the current list for typesetting.

\texttt{\textbackslash hbox\_to\_wd:nn} \smallskip
\texttt{\textbackslash hbox\_to\_wd:nn \{\texttt{\textbackslash dimexpr}\} \{\texttt{\textbackslash contents}\}}

Typesets the \texttt{(contents)} into a horizontal box of width \texttt{(dimexpr)} and then includes this box in the current list for typesetting.

\texttt{\textbackslash hbox\_to\_zero:n} \smallskip
\texttt{\textbackslash hbox\_to\_zero:n \{\texttt{\textbackslash contents}\}}

Typesets the \texttt{(contents)} into a horizontal box of zero width and then includes this box in the current list for typesetting.

\texttt{\textbackslash hbox\_set:Nn} \smallskip
\texttt{\textbackslash hbox\_set:cn} \smallskip
\texttt{\textbackslash hbox\_gset:Nn} \smallskip
\texttt{\textbackslash hbox\_gset:cn}

Typesets the \texttt{(contents)} at natural width and then stores the result inside the \texttt{(box)}.
\hbox_set_to_wd:Nnn \hbox_set_to_wd:cmn \hbox_gset_to_wd:Nnn \hbox_gset_to_wd:cmn

Typesets the \textit{contents} to the width given by the \textit{dimexpr} and then stores the result inside the \textit{box}.

\hbox_overlap_center:n \hbox_overlap_center:n \{\textit{contents}\}

Typesets the \textit{contents} into a horizontal box of zero width such that material protrudes equally to both sides of the insertion point.

\hbox_overlap_right:n \hbox_overlap_right:n \{\textit{contents}\}

Typesets the \textit{contents} into a horizontal box of zero width such that material protrudes to the right of the insertion point.

\hbox_overlap_left:n \hbox_overlap_left:n \{\textit{contents}\}

Typesets the \textit{contents} into a horizontal box of zero width such that material protrudes to the left of the insertion point.

\hbox_set:Nw \hbox_set:Nw \{\textit{box}\} \{\textit{contents}\} \hbox_set_end:

Typesets the \textit{contents} at natural width and then stores the result inside the \textit{box}. In contrast to \hbox_set:Nn this function does not absorb the argument when finding the \textit{content}, and so can be used in circumstances where the \textit{content} may not be a simple argument.

\hbox_set_to_wd:Nnn \hbox_set_to_wd:Nnn \{\textit{dimexpr}\} \{\textit{contents}\} \hbox_set_end:

Typesets the \textit{contents} to the width given by the \textit{dimexpr} and then stores the result inside the \textit{box}. In contrast to \hbox_set_to_wd:Nnn this function does not absorb the argument when finding the \textit{content}, and so can be used in circumstances where the \textit{content} may not be a simple argument.

\hbox_unpack:N \hbox_unpack:N \{\textit{box}\}

Unpacks the content of the horizontal \textit{box}, retaining any stretching or shrinking applied when the \textit{box} was set.

\textbf{T\TeX{}hackers note:} This is the \TeX{} primitive \texttt{\unhcopy{}}.

\subsection{Vertical mode boxes}

Vertical boxes inherit their baseline from their contents. The standard case is that the baseline of the box is at the same position as that of the last item added to the box. This means that the box has no depth unless the last item added to it had depth. As a result most vertical boxes have a large height value and small or zero depth. The exception are
_top boxes, where the reference point is that of the first item added. These tend to have a large depth and small height, although the latter is typically non-zero.

\vbox:n \{\textit{contents}\}

Updated: 2017-04-05

Typesets the \textit{contents} into a vertical box of natural height and includes this box in the current list for typesetting.

\vbox_top:n \{\textit{contents}\}

Updated: 2017-04-05

Typesets the \textit{contents} into a vertical box of natural height and includes this box in the current list for typesetting. The baseline of the box is equal to that of the \textit{first} item added to the box.

\vbox_to_ht:nn \{\textit{dimexpr}\} \{\textit{contents}\}

Updated: 2017-04-05

Typesets the \textit{contents} into a vertical box of height \textit{dimexpr} and then includes this box in the current list for typesetting.

\vbox_to_zero:n \{\textit{contents}\}

Updated: 2017-04-05

Typesets the \textit{contents} into a vertical box of zero height and then includes this box in the current list for typesetting.

\vbox_set:Nn \textit{box} \{\textit{contents}\}

Typesets the \textit{contents} at natural height and then stores the result inside the \textit{box}.

\vbox_set_top:Nn \textit{box} \{\textit{contents}\}

Typesets the \textit{contents} at natural height and then stores the result inside the \textit{box}. The baseline of the box is equal to that of the \textit{first} item added to the box.

\vbox_set_to_ht:Nnn \textit{box} \{\textit{dimexpr}\} \{\textit{contents}\}

Updated: 2017-04-05

Typesets the \textit{contents} to the height given by the \textit{dimexpr} and then stores the result inside the \textit{box}.

\vbox_set:Nw \textit{box} \{\textit{contents}\} \vbox_set_end:

Typesets the \textit{contents} at natural height and then stores the result inside the \textit{box}. In contrast to \texttt{\vbox_set:Nn} this function does not absorb the argument when finding the \textit{content}, and so can be used in circumstances where the \textit{content} may not be a simple argument.
\vbox_set_to_ht:Nnw \vbox_set_to_ht:cnw \vbox_gset_to_ht:Nnw \vbox_gset_to_ht:cnw

New: 2017-06-08

\vbox_set_split_to_ht:NNn \vbox_set_split_to_ht:NNn \vbox_gset_split_to_ht:NNn \vbox_gset_split_to_ht:NNn

Updated: 2018-12-29

Sets \langle box \rangle to contain material to the height given by the \langle dimexpr \rangle by removing content from the top of \langle box2 \rangle (which must be a vertical box).

\vbox_unpack:N \vbox_unpack:c

Unpacks the content of the vertical \langle box \rangle, retaining any stretching or shrinking applied when the \langle box \rangle was set.

\TeX\ hackers note: This is the \TeX primitive \unvcopy.

### 33.12 Using boxes efficiently

The functions above for using box contents work in exactly the same way as for any other expl3 variable. However, for efficiency reasons, it is also useful to have functions which drop box contents on use. When a box is dropped, the box becomes empty at the group level where the box was originally set rather than necessarily at the current group level.

For example, with

\hbox_set:NN \l_tmpa_box { A }
\group_begin:
  \hbox_set:NN \l_tmpa_box { B }
  \group_begin:
    \box_use_drop:N \l_tmpa_box
  \group_end:
  \box_show:N \l_tmpa_box
\group_end:
  \box_show:N \l_tmpa_box

the first use of \box_show:N will show an entirely cleared (void) box, and the second will show the letter A in the box.

These functions should be preferred when the content of the box is no longer required after use. Note that due to the unusual scoping behaviour of drop functions they may be applied to both local and global boxes: the latter will naturally be set and thus cleared at a global level.
\box_use_drop:N \box_use_drop:c
Inserts the current content of the \texttt{<box>} onto the current list for typesetting then drops the box content. An error is raised if the variable does not exist or if it is invalid. This function may be applied to local or global boxes.

\textbf{\TeX hackers note:} This is the \texttt{\box} primitive.

\box_set_eq_drop:NN \box_set_eq_drop:c
\box_gset_eq_drop:NN \box_gset_eq_drop:c
Sets the content of \texttt{<box1>} equal to that of \texttt{<box2>}, then drops \texttt{<box2>}.

\new: 2019-01-17

\hbox_unpack_drop:N \hbox_unpack_drop:c
Unpacks the content of the horizontal \texttt{<box>}, retaining any stretching or shrinking applied when the \texttt{<box>} was set. The original \texttt{<box>} is then dropped.

\textbf{\TeX hackers note:} This is the \TeX primitive \texttt{\unhbox}.

\vbox_unpack_drop:N \vbox_unpack_drop:c
Unpacks the content of the vertical \texttt{<box>}, retaining any stretching or shrinking applied when the \texttt{<box>} was set. The original \texttt{<box>} is then dropped.

\textbf{\TeX hackers note:} This is the \TeX primitive \texttt{\unvbox}.

\section*{33.13 Affine transformations}
Affine transformations are changes which (informally) preserve straight lines. Simple translations are affine transformations, but are better handled in \TeX by doing the translation first, then inserting an unmodified box. On the other hand, rotation and resizing of boxed material can best be handled by modifying boxes. These transformations are described here.
Resizes the ⟨box⟩ to fit within the given ⟨x-size⟩ (horizontally) and ⟨y-size⟩ (vertically); both of the sizes are dimension expressions. The ⟨y-size⟩ is the height only: it does not include any depth. The updated ⟨box⟩ is an hbox, irrespective of the nature of the ⟨box⟩ before the resizing is applied. The final size of the ⟨box⟩ is the smaller of {⟨x-size⟩} and {⟨y-size⟩}, i.e. the result fits within the dimensions specified. Negative sizes cause the material in the ⟨box⟩ to be reversed in direction, but the reference point of the ⟨box⟩ is unchanged. Thus a negative ⟨y-size⟩ results in the ⟨box⟩ having a depth dependent on the height of the original and vice versa.

Resizes the ⟨box⟩ to fit within the given ⟨x-size⟩ (horizontally) and ⟨y-size⟩ (vertically); both of the sizes are dimension expressions. The ⟨y-size⟩ is the total vertical size (height plus depth). The updated ⟨box⟩ is an hbox, irrespective of the nature of the ⟨box⟩ before the resizing is applied. The final size of the ⟨box⟩ is the smaller of {⟨x-size⟩} and {⟨y-size⟩}, i.e. the result fits within the dimensions specified. Negative sizes cause the material in the ⟨box⟩ to be reversed in direction, but the reference point of the ⟨box⟩ is unchanged. Thus a negative ⟨y-size⟩ results in the ⟨box⟩ having a depth dependent on the height of the original and vice versa.

Resizes the ⟨box⟩ to ⟨y-size⟩ (vertically), scaling the horizontal size by the same amount; ⟨y-size⟩ is a dimension expression. The ⟨y-size⟩ is the height only: it does not include any depth. The updated ⟨box⟩ is an hbox, irrespective of the nature of the ⟨box⟩ before the resizing is applied. A negative ⟨y-size⟩ causes the material in the ⟨box⟩ to be reversed in direction, but the reference point of the ⟨box⟩ is unchanged. Thus a negative ⟨y-size⟩ results in the ⟨box⟩ having a depth dependent on the height of the original and vice versa.
Resizes the \textlangle box\textrangle to \textlangle y-size\textrangle (vertically), scaling the horizontal size by the same amount: \textlangle y-size\textrangle is a dimension expression. The \textlangle y-size\textrangle is the total vertical size (height plus depth). The updated \textlangle box\textrangle is an \texttt{ hbox}, irrespective of the nature of the \textlangle box\textrangle before the resizing is applied. A negative \textlangle y-size\textrangle causes the material in the \textlangle box\textrangle to be reversed in direction, but the reference point of the \textlangle box\textrangle is unchanged. Thus a negative \textlangle y-size\textrangle results in the \textlangle box\textrangle having a depth dependent on the height of the original and \textit{vice versa}.

Resizes the \textlangle box\textrangle to \textlangle x-size\textrangle (horizontally), scaling the vertical size by the same amount: \textlangle x-size\textrangle is a dimension expression. The updated \textlangle box\textrangle is an \texttt{ hbox}, irrespective of the nature of the \textlangle box\textrangle before the resizing is applied. A negative \textlangle x-size\textrangle causes the material in the \textlangle box\textrangle to be reversed in direction, but the reference point of the \textlangle box\textrangle is unchanged. Thus a negative \textlangle x-size\textrangle results in the \textlangle box\textrangle having a depth dependent on the height of the original and \textit{vice versa}.

Resizes the \textlangle box\textrangle to \textlangle x-size\textrangle (horizontally) and \textlangle y-size\textrangle (vertically): both of the sizes are dimension expressions. The \textlangle y-size\textrangle is the height only and does not include any depth. The updated \textlangle box\textrangle is an \texttt{ hbox}, irrespective of the nature of the \textlangle box\textrangle before the resizing is applied. Negative sizes cause the material in the \textlangle box\textrangle to be reversed in direction, but the reference point of the \textlangle box\textrangle is unchanged. Thus a negative \textlangle y-size\textrangle results in the \textlangle box\textrangle having a depth dependent on the height of the original and \textit{vice versa}.

Resizes the \textlangle box\textrangle to \textlangle x-size\textrangle (horizontally) and \textlangle y-size\textrangle (vertically): both of the sizes are dimension expressions. The \textlangle y-size\textrangle is the total vertical size (height plus depth). The updated \textlangle box\textrangle is an \texttt{ hbox}, irrespective of the nature of the \textlangle box\textrangle before the resizing is applied. Negative sizes cause the material in the \textlangle box\textrangle to be reversed in direction, but the reference point of the \textlangle box\textrangle is unchanged. Thus a negative \textlangle y-size\textrangle results in the \textlangle box\textrangle having a depth dependent on the height of the original and \textit{vice versa}.
\box_rotate:n {\box \{angle\}}
Rotates the \textit{box} by \textit{angle} (in degrees) anti-clockwise about its reference point. The reference point of the updated box is moved horizontally such that it is at the left side of the smallest rectangle enclosing the rotated material. The updated \textit{box} is an \texttt{ hbox}, irrespective of the nature of the \textit{box} before the rotation is applied.

\box_scale:nnn {\box \{x-scale\} \{y-scale\}}
Scales the \textit{box} by factors \textit{x-scale} and \textit{y-scale} in the horizontal and vertical directions, respectively (both scales are integer expressions). The updated \textit{box} is an \texttt{ hbox}, irrespective of the nature of the \textit{box} before the scaling is applied. Negative scalings cause the material in the \textit{box} to be reversed in direction, but the reference point of the \textit{box} is unchanged. Thus a negative \textit{y-scale} results in the \textit{box} having a depth dependent on the height of the original and \textit{vice versa}.

\section*{33.14 Primitive box conditionals}

\if_hbox:n
\texttt{if_hbox:N \{box\} \{true code\} \texttt{else:} \{false code\} \texttt{fi:}}
Tests is \textit{box} is a horizontal box.

\texttt{TeXhackers note: This is the \TeX primitive \texttt{ifhbox}.}

\if_vbox:n
\texttt{if_vbox:N \{box\} \{true code\} \texttt{else:} \{false code\} \texttt{fi:}}
Tests is \textit{box} is a vertical box.

\texttt{TeXhackers note: This is the \TeX primitive \texttt{ifvbox}.}

\if_box_empty:n
\texttt{if_box_empty:N \{box\} \{true code\} \texttt{else:} \{false code\} \texttt{fi:}}
Tests is \textit{box} is an empty (void) box.

\texttt{TeXhackers note: This is the \TeX primitive \texttt{ifvoid}.}
Chapter 34

The \texttt{l3coffins} package

Coffin code layer

The material in this module provides the low-level support system for coffins. For details about the design concept of a coffin, see the \texttt{xcoffins} module (in the \texttt{l3experimental} bundle).

34.1 Creating and initialising coffins

\begin{verbatim}
\texttt{\coffin_new:N} \texttt{(coffin)}
\texttt{\coffin_new:c}
\texttt{\coffin_clear:N} \texttt{(coffin)}
\texttt{\coffin_clear:c}
\texttt{\coffin_gclear:N}
\texttt{\coffin_gclear:c}
\end{verbatim}

New: 2011-08-17

Updated: 2019-01-21

Creates a new \texttt{(coffin)} or raises an error if the name is already taken. The declaration is global. The \texttt{(coffin)} is initially empty.

\begin{verbatim}
\texttt{\coffin_set_eq:NN} \texttt{(coffin)} \texttt{(coffin)}
\texttt{\coffin_set_eq:NN (Nc|cN|cc)}
\texttt{\coffin_gset_eq:NN (Nc|cN|cc)}
\end{verbatim}

New: 2011-08-17

Updated: 2019-01-21

Clears the content of the \texttt{(coffin)}.

\begin{verbatim}
\texttt{\coffin_if_exist_p:N} \texttt{(coffin)} \texttt{\coffin_if_exist:NTF (coffin)} \texttt{(true code)} \texttt{(false code)}
\texttt{\coffin_if_exist_p:c}
\texttt{\coffin_if_exist:NTF (coffin)} \texttt{(true code)} \texttt{(false code)}
\texttt{\coffin_if_exist:c}
\end{verbatim}

New: 2012-06-20

Tests whether the \texttt{(coffin)} is currently defined.
34.2 Setting coffin content and poles

\hcoffin_set:Nn \hcoffin_set:cn \hcoffin_gset:Nn \hcoffin_gset:cn

New: 2011-08-17
Updated: 2019-01-21

Typesets the \langle material \rangle in horizontal mode, storing the result in the \langle coffin \rangle. The standard poles for the \langle coffin \rangle are then set up based on the size of the typeset material.

\hcoffin_set:Nw \hcoffin_set:cw \hcoffin_gset:Nw \hcoffin_gset:cw

New: 2011-09-10
Updated: 2019-01-21

Typesets the \langle material \rangle in horizontal mode, storing the result in the \langle coffin \rangle. The standard poles for the \langle coffin \rangle are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

\vcoffin_set:Nnn \vcoffin_set:cnn \vcoffin_gset:Nnn \vcoffin_gset:cnn

New: 2011-08-17
Updated: 2019-01-21

Typesets the \langle material \rangle in vertical mode constrained to the given \langle width \rangle and stores the result in the \langle coffin \rangle. The standard poles for the \langle coffin \rangle are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

\vcoffin_set:Nnw \vcoffin_set:cnw \vcoffin_gset:Nnw \vcoffin_gset:cnw

New: 2011-09-10
Updated: 2019-01-21

Typesets the \langle material \rangle in vertical mode constrained to the given \langle width \rangle and stores the result in the \langle coffin \rangle. The standard poles for the \langle coffin \rangle are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

\coffin_set_horizontal_pole:Nnn \coffin_set_horizontal_pole:cn \coffin_gset_horizontal_pole:Nnn \coffin_gset_horizontal_pole:cn

New: 2012-07-20
Updated: 2019-01-21

Sets the \langle pole \rangle to run horizontally through the \langle coffin \rangle. The \langle pole \rangle is placed at the \langle offset \rangle from the baseline of the \langle coffin \rangle. The \langle offset \rangle should be given as a dimension expression.
Sets the ⟨pole⟩ to run vertically through the ⟨coffin⟩. The ⟨pole⟩ is placed at the ⟨offset⟩ from the left-hand edge of the bounding box of the ⟨coffin⟩. The ⟨offset⟩ should be given as a dimension expression.

## 34.3 Coffin affine transformations

\begin{align*}
\text{\texttt{\textbackslash coffin_set_vertical_pole:Nnn}} \quad & \text{\texttt{\textbackslash coffin_set_vertical_pole:cn}} \\
\text{\texttt{\textbackslash coffin_gset_vertical_pole:Nnn}} \quad & \text{\texttt{\textbackslash coffin_gset_vertical_pole:cn}}
\end{align*}

Sets the ⟨pole⟩ to run vertically through the ⟨coffin⟩. The ⟨pole⟩ is placed at the ⟨offset⟩ from the left-hand edge of the bounding box of the ⟨coffin⟩. The ⟨offset⟩ should be given as a dimension expression.

\begin{align*}
\text{\texttt{\textbackslash coffin_resize:Nnn}} \quad & \text{\texttt{\textbackslash coffin_resize:cn}} \\
\text{\texttt{\textbackslash coffin_gresize:Nnn}} \quad & \text{\texttt{\textbackslash coffin_gresize:cn}}
\end{align*}

Resized the ⟨coffin⟩ to ⟨width⟩ and ⟨total-height⟩, both of which should be given as dimension expressions.

\begin{align*}
\text{\texttt{\textbackslash coffin_rotate:Nn}} \quad & \text{\texttt{\textbackslash coffin_rotate:cn}} \\
\text{\texttt{\textbackslash coffin_grotate:Nn}} \quad & \text{\texttt{\textbackslash coffin_grotate:cn}}
\end{align*}

Rotates the ⟨coffin⟩ by the given ⟨angle⟩ (given in degrees counter-clockwise). This process rotates both the coffin content and poles. Multiple rotations do not result in the bounding box of the coffin growing unnecessarily.

\begin{align*}
\text{\texttt{\textbackslash coffin_scale:Nnn}} \quad & \text{\texttt{\textbackslash coffin_scale:cn}} \\
\text{\texttt{\textbackslash coffin_gscale:Nnn}} \quad & \text{\texttt{\textbackslash coffin_gscale:cn}}
\end{align*}

Scales the ⟨coffin⟩ by a factors ⟨x-scale⟩ and ⟨y-scale⟩ in the horizontal and vertical directions, respectively. The two scale factors should be given as real numbers.

## 34.4 Joining and using coffins

\begin{align*}
\text{\texttt{\textbackslash coffin_attach:NnnNnnnn}} \quad & \text{\texttt{\textbackslash coffin_attach:NnnNnnnn}} \\
\text{\texttt{\textbackslash coffin_attach:(cnnNnnnn|Nncnnnn|ncnCNNNN)}} \quad & \text{\texttt{\textbackslash coffin} \{\langle\text{coffin}\rangle \\text{\{\langle\text{coffin-pole}\rangle \\{\langle\text{coffin-pole}\rangle \}}}} \\
\text{\texttt{\textbackslash coffin_gattach:NnnNnnnn}} \quad & \text{\texttt{\textbackslash coffin_gattach:(cnnNnnnn|Nncnnnn|ncnCNNNN)}} \quad \text{\texttt{\textbackslash \{\langle\text{offset}\rangle \\{\langle\text{offset}\rangle \}}}}
\end{align*}

This function attaches ⟨coffin2⟩ to ⟨coffin1⟩ such that the bounding box of ⟨coffin1⟩ is not altered, i.e. ⟨coffin2⟩ can protrude outside of the bounding box of the coffin. The alignment is carried out by first calculating ⟨handle1⟩, the point of intersection of ⟨coffin1-pole1⟩ and ⟨coffin1-pole2⟩, and ⟨handle2⟩, the point of intersection of ⟨coffin2-pole1⟩ and ⟨coffin2-pole2⟩. ⟨coffin2⟩ is then attached to ⟨coffin1⟩ such that the relationship between ⟨handle1⟩ and ⟨handle2⟩ is described by the ⟨x-offset⟩ and ⟨y-offset⟩. The two offsets should be given as dimension expressions.

287
This function joins \( \text{coffin}_1 \) to \( \text{coffin}_2 \) such that the bounding box of \( \text{coffin}_1 \) may expand. The new bounding box covers the area containing the bounding boxes of the two original coffins. The alignment is carried out by first calculating \( \text{handle}_1 \), the point of intersection of \( \text{pole}_{11} \) and \( \text{pole}_{12} \), and \( \text{handle}_2 \), the point of intersection of \( \text{pole}_{21} \) and \( \text{pole}_{22} \). \( \text{coffin}_2 \) is then attached to \( \text{coffin}_1 \) such that the relationship between \( \text{handle}_1 \) and \( \text{handle}_2 \) is described by the \( x\text{-offset} \) and \( y\text{-offset} \). The two offsets should be given as dimension expressions.

Typesetting is carried out by first calculating \( \text{handle} \), the point of intersection of \( \text{pole}_1 \) and \( \text{pole}_2 \). The coffin is then typeset in horizontal mode such that the relationship between the current reference point in the document and the \( \text{handle} \) is described by the \( x\text{-offset} \) and \( y\text{-offset} \). The two offsets should be given as dimension expressions. Type-setting a coffin is therefore analogous to carrying out an alignment where the “parent” coffin is the current insertion point.

### 34.5 Measuring coffins

- \( \text{coffin} \text{dp} : N \) \( \text{coffin} \text{dp} : C \): Calculates the depth (below the baseline) of the \( \text{coffin} \) in a form suitable for use in a \( \text{dimension expression} \).

- \( \text{coffin} \text{ht} : N \) \( \text{coffin} \text{ht} : C \): Calculates the height (above the baseline) of the \( \text{coffin} \) in a form suitable for use in a \( \text{dimension expression} \).

- \( \text{coffin} \text{wd} : N \) \( \text{coffin} \text{wd} : C \): Calculates the width of the \( \text{coffin} \) in a form suitable for use in a \( \text{dimension expression} \).

### 34.6 Coffin diagnostics

- \( \text{coffin} \text{display handles} : N \) \( \text{coffin} \text{display handles} : C \): This function first calculates the intersections between all of the \( \text{poles} \) of the \( \text{coffin} \) to give a set of \( \text{handles} \). It then prints the \( \text{coffin} \) at the current location in the source, with the position of the \( \text{handles} \) marked on the coffin. The \( \text{handles} \) are labelled as part of this process: the locations of the \( \text{handles} \) and the labels are both printed in the \( \text{color} \) specified.
This function first calculates the \langle handle\rangle for the \langle coffin\rangle as defined by the intersection of \langle pole_1\rangle and \langle pole_2\rangle. It then marks the position of the \langle handle\rangle on the \langle coffin\rangle. The \langle handle\rangle are labelled as part of this process: the location of the \langle handle\rangle and the label are both printed in the \langle color\rangle specified.

This function shows the structural information about the \langle coffin\rangle in the terminal. The width, height and depth of the typeset material are given, along with the location of all of the poles of the coffin.

Notice that the poles of a coffin are defined by four values: the \(x\) and \(y\) co-ordinates of a point that the pole passes through and the \(x\)- and \(y\)-components of a vector denoting the direction of the pole. It is the ratio between the later, rather than the absolute values, which determines the direction of the pole.

This function writes the structural information about the \langle coffin\rangle in the log file. See also \texttt{\coffin_show_structure:N} which displays the result in the terminal.

Shows full details of poles and contents of the \langle coffin\rangle in the terminal or log file. See \texttt{\coffin_show_structure:N} and \texttt{\box_show:N} to show separately the pole structure and the contents.

Shows poles and contents of the \langle coffin\rangle in the terminal or log file, showing the first \texttt{\intexpr_1} items in the coffin, and descending into \texttt{\intexpr_2} group levels. See \texttt{\coffin_show_structure:N} and \texttt{\box_show:N} to show separately the pole structure and the contents.

A permanently empty coffin.

Scratch coffins for local assignment. These are never used by the kernel code, and so are safe for use with any \LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

34.7 Constants and variables
Scratch coffins for global assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
Chapter 35

The l3color package

Color support

35.1 Color in boxes

Controlling the color of text in boxes requires a small number of control functions, so that the boxed material uses the color at the point where it is set, rather than where it is used.

\color_group_begin: \color_group_end:

\color_group_begin: \color_group_end:

New: 2011-09-03

Creates a color group: one used to “trap” color settings. This grouping is built in to for example \hbox_set:Nn.

\color_ensure_current:

\color_ensure_current:

New: 2011-09-03

Ensures that material inside a box uses the foreground color at the point where the box is set, rather than that in force when the box is used. This function should usually be used within a \color_group_begin: ... \color_group_end: group.

35.2 Color models

A color model is a way to represent sets of colors. Different models are particularly suitable for different output methods, e.g. screen or print. Parameter-based models can describe a very large number of unique colors, and have a varying number of axes which define a color space. In contrast, various proprietary models are available which define spot colors (more formally separations).

Core models are used to pass color information to output; these are “native” to l3color. Core models use real numbers in the range [0,1] to represent values. The core models supported here are

- \texttt{gray} Grayscale color, with a single axis running from 0 (fully black) to 1 (fully white)
- \texttt{rgb} Red-green-blue color, with three axes, one for each of the components
• **cmyk** Cyan-magenta-yellow-black color, with four axes, one for each of the components.

There are also interface models: these are convenient for users but have to be manipulated before storing/passing to the backend. Interface models are primarily integer-based: see below for more detail. The supported interface models are

• **Gray** Grayscale color, with a single axis running from 0 (fully black) to 15 (fully white)

• **hsb** Hue-saturation-brightness color, with three axes, all real values in the range $[0, 1]$ for hue saturation and brightness

• **Hsb** Hue-saturation-brightness color, with three axes, integer in the range $[0, 360]$ for hue, real values in the range $[0, 1]$ for saturation and brightness

• **HSB** Hue-saturation-brightness color, with three axes, integers in the range $[0, 240]$ for hue, saturation and brightness

• **HTML** HTML format representation of RGB color given as a single six-digit hexadecimal number

• **RGB** Red-green-blue color, with three axes, one for each of the components, values as integers from 0 to 255

• **wave** Light wavelength, a real number in the range 380 to 780 (nanometres)

All interface models are internally stored as **rgb**.

Finally, there are a small number of models which are parsed to allow data transfer from xcolor but which should not be used by end-users. These are

• **cmy** Cyan-magenta-yellow color with three axes, one for each of the components; converted to **cmyk**

• **tHsb** “Tuned” hue-saturation-brightness color with three axes, integer in the range $[0, 360]$ for hue, real values in the range $[0, 1]$ for saturation and brightness; converted to **rgb** using the standard tuning map defined by xcolor

• **&spot** Spot color tint with one value; treated as a gray tint as spot color data is not available for extraction

To allow parsing of data from xcolor, any leading model up the first : will be discarded; the approach of selecting an internal form for data is not used in 3color.

Additional models may be created to allow mixing of separation colors with each other or with those from other models. See Section 35.9 for more detail of color support for additional models.

When color is selected by model, the (values) given are specified as a comma-separated list. The length of the list will therefore be determined by the detail of the model involved.

Color models (and interconversion) are complex, and more details are given in the manual to the \TeX\ 2e xcolor package and in the *PostScript Language Reference Manual*, published by Addison–Wesley.
35.3 Color expressions

In addition to allowing specification of color by model and values, \texttt{l3color} also supports color expressions. These are created by combining one or more color names, with the amount of each specified as a percentage. The latter is given between \% symbols in the expression. Thus for example

\begin{verbatim}
red!50!green
\end{verbatim}

is a mixture of 50\% red and 50\% green. A trailing percentage is interpreted as implicitly followed by \texttt{white}, and so

\begin{verbatim}
red!25
\end{verbatim}

specifies 25\% red mixed with 75\% white.

Where the models for the mixed colors are different, the model of the first color is used. Thus

\begin{verbatim}
red!50!cyan
\end{verbatim}

will result in a color specification using the \texttt{rgb} model, made up of 50\% red and 50\% of cyan expressed in \texttt{rgb}. This may be important as color model interconversion is not exact.

The one exception to the above is where the first model in an expression is \texttt{gray}. In this case, the order of mixing is “swapped” internally, so that for example

\begin{verbatim}
black!50!red
\end{verbatim}

has the same result as

\begin{verbatim}
red!50!black
\end{verbatim}

(the predefined colors \texttt{black} and \texttt{white} use the \texttt{gray} model).

Where more than two colors are mixed in an expression, evaluation takes place in a stepwise fashion. Thus in

\begin{verbatim}
cyan!50!magenta!10!yellow
\end{verbatim}

the sub-expression

\begin{verbatim}
cyan!50!magenta
\end{verbatim}

is first evaluated to give an intermediate color specification, before the second step

\begin{verbatim}
<intermediate>!10!yellow
\end{verbatim}

where \texttt{<intermediate>} represents this transitory calculated value.

Within a color expression, \texttt{.} may be used to represent the color active for typesetting (the current color). This allows for example

\begin{verbatim}
.\%50
\end{verbatim}

to mean a mixture of 50\% of current color with white.

(Color expressions supported here are a subset of those provided by the \LaTeX{}2ε \texttt{xcolor} package. At present, only such features as are clearly useful have been added here.)
35.4 Named colors

Color names are stored in a single namespace, which makes them accessible as part of color expressions. Whilst they are not reserved in a technical sense, the names `black`, `white`, `red`, `green`, `blue`, `cyan`, `magenta` and `yellow` have special meaning and should not be redefined. Color names should be made up of letters, numbers and spaces only; other characters are reserved for use in color expressions. In particular, `.` represents the current color at the start of a color expression.

\color_set:nn \color_set:nn {⟨name⟩} {⟨color expression⟩}

Evaluates the ⟨color expression⟩ and stores the resulting color specification as the ⟨name⟩.

\color_set:nnn \color_set:nnn {⟨name⟩} {⟨model(s)⟩} {⟨value(s)⟩}

Stores the color specification equivalent to the ⟨model(s)⟩ and ⟨values⟩ as the ⟨name⟩.

\color_set_eq:nn \color_set_eq:nn {⟨name1⟩} {⟨name2⟩}

Copies the color specification in ⟨name2⟩ to ⟨name1⟩. The special name . may be used to represent the current color, allowing it to be saved to a name.

\color_if_exist:n \color_if_exist:n {⟨name⟩} {⟨true code⟩} {⟨false code⟩}

Tests whether ⟨name⟩ is currently defined to provide a color specification.

\color_show:n \color_show:n {⟨name⟩}
\color_log:n \color_log:n {⟨name⟩}

Displays the color specification stored in the ⟨name⟩ on the terminal or log file.

35.5 Selecting colors

General selection of color is safe when split across pages: a stack is used to ensure that the correct color is re-selected on the new page.

These commands set the current color (.): other more specialised functions such as fill and stroke selectors do not adjust this value.

\color_select:n \color_select:n {⟨color expression⟩}

Parses the ⟨color expression⟩ and then activates the resulting color specification for typeset material.

\color_select:nn \color_select:nn {⟨model(s)⟩} {⟨value(s)⟩}

Activates the color specification equivalent to the ⟨model(s)⟩ and ⟨value(s)⟩ for typeset material.

\l_color_fixed_model_tl

When this is set to a non-empty value, colors will be converted to the specified model when they are selected. Note that included images and similar are not influenced by this setting.
35.6 Colors for fills and strokes

Colors for drawing operations and so forth are split into strokes and fills (the latter may also be referred to as non-stroke color). The fill color is used for text under normal circumstances. Depending on the backend, stroke color may use a stack, in which case it exhibits the same page breaking behavior as general color. However, dvips/dvisvgm do not support this, and so color will need to be contained within a scope, such as \draw_begin:/draw_end:.

\color_fill:n \color_stroke:n

Parses the \langle color expression\rangle and then activates the resulting color specification for filling or stroking.

\color_fill:nn \color_stroke:nn

Activates the color specification equivalent to the \langle model(s)\rangle and \langle value(s)\rangle for filling or stroking.

\color_sc

When using dvips, this PostScript variables hold the stroke color.

35.6.1 Coloring math mode material

Coloring math mode material using \color_select:nn(n) has some restrictions and often leads to spacing issues and/or poor input syntax. Avoiding generating \mathord atoms whilst coloring only those parts of the input which are required needs careful handling. The functionality here covers this important use case.

\color_math:nn \color_math:nnn

Works as for \color_select:n(n) but applies color only to the math mode \langle content\rangle. The function does not generate a group and the \langle content\rangle therefore retains its math atom states. Sub/superscripts are also properly handled.

\l_color_math_active_tl

This list controls which tokens are considered as math active and should therefore be replaced by their definition during searching for sub/superscripts.

35.7 Multiple color models

When selecting or setting a color with an explicit model, it is possible to give values for more than one model at one time. This is particularly useful where automated conversion between models does not give the desired outcome. To do this, the list of models and list of values are both subdivided using / characters (as for the similar function in xcolor).

For example, to save a color with explicit cmyk and rgb values, one could use

\color_set:nnn \{ foo \} \{ cmyk / rgb \}
\{ 0.1 , 0.2 , 0.3 , 0.4 / 0.1, 0.2 , 0.3 \}
The manually-specified conversion will be used in preference to automated calculation whenever the model(s) listed are used: both in expressions and when a fixed model is active.

Similarly, the same syntax can be applied to directly selecting a color.

```latex
\color_select:nn \{ cmyk / rgb \}
\{ 0.1 , 0.2 , 0.3 , 0.4 / 0.1 , 0.2 , 0.3 \}
```

Again, this list is used when a fixed model is active: the first entry is used unless there is a fixed model matching one of the other entries.

### 35.8 Exporting color specifications

The major use of color expressions is in setting typesetting output, but there are other places in which some form of color information is required. These may need data in a different format or using a different model to the internal representation. Thus a set of functions are available to export colors in different formats.

Valid export targets are:

- **backend** Two brace groups: the first containing the model, the second containing space-separated values appropriate for the model; this is the format required by backend functions of expl3
- **comma-sep-cmyk** Comma-separated cyan-magenta-yellow-black values
- **comma-sep-rgb** Comma-separated red-green-blue values suitable for use as a PDF annotation color
- **HTML** Uppercase two-digit hexadecimal values, expressing a red-green-blue color; the digits are not separated
- **space-sep-cmyk** Space-separated cyan-magenta-yellow-black values
- **space-sep-rgb** Space-separated red-green-blue values suitable for use as a PDF annotation color

```latex
\color_export:nnnN \{⟨model⟩\} \{⟨value(s)⟩\} \{⟨format⟩\} \{⟨tl⟩\}
```

Expresses the combination of ⟨model⟩ and ⟨value(s)⟩ in an internal representation, then converts to the ⟨format⟩ specified and assigns the data to the ⟨tl⟩.

```latex
\color_export:nnN \{⟨color expression⟩\} \{⟨format⟩\} \{⟨tl⟩\}
```

Parses the ⟨color expression⟩ as described earlier, then converts to the ⟨format⟩ specified and assigns the data to the ⟨tl⟩.
35.9 Creating new color models

Additional color models are required to support specialist workflows, for example those involving separations (see https://helpx.adobe.com/indesign/using/spot-process-colors.html for details of the use of separations in print). Color models may be split into families; for the standard device-based color models (DeviceCMYK, DeviceRGB, DeviceGray), these are synonymous. This is not generally the case: see the PDF reference for more details. (Note that l3color uses the shorter names cmyk, etc.)

```
color_model_new:nnn
```

Creates a new ⟨model⟩ which is derived from the color model ⟨family⟩. The latter should be one of

- DeviceN
- ICCBased
- Separation

(The ⟨family⟩ may be given in mixed case as-in the PDF reference: internally, case of these strings is folded.) Depending on the ⟨family⟩, one or more ⟨params⟩ are mandatory or optional.

For a Separation space, there are three compulsory keys.

- name The name of the Separation, for example the formal name of a spot color ink. Such a ⟨name⟩ may contain spaces, etc., which are not permitted in the ⟨model⟩.

- alternative-model An alternative device colorspace, one of cmyk, rgb, gray or CIELAB. The three parameter-based models work as described above; see below for details of CIELAB colors.

- alternative-values A comma-separated list of values appropriate to the alternative-model. This information is used by the PDF application if the Separation is not available.

CIELAB color separations are created using the alternative-model = CIELAB setting. These colors must also have an illuminant key, one of a, c, e, d50, d55, d65 or d75. The alternative-values in this case are the three parameters \( L^* \), \( a^* \) and \( b^* \) of the CIELAB model. Full details of this device-independent color approach are given in the documentation to the colorspace package.

CIELAB colors cannot be converted into other device-dependent color spaces, and as such, mixing can only occur if colors set up using the CIELAB model are also given with an alternative parameter-based model. If that is not the case, l3color will fallback to using black as the colorant in any mixing.

For a DeviceN space, there is one compulsory key.

- names The names of the components of the DeviceN space. Each should be either the ⟨name⟩ of a Separation model, a process color name (cyan, etc.) or the special name none.

For an ICCBased space, there is one compulsory key.

- file The name of the file containing the profile.
35.9.1 Color profiles

Color profiles are used to ensure color accuracy by linking to collaboration. Applying a profile can be used to standardise color which is otherwise device-dependence.

\color_profile_apply:nn \color_profile_apply:nn \{\langle \text{profile} \rangle \} \{\langle \text{model} \rangle \}

This function applies a \langle \text{profile} \rangle to one of the device \langle \text{models} \rangle. The profile will then apply to all color of the selected \langle \text{model} \rangle. The \langle \text{profile} \rangle should specify an ICC profile file. The \langle \text{model} \rangle has to be one the standard device models: \text{cmyk}, \text{gray} or \text{rgb}.
Chapter 36

The \texttt{l3pdf} package

Core PDF support

36.1 Objects

\texttt{\pdf_object_new:n \{object\}}

Declares \texttt{\{object\}} as a PDF object. The object may be referenced from this point on, and written later using \texttt{\pdf_object_write:nnn}.

\texttt{\pdf_object_write:nn \{object\} \{type\} \{content\}}

Writes the \texttt{\{content\}} as content of the \texttt{\{object\}}. Depending on the \texttt{\{type\}} declared for the object, the format required for the \texttt{\{data\}} will vary

- \texttt{array} A space-separated list of values
- \texttt{dict} Key–value pairs in the form /\texttt{\{key\}} \texttt{\{value\}}
- \texttt{fstream} Two brace groups: \texttt{\{file name\}} and \texttt{\{file content\}}
- \texttt{stream} Two brace groups: \texttt{\{attributes (dictionary)\}} and \texttt{\{stream contents\}}

\texttt{\pdf_object_ref:n \{object\}}

Inserts the appropriate information to reference the \texttt{\{object\}} in for example page resource allocation
\pdf_object_unnamed_write:nn \pdf_object_unnamed_write:nn \{\text{type}\} \{\text{content}\}

New: 2021-02-10

Writes the \textit{(content)} as content of an anonymous object. Depending on the \textit{(type)}, the format required for the \textit{(data)} will vary

\begin{itemize}
\item array A space-separated list of values
\item dict Key–value pairs in the form /\text{key} \{\text{value}\}
\item fstream Two brace groups: \textit{(attributes (dictionary))} and \textit{(file name)}
\item stream Two brace groups: \textit{(attributes (dictionary))} and \textit{(stream contents)}
\end{itemize}

\pdf_object_ref_last: \pdf_object_ref_last:

New: 2021-02-10

Inserts the appropriate information to reference the last \textit{(object)} created. This is particularly useful for anonymous objects.

\pdf_pageobject_ref:n \pdf_pageobject_ref:n \{\text{pageobject}\}

New: 2021-02-10

Inserts the appropriate information to reference the \textit{(pageobject)}.

\pdf_object_if_exist_p:n \pdf_object_if_exist:nTF \pdf_object_if_exist:nTF \{\text{object}\}

New: 2020-06-11

Tests whether an object with name \textit{\{object\}} has been defined.

\textbf{36.2 Version}

\pdf_version_compare_p:NnTF \pdf_version_compare:NnTF \{\text{comparator}\} \{\text{version}\} \{\text{true code}\} \{\text{false code}\}

New: 2021-02-10

Compares the version of the PDF being created with the \textit{(version)} string specified, using the \textit{(comparator)}. Either the \textit{(true code)} or \textit{(false code)} will be left in the output stream.

\pdf_version_gset:n \pdf_version_min_gset:n \pdf_version_gset:n \{\text{version}\}

New: 2021-02-10

Sets the \textit{(version)} of the PDF being created. The \textit{min} version will not alter the output version unless it is currently lower than the \textit{(version)} requested.

This function may only be used up to the point where the PDF file is initialised. With \texttt{dvips} it sets \texttt{pdf_version_major:} and \texttt{pdf_version_minor:} and allows to compare the values with \texttt{pdf_version_compare:Nn}, but the PDF version itself still has to be set with the command line option \texttt{-dCompatibilityLevel} of \texttt{ps2pdf}.

\pdf_version: \pdf_version_major: \pdf_version_minor: \pdf_version:

New: 2021-02-10

Expands to the currently-active PDF version.
36.3 Compression

\texttt{\texttt{pdf_uncompress}}:

Disables any compression of the PDF, where possible.

This function may only be used up to the point where the PDF file is initialised.

36.4 Destinations

Destinations are the places a link jumped too. Unlike the name may suggest they don’t described an exact location in the PDF. Instead a destination contains a reference to a page along with an instruction how to display this page. The normally used “XYZ top left zoom” for example instructs the viewer to show the page with the given zoom and the top left corner at the top left coordinates—which then gives the impression that there is an anchor at this position.

If an instruction takes a coordinate, it is calculated by the following commands relative to the location the command is issued. So to get a specific coordinate one has to move the command to the right place.

\texttt{\texttt{pdf_destination:nn}}

\texttt{\texttt{pdf_destination:nn \{name\}} \{(type or integer)\}}

This creates a destination. \{(type or integer)\} can be one of fit, fith, fitv, fitb, fitbh, fitbv, fitr, xyz or an integer representing a scale factor in percent. fitr here gives only a lightweight version of /FitR: The backend code defines fitr so that it will with pdfLaTeX and LuaLaTeX use the coordinates of the surrounding box, with dvips and dvipdfmx it falls back to fit. For full control use \texttt{pdf_destination:nnnn}.

The keywords match to the PDF names as described in the following tabular.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>PDF</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>fit</td>
<td>/Fit</td>
<td>Fits the page to the window</td>
</tr>
<tr>
<td>fith</td>
<td>/FitH top</td>
<td>Fits the width of the page to the window</td>
</tr>
<tr>
<td>fitv</td>
<td>/FitV left</td>
<td>Fits the height of the page to the window</td>
</tr>
<tr>
<td>fitb</td>
<td>/FitB</td>
<td>Fits the page bounding box to the window</td>
</tr>
<tr>
<td>fitbh</td>
<td>/FitBH top</td>
<td>Fits the width of the page bounding box to the window.</td>
</tr>
<tr>
<td>fitbv</td>
<td>/FitBV left</td>
<td>Fits the height of the page bounding box to the window.</td>
</tr>
<tr>
<td>fitr</td>
<td>/FitR left bottom right top</td>
<td>Fits the rectangle specified by the four coordinates to the window (see above for the restrictions)</td>
</tr>
<tr>
<td>xyz</td>
<td>/XYZ left top null</td>
<td>Sets a coordinate but doesn’t change the zoom.</td>
</tr>
<tr>
<td>{(integer)}</td>
<td>/XYZ left top zoom</td>
<td>Sets a coordinate and a zoom meaning {(integer)}%.</td>
</tr>
</tbody>
</table>
This creates a destination with /FitR type with the given dimensions relative to the current location. The destination is in a box of size zero, but it doesn’t switch to horizontal mode.

### 36.5 Deprecated functions

Declares \( \langle \text{object} \rangle \) as a PDF object of \( \langle \text{type} \rangle \), which should be one of

- array
- dict
- fstream
- stream

The object may be referenced from this point on, and written later using \pdf_object_write:nn. Deprecation in favor of \pdf_object_new:n.

Writes the \( \langle \text{content} \rangle \) as content of the \( \langle \text{object} \rangle \). Depending on the \( \langle \text{type} \rangle \) declared for the object, the format required for the \( \langle \text{data} \rangle \) will vary

- array A space-separated list of values
- dict Key–value pairs in the form /\( \langle \text{key} \rangle \) \( \langle \text{value} \rangle \)
- fstream Two brace groups: /\( \langle \text{file name} \rangle \) and /\( \langle \text{file content} \rangle \)
- stream Two brace groups: /\( \langle \text{attributes (dictionary)} \rangle \) and /\( \langle \text{stream contents} \rangle \)

Deprecated in favor of \pdf_object_write:nn.
Part VII
Additions and removals
Chapter 37

The \texttt{l3candidates} package
Experimental additions to \texttt{l3kernel}

37.1 Important notice

This module provides a space in which functions can be added to \texttt{l3kernel (expl3)} while still being experimental.

As such, the functions here may not remain in their current form, or indeed at all, in \texttt{l3kernel} in the future.

In contrast to the material in \texttt{l3experimental}, the functions here are all small additions to the kernel. We encourage programmers to test them out and report back on the \LaTeX-L mailing list.

Thus, if you intend to use any of these functions from the candidate module in a public package offered to others for productive use (e.g., being placed on CTAN) please consider the following points carefully:

- Be prepared that your public packages might require updating when such functions are being finalized.

- Consider informing us that you use a particular function in your public package, e.g., by discussing this on the \LaTeX-L mailing list. This way it becomes easier to coordinate any updates necessary without issues for the users of your package.

- Discussing and understanding use cases for a particular addition or concept also helps to ensure that we provide the right interfaces in the final version so please give us feedback if you consider a certain candidate function useful (or not).

We only add functions in this space if we consider them being serious candidates for a final inclusion into the kernel. However, real use sometimes leads to better ideas, so functions from this module are \textbf{not necessarily stable} and we may have to adjust them!
37.2 Additions to l3box

\box_clip:N  \box_clip:N \langle box \rangle

Clips the ⟨box⟩ in the output so that only material inside the bounding box is displayed in the output. The updated ⟨box⟩ is an hbox, irrespective of the nature of the ⟨box⟩ before the clipping is applied.

These functions require the \LaTeXX 3 native drivers: they do not work with the \LaTeXX 2ε graphics drivers!

\textbf{TExhackers note:} Clipping is implemented by the driver, and as such the full content of the box is placed in the output file. Thus clipping does not remove any information from the raw output, and hidden material can therefore be viewed by direct examination of the file.

\box_set_trim:Nnnnn  \box_set_trim:nnnn (⟨box⟩ {⟨left⟩} {⟨bottom⟩} {⟨right⟩} {⟨top⟩})

Adjusts the bounding box of the ⟨box⟩ ⟨left⟩ is removed from the left-hand edge of the bounding box, ⟨right⟩ from the right-hand edge and so fourth. All adjustments are ⟨dimension expressions⟩. Material outside of the bounding box is still displayed in the output unless \box_clip:N is subsequently applied. The updated ⟨box⟩ is an hbox, irrespective of the nature of the ⟨box⟩ before the trim operation is applied. The behavior of the operation where the trims requested is greater than the size of the box is undefined.

\box_set_viewport:Nnnnn  \box_set_viewport:nnnn (⟨box⟩ {{llx}} {{lly}} {{urx}} {{ury}})

Adjusts the bounding box of the ⟨box⟩ such that it has lower-left co-ordinates ⟨llx⟩, ⟨lly⟩ and upper-right co-ordinates ⟨urx⟩, ⟨ury⟩. All four co-ordinate positions are ⟨dimension expressions⟩. Material outside of the bounding box is still displayed in the output unless \box_clip:N is subsequently applied. The updated ⟨box⟩ is an hbox, irrespective of the nature of the ⟨box⟩ before the viewport operation is applied.

37.3 Additions to l3expan

\exp_args_generate:n  \exp_args_generate:n \{⟨variant argument specifiers⟩\}

Defines \exp_args:N⟨variant⟩ functions for each ⟨variant⟩ given in the comma list \{⟨variant argument specifiers⟩\}. Each ⟨variant⟩ should consist of the letters N, c, n, V, v, o, f, e, x, p and the resulting function is protected if the letter x appears in the ⟨variant⟩. This is only useful for cases where \cs_generate_variant:Nn is not applicable.

37.4 Additions to l3fp

\fp_if_nan:p:n  \fp_if_nan:n ⟨fpexpr⟩

Evaluates the ⟨fpexpr⟩ and tests whether the result is exactly \texttt{nan}. The test returns \texttt{false} for any other result, even a tuple containing \texttt{nan}.

305
37.5 Additions to \texttt{l3file}

\begin{verbatim}
% \allowbreak
\allowbreak
\end{verbatim}

\noindent In the first argument of \texttt{\__wrap:nnnN} (for instance in messages), inserts a break-point that allows a line break. In other words this is a zero-width breaking space.

\noindent \texttt{\__allow_break:}

\noindent \texttt{\__get_term:nnN \get_term:nnN \get_str_term:nnN}

\noindent \code{Function that reads one or more lines (until an equal number of left and right braces are found) from the terminal and stores the result locally in the \texttt{\langle token list \rangle} variable. Tokenization occurs as described for \texttt{\__get:NN} or \texttt{\__str_get:NN}, respectively. When the \texttt{\langle prompt \rangle} is empty, \TeX{} will wait for input without any other indication: typically the programmer will have provided a suitable text using e.g. \texttt{\__term:n}.

\noindent Where the \texttt{\langle prompt \rangle} is given, it will appear in the terminal followed by an \texttt{=} , e.g.

\noindent \texttt{prompt=}

\noindent \texttt{\__shell_open:Nn}

\noindent \code{Opens the pseudo-file created by the output of the \texttt{\langle shell command \rangle} for reading using \texttt{\langle stream \rangle} as the control sequence for access. If the \texttt{\langle stream \rangle} was already open it is closed before the new operation begins. The \texttt{\langle stream \rangle} is available for access immediately and will remain allocated to \texttt{\langle shell command \rangle} until a \texttt{\__close:N} instruction is given or the \TeX{} run ends. If piped system calls are disabled an error is raised. For details of handling of the \texttt{\langle shell command \rangle}, see \texttt{\sys_get_shell:nnNTF}.

37.6 Additions to \texttt{l3flag}

\noindent \texttt{\__flag_raise_if_clear:n}

\noindent \code{Ensures the \texttt{\langle flag \rangle} is raised by making its height at least 1, locally.}

37.7 Additions to \texttt{l3intarray}

\noindent \texttt{\intarray_gset_rand:Nnn \intarray_gset_rand:cn \intarray_gset_rand:Nn \intarray_gset_rand:cn}

\noindent \code{Evaluates the integer expressions \texttt{\langle minimum \rangle} and \texttt{\langle maximum \rangle} then sets each entry (independently) of the \texttt{\langle integer array variable \rangle} to a pseudo-random number between the two (with bounds included). If the absolute value of either bound is bigger than \texttt{2^{30} - 1}, an error occurs. Entries are generated in the same way as repeated calls to \texttt{\int_rand:nn} or \texttt{\int_rand:n} respectively, in particular for the second function the \texttt{\langle minimum \rangle} is 1. Assignments are always global. This is not available in older versions of \texttt{Xe\TeX}.}

\noindent \texttt{\intarray_to_clist:N \intarray_to_clist:c}

\noindent \code{Converts the \texttt{\langle intarray \rangle} to integer denotations separated by commas. All tokens have category code other. If the \texttt{\langle intarray \rangle} has no entry the result is empty; otherwise the result has one fewer comma than the number of items.}
37.8 Additions to \texttt{l3msg}

\begin{verbatim}
\msg_show_eval:Nn \msg_show_eval:NN \{function\} \{expression\}
\msg_log_eval:Nn

Shows or logs the \texttt{expression} (turned into a string), an equal sign, and the result of applying the \texttt{function} to the \texttt{expression} (with f-expansion). For instance, if the \texttt{function} is \texttt{\int_eval:n} and the \texttt{expression} is \texttt{1+2} then this logs \texttt{> 1+2=3}.
\end{verbatim}

\begin{verbatim}
\msg_show_item:n \msg_show_item:nn \msg_show_item:nn \msg_show_item_unbraced:nn \msg_show_item_unbraced:nn

* \seq_map_function:NN \msg_show_item:n
* \prop_map_function:NN \msg_show_item:nn
\end{verbatim}

Used in the text of messages for \texttt{\msg_show:nnxxxx} to show or log a list of items or key–value pairs. The one-argument functions are used for sequences, clist or token lists and the others for property lists. These functions turn their arguments to strings.

37.9 Additions to \texttt{l3prg}

\begin{verbatim}
\bool_set_inverse:N \bool_set_inverse:c \bool_gset_inverse:N \bool_gset_inverse:c

\bool_set_inverse:N \{boolean\}
\end{verbatim}

Toggles the \texttt{boolean} from \texttt{true} to \texttt{false} and conversely: sets it to the inverse of its current value.
\bool_case_true:n \bool_case_true:nTF \bool_case_false:n \bool_case_false:nTF

\prop_rand_key_value:N \prop_rand_key_value:N \prop_rand_key_value:c \prop_rand_key_value:c

\bool_case_true:nTF \bool_case_false:nTF

\prop_rand_key_value:N (property list)

Selects a pseudo-random key–value pair from the \langle property list \rangle and returns \langle key \rangle and \langle value \rangle. If the \langle property list \rangle is empty the result is empty. This is not available in older versions of \TeX{}.\TeX{}hackers note: The result is returned within the \unexpanded primitive \langle \exp_not:n \rangle, which means that the \langle value \rangle does not expand further when appearing in an x-type or e-type argument expansion.

37.10 Additions to l3prop
### 37.11 Additions to l3seq

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\seq_mapthread_function:NNN \textit{✩} \seq_mapthread_function:NNN \textit{ ⟨seq_1⟩} \textit{ ⟨seq_2⟩} \textit{ ⟨function⟩}</td>
<td>Applies \textit{ ⟨function⟩} to every pair of items \textit{ ⟨seq_1-item⟩}–\textit{ ⟨seq_2-item⟩} from the two sequences, returning items from both sequences from left to right. The \textit{ ⟨function⟩} receives two \textit{n-type} arguments for each iteration. The mapping terminates when the end of either sequence is reached (\textit{i.e.} whichever sequence has fewer items determines how many iterations occur).</td>
</tr>
<tr>
<td>\seq_set_filter:NNn \seq_set_filter:NNn \textit{ ⟨sequence_1⟩} \textit{ ⟨sequence_2⟩} {\textit{inline boolexpr}}</td>
<td>Evaluates the \textit{ ⟨inline boolexpr⟩} for every \textit{ ⟨item⟩} stored within the \textit{ ⟨sequence_2⟩}. The \textit{ ⟨inline boolexpr⟩} receives the \textit{ ⟨item⟩} as \textit{#1}. The sequence of all \textit{ ⟨items⟩} for which the \textit{ ⟨inline boolexpr⟩} evaluated to \textit{true} is assigned to \textit{ ⟨sequence_1⟩}.</td>
</tr>
<tr>
<td>\seq_set_from_function:NnN \seq_set_from_function:NnN \textit{ ⟨seq var⟩} {\textit{loop code}} {\textit{function}}</td>
<td>Sets the \textit{ ⟨seq var⟩} equal to a sequence whose items are obtained by x-expanding \textit{ ⟨loop code⟩} \textit{ ⟨function⟩}. This expansion must result in successive calls to the \textit{ ⟨function⟩} with no nonexpandable tokens in between. More precisely the \textit{ ⟨function⟩} is replaced by a wrapper function that inserts the appropriate separators between items in the sequence. The \textit{ ⟨loop code⟩} must be expandable; it can be for example \texttt{\tl_map_function:NN {tl var}} or \texttt{\clist_map_function:nN {clist}} or \texttt{\int_step_function:nnnN {⟨initial value⟩} {⟨step⟩} {⟨final value⟩}}.</td>
</tr>
<tr>
<td>\seq_set_from_inline_x:Nnn \seq_set_from_inline_x:Nnn \textit{ ⟨seq var⟩} {\textit{loop code}} {\textit{inline code}}</td>
<td>Sets the \textit{ ⟨seq var⟩} equal to a sequence whose items are obtained by x-expanding \textit{ ⟨loop code⟩} applied to a \textit{ ⟨function⟩} derived from the \textit{ ⟨inline code⟩}. A \textit{ ⟨function⟩} is defined, that takes one argument, x-expands the \textit{ ⟨inline code⟩} with that argument as \textit{#1}, then adds appropriate separators to turn the result into an item of the sequence. The x-expansion of \textit{ ⟨loop code⟩} \textit{ ⟨function⟩} must result in successive calls to the \textit{ ⟨function⟩} with no nonexpandable tokens in between. The \textit{ ⟨loop code⟩} must be expandable; it can be for example \texttt{\tl_map_function:NN {tl var}} or \texttt{\clist_map_function:nN {clist}} or \texttt{\int_step_function:nnnN {⟨initial value⟩} {⟨step⟩} {⟨final value⟩}}, but not the analogous “inline” mappings.</td>
</tr>
</tbody>
</table>

\textbf{\TeX{}hackers note:} Contrarily to other mapping functions, \seq_map_break:\textit{ cannot be used in this function, and would lead to low-level \TeX{} errors.}

\seq_set_item:Nnn \seq_set_item:cnn \seq_set_item:NnnTF \seq_set_item:cnnTF \seq_gset_item:Nnn \seq_gset_item:cnn \seq_gset_item:NnnTF \seq_gset_item:cnnTF

Removes the item of \langle sequence \rangle at the position given by evaluating the \langle integer expression \rangle and replaces it by \langle item \rangle. Items are indexed from 1 on the left/top of the \langle sequence \rangle, or from \(-1\) on the right/bottom. If the \langle integer expression \rangle is zero or is larger (in absolute value) than the number of items in the sequence, the \langle sequence \rangle is not modified. In these cases, \seq_set_item:Nnn raises an error while \seq_set_item:NnnTF runs the \langle false code \rangle. In cases where the assignment was successful, \langle true code \rangle is run afterwards.

\seq_pop_item:NnN \seq_pop_item:cnN \seq_pop_item:NnnTF \seq_pop_item:cnNTF \seq_gpop_item:NnN \seq_gpop_item:cnN \seq_gpop_item:NnnTF \seq_gpop_item:cnNTF

Removes the \langle item \rangle at position \langle integer expression \rangle in the \langle sequence \rangle, and places it in the \langle token list variable \rangle. Items are indexed from 1 on the left/top of the \langle sequence \rangle, or from \(-1\) on the right/bottom. If the position is zero or is larger (in absolute value) than the number of items in the sequence, the \langle seq var \rangle is not modified, the \langle token list \rangle is set to the special marker \q_no_value, and the \langle false code \rangle is left in the input stream; otherwise the \langle true code \rangle is. The \langle token list \rangle assignment is local while the \langle sequence \rangle is assigned locally for pop or globally for gpop functions.

37.12 Additions to l3sys

\c_sys_engine_version_str

The version string of the current engine, in the same form as given in the banner issued when running a job. For pdf\TeX, Lua\TeX, Xe\TeX this is of the form

\langle major\rangle.\langle minor\rangle.\langle revision\rangle

For pdf\TeX, the form is

\langle major\rangle.\langle minor\rangle

For \p\TeX and up\TeX, only releases since \TeX Live 2018 make the data available, and the form is more complex, as it comprises the \p\TeX version, the up\TeX version and the e-p\TeX version.

p\langle major\rangle.\langle minor\rangle.\langle revision\rangle-u\langle major\rangle.\langle minor\rangle-ep\TeX

where the u part is only present for up\TeX.

\sys_if_rand_exist_p: * \sys_if_rand_exist:TF *

Tests if the engine has a pseudo-random number generator. Currently this is the case in pdf\TeX, Lua\TeX, \p\TeX, up\TeX and recent releases of Xe\TeX.
37.13 Additions to \l3tl

Leaves in the input stream the items from the \langle start index \rangle to the \langle end index \rangle inclusive, using the same indexing as \lrange:nnn. Spaces are ignored. Regardless of whether items appear with or without braces in the \langle token list \rangle, the \tlrange_braced:nnn function wraps each item in braces, while \tlrange_unbraced:nnn does not (overall it removes an outer set of braces). For instance,

\begin{verbatim}
\iow_term:x { \tl_range_braced:nnn { abcd-{e{}}f } { 2 } { 5 } }
\iow_term:x { \tl_range_braced:nnn { abcd-{e{}}f } { -4 } { -1 } }
\iow_term:x { \tl_range_braced:nnn { abcd-{e{}}f } { -2 } { -1 } }
\iow_term:x { \tl_range_braced:nnn { abcd-{e{}}f } { 0 } { -1 } }
\end{verbatim}

prints \{b}{c}{d}{e{}}, \{c}{d}{e{}f}, \{e{}f}, and an empty line to the terminal, while

\begin{verbatim}
\iow_term:x { \tl_range_unbraced:nnn { abcd-{e{}}f } { 2 } { 5 } }
\iow_term:x { \tl_range_unbraced:nnn { abcd-{e{}}f } { -4 } { -1 } }
\iow_term:x { \tl_range_unbraced:nnn { abcd-{e{}}f } { -2 } { -1 } }
\iow_term:x { \tl_range_unbraced:nnn { abcd-{e{}}f } { 0 } { -1 } }
\end{verbatim}

prints bcde{}, cdef, e{}f, and an empty line to the terminal. Because braces are removed, the result of \tlrange_unbraced:nnn may have a different number of items as for \lrange:nnn or \tlrange_braced:nnn. In cases where preserving spaces is important, consider the slower function \lrange:nnn.

\TeX\Hackers note: The result is returned within the \unexpanded primitive (\exp_not:n), which means that the \langle item \rangle does not expand further when appearing in an x-type or e-type argument expansion.

---

\tlbuildbegin:N  \tlbuildgbegin:N \tlbuildbegin:N \tlbuildgbegin:N
\begin{verbatim}
\tlbuildbegin:N \tlbuildgbegin:N \tlbuildbegin:N \tlbuildgbegin:N
\end{verbatim}

Clears the \langle tl var \rangle and sets it up to support other \tlbuild_\ldots functions, which allow accumulating large numbers of tokens piece by piece much more efficiently than standard \l3tl functions. Until \tlbuildend:N \langle tl var \rangle is called, applying any function from \l3tl other than \tlbuild_\ldots will lead to incorrect results. The begin and gbegin functions must be used for local and global \langle tl var \rangle respectively.

\tlbuildclear:N  \tlbuildgclear:N  \tlbuildclear:N  \tlbuildgclear:N
\begin{verbatim}
\tlbuildclear:N \tlbuildgclear:N \tlbuildclear:N \tlbuildgclear:N
\end{verbatim}

Clears the \langle tl var \rangle and sets it up to support other \tlbuild_\ldots functions. The clear and gclear functions must be used for local and global \langle tl var \rangle respectively.
\tl_build_put_left:Nn \tl_build_put_left:Nx \tl_build_gput_left:Nn \tl_build_gput_left:Nx
\tl_build_put_right:Nn \tl_build_put_right:Nx \tl_build_gput_right:Nn \tl_build_gput_right:Nx

Adds \textit{tokens} to the left or right side of the current contents of \textit{tl var}. The \textit{tl var} must have been set up with \tl_build_begin:N or \tl_build_gbegin:N. The \textit{put} and \textit{gput} functions must be used for local and global \textit{tl var} respectively. The \textit{right} functions are about twice faster than the \textit{left} functions.

\tl_build_get:NN \tl_build_get:N \tl_build_get:Nx

Stores the contents of the \textit{tl var1} in the \textit{tl var2}. The \textit{tl var1} must have been set up with \tl_build_begin:N or \tl_build_gbegin:N. The \textit{tl var2} is a “normal” token list variable, assigned locally using \tl_set:Nn.

\tl_build_end:N \tl_build_gend:N

Gets the contents of \textit{tl var} and stores that into the \textit{tl var} using \tl_set:Nn or \tl_gset:Nn. The \textit{tl var} must have been set up with \tl_build_begin:N or \tl_build_gbegin:N. The \textit{end} and \textit{gend} functions must be used for local and global \textit{tl var} respectively. These functions completely remove the setup code that enabled \textit{tl var} to be used for other \tl_build_... functions.

\c_catcode_active_space_tl

Token list containing one character with category code 13, (“active”), and character code 32 (space).

37.14 Additions to \texttt{l3token}
Collects and removes tokens from the input stream until finding a token that does not match the \textit{(test token)} (as defined by the test \texttt{\token_if_eq_catcode:NNTF} or \texttt{\token_if_eq_charcode:NNTF} or \texttt{\token_if_eq_meaning:NNTF}). The collected tokens are passed to the \textit{(inline code)} as #1. When begin-group or end-group tokens (usually \texttt{\{ or \}}) are collected they are replaced by implicit \texttt{\c_group_begin_token} and \texttt{\c_group_end_token}, and when spaces (including \texttt{\c_space_token}) are collected they are replaced by explicit spaces.

For example the following code prints “Hello” to the terminal and leave “, world!” in the input stream.

\begin{verbatim}
\peek_catcode_collect_inline:Nn A \{ \iow_term:n \{#1\} \} Hello,-world!
\end{verbatim}

Another example is that the following code tests if the next token is \texttt{*}, ignoring intervening spaces, but putting them back using \texttt{#1} if there is no \texttt{*}.

\begin{verbatim}
\peek_meaning_collect_inline:Nn \c_space_token
{ \peek_charcode:NNTF \star \{ star \} \{ no-star \#1 \} }
\end{verbatim}
Part VIII
Implementation
Chapter 38

\texttt{l3bootstrap} implementation

\section*{38.1 \texttt{Lua\TeX}--specific code}

Depending on the versions available, the \texttt{\LaTeX} format may not have the raw \texttt{\Umath} primitive names available. We fix that globally: it should cause no issues. Older \texttt{Lua\TeX} versions do not have a pre-built table of the primitive names here so sort one out ourselves. These end up globally-defined but at that is true with a newer format anyway and as they all start \texttt{\U} this should be reasonably safe.

\begin{verbatim}
\begingroup
\expandafter\ifx\csname directlua\endcsname\relax
\else
  \directlua{%
    local i
    local t = {}
    for _,i in pairs(tex.extraprimitives("luatex")) do
      if string.match(i,"^U") then
        if not string.match(i,"^Uchar$") then %$
          table.insert(t,i)
        end
      end
    end
    tex.enableprimitives("", t)
  %}
\fi
\endgroup
\end{verbatim}

\section*{38.2 The \texttt{\pdfstrcmp} primitive in \texttt{\Xe\TeX}}

Only \texttt{pdf\TeX} has a primitive called \texttt{\pdfstrcmp}. The \texttt{\Xe\TeX} version is just \texttt{\strcmp}, so there is some shuffling to do. As this is still a real primitive, using the \texttt{pdf\TeX} name is "safe".

\begin{verbatim}
\begingroup\expandafter\expandafter\expandafter\endgroup
\expandafter\ifx\csname pdfstrcmp\endcsname\relax
\let\pdfstrcmp\strcmp
\fi
\end{verbatim}
38.3 Loading support Lua code

When Lua\TeX\ is used there are various pieces of Lua code which need to be loaded. The code itself is defined in \texttt{l3luatex} and is extracted into a separate file. Thus here the task is to load the Lua code both now and (if required) at the start of each job.

\begin{verbatim}
\begingroup\expandafter\expandafter\expandafter\endgroup
\expandafter\ifx\csname directlua\endcsname\relax
\else
\ifnum\luatexversion<110 \%
\else
For Lua\TeX\ we make sure the basic support is loaded: this is only necessary in plain.
\begin{verbatim}
\begingroup\expandafter\expandafter\expandafter\endgroup
\expandafter\ifx\csname newcatcodetable\endcsname\relax
\input{ltluatex}\%
\fi
\begingroup\expandafter\expandafter\expandafter\endgroup
\expandafter\ifx\csname newluabytecode\endcsname\relax
\else
\newluabytecode{expl@luadata@bytecode}
\fi
\directlua{require("expl3")}\%
\end{verbatim}
\end{verbatim}
\end{verbatim}
\fi
\fi
\end{verbatim}

As the user might be making a custom format, no assumption is made about matching package mode with only loading the Lua code once. Instead, a query to Lua reveals what mode is in operation.

\begin{verbatim}
\ifnum 0\%
\directlua{
  if status.ini_version then
tex.write("1")
end
}>0 \%
\everyjob{\expandafter{\the\expandafter\everyjob}
\csname\detokenize{lua_now:n}\endcsname{require("expl3")}}\%
\fi
\fi
\end{verbatim}

38.4 Engine requirements

The code currently requires \TeX\ and functionality equivalent to \texttt{\pdfstrcmp}, and also driver and Unicode character support. This is available in a reasonably-wide range of engines.

For Lua\TeX, we require at least Lua 5.3 and the \texttt{token.set_lua} function. This is available at least since Lua\TeX\ 1.10.
The L3 programming layer requires the e-TeX primitives and additional functionality as described in the README file. These are available in the engines-
- pdfTeX v1.40.0
- XeTeX v0.99992
- LuaTeX v1.10
- e-(u)pTeX mid-2012
- Prote (2021)
or later.

38.5 Extending allocators

The ability to extend \TeX's allocation routine to allow for \vz\TeX has been around since 1997 in the etex package. Loading this support is delayed until here as we are now sure
that the \TeX extensions and `pdfstrcmp` or equivalent are available. Thus there is no
danger of an “uncontrolled” error if the engine requirements are not met.

For \LaTeX2, we need to make sure that the extended pool is being used: expl3
uses a lot of registers. For formats from 2015 onward there is nothing to do as this is
automatic. For older formats, the `etex` package needs to be loaded to do the job. In that
case, some inserts are reserved also as these have to be from the standard pool. Note
that `reserveinserts` is `outer` and so is accessed here by csname. In earlier versions,
loading `etex` was done directly and so `reserveinserts` appeared in the code: this then
required a `\relax` after `\RequirePackage` to prevent an error with “unsafe” definitions
as seen for example with `capoptions`. The optional loading here is done using a group
and `\ifx` test as we are not quite in the position to have a single name for `pdfstrcmp`
just yet.

```
\begingroup
\def\@tempa{LaTeX2e}\% 
\def\next{}\%
\ifx\fmtname\@tempa
\expandafter\ifx\csname extrafloats\endcsname\relax 
\def\next{\%
\RequirePackage{etex}\%
\csname reserveinserts\endcsname{32}\%
}\%
\fi
\fi
\expandafter\endgroup
\next
```

38.6 The \LaTeX3 code environment

The code environment is now set up.

```
\ExplSyntaxOff
\protect\edef\ExplSyntaxOff{\protect\def\noexpand\ExplSyntaxOff{}\protect\catcode 9 = \the\catcode 9\relax
\catcode 32 = \the\catcode 32\relax
\catcode 34 = \the\catcode 34\relax
\catcode 38 = \the\catcode 38\relax
\catcode 58 = \the\catcode 58\relax
\catcode 94 = \the\catcode 94\relax
\catcode 95 = \the\catcode 95\relax
\endlinechar = \the\endlinechar\relax
\chardef\csname l__kernel_expl_bool\endcsname = 0\relax
}
```

(End definition for `\ExplSyntaxOff`. This function is documented on page 9.)
The code environment is now set up.
\texttt{\catcode 9 = 9\relax}\texttt{\catcode 32 = 9\relax}\texttt{\catcode 34 = 12\relax}\texttt{\catcode 38 = 4\relax}\texttt{\catcode 58 = 11\relax}\texttt{\catcode 94 = 7\relax}\texttt{\catcode 95 = 11\relax}\texttt{\catcode 124 = 12\relax}\texttt{\catcode 126 = 10\relax}\texttt{\endlinechar = 32\relax}

\texttt{\l__kernel_expl_bool} The status for code syntax: this is on at present.
\texttt{\chardef\l__kernel_expl_bool = 1\relax}(End definition for \texttt{\l__kernel_expl_bool}.)

\texttt{\ExplSyntaxOn} The idea here is that multiple \texttt{\ExplSyntaxOn} calls are not going to mess up category codes, and that multiple calls to \texttt{\ExplSyntaxOff} are also not wasting time. Applying \texttt{\ExplSyntaxOn} alters the definition of \texttt{\ExplSyntaxOff} and so in package mode this function should not be used until after the end of the loading process!
\texttt{\protected \def \ExplSyntaxOn}{
\bool_if:NF \l__kernel_expl_bool
\{
\cs_set_protected:Npx \ExplSyntaxOff

\bool_set_true:N \l__kernel_expl_bool
}\}

319
(End definition for \ExplSyntaxOn. This function is documented on page 9.)
Chapter 39

l3names implementation

The prefix here is kernel. A few places need \& to be left as is; this is obtained as \&. The code here simply renames all of the primitives to new, internal, names. The \let primitive is renamed by hand first as it is essential for the entire process to follow. This also uses \global, as that way we avoid leaving an unneeded csname in the hash table.

Everything is inside a (rather long) group, which keeps \__kernel_primitive:NN trapped.

A temporary function to actually do the renaming.

To allow extracting “just the names”, a bit of DocStrip fiddling.

In the current incarnation of this package, all \TeX primitives are given a new name of the form \tex_oldname:NN. But first three special cases which have symbolic original names. These are given modified new names, so that they may be entered without catcode tricks.

\end{itemize}
Post-ε-TeX primitives do not always end up with the same name in all engines, if indeed they are available cross-engine anyway. We therefore take the approach of preferring the shortest name that makes sense. First, we deal with the primitives introduced by pdfTeX which directly relate to PDF output: these are copied with the names unchanged.
These are not related to PDF output and either already appear in other engines without the \pdf prefix, or might reasonably do so at some future stage. We therefore drop the leading pdf here.
The version primitives are not related to PDF mode but are pdftex-specific, so again are carried forward unchanged.

These ones appear in pdfTeX but don’t have pdf in the name at all: no decisions to make.

Post pdftex primitive availability gets more complex. Both XeLaTeX and LuaLaTeX have varying names for some primitives from pdftex. Particularly for LuaLaTeX tracking all of that would be hard. Instead, we now check that we only save primitives if they actually exist.

Some pdfTeX primitives are handled here because they got dropped in LuaLaTeX but the corresponding internal names are emulated later. The Lua code is already loaded at this point, so we shouldn’t overwrite them.
XeLaTeX-specific primitives. Note that XeLaTeX’s `\strcmp` is handled earlier and is “rolled up” into `\pdfstrcmp`. A few cross-compatibility names which lack the `pdf` of the original are handled later.

The set of Unicode math primitives were introduced by X\TeX{} and Lua\TeX{} in a somewhat complex fashion: a few first as \texttt{\textbackslash Xe\textbackslash TeX...} which were then renamed with Lua\TeX{} having a lot more. These names now all start \texttt{\textbackslash U...} and mainly \texttt{\textbackslash Umath...}

339
Omega primitives provided by \TeX{} (listed separately mainly to allow understanding of their source).

Newer cross-engine primitives.

End of the “just the names” part of the source.

The job is done: close the group (using the primitive renamed!).

\textit{\LaTeX2ε} moves a few primitives, so these are sorted out. In newer versions of \LaTeX2ε, expl3 is loaded rather early, so only some primitives are already renamed, so we need two tests here. At the beginning of the \LaTeX2ε format, the primitives \verb|\end| and \verb|\input| are renamed, and only later on the other ones.

If \verb|\@@hyph| is defined, we are loading expl3 in a pre-2020/10/01 release of \LaTeX2ε, so a few other primitives have to be tested as well.

The \verb|\shipout| primitive is particularly tricky as a number of packages want to hook in here. First, we see if a sufficiently-new kernel has saved a copy: if it has, just use that. Otherwise, we need to check each of the possible packages/classes that might move it: here, we are looking for those which do not delay action to the \verb|\AtBeginDocument| hook. (We cannot use \verb|\primitive| as that doesn’t allow us to make a direct copy of the primitive itself.) As we know that \LaTeX2ε is in use, we use it’s \verb|\@tfor| loop here.
Some tidying up is needed for \textit{(pdf)tracingfonts}. Newer \LaTeX{}X has this simply as \texttt{\textbackslash tracingfonts}, but that is overwritten by the \LaTeX{}2\epsilon kernel. So any spurious definition has to be removed, then the real version saved either from the pd\LaTeX{} name or from Lua\LaTeX{}. In the latter case, we leave \texttt{\@@tracingfonts} available: this might be useful and almost all \LaTeX{}2\epsilon users will have \texttt{expl3} loaded by fontspec. (We follow the usual kernel convention that \texttt{@@} is used for saved primitives.)

That is also true for the Lua\LaTeX{}X primitives under \LaTeX{}2\epsilon (depending on the format-building date). There are a few primitives that get the right names anyway so are missing here!
Only pdfTeX and LuaTeX define `\pdfmapfile` and `\pdfmapline`: Tidy up the fact that some format-building processes leave a couple of questionable decisions about that!
A few packages do unfortunate things to date-related primitives.

Up to v0.80, LuaTeX defines the pdfTeX version data: rather confusing. Removing them means that \text{\texttt{\texttt{tex_pdftexversion}}} is a marker for pdfTeX alone: useful in engine-dependent code later.

cslatex moves a couple of primitives which we recover here; as there is no other marker, we can only work by looking for the names.

For ConTeXt, two tests are needed. Both Mark II and Mark IV move several primitives: these are all covered by the first test, again using \texttt{\texttt{end}} as a marker. For Mark IV,
a few more primitives are moved: they are implemented using some Lua code in the current ConTeXt.

\langle /tex \rangle

In LuaTeX, we additionally emulate some primitives using Lua code.

\textunderscore strcmp:D Compare two strings, expanding to 0 if they are equal, \textunderscore minus one if the first one is smaller and 1 if the second one is smaller. Here “smaller” refers to codepoint order which does not correspond to the user expected order for most non-ASCII strings.

local minus_tok = token_new(string.byte’\textunderscore ’, 12)
local zero_tok = token_new(string.byte’0’, 12)
local one_tok = token_new(string.byte’1’, 12)
luaexec(’tex_strcmp:D’, function()
  local first = scan_string()
  local second = scan_string()
  if first < second then
    put_next(minus_tok, one_tok)
  else
    put_next(first == second and zero_tok or one_tok)
  end
end
(End definition for \textunderscore strcmp:D. This function is documented on page ??.)

\textunderscore Ucharcat:D Creating arbitrary chars using \textunderscore cprint. The alternative approach using \textunderscore token.new(…) is about 10% slower but needed to create arbitrary space tokens.
local sprint = tex.sprint
local cprint = tex.cprint
luacmd(\'\text{Ucharcat}:D\', function()
  local charcode = scan_int()
  local catcode = scan_int()
  if catcode == 10 then
    sprint(token_new(charcode, 10))
  else
    cprint(catcode, utf8_char(charcode))
  end
end, \'global\')

(End definition for \text{Ucharcat}:D. This function is documented on page ??.)

\text{filesize}:D Wrap the function from ltxutils.
luacmd(\'\text{filesize}:D\', function()
  local size = filesize(scan_string())
  if size then write(size) end
end, \'global\')

(End definition for \text{filesize}:D. This function is documented on page ??.)

\text{mdfivesum}:D There are two cases: Either hash a file or a string. Both are already implemented in \l3luatex or built-in.
luacmd(\'\text{mdfivesum}:D\', function()
  local hash
  if scan_keyword\"file\" then
    hash = filemd5sum(scan_string())
  else
    hash = md5_HEX(scan_string())
  end
  if hash then write(hash) end
end, \'global\')

(End definition for \text{mdfivesum}:D. This function is documented on page ??.)

\text{filemoddate}:D A primitive for getting the modification date of a file.
luacmd(\'\text{filemoddate}:D\', function()
  local date = filemoddate(scan_string())
  if date then write(date) end
end, \'global\')

(End definition for \text{filemoddate}:D. This function is documented on page ??.)

\text{filedump}:D An emulated primitive for getting a hexdump from a (partial) file. The length has a default of 0. This is consistent with pdf\TeX{}, but it effectively makes the primitive useless without an explicit length. Therefore we allow the keyword \text{whole} to be used instead of a length, indicating that the whole remaining file should be read.
luacmd(\'\text{filedump}:D\', function()
  local offset = scan_keyword\textquoteleft\text{offset}\textquoteright{} and scan_int() or nil
  local length = scan_keyword\textquoteleft\text{length}\textquoteright{} and scan_int()
  or not scan_keyword\textquoteleft\text{whole}\textquoteright{} and 0 or nil
  local data = fieldump(scan_string(), offset, length)
  if data then write(data) end
end, \'global\')
(End definition for \texttt{\textbackslash tex\_filedump:D}. This function is documented on page ??.)

Chapter 40

l3kernel-functions:
kernel-reserved functions

40.1 Internal kernel functions

\class{__kernel_chk_cs_exist:N} \class{\__kernel_chk_cs_exist:N} \var{cs}
This function is only created if debugging is enabled. It checks that \var{cs} exists according to the criteria for \class{\cs_if_exist_p:N}, and if not raises a kernel-level error.

\class{\__kernel_chk_defined:NT} \class{\__kernel_chk_defined:NT} \var{variable} \class{\true code}
If \var{variable} is not defined (according to \class{\cs_if_exist:NTF}), this triggers an error, otherwise the \class{true code} is run.

\class{\__kernel_chk_expr:nNnN} \class{\__kernel_chk_expr:nNnN} \var{expr} \class{\eval} \class{\convert} \var{caller}
This function is only created if debugging is enabled. By default it is equivalent to \class{\use_i:nnnn}. When expression checking is enabled, it leaves in the input stream the result of \class{\tex_the:D} \class{\eval} \var{expr} \class{\tex_relax:D} after checking that no token was left over. If any token was not taken as part of the expression, there is an error message displaying the result of the evaluation as well as the \var{caller}. For instance \class{\eval} can be \class{\int_eval:w} and \var{caller} can be \class{\int_eval:n} or \class{\int_set:Nn}. The argument \var{convert} is empty except for mu expressions where it is \class{\tex_mutoglue:D}, used for internal purposes.

\class{\__kernel_chk_tl_type:NnnT} \class{\__kernel_chk_tl_type:NnnT} \var{control sequence} \class{\specific type} \class{\true code}
Helper to test that the \var{control sequence} is a variable of the given \var{specific type} of token list. Produces suitable error messages if the \var{control sequence} does not exist, or if it is not a token list variable at all, or if the \var{control sequence} differs from the result of x-expanding \var{reconstruction}. If all of these tests succeed then the \class{true code} is run.
\_\_kernel\_codepoint\_to\_bytes:n \_\_kernel\_codepoint\_to\_bytes:n \{(codepoint)\}

Converts the \textit{codepoint} to UTF-8 bytes. The expansion of this function comprises four brace groups, each of which will contain a hexadecimal value: the appropriate byte. As UTF-8 is a variable-length, one or more of the groups may be empty: the bytes read in the logical order, such that a two-byte codepoint will have groups \#1 and \#2 filled and \#3 and \#4 empty.

\_\_kernel\_cs\_parm\_from\_arg\_count:nnF \_\_kernel\_cs\_parm\_from\_arg\_count:nnF \{(follow-on)\} \{(args)\}

\textit{false code}\}

Evaluates the number of \textit{args} and leaves the \textit{follow-on} code followed by a brace group containing the required number of primitive parameter markers (\#1, etc.). If the number of \textit{args} is outside the range [0, 9], the \textit{false code} is inserted instead of the \textit{follow-on}.

\_\_kernel\_dependency\_version\_check:Nn \_\_kernel\_dependency\_version\_check:nn \{(date)\} \{(file)\}

\_\_kernel\_dependency\_version\_check:nn \_\_kernel\_dependency\_version\_check:nn \{(date)\} \{(file)\}

Checks if the loaded version of the \texttt{expl3} kernel is at least \textit{date}, required by \textit{file}. If the kernel date is older than \textit{date}, the loading of \textit{file} is aborted and an error is raised.

\_\_kernel\_deprecation\_code:nn \_\_kernel\_deprecation\_code:nn \{(error code)\} \{(working code)\}

Stores both an \textit{error} and \textit{working} definition for given material such that they can be exchanged by \texttt{\debug\_on} and \texttt{\debug\_off}.

\_\_kernel\_exp\_not:w \_\_kernel\_exp\_not:w \{expandable tokens\} \{(content)\}

Carries out expansion on the \textit{expandable tokens} before preventing further expansion of the \textit{content} as for \texttt{\exp\_not:n}. Typically, the \textit{expandable tokens} will alter the nature of the \textit{content}, \textit{i.e.} allow it to be generated in some way.

\l\_\_kernel\_expl\_bool

A boolean which records the current code syntax status: \texttt{true} if currently inside a code environment. This variable should only be set by \texttt{\ExplSyntaxOn/\ExplSyntaxOff}.

\textit{false code}\}

(End definition for \l\_\_kernel\_expl\_bool.)

\c\_\_kernel\_expl\_date\_tl

A token list containing the release date of the \texttt{l3kernel} preloaded in \texttt{\LaTeX2e} used to check if dependencies match.

(End definition for \c\_\_kernel\_expl\_date\_tl.)

\_\_kernel\_file\_missing:n \_\_kernel\_file\_missing:n \{(name)\}

Expands the \textit{name} as per \texttt{\_\_kernel\_file\_name\_sanitize:n} then produces an error message indicating that this file was not found.

\_\_kernel\_file\_name\_sanitize:n \_\_kernel\_file\_name\_sanitize:n \{(name)\}

Updated: 2021-04-17

Expands the file name using a \texttt{\csname}-based approach, and relies on active characters (for example from UTF-8 characters) being properly set up to expand to a expansion-safe version using \texttt{\ifcsname}. This is less conservative than the token-by-token approach used before, but it is much faster.
\__kernel_file_input_push:n \__kernel_file_input_push:n \{name\}
\__kernel_file_input_pop: \__kernel_file_input_pop:

Used to push and pop data from the internal file stack: needed only in package mode, where interfacing with the \LaTeX\ expansion kernel is necessary.

\__kernel_int_add:nnn \{integer\} \{integer\} \{integer\}

Expands to the result of adding the three \{integers\} (which must be suitable input for \int_eval:w), avoiding intermediate overflow. Overflow occurs only if the overall result is outside \([-2^{31}+1, 2^{31}−1]\). The \{integers\} may be of the form \int_eval:w \ldots \scan_stop: but may be evaluated more than once.

\__kernel_intarray_gset:Nnn \{intarray var\} \{index\} \{value\}

New: 2018-03-31
Faster version of \intarray_gset:Nnn. Stores the \{value\} into the \{integer array variable\} at the \{position\}. The \{index\} and \{value\} must be suitable for a direct assignment to a \TeX{} count register, for instance expanding to an integer denotation or obtained through the primitive \numexpr{} (which may be un-terminated). No bound checking is performed: the caller is responsible for ensuring that the \{position\} is between 1 and the \intarray_count:N, and the \{value\}'s absolute value is at most \(2^{30}−1\). Assignments are always global.

\__kernel_intarray_item:Nn \{intarray var\} \{index\}

New: 2018-03-31
Faster version of \intarray_item:Nn. Expands to the integer entry stored at the \{index\} in the \{integer array variable\}. The \{index\} must be suitable for a direct assignment to a \TeX{} count register and must be between 1 and the \intarray_count:N, lest a low-level \TeX{} error occur.

\__kernel_intarray_range_to_clist:Nnn \{intarray var\} \{start index\} \{end index\}

New: 2020-07-12
Converts to integer denotations separated by commas the entries of the \{intarray\} from positions \{start index\} to \{end index\} included. The \{start index\} and \{end index\} must be suitable for a direct assignment to a \TeX{} count register, must be between 1 and the \intarray_count:N, and be suitably ordered. All tokens have category code other.

\__kernel_intarray_gset_range_from_clist:Nnn \{intarray var\} \{start index\} \{integer clist\}

New: 2020-07-12
Stores the entries of the \{clist\} as entries of the \{intarray var\} starting from the \{start index\}, upwards. This is done without any bound checking. The \{start index\} and all entries of the \{integer comma list\} (which do not undergo space trimming and brace stripping as in normal clist mappings) must be suitable for a direct assignment to a \TeX{} count register. An empty entry may stop the loop.
\_\_kernel_ior\_open:No \quad \_\_kernel_ior\_open:No \ (stream) \ {(file name)}

This function has identical syntax to the public version. However, it does not take precautions against active characters in the (file name), and it does not attempt to add a (path) to the (file name): it is therefore intended to be used by higher-level functions which have already fully expanded the (file name) and which need to perform multiple open or close operations. See for example the implementation of \file\_get\_full\_name:nN.

\_\_kernel_iow\_with:Nnn \quad \_\_kernel_iow\_with:Nnn \ (integer) \ {(value)} \ {(code)}

If the (integer) is equal to the (value) then this function simply runs the (code). Otherwise it saves the current value of the (integer), sets it to the (value), runs the (code), and restores the (integer) to its former value. This is used to ensure that the \newline\char is 10 when writing to a stream, which lets \iow\_newline: work, and that \errorcontext\_lines is −1 when displaying a message.

\_\_kernel_kern:n \quad \_\_kernel_kern:n \ {(length)}

Inserts a kern of the specified (length), a dimension expression.

(End definition for \_\_kernel_kern:n.)

\g\_kernel_prg\_map\_int

This integer is used by non-expandable mapping functions to track the level of nesting in force. The functions \(\langle\text{type}\rangle\_\text{map}_1:w, \langle\text{type}\rangle\_\text{map}_2:w, \text{etc.}, labelled by \g\_kernel_prg\_map\_int\) hold functions to be mapped over various list datatypes in inline and variable mappings.

(End definition for \g\_kernel_prg\_map\_int.)
`\__kernel_quark_new_test:N` `\__kernel_quark_new_test:N \langle name \rangle:(arg spec)`

Defines a quark-test function \langle name \rangle:(arg spec) which tests if its argument is `\q__-(namespace)_recursion_tail`, then acts accordingly, as described below for each possible (arg spec).

The (namespace) is determined as the first (nonempty) _-delimited word in \langle name \rangle and is used internally in the definition of auxiliaries. The function `\__kernel_quark_new_test:N` does not define the `\q__-(namespace)_recursion_tail` and `\q__-(namespace)_recursion_stop` quarks. They should be manually defined with `\quark_new:N`.

There are 6 different types of quark-test functions. Which one is defined depends on the (arg spec), which must be one of the options listed now. Four of them are modeled after `\quark_if_recursion_tail:(N|n)` and `\quark_if_recursion_tail_do:(N|n)n`.

n defines \langle name \rangle:n such that it checks if #1 contains only `\q__-(namespace)_recursion_tail`, and if so consumes all tokens up to `\q__-(namespace)_recursion_stop` (c.f. `\quark_if_recursion_tail_stop:n`).

nn defines \langle name \rangle:nn such that it checks if #1 contains only `\q__-(namespace)_recursion_tail`, and if so consumes all tokens up to `\q__-(namespace)_recursion_stop`, then executes the code #2 after that (c.f. `\quark_if_recursion_tail_stop_do:nn`).

N defines \langle name \rangle:N such that it checks if #1 is `\q__-(namespace)_recursion_tail`, and if so consumes all tokens up to `\q__-(namespace)_recursion_stop` (c.f. `\quark_if_recursion_tail_stop:N`).

Nn defines \langle name \rangle:Nn such that it checks if #1 is `\q__-(namespace)_recursion_tail`, and if so consumes all tokens up to `\q__-(namespace)_recursion_stop`, then executes the code #2 after that (c.f. `\quark_if_recursion_tail_stop_do:Nn`).

The last two are modeled after `\quark_if_recursion_tail_break:(n|N)N`, and in those cases the quark `\q__-(namespace)_recursion_stop` is not used (and thus needs not be defined).

nN defines \langle name \rangle:nN such that it checks if #1 contains only `\q__-(namespace)_recursion_tail`, and if so uses the \langle type \rangle_map_break: function #2.

NN defines \langle name \rangle:NN such that it checks if #1 is `\q__-(namespace)_recursion_tail`, and if so uses the \langle type \rangle_map_break: function #2.

Any other signature, as well as a function without signature are errors, and in such case the definition is aborted.
\__kernel_quark_new_conditional:Nn \__kernel_quark_new_conditional:Nn
\__\langle namespace\rangle\_quark_if\_\langle name\rangle:\langle arg spec \rangle \{\langle conditions \rangle\}

Defines a collection of quark conditionals that test if their argument is the quark \texttt{\_quark_if\_\langle namespace\rangle\_\langle name\rangle} and perform suitable actions. The \langle conditions \rangle are a comma-separated list of one or more of \texttt{p}, \texttt{T}, \texttt{F}, and \texttt{TF}, and one conditional is defined for each \langle condition \rangle in the list, as described for \texttt{\prg_new_conditional:Npnn}. The conditionals are defined using \texttt{\prg_new_conditional:Npnn}, so that their name is obtained by adding \texttt{p}, \texttt{T}, \texttt{F}, or \texttt{TF} to the base name \texttt{\__\langle namespace\rangle\_quark_if\_\langle name\rangle:\langle arg spec \rangle}. The first argument of \texttt{\__kernel_quark_new_conditional:Nn} must contain \texttt{\_quark_if\_} and :, as these markers are used to determine the \langle name \rangle of the quark \texttt{\_quark_new:Nn} does not define it.

The function \texttt{\__kernel_quark_new_conditional:Nn} can define 2 different types of quark conditionals. Which one is defined depends on the \langle arg spec \rangle, which must be one of the following options, modeled after \texttt{\quark_if_nil:(N|n)(TF)}.

- \texttt{n} defines \texttt{\__\langle namespace\rangle\_quark_if\_\langle name\rangle:n(TF)} such that it checks if \texttt{\#1} contains only \texttt{\_quark_if\_\langle namespace\rangle\_\langle name\rangle}, and executes the proper conditional branch.
- \texttt{N} defines \texttt{\__\langle namespace\rangle\_quark_if\_\langle name\rangle:N(TF)} such that it checks if \texttt{\#1} is \texttt{\_quark_new:N}, and executes the proper conditional branch.

Any other signature, as well as a function without signature are errors, and in such case the definition is aborted.

\texttt{\c__kernel_randint_max_int} Maximal allowed argument to \texttt{\__kernel_randint:n}. Equal to \texttt{2^{17} - 1}.

(End definition for \texttt{\c__kernel_randint_max_int})

\__kernel_randint:n \__kernel_randint:n \{\langle max \rangle\}

Used in an integer expression this gives a pseudo-random number between 1 and \langle max \rangle included. One must have \langle max \rangle \leq 2^{17} - 1. The \langle max \rangle must be suitable for \texttt{\int_value:w} (and any \texttt{\int_eval:w} must be terminated by \texttt{\scan_stop:} or equivalent).

\__kernel_randint:nn \__kernel_randint:nn \{\langle min \rangle\} \{\langle max \rangle\}

Used in an integer expression this gives a pseudo-random number between \langle min \rangle and \langle max \rangle included. The \langle min \rangle and \langle max \rangle must be suitable for \texttt{\int_value:w} (and any \texttt{\int_eval:w} must be terminated by \texttt{\scan_stop:} or equivalent). For small ranges \( R = \langle max \rangle - \langle min \rangle + 1 \leq 2^{17} - 1 \), \langle min \rangle - 1 + \texttt{\__kernel_randint:n}\{R\} is faster.

\__kernel_register_show:N \__kernel_register_show:N \{\texttt{\texttt{register}}\}

Used to show the contents of a \TeX{} register at the terminal, formatted such that internal parts of the mechanism are not visible.

\__kernel_register_log:N \__kernel_register_log:N \{\texttt{\texttt{register}}\}

Used to write the contents of a \TeX{} register to the log file in a form similar to \texttt{\__kernel_register_show:N}. 353
\__kernel_str_to_other:n \__kernel_str_to_other:n {⟨token list⟩}
Converts the ⟨token list⟩ to a ⟨other string⟩, where spaces have category code “other”. This function can be f-expanded without fear of losing a leading space, since spaces do not have category code 10 in its result. It takes a time quadratic in the character count of the string.

\__kernel_str_to_other_fast:n \__kernel_str_to_other_fast:n {⟨token list⟩}
Same behaviour \__kernel_str_to_other:n but only restricted-expandable. It takes a time linear in the character count of the string.

\__kernel_tl_to_str:w \__kernel_tl_to_str:w {⟨expandable tokens⟩} {⟨tokens⟩}
Carries out expansion on the ⟨expandable tokens⟩ before conversion of the ⟨tokens⟩ to a string as describe for \tl_to_str:n. Typically, the ⟨expandable tokens⟩ will alter the nature of the ⟨tokens⟩, i.e. allow it to be generated in some way. This function requires only a single expansion.

\__kernel_tl_set:Nx \__kernel_tl_set:Nx {tl var} {⟨tokens⟩}
\__kernel_tl_gset:Nx
Fully expands ⟨tokens⟩ and assigns the result to ⟨tl var⟩. ⟨tokens⟩ must be given in braces and there must be no token between ⟨tl var⟩ and ⟨tokens⟩.

\__kernel_codepoint_data:nn \__kernel_codepoint_data:nn {⟨type⟩} {⟨codepoint⟩}
Expands to the appropriate value for the ⟨type⟩ of data requested for a ⟨codepoint⟩. The current list of ⟨types⟩ and results are

lowercase The single codepoint specified by UnicodeData.txt for lowercase mapping of the codepoint: will be equal to the input ⟨codepoint⟩ if there is no mapping specified in UnicodeData.txt

uppercase The single codepoint specified by UnicodeData.txt for uppercase mapping of the codepoint: will be equal to the input ⟨codepoint⟩ if there is no mapping specified in UnicodeData.txt

\__kernel_codepoint_case:nn \__kernel_codepoint_case:nn {⟨mapping⟩} {⟨codepoint⟩}
Expands to a list of three balanced text, of which at least the first will contain a codepoint. This list of up to three codepoints specifies the full case mapping for the input ⟨codepoint⟩. The ⟨mapping⟩ should be one of

- casefold
- lowercase
- titlecase
- uppercase
40.2 Kernel backend functions

These functions are required to pass information to the backend. The nature of these means that they are defined only when the relevant backend is in use.

\kernel_backend_literal:n \kernel_backend_literal:x
Adds the \langle content \rangle literally to the current vertical list as a whatsis. The nature of the \langle content \rangle will depend on the backend in use.

\kernel_backend_literal_postscript:n \kernel_backend_literal_postscript:x
Adds the \langle PostScript \rangle literally to the current vertical list as a whatsis. No positioning is applied.

\kernel_backend_literal_pdf:n \kernel_backend_literal_pdf:x
Adds the \langle PDF instructions \rangle literally to the current vertical list as a whatsis. No positioning is applied.

\kernel_backend_literal_svg:n \kernel_backend_literal_svg:x
Adds the \langle SVG instructions \rangle literally to the current vertical list as a whatsis. No positioning is applied.

\kernel_backend_postscript:n \kernel_backend_postscript:x
Adds the \langle PostScript \rangle to the current vertical list as a whatsis. The PostScript reference point is adjusted to match the current position. The PostScript is inserted inside a SDict begin/end pair.

\kernel_backend_align_begin: \kernel_backend_align_begin:
\kernel_backend_align_end: \langle PostScript literals \rangle
\kernel_backend_align_end:
Arranges to align the PostScript and DVI current positions and scales.

\kernel_backend_scope_begin: \kernel_backend_scope_begin:
\kernel_backend_scope_end: \langle content \rangle
\kernel_backend_scope_end:
Creates a scope for instructions at the backend level.

\kernel_backend_matrix:n \kernel_backend_matrix:x
Applies the \langle matrix \rangle to the current transformation matrix.

\kernel_backend_header_bool
Specifies whether to write headers for the backend.
\l__kernel_color_stack_int  The color stack used in pdf\TeX{} and Lua\TeX{} for the main color.
Chapter 41

\texttt{l3basics implementation}

\section*{Renaming some \TeX\ primitives (again)}

Having given all the \TeX\ primitives a consistent name, we need to give sensible names to the ones we actually want to use. These will be defined as needed in the appropriate modules, but we do a few now, just to get started.\footnote{This renaming gets expensive in terms of csname usage, an alternative scheme would be to just use the \texttt{\textbackslash tex...:\texttt{D}} name in the cases where no good alternative exists.}

\begin{verbatim}
\if_true:
  \if_false:
  \or:
  \else:
  \fi:
\reverse_if:N
\if:w
\if_charcode:w
\if_catcode:w
\if_meaning:w
\tex_let:D \if_true: \tex_iftrue:D
\tex_let:D \if_false: \tex_iffalse:D
\tex_let:D \or: \tex_or:D
\tex_let:D \else: \tex_else:D
\tex_let:D \fi: \tex_fi:D
\tex_let:D \reverse_if:N \tex_unless:D
\tex_let:D \if:w \tex_if:D
\tex_let:D \if_charcode:w \tex_if:D
\tex_let:D \if_catcode:w \tex_ifcat:D
\tex_let:D \if_meaning:w \tex_ifx:D
\tex_let:D \if_bool:N \tex_ifodd:D
(End definition for \texttt{\if_true:} and others. These functions are documented on page 27.)
\end{verbatim}

\begin{verbatim}
\if_mode_math:
\if_mode_horizontal:
\if_mode_vertical:
\if_mode_inner:
(End definition for \texttt{\if_mode_math:} and others. These functions are documented on page 28.)
\end{verbatim}

\begin{verbatim}
\if_cs_exist:N
\if_cs_exist:w
\cs:w
\cs_end:
Building csnames and testing if control sequences exist.
\end{verbatim}
The five `exp_` functions are used in the `l3expan` module where they are described.

```latex
\begin{verbatim}
\exp_after:wN \exp_not:N \exp_not:n \exp:w \exp_end: = 0 ~
\end{verbatim}
```

Examining a control sequence or token.

```latex
\begin{verbatim}
\token_to_meaning:N \cs_meaning:N \tl_to_str:n \token_to_str:N \__kernel_tl_to_str:w
\end{verbatim}
```

Making strings.

```latex
\begin{verbatim}
\scan_stop: \group_begin: \group_end:
\end{verbatim}
```

The next three are basic functions for which there also exist versions that are safe inside alignments. These safe versions are defined in the `l3prg` module.

```latex
\begin{verbatim}
\if_int_compare:w \__int_to_roman:w
\end{verbatim}
```

For integers.

```latex
\begin{verbatim}
\group_insert_after:N
\end{verbatim}
```

Adding material after the end of a group.

```latex
\begin{verbatim}
\exp_args:Nc \exp_args:cc
\end{verbatim}
```

Discussed in `l3expan`, but needed much earlier.
A small number of variants defined by hand. Some of the necessary functions (\use_{i:nn}, \use_{ii:nn}, and \exp_args:NNc) are not defined at that point yet, but will be defined before those variants are used. The \cs_meaning:c command must check for an undefined control sequence to avoid defining it mistakenly.

\begin{Verbatim}
\tex_def:D \token_to_str:c { \exp_args:Nc \token_to_str:N }
\end{Verbatim}

\begin{Verbatim}
\tex_def:D \cs_meaning:c #1
\end{Verbatim}

\begin{Verbatim}
\if_cs_exist:w #1 \cs_end:
\exp_after:wN \use_i:nn
\else:
\exp_after:wN \use_ii:nn
\fi:
\{ \exp_args:Nc \cs_meaning:N {#1} \}
\{ \tl_to_str:n {undefined} \}
\}
\tex_let:D \token_to_meaning:c = \cs_meaning:c
\end{Verbatim}

(End definition for \token_to_meaning:N. This function is documented on page 187.)

\subsection{Defining some constants}

\begin{Verbatim}
\c_zero_int
\end{Verbatim}

We need the constant \c_zero_int which is used by some functions in the \l3alloc module. The rest are defined in the \l3int module – at least for the ones that can be defined with \tex_chardef:D or \tex_mathchardef:D. For other constants the \l3int module is required but it can’t be used until the allocation has been set up properly!

\begin{Verbatim}
\tex_chardef:D \c_zero_int = 0 ~
\end{Verbatim}

(End definition for \c_zero_int. This variable is documented on page 167.)

\begin{Verbatim}
\c_max_register_int
\end{Verbatim}

This is here as this particular integer is needed both in package mode and to bootstrap \l3alloc, and is documented in \l3int. \LaTeX{} and those which contain parts of the Omega extensions have more registers available than c-\TeX{}.

\begin{Verbatim}
\tex_ifdefined:D \tex_luatexversion:D
\tex_chardef:D \c_max_register_int = 65 535 ~
\end{Verbatim}

\begin{Verbatim}
\tex_else:D
\tex_ifdefined:D \tex_omathchardef:D
\tex_omathchardef:D \c_max_register_int = 65535 ~
\end{Verbatim}

\begin{Verbatim}
\tex_else:D
\tex_mathchardef:D \c_max_register_int = 32767 ~
\end{Verbatim}

\begin{Verbatim}
\tex_fi:D
\end{Verbatim}

(End definition for \c_max_register_int. This variable is documented on page 167.)

\subsection{Defining functions}

We start by providing functions for the typical definition functions. First the local ones.

All assignment functions in \LTeX{} should be naturally protected; after all, the \TeX{} primitives for assignments are and it can be a cause of problems if others aren’t.

\begin{Verbatim}
\cs_set_nopar:Npn \cs_set_nopar:Npx
\cs_set:Npn \cs_set:Npx
\cs_set_protected_nopar:Npn \cs_set_protected:Npx
\cs_set_protected:Npx
\cs_set_protected:N
\cs_set_protected:N
\end{Verbatim}

\begin{Verbatim}
\tex_let:D \cs_set_nopar:Npn \tex_def:D
\end{Verbatim}

\begin{Verbatim}
\tex_let:D \cs_set_nopar:Npx \tex_edef:D
\end{Verbatim}

359
1493 \text_protected:D \text_long:D \text_def:D \cs_set:Npn
1494 { \text_long:D \text_def:D } \text_protected:D \text_def:D \cs_set:Npx
1496 { \text_long:D \text_def:D } \text_protected:D \text_def:D \text_gset_nopar:Npn
1498 { \text_protected:D \text_def:D } \text_protected:D \text_def:D \text_gset_nopar:Npx
1500 { \text_protected:D \text_def:D } \text_protected:D \text_def:D \text_gset_nopar:Npn
1502 { \text_protected:D \text_def:D } \text_protected:D \text_def:D \text_gset_nopar:Npx
1504 { \text_protected:D \text_def:D \text_gdef:D }

(End definition for \cs_gset_nopar:Npn and others. These functions are documented on page 16.)

\cs_gset_nopar:Npn \cs_gset_nopar:Npx \cs_gset:Npn \cs_gset:Npx
\cs_gset_protected_nopar:Npn \cs_gset_protected_nopar:Npx
\cs_gset_protected:Npn \cs_gset_protected:Npx

Global versions of the above functions.

1505 \cs_set_nopar:Npn \l__exp_internal_tl { }
1506 \cs_set_nopar:Npx \l__exp_internal_tl {#1}
1508 \cs_set_protected:Npn \use:x #1 { \cs_set_nopar:Npx \l__exp_internal_tl {#1}
1510 \cs_set_protected:Npx \l__exp_internal_tl {#1}

(End definition for \l__exp_internal_tl.)

41.4 Selecting tokens

\l__exp_internal_tl Scratch token list variable for \l3exp, used by \use:x, used in defining conditionals. We don’t use tl methods because \l3basics is loaded earlier.

1520 \cs_gset_nopar:Npn \l__exp_internal_tl { }

(End definition for \l__exp_internal_tl.)

\use:c This macro grabs its argument and returns a csname from it.

1523 \cs_set:Npn \use:c #1 { \cs:w #1 \cs_end: }

(End definition for \use:c. This function is documented on page 20.)

\use:x Fully expands its argument and passes it to the input stream. Uses the reserved \l__exp_internal_tl which we’ve set up above.

1525 \cs_gset_nopar:Npn \l__exp_internal_tl {#1}
1527 \cs_gset_nopar:Npn \l__exp_internal_tl {#1}
1529}

360
\use:e

In non-Lua\TeX\ engines older than 2019, \expanded is emulated.
\begin{verbatim}
\cs_set:Npn \use:e #1 { \tex_expanded:D {#1} }
\tex_ifdefined:D \tex_expanded:D \tex_else:D
\cs_set:Npn \use:e #1 { \exp_args:Ne \use:n {#1} }
\tex_fi:D
\end{verbatim}

(End definition for \use:e. This function is documented on page 25.)

\use:n
\use:nn
\use:nnn
\use:nnnn

These macros grab their arguments and return them back to the input (with outer braces removed).
\begin{verbatim}
\cs_set:Npn \use:n #1 {#1}
\cs_set:Npn \use:nn #1#2 {#1#2}
\cs_set:Npn \use:nnn #1#2#3 {#1#2#3}
\cs_set:Npn \use:nnnn #1#2#3#4 {#1#2#3#4}
\end{verbatim}

(End definition for \use:n and others. These functions are documented on page 23.)

\use:i:nn
\use:ii:nn

The equivalent to \LaTeX\2ε’s \@firstoftwo and \@secondoftwo.
\begin{verbatim}
\cs_set:Npn \use:i:nn #1#2 {#1}
\cs_set:Npn \use:ii:nn #1#2 {#2}
\end{verbatim}

(End definition for \use:i:nn and \use:ii:nn. These functions are documented on page 24.)

\use:i:nnn
\use:ii:nnn
\use:iii:nnn
\use:i_ii:nnn
\use:i:nnnn
\use:ii:nnnn
\use:iii:nnnn
\use:iv:nnnn

We also need something for picking up arguments from a longer list.
\begin{verbatim}
\cs_set:Npn \use:i:nnn #1#2#3 {#1}
\cs_set:Npn \use:ii:nnn #1#2#3 {#2}
\cs_set:Npn \use:iii:nnn #1#2#3 {#3}
\cs_set:Npn \use:i_ii:nnn #1#2#3 {#1#2}
\cs_set:Npn \use:i:nnnn #1#2#3#4 {#1}
\cs_set:Npn \use:ii:nnnn #1#2#3#4 {#2}
\cs_set:Npn \use:iii:nnnn #1#2#3#4 {#3}
\cs_set:Npn \use:iv:nnnn #1#2#3#4 {#4}
\end{verbatim}

(End definition for \use:i:nnn and others. These functions are documented on page 24.)

\use:ii_i:nn

\begin{verbatim}
\cs_set:Npn \use:ii_i:nn #1#2 { #2 #1 }
\end{verbatim}

(End definition for \use:ii_i:nn. This function is documented on page 24.)

\use_none_delimit_by_q_nil:w
\use_none_delimit_by_q_stop:w
\use_none_delimit_by_q_recursion_stop:w

Functions that gobble everything until they see either \q_nil, \q_stop, or \q_recursion_stop, respectively.
\begin{verbatim}
\cs_set:Npn \use_none_delimit_by_q_nil:w #1 \q_nil { }
\cs_set:Npn \use_none_delimit_by_q_stop:w #1 \q_stop { }
\cs_set:Npn \use_none_delimit_by_q_recursion_stop:w #1 \q_recursion_stop { }
\end{verbatim}

(End definition for \use_none_delimit_by_q_nil:w, \use_none_delimit_by_q_stop:w, and \use_none_delimit_by_q_recursion_stop:w. These functions are documented on page 25.)
Same as above but execute first argument after gobbling. Very useful when you need to
skip the rest of a mapping sequence but want an easy way to control what should be
expanded next.

\begin{verbatim}
\cs_set:Npn \use_i_delimit_by_q_nil:nw #1#2 \q_nil {#1}
\cs_set:Npn \use_i_delimit_by_q_stop:nw #1#2 \q_stop {#1}
\cs_set:Npn \use_i_delimit_by_q_recursion_stop:nw #1#2 \q_recursion_stop {#1}
\end{verbatim}

(End definition for \use_i_delimit_by_q_nil:nw, \use_i_delimit_by_q_stop:nw, and \use_i_delimit_by_q_recursion_stop:nw. These functions are documented on page 25.)

41.5 Gobbling tokens from input

To gobble tokens from the input we use a standard naming convention: the number of
tokens gobbled is given by the number of \texttt{n}'s following the \texttt{:} in the name. Although we
could define functions to remove ten arguments or more using separate calls of \use-none:n
this is very non-intuitive to the programmer who will assume that expanding
such a function once takes care of gobbling all the tokens in one go.

\begin{verbatim}
\cs_set:Npn \use_none:n #1 { }
\cs_set:Npn \use_none:nn #1#2 { }
\cs_set:Npn \use_none:nnn #1#2#3 { }
\cs_set:Npn \use_none:nnnn #1#2#3#4 { }
\cs_set:Npn \use_none:nnnnn #1#2#3#4#5 { }
\cs_set:Npn \use_none:nnnnnn #1#2#3#4#5#6 { }
\cs_set:Npn \use_none:nnnnnnn #1#2#3#4#5#6#7 { }
\cs_set:Npn \use_none:nnnnnnnn #1#2#3#4#5#6#8 { }
\cs_set:Npn \use_none:nnnnnnnn #1#2#3#4#5#6#7#9 { }
\end{verbatim}

(End definition for \use_none:n and others. These functions are documented on page 25.)

41.6 Debugging and patching later definitions

\verb|\__kernel_if_debug:TF|

A more meaningful test of whether debugging is enabled than messing up with guards.
We can also more easily change the logic in one place then. This is needed primarily for
deprecations.

\begin{verbatim}
\cs_set_protected:Npn \__kernel_if_debug:TF #1#2 {#2}
\end{verbatim}

(End definition for \__kernel_if_debug:TF.)

\verb|\debug_on:n| \verb|\debug_off:n|

Stubs.

\begin{verbatim}
\cs_set_protected:Npn \debug_on:n #1
{ \msg_error:nx { debug } { enable-debug } \tl_to_str:n { \debug_on:n {#1} } }
\cs_set_protected:Npn \debug_off:n #1
{ \msg_error:nx { debug } { enable-debug } \tl_to_str:n { \debug_off:n {#1} } }
\end{verbatim}

362
Some commands were more recently deprecated and not yet removed; only make these into errors if the user requests it. This relies on two token lists, filled up in l3deprecation.

\cs_set_nopar:Npn \g__debug_deprecation_on_tl { }
\cs_set_nopar:Npn \g__debug_deprecation_off_tl { }
\cs_set_protected:Npn \__kernel_deprecation_code:nn #1#2
\tl_gput_right:Nn \g__debug_deprecation_on_tl {#1}
\tl_gput_right:Nn \g__debug_deprecation_off_tl {#2
\}

\cs_set:Npn \prg_return_true: { \exp_after:wN \use_i:nn \exp:w }
\cs_set:Npn \prg_return_false: { \exp_after:wN \use_ii:nn \exp:w}

41.7 Conditional processing and definitions

Underneath any predicate function (\p) or other conditional forms (\TF, etc.) is a built-in logic saying that it after all of the testing and processing must return the \state this leaves \TeX in. Therefore, a simple user interface could be something like
\if_meaning:w #1#2
\prg_return_true:
\else:
\if_meaning:w #1#3
\prg_return_true:
\else:
\prg_return_false:
\fi:
\fi:

Usually, a \TeX programmer would have to insert a number of \exp_after:wNs to ensure the state value is returned at exactly the point where the last conditional is finished. However, that obscures the code and forces the \TeX programmer to prove that he/she knows the $2^n - 1$ table. We therefore provide the simpler interface.

\prg_return_true:
\prg_return_false:

The idea here is that \exp:w expands fully any \else: and \fi: that are waiting to be discarded, before reaching the \exp_end: which leaves an empty expansion. The code can then leave either the first or second argument in the input stream. This means that all of the branching code has to contain at least two tokens: see how the logical tests are actually implemented to see this.
\cs_set:Npn \prg_return_true: { \exp_after:wN \use_i:nn \exp:w }
\cs_set:Npn \prg_return_false: { \exp_after:wN \use_ii:nn \exp:w}
An extended state space could be implemented by including a more elaborate function in place of \use_i:nn/\use_ii:nn. Provided two arguments are absorbed then the code would work.

\( \text{End definition for } \texttt{\textbackslash prg\_return\_true: \textbackslash prg\_return\_false:}. \text{These functions are documented on page } 64. \)

Private version of \use_none_delimit_by_q_recursion_stop:w.

\( \text{End definition for } \texttt{\_\_prg\_use\_none\_delimit\_by\_q\_recursion\_stop:w}. \)

The user functions for the types using parameter text from the programmer. The various functions only differ by which function is used for the assignment. For those \texttt{Npnn} type functions, we must grab the parameter text, reading everything up to a left brace before continuing. Then split the base function into name and signature, and feed \{(\texttt{name})\} \{(\texttt{signature})\} \{(\texttt{code})\} to the auxiliary function responsible for defining all conditionals. Note that \texttt{e} stands for expandable and \texttt{p} for protected.

\( \text{End definition for } \texttt{\_\_prg\_set\_conditional:} \texttt{\_\_prg\_gset\_conditional:} \texttt{\_\_prg\_new\_conditional:} \texttt{\_\_prg\_set\_protected\_conditional:} \texttt{\_\_prg\_gset\_protected\_conditional:} \texttt{\_\_prg\_new\_protected\_conditional:} \)

The user functions for the types automatically inserting the correct parameter text based on the signature. The various functions only differ by which function is used for the assignment. Split the base function into name and signature. The second auxiliary generates the parameter text from the number of letters in the signature. Then feed \{(\texttt{name})\} \{(\texttt{signature})\} \{(\texttt{code})\} to the auxiliary function responsible for defining all conditionals. If the \{(\texttt{signature})\} has more than 9 letters, the definition is aborted since \TeX\ macros have at most 9 arguments. The erroneous case where the function name contains no colon is captured later.

\( \text{End definition for } \texttt{\_\_prg\_set\_conditional:} \texttt{\_\_prg\_gset\_conditional:} \texttt{\_\_prg\_new\_conditional:} \texttt{\_\_prg\_set\_protected\_conditional:} \texttt{\_\_prg\_gset\_protected\_conditional:} \texttt{\_\_prg\_new\_protected\_conditional:} \)

364
The workhorse here is going through a list of desired forms, i.e., `p`, `TF`, `T` and `F`. The first three arguments come from splitting up the base form of the conditional, which gives the name, signature and a boolean to signal whether or not there was a colon in the name. In the absence of a colon, we throw an error and don’t define any conditional. The fourth and fifth arguments build up the defining function. The sixth is the parameters to use (possibly empty), the seventh is the list of forms to define, the eighth is the replacement text which we will augment when defining the forms. The use of \texttt{\tl_to_str:n} makes the later loop more robust.

A large number of our low-level conditionals look like \langle \texttt{code} \rangle \texttt{prg_return_true: \else: prg_return_false: fi:} so we optimize this special case by calling \texttt{\_\_prg_generate_conditional_fast:nw \langle \texttt{code} \rangle}. This passes \texttt{\use_i:nn} instead of \texttt{\use_i_i:nnn} to functions such as \texttt{\_\_prg_generate_p_form:nnNNnnnN}.  

\begin{verbatim}
\cs_set_protected:Npm \_prg_generate_conditional:Nnn
\cs_set_protected:Npm \prg_set_conditional:Nnn
\cs_set_protected:Npm \prg_gset_conditional:Nnn
\cs_set_protected:Npn \prg_new_conditional:Nnn
\cs_set_protected:Npn \prg_set_protected_conditional:Nnn
\cs_set_protected:Npn \prg_gset_protected_conditional:Nnn
\cs_set_protected:Npn \prg_new_protected_conditional:Nnn
\cs_set_protected:Npn \__prg_generate_conditional_count:NNNnn #1#2#3
\cs_set_protected:Npn \__prg_generate_conditional_count:nnNNNnnn #1#2#3#4#5 #6 #7 #8
\end{verbatim}
Looping through the list of desired forms. First are six arguments and seventh is the form. Use the form to call the correct type. If the form does not exist, the \use:c construction results in \relax, and the error message is displayed (unless the form is empty, to allow for \{T, , F\}), then \use_none:nnnnnnnn cleans up. Otherwise, the error message is removed by the variant form.

How to generate the various forms. Those functions take the following arguments: 1: junk, 2: \cs_set:Npn or similar, 3: p (for protected conditionals) or e, 4: function name, 5: signature, 6: parameter text, 7: replacement (possibly trimmed by \__prg_generate_conditional_fast:nw), 8: \use_i_ii:nnn or \use_i:nn (for “fast” conditionals). Remember that the logic-returning functions expect two arguments to be present after \exp_end:: notice the construction of the different variants relies on this, and that
the TF and F variants will be slightly faster than the T version. The p form is only valid for expandable tests, we check for that by making sure that the second argument is empty. For “fast” conditionals, #7 has an extra \if\ ... To optimize a bit further we don’t use \exp_after:W \use_ii:nnn and similar but instead use \_\_prg_TF_true:w and similar to swap out the macro after \fi:. It would be a tiny bit faster if we directly grabbed the T and F arguments there, but if those are actually missing, the recovery from the runaway argument would not insert \fi: back, messing up nesting of conditionals.

The setting-equal functions. Split both functions and feed \{(name)\} \{(signature)\} \{boolean\} \{(name)\} \{(signature)\} \{copying function\} \{conditions\}, \q__prg_recursion_tail , \q__prg_recursion_stop to a first auxiliary.

Split the function to be defined, and setup a manual clist loop over argument \#6 of the first auxiliary. The second auxiliary receives twice three arguments coming from splitting the function to be defined and the function to copy. Make sure that both functions contained a colon, otherwise we don’t know how to build conditionals, hence abort. Call the looping macro, with arguments \{(name)\} \{(signature)\} \{name\} \{(signature)\} \{copying function\} and followed by the comma list. At each step in the loop, make sure that the conditional form we copy is defined, and copy it, otherwise abort.

41.8 Dissecting a control sequence

\__cs_count_signature:N \__cs_count_signature:N {function}
Splits the (function) into the (name) (i.e. the part before the colon) and the (signature)
(i.e. after the colon). The (number) of tokens in the (signature) is then left in
the input stream. If there was no (signature) then the result is the marker value –1.

\__cs_get_function_name:N * \__cs_get_function_name:N {function}
Splits the (function) into the (name) (i.e. the part before the colon) and the (signature)
(i.e. after the colon). The (name) is then left in the input stream without the escape
character present made up of tokens with category code 12 (other).
\__cs_get_function_signature:N \__cs_get_function_signature:N ⟨function⟩

Splits the ⟨function⟩ into the ⟨name⟩ (i.e. the part before the colon) and the ⟨signature⟩ (i.e. after the colon). The ⟨signature⟩ is then left in the input stream made up of tokens with category code 12 (other).

\__cs_tmp:w
\cs_to_str:N \__cs_to_str:N \__cs_to_str:w

Function used for various short-term usages, for instance defining functions whose definition involves tokens which are hard to insert normally (spaces, characters with category other).

\cs_to_str:N
\__cs_to_str:N
\__cs_to_str:w

This converts a control sequence into the character string of its name, removing the leading escape character. This turns out to be a non-trivial matter as there a different cases:

- The usual case of a printable escape character;
- the case of a non-printable escape characters, e.g., when the value of the \escapechar is negative;
- when the escape character is a space.

One approach to solve this is to test how many tokens result from \token_to_str:N \a. If there are two tokens, then the escape character is printable, while if it is non-printable then only one is present.

However, there is an additional complication: the control sequence itself may start with a space. Clearly that should not be lost in the process of converting to a string. So the approach adopted is a little more intricate still. When the escape character is printable, \token_to_str:N \a \a yields the escape character itself and a space. The character codes are different, thus the \if:w test is false, and \TeX reads \__cs_to_str:N after turning the following control sequence into a string; this auxiliary removes the escape character, and stops the expansion of the initial \tex_romannumeral:D. The second case is that the escape character is not printable. Then the \if:w test is unfinished after reading a space from \token_to_str:N \a \a, and the auxiliary \__cs_to_str:w is expanded, feeding - as a second character for the test; the test is false, and \TeX skips to \fi:, then performs \token_to_str:N, and stops the \tex_romannumeral:D with \c_zero_int. The last case is that the escape character is itself a space. In this case, the \if:w test is true, and the auxiliary \__cs_to_str:w comes into play, inserting -\int_value:w, which expands \c_zero_int to the character 0. The initial \tex_romannumeral:D then sees 0, which is not a terminated number, followed by the escape character, a space, which is removed, terminating the expansion of \tex_romannumeral:D. In all three cases, \cs_to_str:N takes two expansion steps to be fully expanded.

\cs_set:Npn \cs_to_str:N

We implement the expansion scheme using \tex_romannumeral:D terminating it with \c_zero_int rather than using \exp:w and \exp_end: as we normally do. The reason is that the code heavily depends on terminating the expansion with \c_zero_int so we make this dependency explicit.

\tex_romannumeral:D
\if:w \token_to_str:N \__cs_to_str:w \fi:
\exp_after:wN \__cs_to_str:w \token_to_str:N
\c_zero_int

{ }

\tex_romannumeral:D
\if:w \token_to_str:N \__cs_to_str:w \fi:
\exp_after:wN \__cs_to_str:w \token_to_str:N

370
If speed is a concern we could use \texttt{\csstring} in Lua\TeX{}. For the empty csname that primitive gives an empty result while the current \texttt{\cs_to_str:N} gives incorrect results in all engines (this is impossible to fix without huge performance hit).

(\textit{End definition for \texttt{\cs_to_str:N}, \texttt{\_\_cs_to_str:N}, and \texttt{\_\_cs_to_str:w}. This function is documented on page 21.)

\begin{verbatim}
\_\_cs_split_function:N
\_\_cs_split_function_auxi:w
\_\_cs_split_function_auxii:w
\end{verbatim}

This function takes a function name and splits it into name with the escape char removed and argument specification. In addition to this, a third argument, a boolean \texttt{⟨true⟩} or \texttt{⟨false⟩} is returned with \texttt{⟨true⟩} for when there is a colon in the function and \texttt{⟨false⟩} if there is not.

We cannot use : directly as it has the wrong category code so an x-type expansion is used to force the conversion.

First ensure that we actually get a properly evaluated string by expanding \texttt{\cs_\_\_cs_to_str:N} twice. If the function contained a colon, the auxiliary takes as \texttt{#1} the function name, delimited by the first colon, then the signature \texttt{#2}, delimited by \texttt{\s__cs_mark}, then \texttt{\c_true_bool} as \texttt{#3}, and \texttt{#4} cleans up until \texttt{\s__cs_stop}. Otherwise, the \texttt{#1} contains the function name and \texttt{\s__cs_mark \c_true_bool \#2} is empty, \texttt{#3} is \texttt{\c_false_bool}, and \texttt{#4} cleans up. The second auxiliary trims the trailing \texttt{\s__cs_mark} from the function name if present (that is, if the original function had no colon).

(\textit{End definition for \texttt{\cs_split_function:N}, \texttt{\_\_cs_split_function_auxi:w}, and \texttt{\_\_cs_split_function_\_\_cs_split_function_auxii:w}. This function is documented on page 22.)

\subsection{41.9 Exist or free}

A control sequence is said to \textit{exist} (to be used) if has an entry in the hash table and its meaning is different from the primitive \texttt{\relax} token. A control sequence is said to be \textit{free} (to be defined) if it does not already exist.

\begin{verbatim}
\cs_if_exist_p:N
\cs_if_exist_p:c
\cs_if_exist:N\texttt{TF}
\cs_if_exist:c\texttt{TF}
\end{verbatim}

Two versions for checking existence. For the \texttt{N} form we firstly check for \texttt{\scan_stop:} and then if it is in the hash table. There is no problem when inputting something like \texttt{\else:} or \texttt{\fi:} as \TeX{} will only ever skip input in case the token tested against is \texttt{\scan_stop:}. 

371
For the c form we firstly check if it is in the hash table and then for \texttt{\textbackslash scan\_stop}: so that we do not add it to the hash table unless it was already there. Here we have to be careful as the text to be skipped if the first test is false may contain tokens that disturb the scanner. Therefore, we ensure that the second test is performed after the first one has concluded completely.

\begin{verbatim}
\prg_set_conditional:Npnn \cs_if_exist:N #1 { p , T , F , TF } 
{ 
    \if_meaning:w #1 \scan_stop: 
    \prg_return_false:

\prg_return_true:
\else:
\prg_return_false:
\fi:
{
\prg_return_true: }
}

(End definition for \cs_if_free:NTF. This function is documented on page 27.)

The \cs_if_exist_use:... functions cannot be implemented as conditionals because the true branch must leave both the control sequence itself and the true code in the input stream. For the c variants, we are careful not to put the control sequence in the hash table if it does not exist. In Lua\TeX{} we could use the \texttt{\lastnamedcs} primitive.

\begin{Verbatim}
\cs_set:Npn \cs_if_exist_use:NTF #1#2

{ \cs_if_exist:cTF {#1} { \use:c {#1} } }
\cs_set:Npn \cs_if_exist_use:CT #1#2
{ \cs_if_exist:cTF {#1} { \use:c {#1} #2 } { } }
\cs_set:Npn \cs_if_exist_use:c #1
{ \cs_if_exist:cTF {#1} { \use:c {#1} } { } }
\end{Verbatim}

(End definition for \cs_if_exist_use:NTF. This function is documented on page 21.)

41.10 Preliminaries for new functions

We provide two kinds of functions that can be used to define control sequences. On the one hand we have functions that check if their argument doesn’t already exist, they are called \texttt{\ldots\_new}. The second type of defining functions doesn’t check if the argument is already defined.

Before we can define them, we need some auxiliary macros that allow us to generate error messages. The next few definitions here are only temporary, they will be redefined later on.

\begin{Verbatim}
\msg_error:nnxx
\msg_error:nnx
\msg_error:nn
\end{Verbatim}

If an internal error occurs before \TeX{}3 has loaded \texttt{l3msg} then the code should issue a usable if terse error message and halt. This can only happen if a coding error is made by the team, so this is a reasonable response. Setting the \texttt{\newlinechar} is needed, to turn \texttt{\newlinechar} into a proper line break in plain \TeX{}.
\cs_set_protected:Npn \msg_error:nnxx \#1\#2\#3\#4
\{ }
\tex_newlinechar:D = '\^^J \scan_stop:
\tex_errmessage:D
\{

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!~! ^^J
Argh,-internal-LaTeX3-error! ^^J
Module - #1 , - message-name="#2": ^^J
Arguments-'#3'-and-'#4' ^^J
This-is-one-for-The-LaTeX3-Project:-bailing-out
\}
\tex_end:D
\}
\cs_set_protected:Npn \msg_error:nnx #1#2#3
\{ \msg_error:nnxx {#1} {#2} {#3} { } \}
\cs_set_protected:Npn \msg_error:nn #1#2
\{ \msg_error:nnxx {#1} {#2} { } { } \}

(End definition for \msg_error:nnxx, \msg_error:nnx, and \msg_error:nn. These functions are documented on page ??.)

\msg_line_context: Another one from l3msg which will be altered later.
\cs_set:Npn \msg_line_context:
\{ on-line \tex_the:D \tex_inputlineno:D \}
(End definition for \msg_line_context:. This function is documented on page 78.)

\iow_log:x \iow_term:x We define a routine to write only to the log file. And a similar one for writing to both
the log file and the terminal. These will be redefined later by l3io.
\cs_set_protected:Npn \iow_log:x
\{ \tex_immediate:D \tex_write:D -1 \}
\cs_set_protected:Npn \iow_term:x
\{ \tex_immediate:D \tex_write:D 16 \}
(End definition for \iow_log:x. This function is documented on page 90.)

\__kernel_chk_if_free_cs:N \__kernel_chk_if_free_cs:c
This command is called by \cs_new:nopar:Npn and \cs_new_eq:NN etc. to make sure
that the argument sequence is not already in use. If it is, an error is signalled. It checks
if ⟨csname⟩ is undefined or \scan_stop:. Otherwise an error message is issued. We have
to make sure we don’t put the argument into the conditional processing since it may be
an \if... type function!
\cs_set_protected:Npn \__kernel_chk_if_free_cs:N #1
\{ \cs_if_free:NF #1
\{ \msg_error:nxx \{ kernel \} \{ command-already-defined \}
\{ \token_to_str:N \#1 \} \{ \token_to_meaning:N \#1 \}
\}
\}
\cs_set_protected:Npn \__kernel_chk_if_free_cs:c
\{ \exp_args:Nc \__kernel_chk_if_free_cs:N \}
(End definition for \__kernel_chk_if_free_cs:N.)
41.11 Defining new functions

Function which check that the control sequence is free before defining it.

\cs_set:Npn \__cs_tmp:w #1 #2
{ \cs_set_protected:Npn #1 { \exp_args:Nc #2 } }

Like \cs_set:nopar:Npn and \cs_new:nopar:Npn, except that the first argument consists of the sequence of characters that should be used to form the name of the desired control sequence (the c stands for csname argument, see the expansion module). Global versions are also provided.

\cs_set:cpn \cs_set:cpx \cs_gset:cpn \cs_gset:cpx \cs_new:cpn \cs_new:cpx

Variants of the \cs_set:nopar:Npn versions which make a csname out of the first arguments. We may also do this globally.

(End definition for \cs_new_nopar:Npn and others. These functions are documented on page 15.)

\cs_set:cpn \cs_set:cpn \cs_gset:cpn \cs_gset:cpn \cs_new:cpn \cs_new:cpn

(End definition for \cs_set:nopar:Npn. This function is documented on page 16.)
Variants of the \texttt{\cs_set_protected_nopar:Npn} versions which make a csname out of the first arguments. We may also do this globally.

(End definition for \texttt{\cs_set_protected_nopar:Npn}. This function is documented on page 16.)

Variants of the \texttt{\cs_set_protected:Npn} versions which make a csname out of the first arguments. We may also do this globally.

(End definition for \texttt{\cs_set_protected:Npn}. This function is documented on page 16.)

### 41.12 Copying definitions

These macros allow us to copy the definition of a control sequence to another control sequence.

The = sign allows us to define funny char tokens like = itself or \textasciitilde with this function.

For the definition of \texttt{\cs_space_char{-}} to work we need the - after the =.

\texttt{\cs_set_eq:NN} is long to avoid problems with a literal argument of \texttt{\par}. While \texttt{\cs_new_eq:NN} will probably never be correct with a first argument of \texttt{\par}, define it long in order to throw an “already defined” error rather than “runaway argument”.

(End definition for \texttt{\cs_set_eq:NN}, \texttt{\cs_gset_eq:NN}, and \texttt{\cs_new_eq:NN}. These functions are documented on page 19.)
41.13 Undefining functions

The following function is used to free the main memory from the definition of some function that isn’t in use any longer. The c variant is careful not to add the control sequence to the hash table if it isn’t there yet, and it also avoids nesting TeX conditionals in case #1 is unbalanced in this matter.

\begin{verbatim}
\cs_new_protected:Npn \cs_undefine:N #1
\cs_new_protected:Npn \cs_undefine:c #1
\ifcs_exist:w #1 \cs_end:
\exp_after:wN \use:n
\else:
\exp_after:wN \use_none:n
\fi:
\cs_gset_eq:cn {#1} \tex_undefined:D \end{verbatim}

(End definition for \cs_undefine:N. This function is documented on page 20.)

41.14 Generating parameter text from argument count

\begin{verbatim}
\__kernel_cs_parm_from_arg_count:nnF
\__cs_parm_from_arg_count_test:nnF
\end{verbatim}

\TeX{} provides shorthands to define control sequences and conditionals with a simple parameter text, derived directly from the signature, or more generally from knowing the number of arguments, between 0 and 9. This function expands to its first argument, untouched, followed by a brace group containing the parameter text \{#1...#n\}, where \(n\) is the result of evaluating the second argument (as described in \texttt{\int_eval:n}). If the second argument gives a result outside the range \([0, 9]\), the third argument is returned instead, normally an error message. Some of the functions use here are not defined yet, but will be defined before this function is called.

\begin{verbatim}
\cs_set_protected:Npn \__kernel_cs_parm_from_arg_count:nnF #1#2
\cs_set_protected:Npn \__cs_parm_from_arg_count_test:nnF #1
\begin{verbatim}
\exp_args:Nx \__cs_parm_from_arg_count_test:nnF
\exp_after:wN \exp_not:n
\if_case:w \int_eval:n {#2}
\or: { #1#1 }
\or: { #1#1#1#2 }
\or: { #1#1#1#2#3 }
\or: { #1#1#1#2#3#3#4 }
\or: { #1#1#1#2#3#3#4#5#6 }
\or: { #1#1#1#2#3#3#4#5#6#7 }
\or: { #1#1#1#2#3#3#4#5#6#7#8#9 }
\else: { \c_false_bool }
\fi:
\end{verbatim}
\end{verbatim}

(377)
\cs_set_protected:Npn \__cs_parm_from_arg_count_test:nnF #1#2
{\if_meaning:w \c_false_bool #1 \exp_after:wN \use_ii:nn \else: \exp_after:wN \use_i:nn \fi: \{ #2 \{#1\} \} }

(End definition for \__kernel_cs_parm_from_arg_count:nnF and \__cs_parm_from_arg_count_test:nnF.)

41.15 Defining functions from a given number of arguments

\__cs_count_signature:N \__cs_count_signature:c \__cs_count_signature:n \__cs_count_signature:nnN

Counting the number of tokens in the signature, i.e., the number of arguments the function should take. Since this is not used in any time-critical function, we simply use \tl_count:n if there is a signature, otherwise \-1 arguments to signal an error. We need a variant form right away.

\cs_new:Npn \__cs_count_signature:N #1
{\exp_args:Nf \__cs_count_signature:n {\cs_split_function:N #1} }
\cs_new:Npn \__cs_count_signature:n #1
{\int_eval:n {\__cs_count_signature:nnN #1} }
\cs_new:Npn \__cs_count_signature:nnN #1#2#3
{\if_meaning:w \c_true_bool #3 \tl_count:n {#2} \else: \-1 \fi: }
\cs_new:Npn \__cs_count_signature:c
{\exp_args:Nc \__cs_count_signature:N }

(End definition for \__cs_count_signature:N, \__cs_count_signature:n, and \__cs_count_signature:nnN.)

\cs_generate_from_arg_count:NNnn \cs_generate_from_arg_count:cNnn \cs_generate_from_arg_count:Ncnn

We provide a constructor function for defining functions with a given number of arguments. For this we need to choose the correct parameter text and then use that when defining. Since \LaTeX\ supports from zero to nine arguments, we use a simple switch to choose the correct parameter text, ensuring the result is returned after finishing the conditional. If it is not between zero and nine, we throw an error.

1: function to define, 2: with what to define it, 3: the number of args it requires and 4: the replacement text

\cs_new_protected:Npn \cs_generate_from_arg_count:NNnn #1#2#3#4
{\__kernel_cs_parm_from_arg_count:nnF {\use:nnn #2 #1} \{#3} \{\msg_error:nnxx \{ \token_to_str:N \#1 \} \{ \int_eval:n \{#3\} \} \use_none:n }

378
A variant form we need right away, plus one which is used elsewhere but which is most logically created here.

\cs_new_protected:Npn \cs_generate_from_arg_count:cNnn { \exp_args:Nc \cs_generate_from_arg_count:NNnn }
\cs_new_protected:Npn \cs_generate_from_arg_count:Ncnn { \exp_args:NNc \cs_generate_from_arg_count:NNnn }

(End definition for \cs_generate_from_arg_count:NNnn. This function is documented on page 19.)

\section{Using the signature to define functions}

\langle@@=cs\rangle

We can now combine some of the tools we have to provide a simple interface for defining functions, where the number of arguments is read from the signature. For instance, \cs_set:Nn \foo_bar:nn {#1,#2}.

\cs_set:Nn \cs_set:Nx \cs_set_nopar:Nn \cs_set_nopar:Nx \cs_set_protected:Nn \cs_set_protected:Nx \cs_set_protected_nopar:Nn \cs_set_protected_nopar:Nx \cs_gset:Nn \cs_gset:Nx \cs_gset_nopar:Nn \cs_gset_nopar:Nx \cs_gset_protected:Nn \cs_gset_protected:Nx \cs_gset_protected_nopar:Nn \cs_gset_protected_nopar:Nx

We want to define \cs_set:Nn as

\cs_set:Npn \cs_set:Nn #1#2
{ \cs_generate_from_arg_count:NNnn #1 \cs_set:Npn { \@@_count_signature:N #1 } {#2} }

In short, to define \cs_set:Nn we need just use \cs_set:Npn, everything else is the same for each variant. Therefore, we can make it simpler by temporarily defining a function to do this for us.

\cs_set:Nn \__cs_tmp:w #1#2#3
{ \cs_new_protected:cpx { cs_ #1 : #2 } { \exp_not:N \__cs_generate_from_signature:NNn \exp_after:wN \exp_not:N \cs:w cs_ #1 : #3 \cs_end: } }
\cs_new_protected:Npn \__cs_generate_from_signature:nnNNNn #1#2#3#4#5#6
{ \bool_if:NTF #3
{ \cs_new_protected:Npn \__cs_generate_from_signature:nnNNn \cs_split_function:N #2
\cs_new_protected_nopar:Nx
\bool_if:NTF #3
{ \cs_set_nopar:Npx \__cs_tmp:w
{ \tl_map_function:nN {#2} \__cs_generate_from_signature:n } \tl_if_empty:oF \__cs_tmp:w
\end{verbatim}

379
Then we define the 24 variants beginning with \texttt{N}.

\begin{itemize}
\item \texttt{\cs_set:Nn} \texttt{\cs_set:Nx} \texttt{\cs_set_nopar:Nn} \texttt{\cs_set_protected:Nn} \texttt{\cs_set_protected_nopar:Nn} \texttt{\cs_gset:Nn} \texttt{\cs_gset:Nx} \texttt{\cs_gset_nopar:Nn} \texttt{\cs_gset_protected:Nn} \texttt{\cs_gset_protected_nopar:Nn} \texttt{\cs_new:Nn} \texttt{\cs_new:Nx} \texttt{\cs_new_nopar:Nn} \texttt{\cs_new_protected:Nn} \texttt{\cs_new_protected_nopar:Nn}
\end{itemize}

The 24 \texttt{c} variants simply use \texttt{\exp_args:Nc}.

\begin{itemize}
\item \texttt{\cs_set:cn} \texttt{\cs_set:cx} \texttt{\cs_set_nopar:cn} \texttt{\cs_set_nopar:cx} \texttt{\cs_set_protected:cn} \texttt{\cs_set_protected:cx} \texttt{\cs_set_protected_nopar:cn} \texttt{\cs_set_protected_nopar:cx} \texttt{\cs_gset:cn} \texttt{\cs_gset:cx} \texttt{\cs_gset_nopar:cn} \texttt{\cs_gset_nopar:cx} \texttt{\cs_gset_protected:cn} \texttt{\cs_gset_protected:cx} \texttt{\cs_gset_protected_nopar:cn} \texttt{\cs_gset_protected_nopar:cx} \texttt{\cs_new:cn} \texttt{\cs_new:cx}
\end{itemize}

(End definition for \texttt{cs_set:Nn} and others. These functions are documented on page 17.)

380
41.17 Checking control sequence equality

\cs_if_eq:NN \ Check if two control sequences are identical.
\cs_if_eq:cN \cs_if_eq:Nc \cs_if_eq:cc
\cs_if_eq:p:NN \cs_if_eq:p:cN \cs_if_eq:p:cc
\cs_if_eq:NNTF \cs_if_eq:NcTF \cs_if_eq:ccTF
\cs_new:Npn \cs_if_eq_p:NN \prg_new_conditional:Npnn \cs_if_eq_p:cN
\cs_if_eq_p:Nc \cs_if_eq_p:cc \cs_if_eq_p:ccTF
\cs_if_eq_p:ccT \cs_if_eq_p:ccF
\cs_new:Npn \cs_if_eq_p:cN \cs_if_eq_p:cc
\cs_if_eq:ccTF \cs_if_eq:ccT \cs_if_eq:ccF
\cs_new:Npn \cs_if_eq_p:cc \cs_if_eq_p:cc
\cs_if_eq:ccT \cs_if_eq:ccF

(End definition for \cs_set:Nn. This function is documented on page 17.)

41.18 Diagnostic functions

\langle \@@=kernel \rangle 381
Error if the variable \#1 is not defined.
\cs_new_protected:Npn \__kernel_chk_defined:NT \#1#2\{
    \cs_if_exist:NTF \#1 (#2)
    {\msg_error:nnx { kernel } { variable-not-defined }
      \{ \token_to_str:N \#1 \}}
\}

\__kernel_register_log:N\__kernel_register_log:c\__kernel_register_show:N\__kernel_register_show:c\__kernel_register_show_aux:NN\__kernel_register_show_aux:nNN
Simply using the \showthe primitive does not allow for line-wrapping, so instead use \tl_show:n and \tl_log:n (defined in \tl and that performs line-wrapping). This displays \( \text{\textbackslash show}=(variable)=\text{\textbackslash log} \). We expand the value beforehand as otherwise some integers (such as \currentgrouplevel or \currentgrouptype) altered by the line-wrapping code would show wrong values.
\cs_new_protected:Npn \__kernel_register_show:N { \__kernel_register_show_aux:NN \tl_show:n }
\cs_new_protected:Npn \__kernel_register_show:c { \exp_args:Nc \__kernel_register_show:N }
\cs_new_protected:Npn \__kernel_register_log:N { \__kernel_register_show_aux:NN \tl_log:n }
\cs_new_protected:Npn \__kernel_register_log:c { \exp_args:Nc \__kernel_register_log:N }
\cs_new_protected:Npn \__kernel_register_show_aux:NN #1#2#3 { \exp_args:No \token_to_str:N #2 = #1 }

\cs_show:N\cs_show:c\cs_log:N\cs_log:c\__kernel_show:NN
Some control sequences have a very long name or meaning. Thus, simply using \TeX’s primitive \show could lead to overlong lines. The output of this primitive is mimicked to some extent, then the re-built string is given to \tl_show:n or \tl_log:n for line-wrapping. We must expand the meaning before passing it to the wrapping code as otherwise we would wrongly see the definitions that are in place there. To get correct escape characters, set the \escapechar in a group; this also localizes the assignment performed by x-expansion. The \cs_show:c and \cs_log:c commands convert their argument to a control sequence within a group to avoid showing \relax for undefined control sequences.
We sometimes want to test if a control sequence can be expanded to reveal a hidden value. However, we cannot just expand the macro blindly as it may have arguments and none might be present. Therefore we define these functions to pick either the prefix(es), the parameter specification, or the replacement text from a macro. All of this information is returned as characters with catcode 12. If the token in question isn’t a macro, the token \scan_stop: is returned instead.

```latex
\use:x
\begin{Verbatim}
\exp_not:n { \cs_new:Npn \__kernel_prefix_arg_replacement:wN #1 }
\tl_to_str:n { macro : } \exp_not:n { #2 -> #3 \s__kernel_stop #4 }
\end{Verbatim}
```

(End definition for \cs_show:N, \cs_log:N, and \__kernel_show:NN. These functions are documented on page 14.)

41.19 Decomposing a macro definition

We sometimes want to test if a control sequence can be expanded to reveal a hidden value. However, we cannot just expand the macro blindly as it may have arguments and none might be present. Therefore we define these functions to pick either the prefix(es), the parameter specification, or the replacement text from a macro. All of this information is returned as characters with catcode 12. If the token in question isn’t a macro, the token \scan_stop: is returned instead.

```latex
\use:x
\begin{Verbatim}
\exp_not:n { \cs_new:Npn \__kernel_prefix_arg_replacement:wN #1 }
\tl_to_str:n { macro : } \exp_not:n { #2 -> #3 \s__kernel_stop #4 }
\end{Verbatim}
```
41.20 Doing nothing functions

\prg_do_nothing: \ This does not fit anywhere else!
\cs_new:Npn \prg_do_nothing: \ { \ }

(End definition for \prg_do_nothing:. This function is documented on page 13.)

41.21 Breaking out of mapping functions

\prg_break_point:Nn  \prg_map_break:Nn
\ @@=prg

In inline mappings, the nesting level must be reset at the end of the mapping, even when
the user decides to break out. This is done by putting the code that must be performed
as an argument of \__prg_break_point:Nn. The breaking functions are then defined to
jump to that point and perform the argument of \__prg_break_point:Nn, before the
user’s code (if any). There is a check that we close the correct loop, otherwise we continue
breaking.
\cs_new_eq:NN \prg_break_point:Nn \use_ii:nn
\cs_new:Npn \prg_map_break:Nn \prg_break_point:Nn \use_i:nn
\cs_new:Npn \prg_map_break:Nn \prg_break_point:Nn #1#2#3 \prg_break_point:Nn #4#5
\{ 
#5

(End definition for \cs_prefix_spec:N and others. These functions are documented on page 22.)
\prg_break_point: Very simple analogues of \prg_break_point:Nn and \prg_map_break:Nn, for use in fast short-term recursions which are not mappings, do not need to support nesting, and in which nothing has to be done at the end of the loop.

\prg_break: \prg_break:n

(End definition for \prg_break_point:Nn and \prg_map_break:Nn. These functions are documented on page 70.)

\mode_leave_vertical: The approach here is different to that used by \halign or plain \TeX, which unbox a void box to force horizontal mode. That inserts the \everypar tokens before the re-inserted unboxing tokens. The approach here uses either the \quitvmode primitive or the equivalent protected macro. In vertical mode, the \indent primitive is inserted: this will switch to horizontal mode and insert \everypar tokens and nothing else. Unlike the \halign version, the availability of \eTeX means using a mode test can be done at for example the start of an \halign.

(End definition for \mode_leave_vertical:. This function is documented on page 28.)
Chapter 42

\l3expan implementation

\l__exp_internal_tl The \exp_ module has its private variable to temporarily store the result of x-type argument expansion. This is done to avoid interference with other functions using temporary variables.

(End definition for \l__exp_internal_tl.)

\exp_after:wN \exp_not:N \exp_not:n These are defined in l3basics, as they are needed “early”. This is just a reminder of that fact!

(End definition for \exp_after:wN, \exp_not:N, and \exp_not:n. These functions are documented on page 38.)

42.1 General expansion

In this section a general mechanism for defining functions that handle arguments is defined. These general expansion functions are expandable unless x is used. (Any version of x is going to have to use one of the \LaTeX names for \cs_set:Npx at some point, and so is never going to be expandable.)

The definition of expansion functions with this technique happens in section 42.8. In section 42.2 some common cases are coded by a more direct method for efficiency, typically using calls to \exp_after:wN.

\l__exp_internal_tl This scratch token list variable is defined in l3basics.

(End definition for \l__exp_internal_tl.)

This code uses internal functions with names that start with \:: to perform the expansions. All macros are long since the tokens undergoing expansion may be arbitrary user input.

An argument manipulator \::(Z) always has signature \#1\::\#2\#3 where \#1 holds the remaining argument manipulations to be performed, \:: serves as an end marker for the list of manipulations, \#2 is the carried over result of the previous expansion steps and \#3 is the argument about to be processed. One exception to this rule is \::p, which has to grab an argument delimited by a left brace.
\_\_exp_arg\_next:nnn
\_\_exp_arg\_next:Nnn

#1 is the result of an expansion step, #2 is the remaining argument manipulations and #3 is the current result of the expansion chain. This auxiliary function moves #1 back after #3 in the input stream and checks if any expansion is left to be done by calling #2. In by far the most cases we need to add a set of braces to the result of an argument manipulation so it is more effective to do it directly here. Actually, so far only the c of the final argument manipulation variants does not require a set of braces.

\cs_new:Npn \_\_exp_arg\_next:nnn \#1\#2\#3 { \#2 \::: \{ \#3 {\#1} \} }
\cs_new:Npn \_\_exp_arg\_next:Nnn \#1\#2\#3 { \#2 \::: \{ \#3 \#1 \} }

(End definition for \_\_exp_arg\_next:nnn and \_\_exp_arg\_next:Nnn.)

\::: The end marker is just another name for the identity function.
\cs_new:Npn \::: \#1 \{ \#1 \}

(End definition for \:::. This function is documented on page \textit{42}.)

\::n This function is used to skip an argument that doesn’t need to be expanded.
\cs_new:Npn \::n \#1 \::: \#2\#3 { \#1 \::: \{ \#2 {\#3} \} }

(End definition for \::n. This function is documented on page \textit{42}.)

\::N This function is used to skip an argument that consists of a single token and doesn’t need to be expanded.
\cs_new:Npn \::N \#1 \::: \#2\#3 { \#1 \::: \{ \#2\#3 \} }

(End definition for \::N. This function is documented on page \textit{42}.)

\::p This function is used to skip an argument that is delimited by a left brace and doesn’t need to be expanded. It is not wrapped in braces in the result.
\cs_new:Npn \::p \#1 \::: \#2\#3# \{ \#1 \::: \{\#2\#3\} \}

(End definition for \::p. This function is documented on page \textit{42}.)

\::c This function is used to skip an argument that is turned into a control sequence without expansion.
\cs_new:Npn \::c \#1 \::: \#2\#3
{ \exp_after:wN \_\_exp_arg\_next:Nnn \cs:w \#3 \cs_end: \{ \#1 \} \{ \#2 \} }

(End definition for \::c. This function is documented on page \textit{42}.)

\::o This function is used to expand an argument once.
\cs_new:Npn \::o \#1 \::: \#2\#3
{ \exp_after:wN \_\_exp_arg\_next:nnn \exp_after:wN \{ \#3 \} \{ \#1 \} \{ \#2 \} }

(End definition for \::o. This function is documented on page \textit{42}.)

\::e With the \texttt{expanded} primitive available, just expand. Otherwise defer to \texttt{exp_args:Ne} implemented later.
\cs_if_exist:NTF \texExpanded:D
{ \cs_new:Npn \::e \#1 \::: \#2\#3
  \{ \texExpanded:D \{ \exp_not:n \{ \#1 \::: \} \{ \exp_not:n \{ \#2 \} \#3 \} \} \}
\}
{ \cs_new:Npn \::e \#1 \::: \#2\#3
  \{ \exp_args:Ne \_\_exp_arg\_next:nnn \#3 \{ \#1 \} \{ \#2 \} \}
}\}

387
\exp_stop_f: This function is used to expand a token list until the first unexpandable token is found. This is achieved through \exp:w \exp_end_continue_f:w that expands everything in its way following it. This scanning procedure is terminated once the expansion hits something non-expandable (if that is a space it is removed). We introduce \exp_stop_f: to mark such an end-of-expansion marker. For example, f-expanding \cs_set_eq:Nc \aaa { b \l_tmpa_tl b } where \l_tmpa_tl contains the characters lur gives \texttt{tex_let:D \aaa = \blurb} which then turns out to start with the non-expandable token \texttt{tex_let:D}. Since the expansion of \exp:w \exp_end_continue_f:w is empty, we wind up with a fully expanded list, only \TeX{} has not tried to execute any of the non-expandable tokens. This is what differentiates this function from the \texttt{x} argument type.

\begin{verbatim}
\cs_new:Npn \::f #1 \::: #2#3 {
    \exp_after:wN \__exp_arg_next:nnn
    \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
    {#1} {#2}
}
\end{verbatim}

(End definition for \::f and \exp_stop_f:. These functions are documented on page 42.)

\exp_start_x: This function is used to expand an argument fully. We build in the expansion of \texttt{\_\_exp_arg_next:nnn}.

\begin{verbatim}
\cs_new_protected:Npn \::x #1 \::: #2#3 {
    \exp_after:wN \__exp_arg_next:nnn
    \exp_after:wN { \exp:w \__exp_eval_register:N #3 }
    {#1} {#2}
}
\end{verbatim}

(End definition for \::x. This function is documented on page 42.)

\::v\::V These functions return the value of a register, i.e., one of \texttt{tl}, \texttt{clist}, \texttt{int}, \texttt{skip}, \texttt{dim}, \texttt{muskip}, or built-in \TeX{} register. The \texttt{V} version expects a single token whereas \texttt{v} like \texttt{c} creates a csname from its argument given in braces and then evaluates it as if it was a \texttt{V}. The \exp:w sets off an expansion similar to an \texttt{f}-type expansion, which we terminate using \exp_end:. The argument is returned in braces.

\begin{verbatim}
\cs_new:Npn \::v #1 \::: #2#3 {
    \exp_after:wN \__exp_arg_next:nnn
    \exp_after:wN { \exp:w \__exp_eval_register:c {#3} }
    {#1} {#2}
}
\end{verbatim}

(End definition for \::v and \::V. These functions are documented on page 42.)
This function evaluates a register. Now a register might exist as one of two things: A parameter-less macro or a built-in \TeX register such as \count. For the \TeX registers we have to utilize a \the whereas for the macros we merely have to expand them once. The trick is to find out when to use \the and when not to. What we want here is to find out whether the token expands to something else when hit with \exp_after:wN. The technique is to compare the meaning of the token in question when it has been prefixed with \exp_not:N and the token itself. If it is a macro, the prefixed \exp_not:N temporarily turns it into the primitive \scan_stop:

```
\cs_new:Npn \__exp_eval_register:N #1
{ \exp_after:wN \if_meaning:w \exp_not:N #1 #1
\fi: }
```

If the token was not a macro it may be a malformed variable from a c expansion in which case it is equal to the primitive \scan_stop:. In that case we throw an error. We could let \TeX do it for us but that would result in the rather obscure

```
! You can't use '\relax' after \the.
```

which while quite true doesn’t give many hints as to what actually went wrong. We provide something more sensible.

```
\cs_new:Npn \__exp_eval_register:c #1
{ \exp_after:wN \__exp_eval_register:N \cs:w #1 \cs_end: }
```

Clean up nicely, then call the undefined control sequence. The result is an error message looking like this:

```
! Undefined control sequence.
<argument> \LaTeX3 error: Erroneous variable used!
```

```
\cs_new:Npn \__exp_eval_error_msg:w #1 \tex_the:D #1 \exp_end: \
```

```
\cs_new:Npn \__exp_eval_error_msg:w #1 \tex_the:D #1 \exp_end: \
```

```
\__exp_eval_error_msg:w #1 \tex_the:D #1 \exp_end: \
```

```
\__exp_eval_error_msg:w #1 \exp_end: \
```

```
```

(End definition for \__exp_eval_register:N and \__exp_eval_error_msg:w.)
42.2 Hand-tuned definitions

One of the most important features of these functions is that they are fully expandable.

\begin{verbatim}
\exp_args:Nc
\exp_args:cc
(End definition for \exp_args:Nc and \exp_args:cc. These functions are documented on page 34.)

\exp_args:NNc
\exp_args:Ncc
\exp_args:Nccc
Here are the functions that turn their argument into csnames but are expandable.

\begin{verbatim}
2352 \cs_new:Npn \exp_args:NNc #1#2#3
2353 { \exp_after:wN #1 \exp_after:wN \cs:w # 3\cs_end: }
2354 \cs_new:Npn \exp_args:Ncc #1#2#3
2355 { \exp_after:wN #1 \cs:w #2 \exp_after:wN \cs_end: \cs:w #3 \cs_end: }
2356 \cs_new:Npn \exp_args:Nccc #1#2#3#4
2357 { \exp_after:wN #1 \cs:w #2 \exp_after:wN \cs_end: \cs:w #3 \exp_after:wN \cs_end: \cs:w #4 \cs_end: }
(End definition for \exp_args:NNc, \exp_args:Ncc, and \exp_args:Nccc. These functions are documented on page 36.)

\exp_args:No
\exp_args:NNo
\exp_args:NNNo
Those lovely runs of expansion!

\begin{verbatim}
2363 \cs_new:Npn \exp_args:No #1#2 { \exp_after:wN #1 \exp_after:wN \{#2\} }
2364 \cs_new:Npn \exp_args:NNo #1#2#3
2365 { \exp_after:wN #1 \exp_after:wN \{#2\} \exp_after:wN \{#3\} }
2366 \cs_new:Npn \exp_args:NNNo #1#2#3#4
2367 { \exp_after:wN #1 \exp_after:wN \{#2\} \exp_after:wN \{#3\} \exp_after:wN \{#4\} }
(End definition for \exp_args:No, \exp_args:NNo, and \exp_args:NNNo. These functions are documented on page 35.)

\exp_args:Ne
When the \texttt{\texttt{expanded}} primitive is available, use it. Otherwise use \texttt{\_\_exp_e:nn}, defined later, to fully expand tokens.

\begin{verbatim}
2385 \cs_if_exist:NTF \tex_expanded:D
2386 { \cs_new:Npn \exp_args:Ne #1#2

  \exp_after:wN \exp:w \__exp_eval_register:N #3
  \cs:w #4 \cs_end:
  }
\cs_new:Npn \exp_args:NcNo #1#2#3#4
  {
  \exp_after:wN #1
  \cs:w #2 \exp_after:wN \cs_end:
  \exp_after:wN \exp:w \__exp_eval_register:c {#3} \exp_after:wN #4 }
\end{verbatim}

392
42.3 Last-unbraced versions

There are a few places where the last argument needs to be available unbraced. First some helper macros.

\cs_new:Npn \__exp_arg_last_unbraced:nn #1#2 { #2#1 }
\cs_new:Npn \::o_unbraced \::: #1#2 { \exp_after:wN \__exp_arg_last_unbraced:nn \exp_after:wN {#2} {#1} }
\cs_new:Npn \::V_unbraced \::: #1#2 { \exp_after:wN \__exp_arg_last_unbraced:nn \exp_after:wN { \exp:w \__exp_eval_register:N #2 } {#1} }
\cs_new:Npn \::v_unbraced \::: #1#2 { \exp_after:wN \__exp_arg_last_unbraced:nn \exp_after:wN { \exp:w \__exp_eval_register:c {#2} } {#1} }
\cs_if_exist:NTF \tex_expanded:D { \cs_new:Npn \::e_unbraced \::: #1#2 { \tex_expanded:D { \exp_not:n {#1} #2 } } { \exp:w \exp_end_continue_f:w #2 } {#1} }
\cs_new:Npn \::f_unbraced \::: #1#2 { \cs_set_nopar:Npx \l__exp_internal_tl { \exp_not:n {#1} #2 } }
\cs_new_protected:Npn \::x_unbraced \::: #1#2 { \cs_set_nopar:Npx \l__exp_internal_tl { \exp_not:n {#1} #2 } }
Now the business end: most of these are hand-tuned for speed, but the general system is in place.
If \#2 is a single token then this can be implemented as

\begin{verbatim}
\cs_new:Npn \exp_last_two_unbraced:Noo \#1 \#2 \#3
{ \exp_after:wN \exp_after:wN \exp_after:wN \#1 \exp_after:wN \#2 \#3 }
\end{verbatim}

However, for robustness this is not suitable. Instead, a bit of a shuffle is used to ensure that \#2 can be multiple tokens.

\begin{verbatim}
\cs_new:Npn \exp_last_two_unbraced:Noo \#1#2#3
{ \exp_after:wN \__exp_last_two_unbraced:noN \exp_after:wN {#3} {#2} \#1 }
\end{verbatim}

(End definition for \exp_last_unbraced:No and others. These functions are documented on page 37.)

### 42.4 Preventing expansion

\begin{verbatim}
\exp_not:c \exp_not:o \exp_not:e \exp_not:V
\end{verbatim}

All these except \exp_not:c call the kernel-internal \_\_kernel\_exp_not:w namely \exp_not:o \texttt{tex_unexpanded:D}. (End definition for \_\_kernel\_exp_not:w.)

\begin{verbatim}
\exp_not:c \exp_not:o \_\_kernel\_exp_not:w \texttt{tex_unexpanded:D}
\end{verbatim}

At the kernel level, we need the primitive behaviour to allow expansion \textit{before} the brace group.

(End definition for \_\_kernel\_exp_not:w.)
2600 \__kernel_exp_not:w \exp_args:N e \prg_do_nothing: 

2601 \cs_new:Npn \exp_not:f #1 
2602 \__kernel_exp_not:w \exp_after:wN { \exp:w \exp_end_continue_f:w #1 } 

2603 \cs_new:Npn \exp_not:V #1 
2604 \__kernel_exp_not:w \exp_after:wN \exp:w \__exp_eval_register:N #1 

2605 \cs_new:Npn \exp_not:v #1 
2606 \__kernel_exp_not:w \exp_after:wN \exp:w \__exp_eval_register:c {#1} 

(End definition for \exp_not:c and others. These functions are documented on page 38.)

42.5 Controlled expansion

To trigger a sequence of “arbitrarily” many expansions we need a method to invoke \TeX’s expansion mechanism in such a way that (a) we are able to stop it in a controlled manner and (b) the result of what triggered the expansion in the first place is null, i.e., that we do not get any unwanted side effects. There aren’t that many possibilities in \TeX; in fact the one explained below might well be the only one (as normally the result of expansion is not null).

The trick here is to make use of the fact that \tex_romannumeral:D expands the tokens following it when looking for a number and that its expansion is null if that number turns out to be zero or negative. So we use that to start the expansion sequence: \exp:w is set equal to \tex_romannumeral:D in l3basics. To stop the expansion sequence in a controlled way all we need to provide is a constant integer zero as part of expanded tokens. As this is an integer constant it immediately stops \tex_romannumeral:D’s search for a number. Again, the definition of \exp_end: as the integer constant zero is in l3basics. (Note that according to our specification all tokens we expand initiated by \exp:w are supposed to be expandable (as well as their replacement text in the expansion) so we will not encounter a “number” that actually result in a roman numeral being generated. Or if we do then the programmer made a mistake.)

If on the other hand we want to stop the initial expansion sequence but continue with an f-type expansion we provide the alphabetic constant ‘^^@ that also represents 0 but this time \TeX’s syntax for a ⟨number⟩ continues searching for an optional space (and it continues expansion doing that) — see \TeXbook page 269 for details.

\group_begin:
\tex_catcode:D ‘^^@ = 13
\cs_new_protected:Npn \exp_end_continue_f:w \exp_end_continue_f:nw

If the above definition ever appears outside its proper context the active character ‘^^@ will be executed so we turn this into an error. The test for existence covers the (unlikely) case that some other code has already defined ‘^^@: this is true for example for xmltex.tex.

\if_cs_exist:N ‘^^@ 
else: 

396
The same but grabbing an argument to remove spaces and braces.

\cs_new:Npn \exp_end_continue_f:nw #1 { '^^@ #1 }

(End definition for \exp:w and others. These functions are documented on page 40.)

### 42.6 Emulating e-type expansion

When the \expanded primitive is available it is used to implement e-type expansion; otherwise we emulate it.

\cs_new:Npn \__exp_e:nn #1
\cs_new:Npn \__exp_e:nn #1 #2 { \exp_end: #2 }

\__exp_e:nn

Repeatedly expand tokens, keeping track of fully-expanded tokens in the second argument to \__exp_e:nn; this function eventually calls \__exp_e_end:nn to leave \exp_end: in the input stream, followed by the result of the expansion. There are many special cases: spaces, brace groups, \noexpand, \unexpanded, \the, \primitive. While we use brace tricks \if_false: { \fi:, the expansion of this function is always triggered by \exp:w so brace balance is eventually restored after that is hit with a single step of expansion. Otherwise we could not nest e-type expansions within each other.

\cs_new:Npn \__exp_e_space:nn #1 #2 { \exp_args:Nf \__exp_e:nn {#1} { #2 ~ } }

\__exp_e_space:nn

For an explicit space character, remove it by f-expansion and put it in the (future) output.

\cs_new:Npn \__exp_e_end:nn #1#2 { \exp_end: #2 }

\__exp_e_end:nn

(End definition for \__exp_e:nn and \__exp_e_end:nn.)
For a group, expand its contents, wrap it in two pairs of braces, and call \__exp_e_group:n. This function places the first item (the double-brace wrapped result) into the output. Importantly, \tl_head:n works even if the input contains quarks.

\exp_e:N
\exp_e:Nnn
\exp_e_protected:Nnn
\exp_e_expandable:Nnn

For an N-type token, call \__exp_e:Nnn with arguments the ⟨first token⟩, the remaining tokens to expand and what’s already been expanded. If the ⟨first token⟩ is non-expandable, including \protected \⟨long or not⟩ macros, it is put in the result by \__exp_e_protected:Nnn. The four special primitives \unexpanded, \noexpand, \the, \primitive are detected; otherwise the token is expanded by \__exp_e_expandable:Nnn.
We don’t try hard to make sensible error recovery since the error recovery of \text_{primitive:D} when followed by something else than a primitive depends on the engine. The only valid case is when what follows is \text{N}-type. Then distinguish special primitives \text{unexpanded}, \text{noexpand}, \text{the}, \text{primitive} from other primitives. In the “other” case, the only reasonable way to check if the primitive that follows \text{primitive:D} is expandable is to expand and compare the before-expansion and after-expansion results. If they coincide then probably the primitive is non-expandable and should be put in the output together with \text{primitive:D} (one can cook up contrived counter-examples where the true \text{expanded} would have an infinite loop), and otherwise one should continue expanding.

\begin{verbatim}
\cs_new:Npn \__exp_e_primitive:Nnn #1#2#3
\{ 
  \if_false: \{ fi: 
    \tl_if_head_is_N_type:nTF {#2} 
      \{ \__exp_e_primitive_aux:NNw #1 \} 
    \{ msg_expandable_error:nnn {kernel} {e-type} 
      \{ Missing-primitive-name \} 
    \} \__exp_e_primitive_aux:NNw #1 \c_empty_tl 
    \}
  \}
\}
\cs_new:Npn \__exp_e_primitive_aux:NNw #1#2
\{ \exp_after:wN \__exp_e_primitive_aux:NNnn \exp_after:wN #1 \exp_after:wN #2 \exp_after:wN { \if_false: } \fi: \}
\cs_new:Npn \__exp_e_primitive_aux:NNnn #1#2#3
\{ \exp_args:Nf \str_case_e:nnTF { \cs_to_str:N #2 } 
  { \text{unexpanded} } \{ \__exp_e_unexpanded:Nnn \exp_not:n \} 
  { \text{noexpand} } \{ \__exp_e_noexpand:Nnn \exp_not:N \} 
  { \text{the} } \{ \__exp_e_the:Nnn \tex_the:D \} 
    \{ \sys_if_engine_xetex:T \{ pdf \} 
      \sys_if_engine_luatex:T \{ pdf \} 
      \text{primitive} 
    \} \{ \__exp_e_primitive:Nnn #1 \} 
  \}
\}
\cs_new:Npn \__exp_e_primitive_other:NNnn #1#2#3
\{ \exp_args:N \__exp_e_primitive_other_aux:nNNnn \#1 \#2 \#3 \}
\end{verbatim}
\cs_new:Npn \__exp_e Primitive_other_aux:nNNnn #1#2#3#4#5
\{ \str_if_eq:nnTF {#1} { #2 #3 #4 }
\{ \__exp_e:nn {#4} { #5 #2 #3 } \}
\{ \__exp_e:nn {#1} {#5} \}\}

(End definition for \__exp_e Primitive:Nnn and others.)

\__exp_e_noexpand:Nnn
The \noexpand primitive has no effect when followed by a token that is not N-type; otherwise \__exp_e_put:nn can grab the next token and put it in the result unchanged.

\cs_new:Npn \__exp_e_noexpand:Nnn #1#2
\{ \tl_if_head_is_N_type:nTF {#2} \exp_args:Nf \__exp_e_unexpanded:nn \{ \__exp_e_unexpanded:nN {#1} #2 \}\}

(End definition for \__exp_e_noexpand:Nnn.)

\__exp_e_unexpanded:Nnn
\__exp_e_unexpanded:nn
\__exp_e_unexpanded:nN
\__exp_e_unexpanded:N
The \unexpanded primitive expands and ignores any space, \scan_stop:, or token affected by \exp_not:N, then expects a brace group. Since we only support brace-balanced token lists it is impossible to support the case where the argument of \unexpanded starts with an implicit brace. Even though we want to expand and ignore spaces we cannot blindly f-expand because tokens affected by \exp_not:N should discarded without being expanded further.

As usual distinguish four cases: brace group (the normal case, where we just put the item in the result), space (just f-expand to remove the space), empty (an error), or N-type \langle token \rangle. In the last case call \__exp_e_unexpanded:Nn triggered by an f-expansion. Having a non-expandable \langle token \rangle after \unexpanded is an error (we recover by passing {} to \unexpanded: this is different from \TeX{} because the error recovery of \unexpanded changes the balance of braces), unless that \langle token \rangle is \scan_stop: or a space (recall that we don't implement the case of an implicit begin-group token). An expandable \langle token \rangle is instead expanded, unless it is \noexpand. The latter primitive can be followed by an expandable N-type token (removed), by a non-expandable one (kept and later causing an error), by a space (removed by f-expansion), or by a brace group or nothing (later causing an error).

\cs_new:Npn \__exp_e_unexpanded:Nnn #1 \{ \__exp_e_unexpanded:nn \}
\cs_new:Npn \__exp_e_unexpanded:nn #1 #1
\{ \tl_if_head_is_N_type:nTF {#1} \exp_args:Nf \__exp_e_unexpanded:nn
\{ \__exp_e_unexpanded:nN \{\__exp_e_unexpanded:nn \} #1 \}
\}
\{ \tl_if_head_is_group:nTF {#1} \__exp_e_put:nn
\{ \__exp_e_unexpanded:nN
\{ \tl_if_empty:nTF {#1} \msg_expandable_error:nnn
\{ kernel \} \{ e-type \}
\{ \unexpanded missing-brace \}

400
Finally implement \texttt{\exp_e\_the:N}. Followed by anything other than an \texttt{N}-type \texttt{⟨token⟩} this causes an error (we just let \LaTeX\ make one), otherwise we test the \texttt{⟨token⟩}. If the \texttt{⟨token⟩} is expandable, expand it. Otherwise it could be any kind of register, or things like \texttt{\numexpr}, so there is no way to deal with all cases. Thankfully, only \texttt{\toks} data needs to be protected from expansion since everything else gives a string of characters. If the \texttt{⟨token⟩} is \texttt{\toks} we find a number and unpack using the \texttt{\the\toks} functions. If it is a token register we unpack it in a brace group and call \texttt{\exp_e\_put:nn} to move it to
the result. Otherwise we unpack and continue expanding (useless but safe) since it is
basically impossible to have a handle on where the result of \the ends.

\cs_new:Npn \__exp_e_the:Nnn #1#2
\{
    \tl_if_head_is_N_type:nTF {#2}
    { \if_false: { \fi: \__exp_e_the:N #2 } }
    { \exp_args:No \__exp_e:nn { \tex_the:D #2 } }

(End definition for \__exp_e_the:Nnn, \__exp_e_the:N, and \__exp_e_the_toks_reg:N)

\__exp_e_the_toks:wnn
\__exp_e_the_toks:n
\__exp_e_the_toks:N

The calling function has applied \int_value:w so we collect digits with \__exp_e_the_the_toks:n (which gets the token list as an argument) and \__exp_e_the_the_toks:N (which gets the first token in case it is N-type). The digits are themselves collected into an \int_value:w argument to \__exp_e_the_the_toks:wnn. Then that function unpacks the \toks ⟨number⟩ into the result. We include ? because \__exp_e_the_the_toks_reg:N removes one item from its second argument. Note that our approach is rather crude: in cases like \the\toks12-34 the first \int_value:w removes the space and we will incorrectly unpack the \the\toks1234.

\__cs_recursion_stop

Internal recursion quarks. No l3quark yet, so do things by hand.

\cs_new:Npn \__cs_recursion_stop { \__cs_recursion_stop }

(End definition for \__cs_recursion_stop.)

\cs_generate_variant:Nn \cs_generate_variant:cn

#1: Base form of a function; e.g., \tl_set:Nn
#2: One or more variant argument specifiers; e.g., \{Nx,c,cx\}

After making sure that the base form exists, test whether it is protected or not and define \_cs_tmp:w as either \cs_new:Npx or \cs_new_protected:Npx, which is then used to define all the variants (except those involving x-expansion, always protected). Split up the original base function only once, to grab its name and signature. Then we wish to iterate through the comma list of variant argument specifiers, which we first convert to a string: the reason is explained later.

\cs_new_protected:Npn \cs_generate_variant:Nn \cs_generate_variant:cn

\cs_split_function:N #1

404
The goal here is to pick up protected parent functions. There are four cases: the parent function can be a primitive or a macro, and can be expandable or not. For non-expandable primitives, all variants should be protected; skipping the `\else:` branch is safe because non-expandable primitives cannot be \TeX conditionals.

The other case where variants should be protected is when the parent function is a protected macro: then `\protect` appears in the meaning before the first occurrence of `\macro`. The `\w` auxiliary removes everything in the meaning string after the first `\macro`. We use `\macro` rather than the full `\macro` because the meaning of the `\firstmark` primitive (and four others) can contain an arbitrary string after a leading `\firstmark`: Then, look for `\protect` in the part we extracted: no need to look for anything longer: the only strings we can have are an empty string, `\long`, `\protected`, `\protectedlong`, `\first`, `\top`, `\bot`, `\splittop`, or `\splitbot`, with \ replaced by the appropriate escape character. If `\protect` appears in the part before `\macro`, the first `\s__cs_mark` is taken as an argument of the `\w` auxiliary, and #3 is `\cs_new_protected:Npx`, otherwise it is `\cs_new_protected:Nx`.

\begin{verbatim}
\exp_last_unbraced:NNNNo
\cs_new_protected:Np \__cs_generate_variant:nnNN
#1 : Base name.
#2 : Base signature.
\end{verbatim}
#3: Boolean.
#4: Base function.

If the boolean is \texttt{\textbackslash c\_false\_bool}, the base function has no colon and we abort with an error; otherwise, set off a loop through the desired variant forms. The original function is retained as #4 for efficiency.

```latex
\cs_new_protected:Npn \__cs_generate_variant:nnNN #1#2#3#4
\begin{verbatim}
{ \if_meaning:w \c\_false\_bool #3
 \msg_error:n { kernel } { missing-colon }
 \{ \token_to_str:c {#1} \} \exp_after:wN \__cs_use_none_delimit_by_q_recursion_stop:w
 \fi:\ \\
\__cs_generate_variant:Nnnw #4 {#1}{#2}
\end{verbatim}
```

(End definition for \texttt{\__cs_generate_variant:nnNN}.)

\texttt{\__cs_generate_variant:Nnnw} #1: Base function.
#2: Base name.
#3: Base signature.
#4: Beginning of variant signature.

First check whether to terminate the loop over variant forms. Then, for each variant form, construct a new function name using the original base name, the variant signature consisting of $l$ letters and the last $k - l$ letters of the base signature (of length $k$). For example, for a base function \texttt{\prop\_put:Nnn} which needs a \texttt{c\textbackslash V} variant form, we want the new signature to be \texttt{c\textbackslash Vn}.

There are further subtleties:

- In \texttt{\cs\_generate\_variant:Nn \foo:nnTF \{xxTF\}}, we must define \texttt{\foo:xxTF} using \texttt{\exp\_args:Nxx}, rather than a hypothetical \texttt{\exp\_args:NNxxTF}. Thus, we wish to trim a common trailing part from the base signature and the variant signature.

- In \texttt{\cs\_generate\_variant:Nn \foo:on \{ox\}}, the function \texttt{\foo:ox} must be defined using \texttt{\exp\_args:Nxx}, not \texttt{\exp\_args:Nx}, to avoid double $o$ expansion.

- Lastly, \texttt{\cs\_generate\_variant:Nn \foo:on \{xn\}} must trigger an error, because we do not have a means to replace $o$-expansion by $x$-expansion. More generally, we can only convert $N$ to $c$, or convert $n$ to $V$, $v$, $o$, $f$, $x$.

All this boils down to a few rules. Only $n$ and $N$-type arguments can be replaced by \texttt{\cs\_generate\_variant:Nn}. Other argument types are allowed to be passed unchanged from the base form to the variant: in the process they are changed to $n$ except for $N$ and $p$-type arguments. A common trailing part is ignored.

We compare the base and variant signatures one character at a time within $x$-expansion. The result is given to \texttt{\__cs\_generate\_variant:wwNN} (defined later) in the form \texttt{(processed variant signature) \textbackslash s\_\_cs\_mark \{errors\} \textbackslash s\_\_cs\_stop \{base function\} \{new function\}}. If all went well, \texttt{\{}errors\texttt{\}} is empty; otherwise, it is a kernel error message and some clean-up code.

Note the space after #3 and after the following brace group. Those are ignored by \TeX{} when fetching the last argument for \texttt{\__cs\_generate\_variant\_loop:nNwN}, but can be used as a delimiter for \texttt{\__cs\_generate\_variant\_loop\_end:nwNNNnNn}.

```
\cs_new_protected:Npm \__cs_generate_variant:Nnnw #1#2#3#4 ,
```

406
\{ \if_meaning:w \scan_stop: #4 \exp_after:wN \__cs_use_none_delimit_by_q_recursion_stop:w \fi: \use:x \exp_not:N \__cs_generate_variant:wwNN \__cs_generate_variant_loop:nNwN \s__cs_mark #3 - \{ - { } \fi: \__cs_generate_variant_loop_long:wNNnn \} - \{ } \s__cs_stop \exp_not:N #1 {#2} {#4} \} \__cs_generate_variant:Nnnw #1 {#2} {#3} \}

(End definition for \__cs_generate_variant:NwNN.)

\__cs_generate_variant_loop:nwNN \__cs_generate_variant_loop_base:N \__cs_generate_variant_loop_same:w \__cs_generate_variant_loop_end:nwwNNnn \__cs_generate_variant_loop_long:wNNnn \__cs_generate_variant_loop_invalid:NNwNNnn \__cs_generate_variant_loop_special:NNwNNnn #1: Last few consecutive letters common between the base and variant (more precisely, \__cs_generate_variant_same:N \langle letter \rangle for each letter).
#2: Next variant letter.
#3: Remainder of variant form.
#4: Next base letter.

The first argument is populated by \__cs_generate_variant_loop_same:w when a variant letter and a base letter match. It is flushed into the input stream whenever the two letters are different: if the loop ends before, the argument is dropped, which means that trailing common letters are ignored.

The case where the two letters are different is only allowed if the base is \text{n} and the variant is \text{c}, or when the base is \text{n} and the variant is \text{o}, \text{V}, \text{v}, \text{f} or \text{x}. Otherwise, call \__cs_generate_variant_loop_invalid:NNwNNnn to remove the end of the loop, get arguments at the end of the loop, and place an appropriate error message as a second argument of \__cs_generate_variant:wwNN. If the letters are distinct and the base letter is indeed \text{n} or \text{N}, leave in the input stream whatever argument \#1 was collected, and the next variant letter \#2, then loop by calling \__cs_generate_variant_loop:nwNN.

The loop can stop in three ways.

- If the end of the variant form is encountered first, \#2 is \__cs_generate_variant_loop_end:nwwNNnn (expanded by the conditional \if:w), which inserts some tokens to end the conditional; grabs the \langle base name \rangle as \#7, the \langle variant signature \rangle \#8, the \langle next base letter \rangle \#1 and the part \#3 of the base signature that wasn’t read yet; and combines those into the \langle new function \rangle to be defined.

- If the end of the base form is encountered first, \#4 is \{ \fi: which ends the conditional (with an empty expansion), followed by \__cs_generate_variant_loop_long:wNNnn, which places an error as the second argument of \__cs_generate_variant:wwNN.

- The loop can be interrupted early if the requested expansion is unavailable, namely when the variant and base letters differ and the base is not the right one (\text{n} or \text{N} to
support the variant). In that case too an error is placed as the second argument of
\_\_cs_generate_variant:wwNN.

Note that if the variant form has the same length as the base form, #2 is as described in
the first point, and #4 as described in the second point above. The \_\_cs_generate-
variant_loop_end:nnwwNNnn breaking function takes the empty brace group in #4 as
its first argument: this empty brace group produces the correct signature for the full
variant.

When the base and variant letters are identical, don’t do any expansion. For most argument types, we can use the \texttt{n}-type no-expansion, but the \texttt{N} and \texttt{p} types require a slightly different behaviour with respect to braces. For \texttt{V}-type this function could output \texttt{N} to avoid adding useless braces but that is not a problem.

Chapter 43

\texttt{l3sort} implementation

\section{Variables}

\texttt{\_\_sort\_internal\_seq} \quad Sorting happens in a group; the result is stored in those global variables before being copied outside the group to the proper places. For \texttt{seq} and \texttt{tl} this is more efficient than using \texttt{\use:x} (or some \texttt{\exp_args:NNNx}) to smuggle the definition outside the group since \TeX{} does not need to re-read tokens. For \texttt{clist} we don’t gain anything since the result is converted from \texttt{seq} to \texttt{clist} anyways.

\begin{verbatim}
\seq_new:N \g__sort\_internal\_seq
\tl_new:N \g__sort\_internal\_tl
\end{verbatim}

\texttt{\_\_sort\_length\_int} \quad The sequence has \texttt{\_\_sort\_length\_int} items and is stored from \texttt{\_\_sort\_min\_int} to \texttt{\_\_sort\_top\_int} – 1. While reading the sequence in memory, we check that \texttt{\_\_sort\_top\_int} remains at most \texttt{\_\_sort\_max\_int}, precomputed by \texttt{\_\_sort\_\-compute\_range}. That bound is such that the merge sort only uses \texttt{toks} registers less than \texttt{\_\_sort\_true\_max\_int}, namely those that have not been allocated for use in other code: the user’s comparison code could alter these.

\begin{verbatim}
\int_new:N \l__sort\_length\_int
\int_new:N \l__sort\_min\_int
\int_new:N \l__sort\_top\_int
\int_new:N \l__sort\_max\_int
\int_new:N \l__sort\_true\_max\_int
\end{verbatim}

\texttt{\_\_sort\_block\_int} \quad Merge sort is done in several passes. In each pass, blocks of size \texttt{\_\_sort\_block\_int} are merged in pairs. The block size starts at 1, and, for a length in the range \([2^k + 1, 2^{k+1}]\), reaches \(2^k\) in the last pass.

\begin{verbatim}
\int_new:N \l__sort\_block\_int
\end{verbatim}
When merging two blocks, \texttt{l\_sort\_begin\_int} marks the lowest index in the two blocks, and \texttt{l\_sort\_end\_int} marks the highest index, plus 1.

\begin{verbatim}
\int_new:N \l__sort_begin_int
\int_new:N \l__sort_end_int
\end{verbatim}

(End definition for \texttt{l\_sort\_begin\_int} and \texttt{l\_sort\_end\_int}.)

When merging two blocks (whose end-points are \texttt{beg} and \texttt{end}), \texttt{A} starts from the high end of the low block, and decreases until reaching \texttt{beg}. The index \texttt{B} starts from the top of the range and marks the register in which a sorted item should be put. Finally, \texttt{C} points to the copy of the high block in the interval of registers starting at \texttt{l\_sort\_length\_int}, upwards. \texttt{C} starts from the upper limit of that range.

\begin{verbatim}
\int_new:N \l__sort_A_int
\int_new:N \l__sort_B_int
\int_new:N \l__sort_C_int
\end{verbatim}

(End definition for \texttt{l\_sort\_A\_int}, \texttt{l\_sort\_B\_int}, and \texttt{l\_sort\_C\_int}.)

\texttt{s\_sort\_mark} Internal scan marks.
\texttt{s\_sort\_stop}

\begin{verbatim}
\scan_new:N \s__sort_mark
\scan_new:N \s__sort_stop
\end{verbatim}

(End definition for \texttt{s\_sort\_mark} and \texttt{s\_sort\_stop}.)

### 43.2 Finding available \texttt{toks} registers

\texttt{\_sort\_shrink\_range:} After \texttt{\_sort\_compute\_range:} (defined below) determines that \texttt{toks} registers between \texttt{l\_sort\_min\_int} (included) and \texttt{l\_sort\_true\_max\_int} (excluded) have not yet been assigned, \texttt{\_sort\_shrink\_range:} computes \texttt{l\_sort\_max\_int} to reflect the need for a buffer when merging blocks in the merge sort. Given $2^n \leq A \leq 2^n + 2^{n-1}$ registers we can sort $\lceil A/2 \rceil + 2^{n-2}$ items while if we have $2^n + 2^{n-1} \leq A \leq 2^{n+1}$ registers we can sort $A - 2^{n-1}$ items. We first find out a power $2^n$ such that $2^n \leq A \leq 2^{n+1}$ by repeatedly halving \texttt{l\_sort\_block\_int}, starting at $2^{15}$ or $2^{14}$ namely half the total number of registers, then we use the formulas and set \texttt{l\_sort\_max\_int}.

\begin{verbatim}
\cs_new_protected:Npn \_sort\_shrink\_range:
\_sort\_shrink\_range\_loop:
\end{verbatim}

\begin{verbatim}
\int_set:Nn \l__sort_A_int
\int_set:Nn \l__sort_B_int
\int_set:Nn \l__sort_C_int
\end{verbatim}

417
First find out what \toks have not yet been assigned. There are many cases. In \LaTeX2ε with no package, available \toks range from \count15 + 1 to \c_max_register_int included (this was not altered despite the 2015 changes). When \loctoks is defined, namely in plain (e)\TeX, or when the package etex is loaded in \LaTeX2ε, redefine \_sort_compute_range: to use the range \count265 to \count275 − 1. The elocalloc package also defines \loctoks but uses yet another number for the upper bound, namely \e@alloc@top (minus one). We must check for \loctoks every time a sorting function is called, as etex or elocalloc could be loaded.

In Con\TeX\, MkIV the range is from \c_syst_last_allocated_toks + 1 to \c_max_register_int, and in MkII it is from \lastallocatedtoks + 1 to \c_max_register_int. In all these cases, call \_sort_shrink_range::
\_\_sort\_main:NNNn  Sorting happens in three steps. First store items in \toks registers ranging from \l\_\_sort\_min\_int to \l\_\_sort\_top\_int − 1, while checking that the list is not too long. If we reach the maximum length, that’s an error; exit the group. Secondly, sort the array of \toks registers, using the user-defined sorting function: \_\_sort\_level; calls \_\_sort\_compare:nn as needed. Finally, unpack the \toks registers (now sorted) into the target \tl, or into \g\_\_sort\_internal\_seq for seq and clist. This is done by \_\_sort\_seq:NNNNn and \_\_sort\_tl:NNn.

43.3 Protected user commands

\_\_sort\_main:NNNn

Call the main sorting function then unpack \toks registers outside the group into the target token list. The unpacking is done by \_\_sort\_tl\_toks:w; registers are numbered from \l\_\_sort\_min\_int to \l\_\_sort\_top\_int − 1. For expansion behaviour we need...
a couple of primitives. The \texttt{\tl_gclear:N} reduces memory usage. The \texttt{\prg_break_point} is used by \texttt{\__sort_main:NNNn} when the list is too long.

(End definition for \texttt{\tl_sort:Nn} and others. These functions are documented on page 117.)

Use the same general framework for seq and clist. Apply the general sorting code, then unpack \texttt{\toks} into \texttt{\__sort_internal_seq}. Outside the group copy or convert (for clist) the data to the target variable. The \texttt{\seq_gclear:N} reduces memory usage. The \texttt{\prg_break_point} is used by \texttt{\__sort_main:NNNn} when the list is too long.

43.4 Merge sort

__/sort_level/: This function is called once blocks of size \l__sort_block_int (initially 1) are each sorted. If the whole list fits in one block, then we are done (this also takes care of the case of an empty list or a list with one item). Otherwise, go through pairs of blocks starting from 0, then double the block size, and repeat.

\cs_new_protected:Npn __sort_level:
  { \if_int_compare:w \l__sort_block_int < \l__sort_length_int
      \l__sort_end_int \l__sort_min_int
      \__sort_merge_blocks:
      \tex_advance:D \l__sort_end_int \l__sort_block_int
      \exp_after:wN __sort_level:
      \fi: }

(End definition for __sort_level:.)

__/sort_merge_blocks/: This function is called to merge a pair of blocks, starting at the last value of \l__sort_end_int (end-point of the previous pair of blocks). If shifting by one block to the right we reach the end of the list, then this pass has ended: the end of the list is sorted already. Otherwise, store the result of that shift in \textit{A}, which indexes the first block starting from the top end. Then locate the end-point (maximum) of the second block: shift \textit{end} upwards by one more block, but keeping it \leq \textit{top}. Copy this upper block of \texttt{toks} registers in registers above \texttt{length}, indexed by \textit{C}: this is covered by __sort_copy_block:. Once this is done we are ready to do the actual merger using __sort_merge_blocks_aux:: after shifting \textit{A}, \textit{B} and \textit{C} so that they point to the largest index in their respective ranges rather than pointing just beyond those ranges. Of course, once that pair of blocks is merged, move on to the next pair.

\cs_new_protected:Npn __sort_merge_blocks:
  { \l__sort_begin_int \l__sort_end_int
    \tex_advance:D \l__sort_end_int \l__sort_block_int
    \if_int_compare:w \l__sort_end_int < \l__sort_top_int
      \l__sort_A_int \l__sort_end_int
      \tex_advance:D \l__sort_end_int \l__sort_block_int
      \if_int_compare:w \l__sort_end_int > \l__sort_top_int
        \l__sort_end_int \l__sort_top_int
      \else:
        \l__sort_end_int \l__sort_top_int
      \fi: }

(End definition for __sort_merge_blocks.)
\_\_sort\_copy\_block: We wish to store a copy of the “upper” block of \toks registers, ranging between the initial value of \l\_\_sort\_B\_int (included) and \l\_\_sort\_end\_int (excluded) into a new range starting at the initial value of \l\_\_sort\_C\_int, namely \l\_\_sort\_top\_int.

\cs\_new\_protected:Npn \_\_sort\_copy\_block:
{\\text\_toks:D \l\_\_sort\_C\_int \\text\_toks:D \l\_\_sort\_B\_int\\int\_incr:N \l\_\_sort\_C\_int\\int\_incr:N \l\_\_sort\_B\_int\if\int\_compare:w \l\_\_sort\_B\_int = \l\_\_sort\_end\_int \use\_i:nn \fi:
\_\_sort\_copy\_block:\}

(End definition for \_\_sort\_copy\_block:)

\_\_sort\_merge\_blocks\_aux: At this stage, the first block starts at \l\_\_sort\_begin\_int, and ends at \l\_\_sort\_A\_int, and the second block starts at \l\_\_sort\_top\_int and ends at \l\_\_sort\_C\_int. The result of the merger is stored at positions indexed by \l\_\_sort\_B\_int, which starts at \l\_\_sort\_end\_int − 1 and decreases down to \l\_\_sort\_begin\_int, covering the full range of the two blocks. In other words, we are building the merger starting with the largest values. The comparison function is defined to return either \texttt{swapped} or \texttt{same}. Of course, this means the arguments need to be given in the order they appear originally in the list.

\cs\_new\_protected:Npn \_\_sort\_merge\_blocks\_aux:
{\exp\_after:wN \_\_sort\_compare:nn \exp\_after:wN\{\text\_the:D \\text\_toks:D \exp\_after:wN \l\_\_sort\_A\_int \exp\_after:wN\}\exp\_after:wN \{\text\_the:D \\text\_toks:D \l\_\_sort\_C\_int\}\prg\_do\_nothing:\\_\_sort\_return\_mark:w\_\_sort\_return\_mark:w\_\_sort\_mark\_\_sort\_return\_none\_error:}

(End definition for \_\_sort\_merge\_blocks\_aux:)
Each comparison should call \texttt{\sort\_return\_same:} or \texttt{\sort\_return\_swapped:} exactly once. If neither is called, \texttt{\_\_sort\_return\_none\_error:} is called, since the return-\texttt{mark} removes tokens until \texttt{\s\_\_sort\_mark}. If one is called, the return-\texttt{mark} auxiliary removes everything except \texttt{\_\_sort\_return\_same:w} (or its swapped analogue) followed by \texttt{\_\_sort\_return\_none\_error:}. Finally if two or more are called, \texttt{\_\_sort\_return\_two\_error:} ends up before any \texttt{\_\_sort\_return\_mark:w}, so that it produces an error.

\begin{verbatim}
\cs_new_protected:Npn \sort\_return\_same: #1 \__sort\_return\_mark:w #2 \s\_\_sort\_mark {
\__sort\_return\_two\_error:
\__sort\_return\_mark:w \s\_\_sort\_mark \__sort\_return\_same:w
}
\cs_new_protected:Npn \sort\_return\_swapped: #1 \__sort\_return\_mark:w #2 \s\_\_sort\_mark {
\__sort\_return\_two\_error:
\__sort\_return\_mark:w \s\_\_sort\_mark \__sort\_return\_swapped:w
}
\cs_new_protected:Npn \__sort\_return\_same:w \__sort\_return\_none\_error: {
\tex\_toks:D \l\_\_sort\_B\_int \tex\_toks:D \l\_\_sort\_C\_int
\int\_decr:N \l\_\_sort\_B\_int
}\end{verbatim}

(End definition for \texttt{\sort\_return\_same:} and others. These functions are documented on page \pageref{page}.)

\texttt{\_\_sort\_return\_same:w} If the comparison function returns \texttt{same}, then the second argument fed to \texttt{\_\_sort\_\_compare:nn} should remain to the right of the other one. Since we build the merger starting from the right, we copy that \texttt{\toks} register into the allotted range, then shift the pointers \texttt{B} and \texttt{C}, and go on to do one more step in the merger, unless the second block has been exhausted: then the remainder of the first block is already in the correct registers and we are done with merging those two blocks.

\begin{verbatim}
\cs_new_protected:Npn \_\_sort\_return\_same:w \_\_sort\_return\_none\_error: {
\__sort\_return\_two\_error:
\__sort\_return\_none\_error:
}
\cs_new_protected:Npn \_\_sort\_return\_two\_error: {
\msg\_error:nnxx \{ sort \} \{ return\_two \}
\l\_\_sort\_A\_int \l\_\_sort\_C\_int
}\end{verbatim}
\_\_sort\_return\_swapped:w

If the comparison function returns \texttt{swapped}, then the next item to add to the merger is the first argument, contents of the \texttt{toks} register \texttt{A}. Then shift the pointers \texttt{A} and \texttt{B} to the left, and go for one more step for the merger, unless the left block was exhausted (\texttt{A} goes below the threshold). In that case, all remaining \texttt{toks} registers in the second block, indexed by \texttt{C}, are copied to the merger by \_\_sort\_merge\_blocks\_end:.

\_\_sort\_merge\_blocks\_end:

This function’s task is to copy the \texttt{toks} registers in the block indexed by \texttt{C} to the merger indexed by \texttt{B}. The end can equally be detected by checking when \texttt{B} reaches the threshold \texttt{begin}, or when \texttt{C} reaches \texttt{top}.

43.5 Expandable sorting

Sorting expandably is very different from sorting and assigning to a variable. Since tokens cannot be stored, they must remain in the input stream, and be read through at every step. It is thus necessarily much slower (at best $O(n^2 \ln n)$) than non-expandable sorting functions ($O(n \ln n)$).

A prototypical version of expandable quicksort is as follows. If the argument has no item, return nothing, otherwise partition, using the first item as a pivot (argument \#4 of \_\_sort:nnNnn). The arguments of \_\_sort:nnNnn are 1. items less than \#4, 2. items greater or equal to \#4, 3. comparison, 4. pivot, 5. next item to test. If \#5 is the tail of
the list, call \texttt{\tl_sort:nN} on \#1 and on \#2, placing \#4 in between; \texttt{\use:ff} expands the parts to make \texttt{\tl_sort:nN} \texttt{f}-expandable. Otherwise, compare \#4 and \#5 using \#3. If they are ordered, place \#5 amongst the “greater” items, otherwise amongst the “lesser” items, and continue partitioning.

\begin{verbatim}
\cs_new:Npn \tl_sort:nN #1#2
{\tl_if_blank:nF {#1}
{\__sort:nnNnn { } { } #2
 #1 \q__sort_recursion_tail \q__sort_recursion_stop
}
}\cs_new:Npn \__sort:nnNnn #1#2#3#4#5
{\quark_if_recursion_tail_stop_do:nn {#5}
{\use:ff \{ \tl_sort:nN {#1} #3 {#4} \} \{ \tl_sort:nN {#2} #3 \}}
#3 \{#4\} \{#5\}
{\__sort:nnNnn {#1} \{ #2 \{#5\} \} #3 \{#4\}}
{\__sort:nnNnn { #1 \{#5\} } \{#2\} #3 \{#4\}}
}\cs_generate_variant:Nn \use:nn { ff }
\end{verbatim}

There are quite a few optimizations available here: the code below is less legible, but more than twice as fast.

In the simple version of the code, \texttt{\__sort:nnNnn} is called \textit{O}(n \log n) times on average (the number of comparisons required by the quicksort algorithm). Hence most of our focus is on optimizing that function.

The first speed up is to avoid testing for the end of the list at every call to \texttt{\__sort:nnNnn}. For this, the list is prepared by changing each \texttt{⟨item⟩} of the original token list into \texttt{⟨command⟩{⟨item⟩}}, just like sequences are stored. We arrange things such that the \texttt{⟨command⟩} is the \texttt{⟨conditional⟩} provided by the user: the loop over the \texttt{⟨prepared tokens⟩} then looks like

\begin{verbatim}
\cs_new:Npn \__sort_loop:wNn ... #6#7
{ #6 \{⟨pivot⟩\} \{#7\} \{⟨loop big⟩\} \{loop small\}
 \langle extra arguments \rangle
 \texttt{\__sort_loop:wNn} ... \langle prepared tokens \rangle
 \langle end-loop \rangle \{\} \s__sort_stop
\end{verbatim}

In this example, which matches the structure of \texttt{\__sort_quick_split_i:NnnnnNn} and a few other functions below, the \texttt{\__sort_loop:wNn} auxiliary normally receives the user’s \texttt{⟨conditional⟩} as \#6 and an \texttt{⟨item⟩} as \#7. This is compared to the \texttt{⟨pivot⟩} (the argument \#5, not shown here), and the \texttt{⟨conditional⟩} leaves the \texttt{⟨loop big⟩} or \texttt{⟨loop small⟩} auxiliary, which both have the same form as \texttt{\__sort_loop:wNn}, receiving the next pair \texttt{⟨conditional⟩ ⟨⟨item⟩⟩} as \#6 and \#7. At the end, \#6 is the \texttt{⟨end-loop⟩} function, which terminates the loop.

The second speed up is to minimize the duplicated tokens between the \texttt{true} and \texttt{false} branches of the conditional. For this, we introduce two versions of \texttt{\__sort:nnNnn},
which receive the new item as #1 and place it either into the list #2 of items less than the pivot #4 or into the list #3 of items greater or equal to the pivot.

\cs_new:Npn \__sort_i:nnnnNn #1#2#3#4#5#6
{ #5 {#4} {#6} \__sort_ii:nnnnNn \__sort_i:nnnnNn
  {#6} {#2 {#1}} {#3} {#4} }
\cs_new:Npn \__sort_ii:nnnnNn #1#2#3#4#5#6
{ #5 {#4} {#6} \__sort_ii:nnnnNn \__sort_i:nnnnNn
  {#6} {#2} {#3 {#1}} {#4} }

Note that the two functions have the form of \texttt{\_sort_loop:wNn} above, receiving as #5 the conditional or a function to end the loop. In fact, the lists #2 and #3 must be made of pairs \texttt{⟨conditional⟩ {⟨item⟩}}, so we have to replace \{#6\} above by \{ #5 {#6} \}, and \{#1\} by #1. The actual functions have one more argument, so all argument numbers are shifted compared to this code.

The third speed up is to avoid \texttt{\_use:ff} using a continuation-passing style: \texttt{\_sort_quick_split:NnNn} expects a list followed by \texttt{\s__sort_mark {⟨code⟩}}, and expands to \texttt{⟨code⟩ {sorted list}}. Sorting the two parts of the list around the pivot is done with

\begin{verbatim}
\_sort_quick_split:NnNn #2 ... \s_sort_mark
{ \_sort_quick_split:NnNn #1 ... \s_sort_mark {⟨code⟩}
  {⟨pivot⟩} }
\end{verbatim}

Items which are larger than the \texttt{⟨pivot⟩} are sorted, then placed after code that sorts the smaller items, and after the (braced) \texttt{⟨pivot⟩}.

The fourth speed up is avoid the recursive call to \texttt{\tl_sort:nN} with an empty first argument. For this, we introduce functions similar to the \texttt{\_sort_i:nnnnNn} of the last example, but aware of whether the list of \texttt{⟨conditional⟩ {⟨item⟩}} read so far that are less than the pivot, and the list of those greater or equal, are empty or not: see \texttt{\_sort_quick_split:NnNn} and functions defined below. Knowing whether the lists are empty or not is useless if we do not use distinct ending codes as appropriate. The splitting auxiliaries communicate to the \texttt{⟨end-loop⟩} function (that is initially placed after the “prepared” list) by placing a specific ending function, ignored when looping, but useful at the end. In fact, the \texttt{⟨end-loop⟩} function does nothing but place the appropriate ending function in front of all its arguments. The ending functions take care of sorting non-empty sublists, placing the pivot in between, and the continuation before.

The final change in fact slows down the code a little, but is required to avoid memory issues: schematically, when \TeX{} encounters

\begin{verbatim}
\use:n { \use:n { \use:n { ... } ... } ... }
\end{verbatim}

the argument of the first \texttt{\use:n} is not completely read by the second \texttt{\use:n}, hence must remain in memory; then the argument of the second \texttt{\use:n} is not completely read when grabbing the argument of the third \texttt{\use:n}, hence must remain in memory, and so on. The memory consumption grows quadratically with the number of nested \texttt{\use:n}. In
practice, this means that we must read everything until a trailing \_\_sort_stop once in a while, otherwise sorting lists of more than a few thousand items would exhaust a typical \TeX's memory.

The code within the \texttt{exp_not:f} sorts the list, leaving in most cases a leading \texttt{exp_not:f}, which stops the expansion, letting the result be return within \texttt{exp_not:n}. We filter out the case of a list with no item, which would otherwise cause problems. Then prepare the token list \#1 by inserting the conditional \#2 before each item. The \texttt{prepare} auxiliary receives the conditional as \#1, the prepared token list so far as \#3, and the item after that as \#4. The loop ends when \#4 contains \texttt{prg_break_point:}, then the \texttt{prepare_end} auxiliary finds the prepared token list as \#4.

The scene is then set up for \texttt{\_\_sort_quick_split:Nnnn}, which sorts the prepared list and perform the post action placed after \texttt{\_\_sort_mark}, namely removing the trailing \texttt{\_\_sort_stop} and \texttt{\_\_sort_stop} and leaving \texttt{\exp_stop_f:} to stop f-expansion.

\begin{verbatim}
\cs_new:Npn \tl_sort:nN #1#2
\begin{verbatim}
(End definition for \texttt{\_\_sort:nN} and others. This function is documented on page 117.)

The only_i, only_ii, split_i and split_ii auxiliaries receive a useless first argument, the new item \#2 (that they append to either one of the next two arguments), the list \#3 of items less than the pivot, bigger items \#4, the pivot \#5, a \texttt{⟨function⟩} \#6, and an item \#7. The \texttt{⟨function⟩} is the user's \texttt{⟨conditional⟩} except at the end of the list where it is \texttt{\_\_sort_quick_end:nNNn}. The comparison is applied to the \texttt{⟨pivot⟩} and the \texttt{⟨item⟩}, and calls the only_i or split_i auxiliaries if the \texttt{⟨item⟩} is smaller, and the only_ii or split_ii auxiliaries otherwise. In both cases, the next auxiliary goes to work right away, with no intermediate expansion that would slow down operations. Note that the argument \#2 left for the next call has the form \texttt{⟨conditional⟩ {⟨item⟩}}, so that the lists \#3 and \#4 keep the right form to be fed to the next sorting function. The split auxiliary

\end{verbatim}
\end{verbatim}
differs from these in that it is missing three of the arguments, which would be empty, and its first argument is always the user’s (conditional) rather than an ending function.

\begin{verbatim}
\cs_new:Npn \__sort_quick_split:NnNn #1#2#3#4 #5\__sort_quick_only_i:NNnnNn \__sort_quick_single_end:nnnww
{ #3 {#4} } { } { } {#2}\}
\cs_new:Npn \__sort_quick_only_i:NNnnNn #1#2#3#4#5#6#7
{ #6 {#5} {#7} \__sort_quick_split_ii:NNnnNn \__sort_quick_only_i:NNnnNn \__sort_quick_only_i_end:nnnww
{ #6 {#7} } { #3 #2 } { } {#5}\}
\cs_new:Npn \__sort_quick_split_ii:NNnnNn #1#2#3#4#5#6#7
{ #6 {#5} {#7} \__sort_quick_split_ii:NNnnNn \__sort_quick_split_i:NNnnNn \__sort_quick_split_end:nnnww
{ #6 {#7} } { #3 #2 } {#4} {#5}\}
\cs_new:Npn \__sort_quick_split_i:NNnnNn #1#2#3#4#5#6#7
{ #6 {#5} {#7} \__sort_quick_split_i:NNnnNn \__sort_quick_split_end:nnnww
{ #6 {#7} } { #3 } { #4 #2 } {#5}\}
\cs_new:Npn \__sort_quick_split_end:nnnww
{ #6 {#5} {#7} \__sort_quick_split_end:nnnww
{ #6 {#7} } {#3} { #4 #2 } {#5}\}
\end{verbatim}

(End definition for \_sort_quick_split:NnNn and others.)

The \_sort_quick_end:nnTFNn appears instead of the user’s conditional, and receives as its arguments the pivot \#1, a fake item \#2, a true and a false branches \#3 and \#4, followed by an ending function \#5 (one of the four auxiliaries here) and another copy \#6 of the fake item. All those are discarded except the function \#5. This function receives lists \#1 and \#2 of items less than or greater than the pivot \#3, then a continuation code \#5 just after \s__sort_mark. To avoid a memory problem described earlier, all of the ending functions read \#6 until \s__sort_stop and place \#6 back into the input stream. When the lists \#1 and \#2 are empty, the single auxiliary simply places the continuation \#5 before the pivot \{#3}. When \#2 is empty, \#1 is sorted and placed before the pivot \{#3\}, taking care to feed the continuation \#5 as a continuation for the function sorting \#1. When \#1 is empty, \#2 is sorted, and the continuation argument is used to place the continuation \#5 and the pivot \{#3\} before the sorted result. Finally, when both
lists are non-empty, items larger than the pivot are sorted, then items less than the pivot,
and the continuations are done in such a way to place the pivot in between.

3693 \cs_new_protected:Npn \__sort_disable_toksdef:
3694 { \cs_set_eq:NN \toksdef \__sort_disabled_toksdef:n }

(End definition for \__sort_error:.)

While sorting, \toksdef is locally disabled to prevent users from using \newtoks or
similar commands in their comparison code: the \toks registers that would be assigned
are in use by l3sort. In format mode, none of this is needed since there is no \toks
allocator.
When there are too many items in a sequence, this is an error, and we clean up properly the mapping over items in the list: break using the type-specific breaking function \#1.

Chapter 44

\l3tl-analysis implementation

\s__tl The format used to store token lists internally uses the scan mark \s__tl as a delimiter.

(End definition for \s__tl.)

44.2 Internal format

The task of the \l3tl-analysis module is to convert token lists to an internal format which allows us to extract all the relevant information about individual tokens (category code, character code), as well as reconstruct the token list quickly. This internal format is used in \l3regex where we need to support arbitrary tokens, and it is used in conversion functions in \l3str-convert, where we wish to support clusters of characters instead of single tokens.

We thus need a way to encode any \langle token\rangle (even begin-group and end-group character tokens) in a way amenable to manipulating tokens individually. The best we can do is to find \langle tokens\rangle which both o-expand and x-expand to the given \langle token\rangle. Collecting more information about the category code and character code is also useful for regular expressions, since most regexes are catcode-agnostic. The internal format thus takes the form of a succession of items of the form

\langle tokens\rangle \s__tl \langle catcode\rangle \langle char code\rangle \s__tl

The \langle tokens\rangle o- and x-expand to the original token in the token list or to the cluster of tokens corresponding to one Unicode character in the given encoding (for \l3str-convert). The \langle catcode\rangle is given as a single hexadecimal digit, 0 for control sequences. The \langle char code\rangle is given as a decimal number, −1 for control sequences.

Using delimited arguments lets us build the \langle tokens\rangle progressively when doing an encoding conversion in \l3str-convert. On the other hand, the delimiter \s__tl may not appear unbraced in \langle tokens\rangle. This is not a problem because we are careful to wrap control sequences in braces (as an argument to \exp_not:n) when converting from a general token list to the internal format.

The current rule for converting a \langle token\rangle to a balanced set of \langle tokens\rangle which both o-expands and x-expands to it is the following.
A control sequence \texttt{\cs} becomes \texttt{\exp_not:n \{ \cs \} \s__tl 0 \mathord{-} 1 \s__tl}.

A begin-group character \{ becomes \texttt{\exp_after:wN \{ \if_false: \fi: \s__tl 1 \langle \text{char code} \rangle \s__tl}.

An end-group character } becomes \texttt{\if_false: \fi: \s__tl 2 \langle \text{char code} \rangle \s__tl}.

A character with any other category code becomes \texttt{\exp_not:n \{ \langle \text{character} \rangle \} \s__tl \langle \text{hex catcode} \rangle \langle \text{char code} \rangle \s__tl}.

In contrast, for \texttt{\peek_analysis_map_inline:n} we must allow for an input stream containing \texttt{\outer} macros, so that wrapping all control sequences in \texttt{\exp_not:n} is unsafe. Instead, we write the more elaborate \texttt{\_kernel_exp_not:w \exp_after:wN \{ \exp_not:N \cs \}}. (On the other hand we make a better effort by avoiding \texttt{\exp_not:n} for characters other than active and macro parameters.)

44.3 Variables and helper functions

\texttt{\s__tl} The scan mark \texttt{\s__tl} is used as a delimiter in the internal format. This is more practical than using a quark, because we would then need to control expansion much more carefully: compare \texttt{\int_value:w \#1 \s__tl} with \texttt{\int_value:w \#1 \exp_stop_f: \exp_not:N \q_mark} to extract a character code followed by the delimiter in an \texttt{x}-expansion.

\texttt{\l__tl_analysis_token} The tokens in the token list are probed with the \TeX primitive \texttt{\futurelet}. We use \texttt{\l__tl_analysis_token} in that construction. In some cases, we convert the following token to a string before probing it: then the token variable used is \texttt{\l__tl_analysis_char_token}. When getting tokens from the input stream we may need to look two tokens ahead, for which we use \texttt{\l__tl_analysis_next_token}.

\texttt{\l__tl_peek_code_tl} Holds some code to be run once the next token has been fully analysed in \texttt{\peek_analysis_map_inline:n}.

\texttt{\c__tl_peek_catcodes_tl} A token list containing the character number 32 (space) with all possible category codes except 1 and 2 (begin-group and end-group). Why 32? Because some \LaTeX versions only allow creation of catcode 10 (space) tokens with this character code, so that we decided to make \texttt{\char_generate:nn} refuse to create such weird spaces as well. We do not include the macro parameter case (catcode 6) because it cannot be used as a macro delimiter.
The number of normal (N-type argument) tokens since the last special token.
\int_new:N \l__tl_analysis_normal_int
(End definition for \l__tl_analysis_normal_int.)

During the first pass, this is the index in the array being built. During the second pass, it is equal to the maximum index in the array from the first pass.
\int_new:N \l__tl_analysis_index_int
(End definition for \l__tl_analysis_index_int.)

Nesting depth of explicit begin-group and end-group characters during the first pass. This lets us detect the end of the token list without a reserved end-marker.
\int_new:N \l__tl_analysis_nesting_int
(End definition for \l__tl_analysis_nesting_int.)

When encountering special characters, we record their “type” in this integer.
\int_new:N \l__tl_analysis_type_int
(End definition for \l__tl_analysis_type_int.)

The result of the conversion is stored in this token list, with a succession of items of the form
\langle tokens \rangle \langle catcode \rangle \langle char code \rangle \langle tokens \rangle
\int_new:N \g__tl_analysis_result_tl
(End definition for \g__tl_analysis_result_tl.)

Extracting the character code from the meaning of \l__tl_analysis_token. This has no error checking, and should only be assumed to work for begin-group and end-group character tokens. It produces a number in the form ‘\langle char \rangle’.
\cs_new:Npn \__tl_analysis_extract_charcode:
{ \exp_after:wN \__tl_analysis_extract_charcode_aux:w \token_to_meaning:N \l__tl_analysis_token
\token_to_str:N \c_space_tl
\token_to_str:N A
\token_to_str:N B
\token_to_str:N C
\token_to_str:N D
\group_end:
(End definition for \c__tl_peek_catcodes_tl.)
\end{verbatim}

434
Counts the number of spaces in the string representation of its second argument, as well as the number of characters following the last space in that representation, and feeds the two numbers as semicolon-delimited arguments to the first argument. When this function is used, the escape character is printable and non-space.

\begin{verbatim}
\cs_new:Npn \__tl_analysis_cs_space_count:NN #1 #2
\{\exp_after:wN #1 \int_value:w \int_eval:w 0 \exp_after:wN \__tl_analysis_cs_space_count:w \token_to_str:N #2 \fi: \__tl_analysis_cs_space_count_end:w ; - ! \}
\cs_new:Npn \__tl_analysis_cs_space_count:w #1 ~
{\if_false: #1 #1 \fi:+ 1 \__tl_analysis_cs_space_count:w}
\cs_new:Npn \__tl_analysis_cs_space_count_end:w ; #1 \fi: \str_count_ignore_spaces:n {#1} ;
\end{verbatim}

(End definition for \__tl_analysis_extract_charcode: and \__tl_analysis_extract_charcode_-aux:w.)

44.4 Plan of attack

Our goal is to produce a token list of the form roughly

\begin{verbatim}
\langle token 1 \rangle \s__tl \langle catcode 1 \rangle \langle char code 1 \rangle \s__tl
\langle token 2 \rangle \s__tl \langle catcode 2 \rangle \langle char code 2 \rangle \s__tl
\ldots \langle token N \rangle \s__tl \langle catcode N \rangle \langle char code N \rangle \s__tl
\end{verbatim}

... (token $N$) $\s__tl$ (catcode $N$) (char code $N$) $\s__tl$

Most but not all tokens can be grabbed as an undelimited (N-type) argument by \TeX. The plan is to have a two pass system. In the first pass, locate special tokens, and store them in various \toks registers. In the second pass, which is done within an x-expanding assignment, normal tokens are taken in as N-type arguments, and special tokens are retrieved from the \toks registers, and removed from the input stream by some means. The whole process takes linear time, because we avoid building the result one item at a time.

We make the escape character printable (backslash, but this later oscillates between slash and backslash): this allows us to distinguish characters from control sequences.

A token has two characteristics: its \meaning, and what it looks like for \TeX{} when it is in scanning mode (e.g., when capturing parameters for a macro). For our purposes, we distinguish the following meanings:

- begin-group token (category code 1), either space (character code 32), or non-space;
- end-group token (category code 2), either space (character code 32), or non-space;
- space token (category code 10, character code 32);
• anything else (then the token is always an \texttt{N}-type argument).

The token itself can “look like” one of the following:

• a non-active character, in which case its meaning is automatically that associated to its character code and category code, we call it “true” character;
• an active character;
• a control sequence.

The only tokens which are not valid \texttt{N}-type arguments are true begin-group characters, true end-group characters, and true spaces. We detect those characters by scanning ahead with \texttt{\futurelet}, then distinguishing true characters from control sequences set equal to them using the \texttt{\string} representation.

The second pass is a simple exercise in expandable loops.

\begin{verbatim}
\_tl_analysis:n Everything is done within a group, and all definitions are local. We use \texttt{\group_align_safe_begin/end:} to avoid problems in case \_tl_analysis:n is used within an alignment and its argument contains alignment tab tokens.

\cs_new_protected:Npn \_tl_analysis:n #1
\group_begin:
\group_align_safe_begin:
\_tl_analysis_a:n {#1}
\_tl_analysis_b:n {#1}
\group_align_safe_end:
\group_end:
\end{verbatim}

(End definition for \_tl_analysis:n.)

\subsection{Disabling active characters}

Active characters can cause problems later on in the processing, so we provide a way to disable them, by setting them to \texttt{undefined}. Since Unicode contains too many characters to loop over all of them, we instead do this whenever we encounter a character. For \texttt{\LaTeX} and \texttt{up\LaTeX} we skip characters beyond \texttt{[0, 255]} because \texttt{lccode} only allows those values.

\begin{verbatim}
\_tl_analysis_disable:n \_group_begin:
\char_set_catcode_active:N \^^@ \_cs_new_protected:Npn \_tl_analysis_disable:n #1
\group_begin:
\_cs_new_protected:Npn \_tl_analysis_disable:n #1
\tex_lccode:D 0 = #1 \exp_stop_f:
\tex_lowercase:D { \tex_let:D ^^@ } \tex_undefined:D
\bool_lazy_or:nnT \sys_if_engine_ptex_p: \sys_if_engine_uptex_p:
\cs_gset_protected:Npn \_tl_analysis_disable:n #1
\if_int_compare:w 256 > #1 \exp_stop_f:
\tex_lccode:D 0 = #1 \exp_stop_f:
\end{verbatim}

436
44.6 First pass

The goal of this pass is to detect special (non-N-type) tokens, and count how many N-type tokens lie between special tokens. Also, we wish to store some representation of each special token in a \toks register.

We have 11 types of tokens:

1. a true non-space begin-group character;
2. a true space begin-group character;
3. a true non-space end-group character;
4. a true space end-group character;
5. a true space blank space character;
6. an active character;
7. any other true character;
8. a control sequence equal to a begin-group token (category code 1);
9. a control sequence equal to an end-group token (category code 2);
10. a control sequence equal to a space token (character code 32, category code 10);
11. any other control sequence.

Our first tool is \futurelet. This cannot distinguish case 8 from 1 or 2, nor case 9 from 3 or 4, nor case 10 from case 5. Those cases are later distinguished by applying the \string primitive to the following token, after possibly changing the escape character to ensure that a control sequence’s string representation cannot be mistaken for the true character.

In cases 6, 7, and 11, the following token is a valid N-type argument, so we grab it and distinguish the case of a character from a control sequence: in the latter case, \str_tail:n \{\langle token\rangle\} is non-empty, because the escape character is printable.

\__tl_analysis_a:n We read tokens one by one using \futurelet. While performing the loop, we keep track of the number of true begin-group characters minus the number of true end-group characters in \l__tl_analysis_nesting_int. This reaches −1 when we read the closing brace.
\_tl_analysis\_a:loop:w Read one character and check its type.

\cs_new_protected:Npn \_tl_analysis\_a:loop:w
\{ \tex_futurelet:D \l__tl_analysis_token \_tl_analysis\_a:type:w \}

(End definition for \_tl_analysis\_a:loop:w.)

\_tl_analysis\_a:type:w At this point, \_tl_analysis\_token holds the meaning of the following token. We store in \_tl_analysis\_type_int information about the meaning of the token ahead:

- 0 space token;
- 1 begin-group token;
- -1 end-group token;
- 2 other.

The values 0, 1, -1 correspond to how much a true such character changes the nesting level (2 is used only here, and is irrelevant later). Then call the auxiliary for each case. Note that nesting conditionals here is safe because we only skip over \_tl_analysis\_token if it matches with one of the character tokens (hence is not a primitive conditional).

\cs_new_protected:Npm \_tl_analysis\_a:type:w
\{
\_tl_analysis\_type_int =
\if_meaning:w \_tl_analysis_token \c_space_token

      - 1
    \else:
      2
    \fi:
  \fi:
\fi:
\exp_stop_f:
\if_case:w \_tl_analysis\_type_int
  \exp_after:wN \_tl_analysis\_a:space:w
  \or: \exp_after:wN \_tl_analysis\_a:bgroup:w
  \or: \exp_after:wN \_tl_analysis\_a:egroup:w
  \else: \exp_after:wN \_tl_analysis\_a:else:w
\fi:
\}

(End definition for \_tl_analysis\_a:type:w.)
In this branch, the following token’s meaning is a blank space. Apply \string to that token: a true blank space gives a space, a control sequence gives a result starting with the escape character, an active character gives something else than a space since we disabled the space. We grab as \__tl_analysis_a_space:w the first character of the string representation then test it in \__tl_analysis_a_space_test:w. Also, since \__tl_analysis_a_store: expects the special token to be stored in the relevant \toks register, we do that. The extra \exp_not:n is unnecessary of course, but it makes the treatment of all tokens more homogeneous. If we discover that the next token was actually a control sequence or an active character instead of a true space, then we step the counter of normal tokens. We now have in front of us the whole string representation of the control sequence, including potential spaces; those will appear to be true spaces later in this pass. Hence, all other branches of the code in this first pass need to consider the string representation, so that the second pass does not need to test the meaning of tokens, only strings.

\cs_new_protected:Npn \__tl_analysis_a_space:w
\__tl_analysis_a_space_test:w
\__tl_analysis_a_bgroup:w
\__tl_analysis_a_egroup:w
\__tl_analysis_a_group:nw
\__tl_analysis_a_group_aux:w
\__tl_analysis_a_group_test:w

The token is most likely a true character token with catcode 1 or 2, but it might be a control sequence, or an active character. Optimizing for the first case, we store in a toks register some code that expands to that token. Since we will turn what follows into a string, we make sure the escape character is different from the current character code (by switching between solidus and backslash). To detect the special case of an active character let to the catcode 1 or 2 character with the same character code, we disable the active character with that character code and re-test: if the following token has become undefined we can in fact safely grab it. We are finally ready to turn what follows to a string and test it. This is one place where we need \__tl_analysis_char_token to be a separate control sequence from \__tl_analysis_token, to compare them.
This function is called each time we meet a special token; at this point, the \toks register \l__tl_analysis_index_int holds a token list which expands to the given special token. Also, the value of \l__tl_analysis_type_int indicates which case we are in:

-1 end-group character;
0 space character;
1 begin-group character.

We need to distinguish further the case of a space character (code 32) from other character codes, because those behave differently in the second pass. Namely, after testing the \lccode of 0 (which holds the present character code) we change the cases above to

-2 space end-group character;
-1 non-space end-group character;
0 space blank space character;

(End definition for \__tl_analysis_a_bgroup:w and others.)
• 1 non-space begin-group character;
• 2 space begin-group character.

This has the property that non-space characters correspond to odd values of \l__tl_analysis_type_int. The number of normal tokens until here and the type of special token are packed into a \skip register. Finally, we check whether we reached the last closing brace, in which case we stop by disabling the looping function (locally).

\cs_new_protected:Npn \__tl_analysis_a_store:
\begin{verbatim}
  { \tex_advance:D \l__tl_analysis_nesting_int \l__tl_analysis_type_int

}{ \__tl_analysis_cs_space_count:NN \__tl_analysis_a_cs:ww #1 }
\end{verbatim}

(End definition for \__tl_analysis_a_store:.)

\__tl_analysis_a_safe:N This should be the simplest case: since the upcoming token is safe, we can simply grab it in a second pass. If the token is a single character (including space), the \if_charcode:w test yields true; we disable a potentially active character (that could otherwise masquerade as the true character in the next pass) and we count one “normal” token. On the other hand, if the token is a control sequence, we should replace it by its string representation for compatibility with other code branches. Instead of slowly looping through the characters with the main code, we use the knowledge of how the second pass works: if the control sequence name contains no space, count that token as a number of normal tokens equal to its string length. If the control sequence contains spaces, they should be registered as special characters by increasing \l__tl_analysis_index_int (no need to carefully count character between each space), and all characters after the last space should be counted in the following sequence of “normal” tokens.

\cs_new_protected:Npn \__tl_analysis_a_safe:N #1
\begin{verbatim}
  { \if_charcode:w \scan_stop:

  { \__tl_analysis_disable:n { '#1 } }
  \int_incr:N \l__tl_analysis_normal_int
}{ \__tl_analysis_cs_space_count:NN \__tl_analysis_a_cs:ww #1 }
\end{verbatim}

441
44.7 Second pass

The second pass is an exercise in expandable loops. All the necessary information is stored in \texttt{skip} and \texttt{toks} registers.

The first argument is the number of normal tokens which remain to be read, and the second argument is the index in the array produced in the first step. A character’s string representation is always one character long, while a control sequence is always longer (we have set the escape character to a printable value). In both cases, we leave \texttt{\exp_not:n \{\langle token\rangle\} \_s\_\_t1} in the input stream (after x-expansion). Here, \texttt{\exp_not:n} is used rather than \texttt{\exp_not:N} because \#3 could be a macro parameter character or could be \texttt{\_s\_\_t1} (which must be hidden behind braces in the result).
\cs_new:Np \__tl_analysis_b_normal:wwN #1; #2; #3
{
  \exp_not:n { \exp_not:n { #3 } } \s__tl
  \if_charcode:w
    \scan_stop:
    \exp_after:wN \use_none:n \token_to_str:N #3 \prg_do_nothing:
    \scan_stop:
    \exp_after:wN \__tl_analysis_b_char:Nn

\group_end:
44.8 Mapping through the analysis

First obtain the analysis of the token list into \texttt{\_\_\_tl_analysis_result_tl}. To allow nested mappings, increase the nesting depth \texttt{\_\_\_kernel_prg_map_int} (shared between all modules), then define the payload macro, which runs the user code and has a name specific to that nesting depth. The looping macro grabs the \langle tokens \rangle, \langle catcode \rangle and \langle char code \rangle; it checks for the end of the loop with \texttt{\use_none:n ##2}, normally empty, but which becomes \texttt{\_\_\_tl_map_break:} at the end; it then calls the payload macro with the arguments in the correct order (this is the reason why we cannot directly use the same macro for looping and payload), and loops by calling itself. When the loop ends, remember to decrease the nesting depth.

(End definition for \texttt{\_\_\_tl_analysis_b_special:w}, \texttt{\_\_\_tl_analysis_b_special_char:w}, and \texttt{\_\_\_tl_analysis_b_special_space:w}.)
### 44.9 Showing the results

Add to `\_\_tl_analysis:n` a third pass to display tokens to the terminal. If the token list variable is not defined, throw the same error as `\tl_show:N` by simply calling that function.

\begin{verbatim}
\cs_new_protected:Npn \tl_analysis_show:N
  { \__tl_analysis_show:NNN \msg_show:nnxxxx \tl_show:N }
\cs_new_protected:Npn \tl_analysis_log:N
  { \__tl_analysis_show:NNN \msg_log:nnxxxx \tl_log:N }
\cs_new_protected:Npn \__tl_analysis_show:NNN #1#2#3
  { \tl_if_exist:NTF #3
    { \__tl_analysis:n {#3} #1 { tl } { show-analysis } { } { \__tl_analysis_show: } { } { }
    { #2 #3 }
  }
\end{verbatim}

(End definition for `\tl_analysis_show:N`, `\tl_analysis_log:N`, and `\__tl_analysis_show:NNN`. These functions are documented on page 45.)

No existence test needed here.

\begin{verbatim}
\cs_new_protected:Npn \tl_analysis_show:n

Here, `#1` o- and x-expands to the token; `#2` is the category code (one uppercase hexadecimal digit), 0 for control sequences; `#3` is the character code, which we ignore. In the cases of control sequences and active characters, the meaning may overflow one line, and we want to truncate it. Those cases are thus separated out.

\begin{verbatim}
\cs_new:Npn \__tl_analysis_show:

After a call to \futurelet \l__tl_analysis_token followed by a stringified character token (either explicit space or catcode other character), grab the argument and pass it to #1. We only need to do anything in the case of a space.

\cs_new:Npn \__tl_analysis_char_arg:Nw \cs_new:Npn \__tl_analysis_char_arg_aux:Nw #1 - { #1 { ~ } } (End definition for \__tl_analysis_char_arg:Nw and \__tl_analysis_char_arg_aux:Nw.)
Save the user’s code in a control sequence that is suitable for nested maps. We may wish
to pass to this function an \outer control sequence or active character; for this we will
undefine potentially-outer tokens within a group, closed after the function reads its
arguments (for an outer active character there is no good alternative). This user’s code
function also calls the loop auxiliary, and includes the trailing \prg_break_point:Nn for
when the user wants to stop the loop. The loop auxiliary must remove that break point
because it must look at the input stream.

\cs_new_protected:Npn \peek_analysis_map_inline:n #1

\else:
Expandable tokens (which are automatically N-type) can be \outer\ macros, hence the need for \exp_after:wN and \exp_not:N in the code above, which allows the next function to safely grab the token as an argument. We run some code that is expanded using the primitive \cs_set_nopar:Npx rather than \tl_set:Nx to avoid grabbing it as an argument as #1 may be \outer. To allow #1 as an argument of the user's function (stored in \l__tl_peek_code_tl), we set it equal to \scan_stop; but we do it at the last minute because #1 may be some pretty important function such as \exp_after:wN. Then we put the user's function and the elaborate first argument \__kernel_exp_not:w \exp_after:wN \__kernel_exp_not:w \exp_not:n \exp_not:N #1: indeed we cannot use \exp_not:n \exp_not:N #1, as o-expanding this yields a “notexpanded” token equal to (a weird) \relax, which would have the wrong value for primitive \TeX\ conditionals such as \if_meaning:w.

Then we must add (-1)0 if the token is a control sequence and {{\charcode}}D otherwise. Distinguishing the two cases is easy: since we have made the escape character printable, \token_to_str:N gives at least two characters for a control sequence versus a single one for an active character (possibly being a space). Producing the right outcome is trickier, as #1 cannot appear in either branch of the conditional (it could be \outer, or simply a \TeX\ conditional), and can only be safely discarded by \use_none:n if it is first hit with \exp_not:N.

For normal non-expandable tokens we must distinguish characters (including active ones and macro parameter characters) from control sequences (whose string representation is more than one character because we made the escape character printable). For a control
sequence call the user code with suitable arguments, wrapping \texttt{#1} within \texttt{\exp_not:n} just in case it happens to be equal to a macro parameter character. We do not skip \texttt{\exp_not:n} when unnecessary, because there might be situations where the argument could be used by the user after further redefinitions of the token, and it seems more convenient to know that \texttt{\exp_not:n} is always used.

\begin{verbatim}
cs_new_protected:Npn \__tl_peek_analysis_nonexp:N #1  
  {  
    \if_charcode:w \scan_stop:  
      \exp_after:wN \use_none:n \token_to_str:N #1 \prg_do_nothing:  
      \scan_stop:  
      \exp_after:wN \__tl_peek_analysis_char:N  
    \else:  
      \exp_after:wN \__tl_peek_analysis_cs:N  
    \fi:  
    #1  
  }

\cs_new_protected:Npn \__tl_peek_analysis_cs:N #1  
  \l__tl_peek_code_tl { \exp_not:n {#1} } {-1} 0
\end{verbatim}

For normal characters we must determine their catcode. The main difficulty is that the character may be an active character masquerading as (i.e., set equal to) itself with a different catcode. Two approaches based on \texttt{\lowercase} can detect this. One could make an active character with the same catcode as \texttt{#1} and change its definition before testing the catcode of \texttt{#1}, but in some Unicode engine this fills up the hash table uselessly. Instead, we lowercase \texttt{#1} itself, changing its character code to 32, namely space (because \LaTeX{} cannot turn catcode 10 characters to anything else than character code 32), then we apply \texttt{\__tl_analysis_b_char:Nn}, which detects active characters by comparing them to \texttt{\tex_undefined:D}, and we must have undefined the active space for this test to work—we use an \texttt{x}-expanding assignment to get the active space in the right place. Finally \texttt{\__tl_peek_analysis_char:w} puts the arguments in the correct order, including \texttt{\exp_not:n} for macro parameter characters and active characters (the latter could be macro parameter characters, and it seems more uniform to always put \texttt{\exp_not:n}).

\begin{verbatim}
\group_begin:  
\char_set_active_eq:NN \scan_stop:  
\cs_new_protected:Npx \__tl_peek_analysis_char:N #1

\end{verbatim}

451
For special characters the idea is to eventually act with \token_to_str:N, then pick up one by one the characters of this string representation until hitting the token that follows. First determine the character code of (the meaning of) the ⟨token⟩ (which we know is a special token), make sure the escape character is different from it, normalize the meanings of two active characters and the empty control sequence, and filter out these cases in \__tl_peek_analysis_retest:.

At this point we know the meaning of the ⟨token⟩ in the input stream is \l_peek_token, either a space (32, 10) or a begin-group or end-group token (catcode 1 or 2), and we excluded a few cases that would be difficult later (empty control sequence, active character with the same character code as its meaning or as the escape character). Now look at the ⟨next token⟩ following it using a combination of \afterassignment and \futurelet. (In fact look twice to reset an internal TeX flag in case the ⟨next token⟩ had been hit with \exp_not:N.) The syntax of this primitive is \futurelet ⟨peek token⟩ ⟨first token⟩ ⟨next token⟩, and it sets ⟨peek token⟩ equal to ⟨next token⟩. Traditionally, one takes ⟨first token⟩ to be some macro that regains control of the code and, e.g., analyses ⟨peek token⟩. Here, both ⟨first token⟩ and ⟨next token⟩ are mostly unknown tokens in the
input stream (but we know the \textit{first token} has catcode 1, 2 or 10), where \textit{first token} was already stored as \verb!\l_peek_token!, and we regain control using \verb!\afterassignment!, which inserts its argument after the assignment, hence after \textit{peek token} but before \textit{first token}.

We then hit the \textit{first token} with \verb!\token_to_str:N! and grab characters until finding \verb!\l__tl_analysis_next_token!. More precisely, by looking at the first character in the string representation of the \textit{first token} we distinguish three cases: a stringified control sequence starts with the escape character; for an explicit character we find that same character; for an explicit character we find anything else (we made sure to exclude the case of an active character whose string representation coincides with the other two cases).

When \texttt{#1} is a stringified active character we pass appropriate arguments to the user’s code; thankfully \verb!\char_generate:nn! can make active characters.
When \#1 matches the character we had extracted from the meaning of \l_peek_token, the token was an explicit character, which can be a standard space, or a begin-group or end-group character with some character code. In the latter two cases we call \char_generate:nn with suitable arguments and put suitable \if_false: \fi: constructions to make the result balanced and such that \alpha-expanding or \beta-expanding gives back a single (unbalanced) begin-group or end-group character.

\cs_new_protected:Npn \__tl_peek_analysis_explicit:n #1
\begin{verbatim}
\tl_put_right:Nx \l__tl_peek_code_tl
\{\fi: \if_false: \fi: \fi: \fi:
\exp_not:N \if_false: \fi: \fi: \fi:
\exp_not:N \if_true: \fi: \fi: \fi:
\exp_not:N \if_false: \fi: \fi: \fi: \fi:
\exp_not:N \if_false: \fi: \fi: \fi: \fi:
\exp_not:N \if_false: \fi: \fi: \fi: \fi:
\end{verbatim}

\cs_new_protected:Npn \__tl_peek_analysis_escape:
\begin{verbatim}
\tl_clear:N \l__tl_internal_a_tl
\end{verbatim}

Finally there is the case of a special token whose string representation starts with an escape character, namely the token was a control sequence. In that case we could have grabbed the token directly as an \N-type argument, but of course we couldn’t know that until we had run all the various tests including stringifying the token. We are thus left with the hard work of picking up one by one the characters in the csname (being careful about spaces), until finding a token that matches the \langle next token \rangle picked up earlier (which was not stringified), such that the control sequence that we found so far indeed has the expected meaning \l_peek_token. This comparison with \l_peek_token catches a reasonably common case like \c_group_begin_token _ in which the trailing _ has category code other: without comparison of the constructed csname with \l_peek_token collection would stop at \c, which is wrong.

\cs_new_protected:Npn \__tl_peek_analysis_escape:
When a control sequence (or active character) and its meaning are too long to fit in one line of the terminal, the end is replaced by this token list.

Chapter 45

l3regex implementation

45.1 Plan of attack

Most regex engines use backtracking. This allows to provide very powerful features (back-
references come to mind first), but it is costly, and raises the problem of catastrophic
backtracking. Since \TeX is not first and foremost a programming language, complicated
code tends to run slowly, and we must use faster, albeit slightly more restrictive,
techniques, coming from automata theory.

Given a regular expression of \( n \) characters, we do the following:

- (Compiling.) Analyse the regex, finding invalid input, and convert it to an internal
  representation.

- (Building.) Convert the compiled regex to a non-deterministic finite automaton
  (NFA) with \( O(n) \) states which accepts precisely token lists matching that regex.

- (Matching.) Loop through the query token list one token (one “position”) at a
time, exploring in parallel every possible path (“active thread”) through the NFA,
considering active threads in an order determined by the quantifiers’ greediness.

We use the following vocabulary in the code comments (and in variable names).

- Group: index of the capturing group, \(-1\) for non-capturing groups.

- Position: each token in the query is labelled by an integer \( \langle \text{position} \rangle \), with
  \( \text{min_pos} - 1 \leq \langle \text{position} \rangle \leq \text{max_pos} \). The lowest and highest positions
  \( \text{min_pos} - 1 \) and \( \text{max_pos} \) correspond to imaginary begin and end markers (with non-existent
  category code and character code). \( \text{max_pos} \) is only set quite late in the processing.

- Query: the token list to which we apply the regular expression.

- State: each state of the NFA is labelled by an integer \( \langle \text{state} \rangle \) with \( \text{min_state} \leq
  \langle \text{state} \rangle < \text{max_state} \).

- Active thread: state of the NFA that is reached when reading the query token list for
the matching. Those threads are ordered according to the greediness of quantifiers.
• **Step**: used when matching, starts at 0, incremented every time a character is read, and is not reset when searching for repeated matches. The integer `\texttt{\_regex\_step\_int}` is a unique id for all the steps of the matching algorithm.

We use `l3intarray` to manipulate arrays of integers. We also abuse \TeX's `\toks` registers, by accessing them directly by number rather than tying them to control sequence using the `\newtoks` allocation functions. Specifically, these arrays and `\toks` are used as follows. When building, `\toks(state)` holds the tests and actions to perform in the ⟨state⟩ of the NFA. When matching,

- `\g__regex_state_active_intarray` holds the last ⟨step⟩ in which each ⟨state⟩ was active.

- `\g__regex_thread_info_intarray` consists of blocks for each ⟨thread⟩ (with `min\_thread ≤ ⟨thread⟩ < max\_thread`). Each block has `1+2\texttt{\_regex\_capturing\_group\_int}` entries: the ⟨state⟩ in which the ⟨thread⟩ currently is, followed by the beginnings of all submatches, and then the ends of all submatches. The ⟨threads⟩ are ordered starting from the best to the least preferred.

- `\g__regex_submatch_prev_intarray, \g__regex_submatch_begin_intarray` and `\g__regex_submatch_end_intarray` hold, for each submatch (as would be extracted by `\regex\_extract\_all:nnN`), the place where the submatch started to be looked for and its two end-points. For historical reasons, the minimum index is `twice max\_state`, and the used registers go up to `\texttt{\_regex\_submatch\_int}`. They are organized in blocks of `\texttt{\_regex\_capturing\_group\_int}` entries, each block corresponding to one match with all its submatches stored in consecutive entries.

When actually building the result,

- `\toks(position)` holds ⟨tokens⟩ which o- and x-expand to the ⟨position⟩-th token in the query.

- `\g__regex_balance_intarray` holds the balance of begin-group and end-group character tokens which appear before that point in the token list.

The code is structured as follows. Variables are introduced in the relevant section. First we present some generic helper functions. Then comes the code for compiling a regular expression, and for showing the result of the compilation. The building phase converts a compiled regex to NFA states, and the automaton is run by the code in the following section. The only remaining brick is parsing the replacement text and performing the replacement. We are then ready for all the user functions. Finally, messages, and a little bit of tracing code.

### 45.2 Helpers

\`\_\_regex\_int\_eval:w` Access the primitive: performance is key here, so we do not use the slower route via `\int\_eval:n`.

\begin{verbatim}
\cs_new_eq:NN \_\_regex\_int\_eval:w \tex\_numexpr:D
\end{verbatim}

(End definition for `\_\_regex\_int\_eval:w`)

\`\_\_regex\_standard\_escapechar:` Make the `\escapechar` into the standard backslash.

\begin{verbatim}
\cs_new_protected:Npn \_\_regex\_standard\_escapechar:
\{ \int\_set:Nn \tex\_escapechar:D \{ `' `\} \}
\end{verbatim}

458
Unpack a \toks given its number.

\cs_new:Npn \__regex_toks_use:w { \tex_the:D \tex_toks:D }

Empty a \toks or set it to a value, given its number.

\cs_new_protected:Npn \__regex_toks_clear:N #1 { \__regex_toks_set:Nn #1 { } }
\cs_new_eq:NN \__regex_toks_set:Nn \tex_toks:D
\cs_new_protected:Npn \__regex_toks_set:No #1 { \tex_toks:D #1 \exp_after:wN }

Copy #3 \toks registers from #2 onwards to #1 onwards, like C's memcpy.

\cs_new_protected:Npn \__regex_toks_memcpy:NNn #1#2#3 { \prg_replicate:nn {#3} { \tex_toks:D #1 = \tex_toks:D #2 \int_incr:N #1 \int_incr:N #2 } }

During the building phase we wish to add x-expanded material to \toks, either to the left or to the right. The expansion is done "by hand" for optimization (these operations are used quite a lot). The \texttt{Nn} version of \__regex_toks_put_right:Nx is provided because it is more efficient than x-expanding with \texttt{\exp_not:n}.

\cs_new_protected:Npn \__regex_toks_put_left:Nx #1#2 { \cs_set_nopar:Npx \__regex_tmp:w { #2 } \tex_toks:D #1 \exp_after:wN \exp_after:wN \exp_after:wN { \exp_after:wN \__regex_tmp:w \tex_the:D \tex_toks:D #1 } }
\cs_new_protected:Npn \__regex_toks_put_right:Nx #1#2 { \cs_set_nopar:Npx \__regex_tmp:w {#2} \tex_toks:D #1 \exp_after:wN { \tex_the:D \tex_toks:D \exp_after:wN #1 \__regex_tmp:w } }

Expands to the string representation of the token (known to be a control sequence) at the current position \texttt{\_\_regex_curr_pos_int}. It should only be used in x-expansion to avoid losing a leading space.

\cs_new:Npn \__regex_curr_cs_to_str:

45.2.3 Internal auxiliaries

\_\_regex\_recursion\_stop

Internal recursion quarks.

\_\_regex\_nil

Internal quarks.

Functions to gobble up to a quark.

\_\_regex\_quark\_if\_nil\_p:n
\_\_regex\_quark\_if\_nil:n:TF

Branching quark conditional.

\_\_regex\_break\_point:TF
\_\_regex\_break\_true:w

When testing whether a character of the query token list matches a given character class in the regular expression, we often have to test it against several ranges of characters, checking if any one of those matches. This is done with a structure like

\langle test1 \rangle \ldots \langle testn \rangle  \\
\_\_regex\_break\_point:TF \{ \langle true code \rangle \} \{ \langle false code \rangle \}

If any of the tests succeeds, it calls \_\_regex\_break\_true:w, which cleans up and leaves \langle true code \rangle in the input stream. Otherwise, \_\_regex\_break\_point:TF leaves the \langle false code \rangle in the input stream.

\_\_regex\_item\_reverse:n

This function makes showing regular expressions easier, and lets us define \( \text{D} \) in terms of \( \text{d} \) for instance. There is a subtlety: the end of the query is marked by −2, and thus matches \( \text{D} \) and other negated properties; this case is caught by another part of the code.

(End definition for \_\_regex\_item\_reverse:n)
Simple comparisons triggering \_\_regex_break_true: when true.

\cs_new_protected:Npn \_\_regex_item_caseful_equal:n \#1

\_\_regex_posix_xdigit:
Before actually parsing the regular expression or the replacement text, we go through them once, converting \n to the character 10, etc. In this pass, we also convert any special character (\*, ?, {, etc.) or escaped alphanumeric character into a marker indicating that this was a special sequence, and replace escaped special characters and non-escaped alphanumeric characters by markers indicating that those were "raw" characters. The rest of the code can then avoid caring about escaping issues (those can become quite complex to handle in combination with ranges in character classes).

Usage: \_regex_escape_use:nnnn ⟨inline 1⟩ ⟨inline 2⟩ ⟨inline 3⟩ {⟨token list⟩}

The ⟨token list⟩ is converted to a string, then read from left to right, interpreting backslashes as escaping the next character. Unescaped characters are fed to the function ⟨inline 1⟩, and escaped characters are fed to the function ⟨inline 2⟩ within an x-expansion context (typically those functions perform some tests on their argument to decide how to output them). The escape sequences \a, \e, \f, \n, \r, \t and \x are recognized, and those are replaced by the corresponding character, then fed to ⟨inline 3⟩. The result is then left in the input stream. Spaces are ignored unless escaped.

The conversion is done within an x-expanding assignment.

\_regex_escape_use:nnnn

The result is built in \_regex_internal_a_tl, which is then left in the input stream. Tracing code is added as appropriate inside this token list. Go through #4 once, applying #1, #2, or #3 as relevant to each character (after de-escaping it).

  \fi:
  \use:n

469
\_\_regex_escape_x:N

This looks for the second digit in the unbraced case.

\_\_regex_escape\_x\_\_loop:N

Grab hexadecimal digits, skip spaces, and at the end, check that there is a right brace, otherwise raise an error outside the assignment.
TEX detects uppercase hexadecimal digits for us but not the lowercase letters, which we need to detect and replace by their uppercase counterpart.

These two tests are used in the first pass when parsing a regular expression. That pass is responsible for finding escaped and non-escaped characters, and recognizing which ones have special meanings and which should be interpreted as “raw” characters. Namely,

- alphanumerics are “raw” if they are not escaped, and may have a special meaning when escaped;
- non-alphanumeric printable ascii characters are “raw” if they are escaped, and may have a special meaning when not escaped;
- characters other than printable ascii are always “raw”.

(End definition for \_regex_hexadecimal_use:NTF.)
The code is ugly, and highly based on magic numbers and the ascii codes of characters. This is mostly unavoidable for performance reasons. Maybe the tests can be optimized a little bit more. Here, “alphanumeric” means 0–9, A–Z, a–z; “special” character means non-alphanumeric but printable ascii, from space (hex 20) to del (hex 7E).

45.3 Compiling

A regular expression starts its life as a string of characters. In this section, we convert it to internal instructions, resulting in a “compiled” regular expression. This compiled
expression is then turned into states of an automaton in the building phase. Compiled
regular expressions consist of the following:

• \_\_regex_class:NNN\{ \langle boolean \rangle \{ \langle tests \rangle \} \{ \langle min \rangle \{ \langle more \rangle \{ lazyness \} \} \}

• \_\_regex_group:NN\{ \langle branches \rangle \{ \langle min \rangle \{ \langle more \rangle \{ lazyness \}, also \_\_regex_group_no_capture:NN\ and \_\_regex_group_resetting:NN with the same syntax. \}

• \_\_regex_branch:n \{ \langle contents \rangle \}

• \_\_regex_command_K:

• \_\_regex_assertion:Nn \{ \langle boolean \rangle \{ \langle assertion test \rangle \} \}

Tests can be the following:

• \_\_regex_item_caseful_equal:n \{ \langle char code \rangle \}

• \_\_regex_item_caseless_equal:n \{ \langle char code \rangle \}

• \_\_regex_item_caseful_range:nn \{ \langle min \rangle \{ \langle max \rangle \} \}

• \_\_regex_item_caseless_range:nn \{ \langle min \rangle \{ \langle max \rangle \} \}

• \_\_regex_item_catcode:nT \{ \langle catcode bitmap \rangle \{ \langle tests \rangle \}

• \_\_regex_item_catcode_reverse:nT \{ \langle catcode bitmap \rangle \{ \langle tests \rangle \}

• \_\_regex_item_reverse:n \{ \langle tests \rangle \}

• \_\_regex_item_exact:nn \{ \langle catcode \rangle \{ \langle char code \rangle \}

• \_\_regex_item_exact_cs:n \{ \langle csnames \rangle \}, more precisely given as \langle csname \rangle \scan_stop: \langle csname \rangle \scan_stop: \langle csname \rangle and so on in a brace group.

45.3.1 Variables used when compiling

We make sure to open the same number of groups as we close.

\int_new:N \l__regex_group_level_int

(End definition for \l__regex_group_level_int.)

\int_new:N \l__regex_mode_int
\int_const:Nn \c__regex_cs_in_class_mode_int { -6 }
\int_const:Nn \c__regex_cs_mode_int { -2 }
\int_const:Nn \c__regex_outer_mode_int { 0 }
\int_const:Nn \c__regex_catcode_mode_int { 2 }
\int_const:Nn \c__regex_class_mode_int { 3 }
\int_const:Nn \c__regex_catcode_in_class_mode_int { 6 }

While compiling, ten modes are recognized, labelled −63, −23, −6, −2, 0, 2, 3, 6, 23, 63. See section 45.3.3. We only define some of these as constants.
We wish to allow constructions such as \texttt{\c[^BE]} (.. \texttt{\cL[a-z]} ..), where the outer catcode test applies to the whole group, but is superseded by the inner catcode test. For this to work, we need to keep track of lists of allowed category codes: \texttt{\l__regex_catcodes_int} and \texttt{\l__regex_default_catcodes_int} are bitmaps, sums of \(4^c\), for all allowed catcodes \(c\). The latter is local to each capturing group, and we reset \texttt{\l__regex_catcodes_int} to that value after each character or class, changing it only when encountering a \texttt{\c} escape. The boolean records whether the list of categories of a catcode test has to be inverted: compare \texttt{\c[^BE]} and \texttt{\c[BE]}.

\begin{verbatim}
\int_new:N \l__regex_catcodes_int
\int_new:N \l__regex_default_catcodes_int
\bool_new:N \l__regex_catcodes_bool
\end{verbatim}

Constants: \(4^c\) for each category, and the sum of all powers of 4.

\begin{verbatim}
\int_const:Nn \c__regex_catcode_C_int { "1 }\n\int_const:Nn \c__regex_catcode_B_int { "4 }\n\int_const:Nn \c__regex_catcode_E_int { "10 }\n\int_const:Nn \c__regex_catcode_M_int { "40 }\n\int_const:Nn \c__regex_catcode_T_int { "100 }\n\int_const:Nn \c__regex_catcode_P_int { "1000 }\n\int_const:Nn \c__regex_catcode_U_int { "4000 }\n\int_const:Nn \c__regex_catcode_D_int { "10000 }\n\int_const:Nn \c__regex_catcode_S_int { "100000 }\n\int_const:Nn \c__regex_catcode_L_int { "400000 }\n\int_const:Nn \c__regex_catcode_O_int { "1000000 }\n\int_const:Nn \c__regex_catcode_A_int { "4000000 }\n\int_const:Nn \c__regex_all_catcodes_int { "5515155 }\n\end{verbatim}

The compilation step stores its result in this variable.

\begin{verbatim}
\cs_new_eq:NN \l__regex_internal_regex \c__regex_no_match_regex
\end{verbatim}

This sequence holds the prefix that makes up the line displayed to the user. The various items must be removed from the right, which is tricky with a token list, hence we use a sequence.

\begin{verbatim}
\seq_new:N \l__regex_show_prefix_seq
\end{verbatim}

A hack. To know whether a given class has a single item in it or not, we count the number of lines when showing the class.

\begin{verbatim}
\int_new:N \l__regex_show_lines_int
\end{verbatim}
45.3.2 Generic helpers used when compiling

\_\_regex_two_if_eq:NNNNTF

Used to compare pairs of things like \_\_regex_compile_special:N ? together. It’s often inconvenient to get the catcodes of the character to match so we just compare the character code. Besides, the expanding behaviour of if:w is very useful as that means we can use \_c_left_brace_str and the like.

\prg_new_conditional:Npnn \_\_regex_two_if_eq:NNNNTF #1#2#3#4 { TF }
{\if_meaning:w #1 #3 \if:w #2 #4 \else:\prg_return_true:\else:\prg_return_false:\fi:\else:\prg_return_false:\fi:\}

(End definition for \_\_regex_two_if_eq:NNNNTF.)

\_\_regex_get_digits:NTFw
\_\_regex_get_digits_loop:w

If followed by some raw digits, collect them one by one in the integer variable #1, and take the true branch. Otherwise, take the false branch.

\cs_new_protected:Npn \_\_regex_get_digits:NTFw #1#2#3#4#5 {\if_meaning:w \_\_regex_compile_raw:N #1 \if_int_compare:w 1 < 1 #2 \exp_stop_f:\prg_return_true:\else:\prg_return_false:\fi:\else:\prg_return_false:\fi:\}

(End definition for \_\_regex_get_digits:NTFw and \_\_regex_get_digits_loop:w.)

\_\_regex_if_raw_digit:NNTF

Test used when grabbing digits for the \{m,n\} quantifier. It only accepts non-escaped digits.

\prg_new_conditional:Npnn \_\_regex_if_raw_digit:NN #1#2 { TF }
{\if_meaning:w \_\_regex_compile_raw:N #1 \if_int_compare:w 1 < 1 #2 \exp_stop_f:\prg_return_true:\else:\prg_return_false:\fi:\else:\prg_return_false:\fi:\}

(End definition for \_\_regex_if_raw_digit:NNTF.)
45.3.3 Mode

When compiling the NFA corresponding to a given regex string, we can be in ten distinct modes, which we label by some magic numbers:

-6 \{c{...}] control sequence in a class,
-2 \c{...} control sequence,
0 ... outer,
2 \c... catcode test,
6 \c...] catcode test in a class,
-63 \c{[...]} class inside mode −6,
-23 \c{[...]} class inside mode −2,
3 [...] class inside mode 0,
23 \c[...] class inside mode 2,
63 \c[...] class inside mode 6.

This list is exhaustive, because \c escape sequences cannot be nested, and character classes cannot be nested directly. The choice of numbers is such as to optimize the most useful tests, and make transitions from one mode to another as simple as possible.

- Even modes mean that we are not directly in a character class. In this case, a left bracket appends 3 to the mode. In a character class, a right bracket changes the mode as \( m \rightarrow (m - 15)/13 \), truncated.

- Grouping, assertion, and anchors are allowed in non-positive even modes (0, −2, −6), and do not change the mode. Otherwise, they trigger an error.

- A left bracket is special in even modes, appending 3 to the mode; in those modes, quantifiers and the dot are recognized, and the right bracket is normal. In odd modes (within classes), the left bracket is normal, but the right bracket ends the class, changing the mode from \( m \) to \( (m - 15)/13 \), truncated; also, ranges are recognized.

- In non-negative modes, left and right braces are normal. In negative modes, however, left braces trigger a warning; right braces end the control sequence, going from −2 to 0 or −6 to 3, with error recovery for odd modes.

- Properties (such as the \d character class) can appear in any mode.

\_regex_if_in_class:TF Test whether we are directly in a character class (at the innermost level of nesting). There, many escape sequences are not recognized, and special characters are normal. Also, for every raw character, we must look ahead for a possible raw dash.

\cs_new:Npn \_regex_if_in_class:TF
\{\if_int_odd:w \l__regex_mode_int
\exp_after:wN \use_i:nn\else:\exp_after:wN \use_ii:nn\fi:\}
\]
Right braces are special only directly inside control sequences (at the inner-most level of nesting, not counting groups).

\_regex_if_in_cs:TF

\cs_new:Npn \_regex_if_in_cs:TF
{
\if_int_odd:w \l__regex_mode_int
\exp_after:wN \use_ii:nn
\else:
\if_int_compare:w \l__regex_mode_int < \c__regex_outer_mode_int
\exp_after:wN \exp_after:wN \exp_after:wN \use_i:nn
\else:
\exp_after:wN \exp_after:wN \exp_after:wN \use_ii:nn
\fi:
\fi:
}\}

(End definition for \_regex_if_in_cs:TF.)

\_regex_if_in_class_or_catcode:TF

Assertions are only allowed in modes 0, −2, and −6, i.e., even, non-positive modes.
\cs_new:Npn \_regex_if_in_class_or_catcode:TF
{
\if_int_odd:w \l__regex_mode_int
\exp_after:wN \use_i:nn
\else:
\if_int_compare:w \l__regex_mode_int > \c__regex_outer_mode_int
\exp_after:wN \exp_after:wN \exp_after:wN \use_i:nn
\else:
\exp_after:wN \exp_after:wN \exp_after:wN \use_ii:nn
\fi:
\fi:
}\}

(End definition for \_regex_if_in_class_or_catcode:TF.)

\_regex_if_within_catcode:TF

This test takes the true branch if we are in a catcode test, either immediately following it (modes 2 and 6) or in a class on which it applies (modes 23 and 63). This is used to tweak how left brackets behave in modes 2 and 6.
\cs_new:Npn \_regex_if_within_catcode:TF
{
\if_int_compare:w \l__regex_mode_int > \c__regex_outer_mode_int
\exp_after:wN \use_i:nn
\else:
\exp_after:wN \use_ii:nn
\fi:
}\}

(End definition for \_regex_if_within_catcode:TF.)

\_regex_chk_c_allowed:T

The \c escape sequence is only allowed in modes 0 and 3, i.e., not within any other \c escape sequence.
\cs_new_protected:Npn \_regex_chk_c_allowed:T
{\if_int_compare:w \l__regex_mode_int = \c__regex_outer_mode_int 477
\_\_regex\_mode\_quit\_c: This function changes the mode as it is needed just after a catcode test.

\cs_new_protected:Npn \_\_regex\_mode\_quit\_c: {
  \if_int_compare:w \l__regex\_mode\_int = \c\_\_regex\_catcode\_mode\_int
  \int_set_eq:NN \l__regex\_mode\_int \c\_\_regex\_outer\_mode\_int
  \else:
    \if_int_compare:w \l__regex\_mode\_int = \c\_\_regex\_catcode\_in\_class\_mode\_int
      \int_set_eq:NN \l__regex\_mode\_int \c\_\_regex\_class\_mode\_int
    \fi:
  \fi:
}\fi:
}(End definition for \_\_regex\_mode\_quit\_c:)

45.3.4 Framework

\_\_regex\_compile:w \_\_regex\_compile\_end: Used when compiling a user regex or a regex for the \texttt{\textbackslash c\ldots} escape sequence within another regex. Start building a token list within a group (with x-expansion at the outset), and set a few variables (group level, catcodes), then start the first branch. At the end, make sure there are no dangling classes nor groups, close the last branch: we are done building \texttt{\textbackslash l\_\_regex\_internal\_regex}.

\cs_new_protected:Npn \_\_regex\_compile:w {
  \group_begin:
  \tl_build_begin:N \l__regex\_build\_tl
  \int_zero:N \l__regex\_group\_level\_int
  \int_set_eq:NN \l__regex\_default\_catcodes\_int \c\_\_regex\_all\_catcodes\_int
  \cs_set:Npn \__regex\_item\_equal:n { \__regex\_item\_caseful\_equal:n }
  \cs_set:Npn \__regex\_item\_range:nn { \__regex\_item\_caseful\_range:nn }
  \tl_build_put_right:Nn \l__regex\_build\_tl { \__regex\_branch:n { \if_false: \fi: } 
  \tl_build\_end
}\group_end:
}\cs_new_protected:Npn \_\_regex\_compile\_end: {
}\_\_regex\_if\_in\_class:TF
  \msg_error:nn { \_\_regex\_compile\_end\_false: } { missing-rbrack }
}\use:c { \_\_\_regex\_compile\_end\_true: }
\__regex_compile:n

The compilation is done between \__regex_compile:w and \__regex_compile_end:, starting in mode 0. Then \__regex_escape_use:nnnn distinguishes special characters, escaped alphanumerics, and raw characters, interpreting \a, \x and other sequences. The 4 trailing \prg_do_nothing: are needed because some functions defined later look up to 4 tokens ahead. Before ending, make sure that any \c{...} is properly closed. No need to check that brackets are closed properly since \__regex_compile_end: does that. However, catch the case of a trailing \cL construction.

\cs_new_protected:Npn \__regex_compile:n #1
\prg_do_nothing: \prg_do_nothing:
\prg_do_nothing: \prg_do_nothing:
\if_int_compare:w \l__regex_group_level_int > \c_zero_int
\msg_error:nnx { regex } { missing-rparen }
\{ \int_use:N \l__regex_group_level_int

\}
\tl_build_end:N \l__regex_build_tl
\exp_args:NNNo
\group_end:
\tl_build_put_right:Nn \l__regex_build_tl
\{ \l__regex_build_tl 
\}
\fi:
\tl_build_put_right:Nn \l__regex_build_tl \{ \if_false: { \fi: } 
\tl_build_end:N \l__regex_build_tl
\exp_args:NNNx
\group_end:
\tl_set:Nn \l__regex_internal_regex \l__regex_build_tl
\}

(End definition for \__regex_compile:w and \__regex_compile_end:.)
\_\_regex_compile\_use:n

Use a regex, regardless of whether it is given as a string (in which case we need to compile) or as a regex variable. This is used for \texttt{\regex\_match\_case:nn} and related functions to allow a mixture of explicit regex and regex variables.

\cs_new_protected:Npn \_\_regex_compile\_use:n #1
  {
    \tl_if_single_token:nT {#1}
    {
      \exp_after:wN \_\_regex_compile\_use\_aux:w
      \token_to_meaning:N #1 ~ \q__regex_nil
    }
    \_\_regex_compile:n {#1} \l__regex\_internal\_regex
  }

\cs_new_protected:Npn \_\_regex_compile\_escaped:N #1
  {
    \cs_if_exist_use:cF { \_\_regex_compile/_#1: }
    { \_\_regex_compile\_raw:N #1 }
  }

\cs_new_protected:Npn \_\_regex_compile\_special:N #1
  {
    \cs_if_exist_use:cF { \_\_regex_compile\_#1: }\)
    { \_\_regex_compile\_raw:N #1 }
  }

(End definition for \_\_regex\_compile\_use:n.)

\_\_regex\_compile\_escaped:N
\_\_regex\_compile\_special:N

If the special character or escaped alphanumeric has a particular meaning in regexes, the corresponding function is used. Otherwise, it is interpreted as a raw character. We distinguish special characters from escaped alphanumeric characters because they behave differently when appearing as an end-point of a range.

\cs_new_protected:Npn \_\_regex_compile\_escaped:N #1
  {
    \cs_if_exist_use:cF { \_\_regex_compile\_#1: }
    { \_\_regex_compile\_raw:N #1 }
  }

\cs_new_protected:Npn \_\_regex_compile\_special:N #1
  {
    \cs_if_exist_use:cF { \_\_regex_compile\_#1: }
    { \_\_regex_compile\_raw:N #1 }
  }

(End definition for \_\_regex\_compile\_escaped:N and \_\_regex\_compile\_special:N.)

\_\_regex\_compile\_one:n

This is used after finding one “test”, such as \texttt{\d}, or a raw character. If that followed a catcode test (e.g., \texttt{\cL}), then restore the mode. If we are not in a class, then the test is

480
“standalone”, and we need to add \__regex_class:NnnnN and search for quantifiers. In any case, insert the test, possibly together with a catcode test if appropriate.

(End definition for \__regex_compile_one:n.)

\__regex_compile_abort_tokens:n \__regex_compile_abort_tokens:x

This function places the collected tokens back in the input stream, each as a raw character. Spaces are not preserved.

(End definition for \__regex_compile_abort_tokens:n.)

45.3.5 Quantifiers

This looks ahead and checks whether there are any quantifier (special character equal to either of \?++{}). This is useful for the \ua and \ur escape sequences.

(End definition for \__regex_compile_if_quantifier:TFw.)
\__regex_compile_quantifier:w

This looks ahead and finds any quantifier (special character equal to either of \?\+\*\{).
\cs_new_protected:Npn \__regex_compile_quantifier:w #1#2
\{
\token_if_eq_meaning:NNTF #1 \__regex_compile_special:N
{\cs_if_exist_use:cF { \__regex_compile_quantifier_#2:w }
{ \__regex_compile_quantifier_none: #1 #2 }
}
\}
\__regex_compile_quantifier_none: #1 #2
\}
(End definition for \__regex_compile_quantifier:w)

\__regex_compile_quantifier_none:
\__regex_compile_quantifier_abort:xNN

Those functions are called whenever there is no quantifier, or a braced construction is invalid (equivalent to no quantifier, and whatever characters were grabbed are left raw).
\cs_new_protected:Npn \__regex_compile_quantifier_none:
{\tl_build_put_right:Nn \l__regex_build_tl { \if_false: { \fi: } { 1 } { 0 } \c_false_bool }
}\cs_new_protected:Npn \__regex_compile_quantifier_abort:xNN #1#2#3
{\__regex_compile_quantifier_none:
\msg_warning:nnxx { regex } { invalid-quantifier } {#1} {#3}
\__regex_compile_abort_tokens:x {#1} #2 #3
}
(End definition for \__regex_compile_quantifier_none: and \__regex_compile_quantifier_abort:xNN.)

\__regex_compile_quantifier_lazyness:nnNN

Once the “main” quantifier (\?, \*, + or a braced construction) is found, we check whether it is lazy (followed by a question mark). We then add to the compiled regex a closing brace (ending \__regex_class:NnnnN and friends), the start-point of the range, its end-point, and a boolean, true for lazy and false for greedy operators.
\cs_new_protected:Npn \__regex_compile_quantifier_lazyness:nnNN #1#2#3#4
{\__regex_two_if_eq:NNNNTF #3 #4 \__regex_compile_special:N ?
{\tl_build_put_right:Nn \l__regex_build_tl { \if_false: { \fi: } { #1 } { #2 } \c_true_bool }
}
{\tl_build_put_right:Nn \l__regex_build_tl { \if_false: { \fi: } { #1 } { #2 } \c_false_bool }
#3 #4
}
(End definition for \__regex_compile_quantifier_lazyness:nnNN.)

\__regex_compile_quantifier_?:w
\__regex_compile_quantifier_*:w
\__regex_compile_quantifier_+:w

For each “basic” quantifier, \?, \*, +, feed the correct arguments to \__regex_compile_quantifier_lazyness:nnNN, −1 means that there is no upper bound on the number of repetitions.
\cs_new_protected:cpn { \__regex_compile_quantifier_?:w }

482
Three possible syntaxes: \{\langle \text{int} \rangle \}, \{\langle \text{int} \rangle, \langle \text{int} \rangle \}, or \{\langle \text{int} \rangle, \langle \text{int} \rangle, \langle \text{int} \rangle \}. Any other syntax causes us to abort and put whatever we collected back in the input stream, as raw characters, including the opening brace. Grab a number into \l__regex_internal_a_int. If the number is followed by a right brace, the range is \([a, a]\). If followed by a comma, grab one more number, and call the \_ii or \_iii auxiliary. Those auxiliaries check for a closing brace, leading to the range \([a, \infty)\) or \([a, b)\), encoded as \{a\}{−1} and \{a\}{b−a}.

\begin{verbatim}
\cs_new_protected:Npn \__regex_compile_quantifier_braced_auxi:w #1#2
\__regex_get_digits:NTFw \l__regex_internal_a_int
\__regex_compile_quantifier_braced_auxi:w

\__regex_compile_quantifier_abort:xNN
\{ \c_left_brace_str
\int_use:N \l__regex_internal_a_int ,
\int_use:N \l__regex_internal_b_int
\}
#1 #2
\}
\}
\end{verbatim}
\end{quote}

(End definition for \__regex_compile_quantifier_{:w and others.})

\subsection{Raw characters}
\__regex_compile_raw_error:N

Within character classes, and following catcode tests, some escaped alphanumeric sequences such as \verb|\b| do not have any meaning. They are replaced by a raw character, after spitting out an error.

\begin{verbatim}
\cs_new_protected:Npn \__regex_compile_raw_error:N #1
\{ \msg_error:nnx { regex } { bad-escape } \{\#1\}
\__regex_compile_raw:N \{ \int_use:N \l__regex_internal_a_int
\int_use:N \l__regex_internal_b_int
\}
\}
\end{verbatim}

(End definition for \__regex_compile_raw_error:N.)

\__regex_compile_raw:N

If we are in a character class and the next character is an unescaped dash, this denotes a range. Otherwise, the current character \#1 matches itself.

\begin{verbatim}
\cs_new_protected:Npn \__regex_compile_raw:N \#1\#2\#3
{ \__regex_if_in_class:TF
\{ \__regex_two_if_eq:NNNNTF \#2 \#3 \__regex_compile_special:N \c_right_brace_str
\{ \__regex_compile_range:Nw \#1 \}
\}
\}
\end{verbatim}

484
We have just read a raw character followed by a dash; this should be followed by an end-point for the range. Valid end-points are: any raw character; any special character, except a right bracket. In particular, escaped characters are forbidden.

\msg_error:nxx { regex } { range-backwards } {#1} {#3}
\msg_warning:nxx { regex } { range-missing-end } {#1} {c_backslash_str #3}

\_regex_compile_one:n
{ \_regex_item_equal:n { \int_value:w '#1 } } #2 #3
\}
{ \_regex_compile_one:n
{ \_regex_item_equal:n { \int_value:w '#1 } } #2 #3
\}
\__regex_compile_range:Nw
\_regex_if_end_range:NNTF

(End definition for \_regex_compile_raw:N.)
\_regex_build_put_right:Nx \_\_regex_build_tl
{
    \_\_regex_item_equal:n { \int_value:w '#1 \exp_stop_f: }
    \_\_regex_item_equal:n { \int_value:w '- \exp_stop_f: }
}
#2#3

(End definition for \_\_regex_compile_range:Nw and \_\_regex_if_end_range:NNTF.)

45.3.7 Character properties

\_\_regex_compile_.: In a class, the dot has no special meaning. Outside, insert \_\_regex_prop_.:, which matches any character or control sequence, and refuses −2 (end-marker).

\_\_regex_prop_.: \texttt{\cs_new_protected:cpx \{ \_\_regex_compile_.: \}}
{
    \exp_not:N \_\_regex_if_in_class:TF
    \_\_regex_compile_raw:N .
    \_\_regex_compile_one:n \exp_not:c \{ \_\_regex_prop_.: \}
}
\_\_regex_compile_/d: The constants \_\_regex_prop_d:, etc. hold a list of tests which match the corresponding character class, and jump to the \_\_regex_break_point:TF marker. As for a normal character, we check for quantifiers.

(End definition for \_\_regex_compile_/d: and others.)
45.3.8 Anchoring and simple assertions

In modes where assertions are forbidden, anchors such as \A produce an error (\A is invalid in classes); otherwise they add an \__regex_assertion:Nn test as appropriate (the only negative assertion is \B). The test functions are defined later. The implementation for $ and ~ is only different from \A etc because these are valid in a class.

```latex
\cs_new_protected:Npn \__regex_compile_anchor_letter:NNN #1#2#3
\begin{verbatim}
{ \__regex_if_in_class_or_catcode:TF { \__regex_compile_raw_error:N #1 } { \tl_build_put_right:Nn \l__regex_build_tl { \__regex_assertion:Nn #2 {#3} } } }
\end{verbatim}
\cs_new_protected:cpn { \__regex_compile_/A: } { \__regex_compile_anchor_letter:NNN A \c_true_bool \__regex_A_test: }
\cs_new_protected:cpn { \__regex_compile_/G: } { \__regex_compile_anchor_letter:NNN G \c_true_bool \__regex_G_test: }
\cs_new_protected:cpn { \__regex_compile_/Z: } { \__regex_compile_anchor_letter:NNN Z \c_true_bool \__regex_Z_test: }

\begin{verbatim}
{ \cs_new_protected:cpn { \__regex_compile_#1: } { \__regex_if_in_class:TF { \__regex_mode_int > \c__regex_catcode_in_class_mode_int } { \tl_build_put_right:Nn \l__regex_build_tl { \__regex_assertion:Nn \c_true_bool {#2} } } }
\exp_args:Nx \__regex_tmp:w { \iow_char:N \^ } { \__regex_A_test: }
\exp_args:Nx \__regex_tmp:w { \iow_char:N $ } { \__regex_Z_test: }
\end{verbatim}

(End definition for \__regex_compile_anchor_letter:NNN and others.)

45.3.9 Character classes

Outside a class, right brackets have no meaning. In a class, change the mode \( m \to (m - 15)/13 \), truncated) to reflect the fact that we are leaving the class. Look for quantifiers, unless we are still in a class after leaving one (the case of \[ \ldots c \mid \ldots \ldots \]). quantifiers.

```latex
\cs_new_protected:cpn { \__regex_compile_]: }
\begin{verbatim}
{ \__regex_if_in_class_or_catcode:TF { \__regex_mode_int > \c__regex_catcode_in_class_mode_int } { \tl_build_put_right:Nn \l__regex_build_tl { \__regex_assertion:Nn \c_true_bool {#2} } } }
\end{verbatim}
```
\_\_regex\_compile\_[:]

In a class, left brackets might introduce a POSIX character class, or mean nothing. Immediately following \c{category}, we must insert the appropriate catcode test, then parse the class; we pre-expand the catcode as an optimization. Otherwise (modes 0, \(-2\) and \(-6\)) just parse the class. The mode is updated later.

\cs_new_protected:cpn \{ \_\_regex\_compile\_[: }  
\{ \_\_regex\_if\_in\_class:TF  
\{ \_\_regex\_compile\_class\_posix\_test:w \}  
\_\_regex\_if\_within\_catcode:TF  
\{ \_\_regex\_if\_within\_catcode:TF \}  
\_\_regex\_compile\_class\_catcode:w  
\_\_regex\_compile\_class\_catcode:w \l__regex\_compile\_raw:N ] \}  
\}  
(End definition for \_\_regex\_compile\_[:])

\_\_regex\_compile\_class\_normal:w

In the “normal” case, we insert \_\_regex\_class:NnnnN \langle boolean \rangle in the compiled code. The \langle boolean \rangle is true for positive classes, and false for negative classes, characterized by a leading \textasciitilde. The auxiliary \_\_regex\_compile\_class:TF\textasciitilde\textasciitilde also checks for a leading \textbackslash] which has a special meaning.

\cs_new_protected:np \{ \_\_regex\_class\_normal:w \}  
\{ \_\_regex\_class\_normal:w \}  
\}  
(End definition for \_\_regex\_compile\_class\_normal:w)

\_\_regex\_compile\_class\_catcode:w

This function is called for a left bracket in modes 2 or 6 (catcode test, and catcode test within a class). In mode 2 the whole construction needs to be put in a class (like single character). Then determine if the class is positive or negative, inserting \_\_regex\_item\_catcode:nT or the \texttt{reverse} variant as appropriate, each with the current catcodes bitmap #1 as an argument, and reset the catcodes.

\cs_new_protected:np \{ \_\_regex\_compile\_class\_catcode:w \}  
\{ \_\_regex\_compile\_class\_catcode:w \}  
(End definition for \_\_regex\_compile\_class\_catcode:w)
If the first character is `^`, then the class is negative (use \texttt{#2}), otherwise it is positive (use \texttt{#1}). If the next character is a right bracket, then it should be changed to a raw one.

\begin{verbatim}
\cs_new_protected:Npn \__regex_compile_class:TFNN #1#2#3#4
{ \l__regex_mode_int = \int_value:w \l__regex_mode_int 3 \exp_stop_f:
  \__regex_two_if_eq:NNNNTF #3 #4 \__regex_compile_special:N ^
  { \tl_build_put_right:Nn \l__regex_build_tl { #2 { \if_false: } \fi: }
    \__regex_compile_class:NN }
  { \tl_build_put_right:Nn \l__regex_build_tl { #1 { \if_false: } \fi: }
    \__regex_compile_class:NN #3 #4 }
}
\end{verbatim}

\begin{verbatim}
\cs_new_protected:Npn \__regex_compile_class:NN #1#2
{ \token_if_eq_meaning:NNT \__regex_compile_special:N #1
  { \str_case:nn { #2 } 
    : { \__regex_compile_class_posix_loop:w \__regex_compile_class_posix_posix_end:w
    \__regex_compile_class_posix_loop:w \__regex_compile_class_posix_loop:w
    \__regex_compile_class_posix_loop:w
}
\end{verbatim}

(End definition for \texttt{\__regex_compile_class:catcode:w})

Here we check for a syntax such as \texttt{[:alpha:]}. We also detect \texttt{[= and [. which have a meaning in POSIX regular expressions, but are not implemented in \texttt{l3regex}. In case we see \texttt{[.}, grab raw characters until hopefully reaching \texttt{:]}. If that’s missing, or the POSIX class is unknown, abort. If all is right, add the test to the current class, with an extra \texttt{\__regex_item_reverse:n} for negative classes (we make sure to wrap its argument in braces otherwise \texttt{\regex_show:N} would not recognize the regex as valid).

\begin{verbatim}
\cs_new_protected:Npn \__regex_compile_class_posix_test:w #1 #2
{ \token_if_eq_meaning:NNT \__regex_compile_special:N #1
  \__regex_compile_class_posix_test:w #1 #2

490
45.3.10 Groups and alternations

The contents of a regex group are turned into compiled code in \l__regex_build_tl, which ends up with items of the form \l__regex_branch:n \{\lconcatenation\}. This construction is done using \tl_build... functions within a TeX group, which automatically makes sure that options (case-sensitivity and default catcode) are reset at the end of the group. The argument \#1 is \l__regex_group:nnnN or a variant thereof. A small subtlety to support \cL(abc) as a shorthand for \L(a\Lb\Lc): exit any pending catcode test, save the category code at the start of the group as the default catcode for that group, and make sure that the catcode is restored to the default outside the group.

\cs_new_protected:Npn \__regex_compile_group_begin:N #1

      \_regex_compile_raw:N -
      #1 #2 #3 #4
    )
  }
\end{verbatim}

\paragraph*{45.3.11 Catcodes and csnames}

The \texttt{\c} escape sequence can be followed by a capital letter representing a character category, by a left bracket which starts a list of categories, or by a brace group holding a regular expression for a control sequence name. Otherwise, raise an error.

\begin{verbatim}
\cs_new_protected:cpn { \_regex_compile_c: } 
  { \_regex_chk_c_allowed:T { \_regex_compile_c_test:NN } }
\end{verbatim}
\_regex\_compile\_c:NN

If \textbackslash cC is not followed by . or (…) then complain because that construction cannot match anything, except in cases like \textbackslash cC[c(…)], where it has no effect.

\_regex\_compile\_c[C:]w

When encountering \textbackslash cC, the task is to collect uppercase letters representing character categories. First check for ^ which negates the list of category codes.
The case of a left brace is easy, based on what we have done so far: in a group, compile the regular expression, after changing the mode to forbid nesting \c. Additionally, disable submatch tracking since groups don’t escape the scope of \c{...}.

\__regex_compile_c_{:}:

\cs_new_protected:cpn { \__regex_compile_c_ \c_left_brace_str :w }
\__regex_disable_submatches: \l__regex_mode_int
= \if_case:w \l__regex_mode_int
\c__regex_cs_mode_int
\else:
\c__regex_cs_in_class_mode_int
\fi:
\}

(End definition for \__regex_compile_c_{:})

\__regex_compile_{:}
We forbid unescaped left braces inside a \c{...} escape because they otherwise lead to the confusing question of whether the first right brace in \c{{}x} should end \c or whether one should match braces.
\cs_new_protected:cpn { __regex_compile_ \c_left_brace_str : }
\__regex_if_in_cs:TF

\msg_error:nnx { regex } { u-missing-rbrace } {#2}\l__regex_internal_b_tl
For the \ur{...} construction, once we have extracted the variable’s name, we replace all groups by non-capturing groups in the compiled regex (passed as the argument of \__regex_compile_ur:n), if that has a single branch (namely \tl_if_empty:oTF is false) and there is no quantifier, then simply insert the contents of this branch (obtained by \use_ii:nn, which is expanded later). In all other cases, insert a non-capturing group and look for quantifiers to determine the number of repetition etc.

Once we have extracted the variable’s name, we check for quantifiers, in which case we set up a non-capturing group with a single branch. Inside this branch (we omit it and the group if there is no quantifier), \__regex_compile_u_payload: puts the right tests corresponding to the contents of the variable, which we store in \l__regex_internal_a_tl. The behaviour of \u then depends on whether we are within a \c{...} escape (in this case, the variable is turned to a string), or not.

### 45.3.14 Showing regexes

Before showing a regex we check that it is “clean” in the sense that it has the correct internal structure. We do this (in the implementation of \regex_show:N and \regex_log:N) by comparing it with a cleaned-up version of the same regex. Along the way we also need similar functions for other types: all \_regex_clean_(type):n functions produce valid (type) tokens (bool, explicit integer, etc.) from arbitrary input, and the output coincides with the input if that was valid.

```latex
\cs_new:Npn \_regex_clean_bool:n #1
\begin{verbatim}
\tl_if_single:nTF {#1}
\end{verbatim}
\end{verbatim}
```

501
When cleaning a class there are many cases, including a dozen or so like \_\_regex_prop_d or \_\_regex_posix_alpha. To avoid listing all of them we allow any command that starts with the 13 characters \_\_regex_prop or \_\_regex_posix (handily these have the same length, except for the trailing underscore).
\exp_args:Nf \str_range:nnn
  \{ \cs_to_str:N \#1 \} \{ 1 \} \{ 13 \}
\}
\{
  \_regex_prop_ \}
\{
  \_regex posix \}

    \_regex_show_group_aux:nnnn \{ ~(no-capture) \} \}
\}
504
Show a single character, together with its ascii representation if available. This could be extended to beyond ascii. It is not ideal for parentheses themselves.
\__regex_show_char:n
\__regex_show_one:n
\__regex_show_push:n
\__regex_show_pop:
\__regex_show_scope:nn
\__regex_show_group_aux:nnnnN

Every part of the final message go through this function, which adds one line to the output, with the appropriate prefix.

\cs_new_protected:Npn \__regex_show_one:n #1
{ \int_incr:N \l__regex_show_lines_int \tl_build_put_right:Nx \l__regex_build_tl { \exp_not:N \iow_newline: \seq_map_function:NN \l__regex_show_prefix_seq \use:n #1 } }

(End definition for \__regex_show_one:n.)

Enter and exit levels of nesting. The scope function prints its first argument as an “introduction”, then performs its second argument in a deeper level of nesting.

\cs_new_protected:Npn \__regex_show_push:n #1
{ \seq_put_right:Nx \l__regex_show_prefix_seq { #1 ~ } }
\cs_new_protected:Npn \__regex_show_pop:
{ \seq_pop_right:NN \l__regex_show_prefix_seq \l__regex_internal_a_tl }
\cs_new_protected:Npn \__regex_show_scope:nn #1#2
{ \__regex_show_one:n { #1 } \__regex_show_push:n { ~ } \use_ii:nn #2 \__regex_show_pop:
\__regex_show_one:n #1#2
\__regex_show_push:n { ~ } #2 \__regex_show_pop:
}

(End definition for \__regex_show_push:n, \__regex_show_pop:, and \__regex_show_scope:nn.)

We display all groups in the same way, simply adding a message, (no capture) or (resetting), to special groups. The odd \use_ii:nn avoids printing a spurious +-branch for the first branch.

\cs_new_protected:Npn \__regex_show_group_aux:nnnnN #1#2#3#4#5
{ \__regex_show_one:n { ~,group-begin #1 } \__regex_show_push:n { ~ } \use_ii:nn #2 \__regex_show_pop:
\__regex_show_one:n
\__regex_msg_repeated:nnnN (#3) (#4) #5 }

(End definition for \__regex_show_group_aux:nnnnN.)
I'm entirely unhappy about this function: I couldn't find a way to test if a class is a single

Instead, collect the representation of the tests in the class. If that had more than

one line, write Match or Don’t match on its own line, with the repeating information if

any. Then the various tests on lines of their own, and finally a line. Otherwise, we need
to evaluate the representation of the tests again (since the prefix is incorrect). That’s

chunky, but not too expensive, since it’s only one test.

```latex
\cs_set:Npn \__regex_show_class:NnnnN #1#2#3#4#5

\__regex_show_scope:nn
\)
```

\__regex_show_item_catcode:NnT

Produce a sequence of categories which the catcode bitmap #2 contains, and show it,
indenting the tests on which this catcode constraint applies.
45.4 Building

45.4.1 Variables used while building

\__regex_min_state_int\  \__regex_max_state_int

The last state that was allocated is \__regex_max_state_int\ − 1, so that \__regex_max_state_int always points to a free state. The min\_state variable is 1 to begin with, but gets shifted in nested calls to the matching code, namely in \texttt{\c{...}} constructions.

\__regex_left_state_int\  \__regex_right_state_int\  \__regex_left_state_seq\  \__regex_right_state_seq

Alternatives are implemented by branching from a left state into the various choices, then merging those into a right state. We store information about those states in two sequences. Those states are also used to implement group quantifiers. Most often, the left and right pointers only differ by 1.

\__regex_capturing_group_int

\__regex_capturing_group_int is the next id number to be assigned to a capturing group. This starts at 0 for the group enclosing the full regular expression, and groups are counted in the order of their left parenthesis, except when encountering resetting groups.

(End definition for \_\_regex\_show\_item\_catcode:NN.)
45.4.2 Framework

This phase is about going from a compiled regex to an NFA. Each state of the NFA is stored in a `toks`. The operations which can appear in the `toks` are

- `__regex_action_startWildcard:N (boolean)` inserted at the start of the regular expression, where a true (boolean) makes it unanchored.
- `__regex_action_success:` marks the exit state of the NFA.
- `__regex_action_cost:n {<shift>}` is a transition from the current `(state)` to `(state) + <shift>`, which consumes the current character: the target state is saved and will be considered again when matching at the next position.
- `__regex_action_free:n {<shift>}`, and `__regex_action_freeGroup:n {<shift>}` are free transitions, which immediately perform the actions for the state `(state) + <shift>` of the NFA. They differ in how they detect and avoid infinite loops. For now, we just need to know that the group variant must be used for transitions back to the start of a group.
- `__regex_action_submatch:nN {<group>} {<key>}` where the `<key>` is `<` or `>` for the beginning or end of group numbered `<group>`. This causes the current position in the query to be stored as the `<key>` submatch boundary.

- One of these actions, within a conditional.

We strive to preserve the following properties while building.

- The current capturing group is `capturing_group − 1`, and if a group opened now it would be labelled `capturing_group`.
- The last allocated state is `max_state − 1`, so `max_state` is a free state.
- The `left_state` points to a state to the left of the current group or of the last class.
- The `right_state` points to a newly created, empty state, with some transitions leading to it.
- The `left/right` sequences hold a list of the corresponding end-points of nested groups.

The `n`-type function first compiles its argument. Reset some variables. Allocate two states, and put a wildcard in state 0 (transitions to state 1 and 0 state). Then build the regex within a (capturing) group numbered 0 (current value of `capturing_group`). Finally, if the match reaches the last state, it is successful. A false boolean for argument #1 for the auxiliaries will suppress the wildcard and make the match anchored: used for `peek_regex:nTF` and similar.
\g__regex_case_int \ Case number that was successfully matched in \regex_match_case:nn and related functions.
\int_new:N \g__regex_case_int

(End definition for \g__regex_case_int.)

\l__regex_case_max_group_int \ The largest group number appearing in any of the \langle regex \rangle in the argument of \regex_-match_case:nn and related functions.
\int_new:N \l__regex_case_max_group_int

(End definition for \l__regex_case_max_group_int.)

\_regex_case_build:n \ See \_regex_build:n, but with a loop.
\_regex_case_build:x
\_regex_case_build_aux:Nn
\_regex_case_build_loop:n
The matching code relies on some global intarray variables, but only uses a range of their entries. Specifically,

- \texttt{\g__regex_state_active_intarray} from \texttt{\l__regex_min_state_int} to \texttt{\l__regex_max_state_int} − 1;

Here, in this nested call to the matching code, we need the new versions of this range to involve completely new entries of the intarray variables, so we begin by setting (the new) \texttt{\l__regex_min_state_int} to (the old) \texttt{\l__regex_max_state_int} to use higher entries.

When using a regex to match a cs, we don’t insert a wildcard, we anchor at the end, and since we ignore submatches, there is no need to surround the expression with a group. However, for branches to work properly at the outer level, we need to put the appropriate left and right states in their sequence.
45.4.3 Helpers for building an nfa

\_regex_push_lr_states: When building the regular expression, we keep track of pointers to the left-end and right-end of each group without help from TeX’s grouping.

\_regex_pop_lr_states: \cs_new_protected:Npn \_regex_push_lr_states: { \seq_push:No \l__regex_left_state_seq { \int_use:N \l__regex_left_state_int } \seq_push:No \l__regex_right_state_seq { \int_use:N \l__regex_right_state_int } }

Building classes

The arguments are: \textit{(boolean) \{\textit{(tests)}\} \{\textit{(min)}\} \{\textit{(more)}\} \{\textit{lazyness}\}). First store the tests with a trailing \__regex_action_cost:n, in the true branch of \__regex_break_point:TF for positive classes, or the false branch for negative classes. The integer \textit{(more)} is 0 for fixed repetitions, −1 for unbounded repetitions, and \textit{(max)} − \textit{(min)} for a range of repetitions.

\cs_new_protected:Npm \__regex_class:NnnnN #1#2#3#4#5
\cs_set:Npx \__regex_tests_action_cost:n ##1
\exp_not:n { \exp_not:n {#2} }
\bool_if:NTF #1 { \__regex_break_point:TF { \__regex_action_cost:n {##1} } { } } { \__regex_break_point:TF { } { \__regex_action_cost:n {##1} } }
\if_case:w - #4 \exp_stop_f:
\__regex_class_repeat:nN {#3}
\or: \__regex_class_repeat:nnN {#3} #5
\else: \__regex_class_repeat:nnN {#3} {#4} #5

(End definition for \__regex_class:NnnnN and \__regex_tests_action_cost:n.)

\__regex_class_repeat:n
This is used for a fixed number of repetitions. Build one state for each repetition, with a transition controlled by the tests that we have collected. That works just fine for #1 = 0 repetitions: nothing is built.

\cs_new_protected:Npm \__regex_class_repeat:n #1
\prg_replicate:nn {#1}

This implements unbounded repetitions of a single class (e.g. the * and + quantifiers). If the minimum number #1 of repetitions is 0, then build a transition from the current state to itself governed by the tests, and a free transition to a new state (hence skipping the tests). Otherwise, call \_regex_class_repeat:n for the code to match #1 repetitions, and add free transitions from the last state to the previous one, and to a new one. In both cases, the order of transitions is controlled by the lazyness boolean #2.

\cs_new_protected:Npn \_regex_class_repeat:nN \#1\#2
\begin{verbatim}
\if_int_compare:w \#1 = \c_zero_int
 \_regex_build_transitions_lazyness:NNNNN \#2

 \_regex_action_free:n \l__regex_internal_a_int
 \_regex_tests_action_cost:n \l__regex_right_state_int
\end{verbatim}
(End definition for \_regex_class_repeat:nnN.)
45.4.5 Building groups

Arguments: \{(label)\} \{(contents)\} \{(min)\} \{(more)\} \{(lazyness)\}. If \{(min)\} is 0, we need to add a state before building the group, so that the thread which skips the group does not also set the start-point of the submatch. After adding one more state, the left_state is the left end of the group, from which all branches stem, and the right_state is the right end of the group, and all branches end their course in that state. We store those two integers to be queried for each branch, we build the NFA states for the contents \#2 of the group, and we forget about the two integers. Once this is done, perform the repetition: either exactly \#3 times, or \#3 or more times, or between \#3 and \#3 + \#4 times, with lazyness \#5. The \{(label)\} \#1 is used for submatch tracking. Each of the three auxiliaries expects left_state and right_state to be set properly.

\[\text{\texttt{\_\_regex_group_aux:nnnnN}}\]

\[\text{\texttt{\_\_regex_build_new_state:}}\]
\[\text{\texttt{\_\_regex_build_transition_right:nNn \_\_regex_action_free_group:n}}\]
\[\text{\texttt{\_\_regex_left_state_int \_\_regex_right_state_int}}\]
\[\text{\texttt{\_\_regex_pop_lr_states:}}\]
\[\text{\texttt{\_\_regex_group_repeat:nn {\#1} {\#3}}\]
\[\text{\texttt{\_\_regex_group_repeat:nnN {\#1} {\#3} \#5}}\]
\[\text{\texttt{\_\_regex_group_repeat:nnnN {\#1} {\#3} \#4 \#5}}\]

(End definition for \texttt{\_\_regex_group_aux:nnnnN}.)

\[\text{\texttt{\_\_regex_group:nnnN}}\]
\[\text{\texttt{\_\_regex_group_no_capture:nnnN}}\]

Hand to \texttt{\_\_regex_group_aux:nnnnN} the label of that group (expanded), and the group itself, with some extra commands to perform.

\[\text{\texttt{\_\_regex_group_resetting:nnnN}}\]
\[\text{\texttt{\_\_regex_group.resetting_loop:nnNn}}\]

Again, hand the label \{-1\} to \texttt{\_\_regex_group_aux:nnnnN}, but this time we work a little bit harder to keep track of the maximum group label at the end of any branch, and to reset the group number at each branch. This relies on the fact that a compiled regex always is a sequence of items of the form \texttt{\_\_regex_branch:n \{(branch)\}}.
\_\_regex_group_repeat:nn

This function is called to repeat a group a fixed number of times \#2; if this is 0 we remove the group altogether (but don’t reset the capturing_group label). Otherwise, the auxiliary \_\_regex_group_repeat_aux:n copies \#2 times the \toks for the group, and leaves internal_a pointing to the left end of the last repetition. We only record the submatch information at the last repetition. Finally, add a state at the end (the transition to it has been taken care of by the replicating auxiliary).

\cs_new_protected:Npn \_\_regex_group_repeat:nn #1#2

{}
\__regex_group_repeat:nnN

This function is called to repeat a group at least \texttt{n} times; the case \texttt{n} = 0 is very different from \texttt{n} > 0. Assume first that \texttt{n} = 0. Insert submatch tracking information at the start and end of the group, add a free transition from the right end to the “true” left state \texttt{a}.

\__regex_group_repeat_aux:n

Here we repeat \toks ranging from \texttt{left_state} to \texttt{max_state}, \texttt{#1} > 0 times. First add a transition so that the copies “chain” properly. Compute the shift \texttt{c} between the original copy and the last copy we want. Shift the \texttt{right_state} and \texttt{max_state} to their final values. We then want to perform \texttt{c} copy operations. At the end, \texttt{b} is equal to the \texttt{max_state}, and \texttt{a} points to the left of the last copy of the group.

\cs_new_protected:Npn \__regex_group_submatches:nNN #1

This inserts in states \texttt{#2} and \texttt{#3} the code for tracking submatches of the group \texttt{#1}, unless inhibited by a label of \texttt{-1}.

\cs_new_protected:Npn \__regex_group_repeat_aux:n #1

\if_int_compare:w \#1 > \c_one_int

\__regex_toks_put_left:Nx \#2 { \__regex_action_submatch:nN {#1} < }

\__regex_toks_put_left:Nx \#3 { \__regex_action_submatch:nN {#1} > }
\fi:

(End definition for \__regex_group_repeatAux:n.)
(remember: in this case we had added an extra state before the left state). This forms the loop, which we break away from by adding a free transition from a to a new state.

Now consider the case $n > 0$. Repeat the group $n$ times, chaining various copies with a free transition. Add submatch tracking only to the last copy, then add a free transition from the right end back to the left end of the last copy, either before or after the transition to move on towards the rest of the NFA. This transition can end up before submatch tracking, but that is irrelevant since it only does so when going again through the group, recording new matches. Finally, add a state; we already have a transition pointing to it from $\text{\_\_regex_group_repeat_aux:n}$.  

\begin{verbatim}
\cs_new_protected:Npn \__regex_group_repeat:nnN #1#2#3 {

      \l__regex_right_state_int \l__regex_internal_a_int
    \fi:
    \__regex_build_new_state:
  \fi:
\}
\end{verbatim}

(End definition for $\text{\_\_regex_group_repeat:nnN}$.)

We wish to repeat the group between $\#2$ and $\#2 + \#3$ times, with a lazyness controlled by $\#4$. We insert submatch tracking up front: in principle, we could avoid recording submatches for the first $\#2$ copies of the group, but that forces us to treat specially the case $\#2 = 0$. Repeat that group with submatch tracking $\#2 + \#3$ times (the maximum number of repetitions). Then our goal is to add $\#3$ transitions from the end of the $\#2$-th group, and each subsequent groups, to the end. For a lazy quantifier, we add those transitions to the left states, before submatch tracking. For the greedy case, we add the transitions to the right states, after submatch tracking and the transitions which go on with more repetitions. In the greedy case with $\#2 = 0$, the transition which skips over all
copies of the group must be added separately, because its starting state does not follow the normal pattern: we had to add it “by hand” earlier.

45.5 Matching

We search for matches by running all the execution threads through the NFA in parallel, reading one token of the query at each step. The NFA contains “free” transitions to other states, and transitions which “consume” the current token. For free transitions, the instruction at the new state of the NFA is performed immediately. When a transition consumes a character, the new state is appended to a list of “active states”, stored in \_\_\_regex_thread_info_intarray (together with submatch information): this thread is made active again when the next token is read from the query. At every step (for each token in the query), we unpack that list of active states and the corresponding submatch props, and empty those.

If two paths through the NFA “collide” in the sense that they reach the same state after reading a given token, then they only differ in how they previously matched, and any future execution would be identical for both. (Note that this would be wrong in the presence of back-references.) Hence, we only need to keep one of the two threads: the thread with the highest priority. Our NFA is built in such a way that higher priority actions always come before lower priority actions, which makes things work.

The explanation in the previous paragraph may make us think that we simply need to keep track of which states were visited at a given step: after all, the loop generated when matching \( (a?)^* \) against \( a \) is broken, isn’t it? No. The group first matches \( a \), as it should, then repeats; it attempts to match \( a \) again but fails; it skips \( a \), and finds out that this state has already been seen at this position in the query: the match stops. The capturing group is (wrongly) \( a \). What went wrong is that a thread collided with itself, and the later version, which has gone through the group one more times with an empty match, should have a higher priority than not going through the group.

We solve this by distinguishing “normal” free transitions \_\_\_regex_action_free:n from transitions \_\_\_regex_action_free_group:n which go back to the start of the group. The former keeps threads unless they have been visited by a “completed” thread, while the latter kind of transition also prevents going back to a state visited by the current thread.

45.5.1 Variables used when matching

The tokens in the query are indexed from \texttt{min_pos} for the first to \texttt{max_pos} – 1 for the last, and their information is stored in several arrays and \texttt{toks} registers with those numbers. We match without backtracking, keeping all threads in lockstep at the \texttt{curr_pos} in the query. The starting point of the current match attempt is \texttt{start_pos}, and \texttt{success_pos}, updated whenever a thread succeeds, is used as the next starting position.

\begin{verbatim}
\int_new:N \l__regex_min_pos_int
\int_new:N \l__regex_max_pos_int
\int_new:N \l__regex_curr_pos_int
\int_new:N \l__regex_start_pos_int
\int_new:N \l__regex_success_pos_int
\end{verbatim}
The character and category codes of the token at the current position and a token list expanding to that token; the character code of the token at the previous position; the character code of the token just before a successful match; and the character code of the result of changing the case of the current token (A-Z ↔ a-z). This last integer is only computed when necessary, and is otherwise \texttt{\c_max_int}. The \texttt{curr_char} variable is also used in various other phases to hold a character code.

\begin{verbatim}
\int_new:N \l__regex_curr_char_int
\int_new:N \l__regex_curr_catcode_int
\tl_new:N \l__regex_curr_token_tl
\int_new:N \l__regex_last_char_int
\int_new:N \l__regex_last_char_success_int
\int_new:N \l__regex_case_changed_char_int
\end{verbatim}

For every character in the token list, each of the active states is considered in turn. The variable \texttt{\l__regex_curr_state_int} holds the state of the \texttt{nfa} which is currently considered: transitions are then given as shifts relative to the current state.

\begin{verbatim}
\int_new:N \l__regex_curr_state_int
\end{verbatim}

The submatches for the thread which is currently active are stored in the \texttt{curr_} submatches list, which is almost a comma list, but ends with a comma. This list is stored by \texttt{\regex_store_state:n} into an intarray variable, to be retrieved when matching at the next position. When a thread succeeds, this list is copied to \texttt{\l__regex_success_} submatches_tl: only the last successful thread remains there.

\begin{verbatim}
\tl_new:N \l__regex_curr_submatches_tl
\tl_new:N \l__regex_success_submatches_tl
\end{verbatim}

This integer, always even, is increased every time a character in the query is read, and not reset when doing multiple matches. We store in \texttt{\g__regex_state_active_intarray} the last step in which each \texttt{⟨state⟩} in the \texttt{nfa} was encountered. This lets us break infinite loops by not visiting the same state twice in the same step. In fact, the step we store is equal to \texttt{step} when we have started performing the operations of \texttt{toks⟨state⟩}, but not finished yet. However, once we finish, we store \texttt{step + 1} in \texttt{\g__regex_state_} active_intarray. This is needed to track submatches properly (see building phase). The step is also used to attach each set of submatch information to a given iteration (and automatically discard it when it corresponds to a past step).

\begin{verbatim}
\int_new:N \l__regex_step_int
\end{verbatim}

All the currently active threads are kept in order of precedence in \texttt{\g__regex_thread_} info_intarray together with the corresponding submatch information. Data in this intarray is organized as blocks from \texttt{min_thread} (included) to \texttt{max_thread} (excluded). At the start of every step, the whole array is unpacked, so that the space can immediately be reused, and \texttt{max_thread} is reset to \texttt{min_thread}, effectively clearing the array.

\begin{verbatim}
\int_new:N \l__regex_min_thread_int
\int_new:N \l__regex_max_thread_int
\end{verbatim}
\g__regex_state_active_intarray \g__regex_thread_info_intarray
\g__regex_state_active_intarray stores the last \langle step \rangle in which each \langle state \rangle was active. \g__regex_thread_info_intarray stores threads to be considered in the next step, more precisely the states in which these threads are.

\l__regex_matched_analysis_tl \l__regex_curr_analysis_tl
The list \l__regex_curr_analysis_tl consists of a brace group containing three brace groups corresponding to the current token, with the same syntax as \tl_analysis_map_inline:nn. The list \l__regex_matched_analysis_tl (constructed under the \tl_build machinery) has one item for each token that has already been treated so far in a given match attempt: each item consists of three brace groups with the same syntax as \tl_analysis_map_inline:nn.
\tl_new:N \l__regex_matched_analysis_tl
\tl_new:N \l__regex_curr_analysis_tl
(End definition for \l__regex_matched_analysis_tl and \l__regex_curr_analysis_tl.)
\l__regex_every_match_tl
Every time a match is found, this token list is used. For single matching, the token list is empty. For multiple matching, the token list is set to repeat the matching, after performing some operation which depends on the user function. See \__regex_single_match: and \__regex_multi_match:n.
\tl_new:N \l__regex_every_match_tl
(End definition for \l__regex_every_match_tl.)
\l__regex_fresh_thread_bool \l__regex_empty_success_bool
\bib{\regex_if_two_empty_matches:F} When doing multiple matches, we need to avoid infinite loops where each iteration matches the same empty token list. When an empty token list is matched, the next successful match of the same empty token list is suppressed. We detect empty matches by setting \l__regex_fresh_thread_bool to \texttt{true} for threads which directly come from the start of the regex or from the \K command, and testing that boolean whenever a thread succeeds. The function \regex_if_two_empty_matches:F is redefined at every match attempt, depending on whether the previous match was empty or not: if it was, then the function must cancel a purported success if it is empty and at the same spot as the previous match; otherwise, we definitely don’t have two identical empty matches, so the function is \use:n.
\bool_new:N \l__regex_fresh_thread_bool
\bool_new:N \l__regex_empty_success_bool
\bool_new:n \l__regex_if_two_empty_matches:F \use:n
(End definition for \l__regex_fresh_thread_bool, \l__regex_empty_success_bool, and \__regex_if_two_empty_matches:F.)
\g__regex_success_bool \l__regex_saved_success_bool \l__regex_match_success_bool
The boolean \l__regex_match_success_bool is true if the current match attempt was successful, and \g__regex_success_bool is true if there was at least one successful match. This is the only global variable in this whole module, but we would need it to be local when matching a control sequence with \texttt{\c{...}}. This is done by saving the global variable into \l__regex_saved_success_bool, which is local, hence not affected by the changes due to inner regex functions.
\bool_new:N \g__regex_success_bool
\bool_new:N \l__regex_saved_success_bool
\bool_new:N \l__regex_match_success_bool
523
45.5.2 Matching: framework

Initialize the variables that should be set once for each user function (even for multiple matches). Namely, the overall matching is not yet successful; none of the states should be marked as visited (\texttt{\g__regex_state_active_intarray}), and we start at step 0; we pretend that there was a previous match ending at the start of the query, which was not empty (to avoid smothering an empty match at the start). Once all this is set up, we are ready for the ride. Find the first match.

    \int_set:Nn \l__regex_submatch_int \l__regex_min_submatch_int
    \bool_set_false:N \l__regex_empty_success_bool
\}
\end{verbatim}
This function resets various variables used when finding one match. It is called before the loop through characters, and every time we find a match, before searching for another match (this is controlled by the `every_match` token list).

First initialize some variables: set the conditional which detects identical empty matches; this match attempt starts at the previous `success_pos`, is not yet successful, and has no submatches yet; clear the array of active threads, and put the starting state 0 in it. We are then almost ready to read our first token in the query, but we actually start one position earlier than the start because `__regex_match_one_token` increments `\l__regex_curr_pos_int` and saves `\l__regex_curr_char_int` as the `last_char` so that word boundaries can be correctly identified.

For a single match, the overall success is determined by whether the only match attempt is a success. When doing multiple matches, the overall matching is successful as soon as any match succeeds. Perform the action `#1`, then find the next match.
At each new position, set some variables and get the new character and category from the query. Then unpack the array of active threads, and clear it by resetting its length (max_thread). This results in a sequence of \_\_regex_use_state_and_submatches:w ⟨state⟩, ⟨submatch-clist⟩; and we consider those states one by one in order. As soon as a thread succeeds, exit the step, and, if there are threads to consider at the next position, and we have not reached the end of the string, repeat the loop. Otherwise, the last thread that succeeded is the match. We explain the fresh_thread business when describing \_\_regex_action_wildcard:.

45.5.4 Actions when matching

\_\_regex_action_start_wildcard:N

For an unanchored match, state 0 has a free transition to the next and a costly one to itself, to repeat at the next position. To catch repeated identical empty matches, we need to know if a successful thread corresponds to an empty match. The instruction resetting \_\_regex_fresh_thread_bool may be skipped by a successful thread, hence we had to add it to \_\_regex_match_one_token:nn too.

(End definition for \_\_regex_action_start_wildcard:N.)

\_\_regex_action_free:n
\_\_regex_action_free_group:n
\_\_regex_action_free_aux:nn

These functions copy a thread after checking that the NFA state has not already been used at this position. If not, store submatches in the new state, and insert the instructions for that state in the input stream. Then restore the old value of \_\_regex_curr_state_int and of the current submatches. The two types of free transitions differ by how they test that the state has not been encountered yet: the group version is stricter, and will not use a state if it was used earlier in the current thread, hence forcefully breaking the loop, while the “normal” version will revisit a state even within the thread itself.

(End definition for \_\_regex_action_free:n, \_\_regex_action_free_group:n, and \_\_regex_action_free_aux:nn.)

\_\_regex_action_cost:n

A transition which consumes the current character and shifts the state by #1. The resulting state is stored in the appropriate array for use at the next position, and we also store the current submatches.

\l__regex_replacement_category_tl
\l__regex_replacement_category_seq
This sequence of letters is used to correctly restore categories in nested constructions such as \cL(abc\cD(\_)d).
\tl_new:N \l__regex_replacement_category_tl
\seq_new:N \l__regex_replacement_category_seq
530
\_\_regex_replacement_category_tl

This token list holds the replacement text for \_\_regex_replacement_balance_one_match:n while it is being built incrementally.

\tl\_\_new:N \g\_\_regex_balance_tl

(End definition for \_\_regex_replacement_balance_tl)

\_\_regex_replacement_balance_one_match:n

This expects as an argument the first index of a set of entries in \_\_regex_submatch_-begin_intarray (and related arrays) which hold the submatch information for a given match. It can be used within an integer expression to obtain the brace balance incurred by performing the replacement on that match. This combines the braces lost by removing the match, braces added by all the submatches appearing in the replacement, and braces appearing explicitly in the replacement. Even though it is always redefined before use, we initialize it as for an empty replacement. An important property is that concatenating several calls to that function must result in a valid integer expression (hence a leading + in the actual definition).

\cs\_\_new:Npn \_\_regex_replacement_balance_one_match:n #1

{ - \_\_regex_submatch_balance:n {#1} }

(End definition for \_\_regex_replacement_balance_one_match:n)

\_\_regex_replacement_do_one_match:n

The input is the same as \_\_regex_replacement_balance_one_match:n. This function is redefined to expand to the part of the token list from the end of the previous match to a given match, followed by the replacement text. Hence concatenating the result of this function with all possible arguments (one call for each match), as well as the range from the end of the last match to the end of the string, produces the fully replaced token list. The initialization does not matter, but (as an example) we set it as for an empty replacement.

\cs\_\_new:Npn \_\_regex_replacement_do_one_match:n #1

{ \_\_regex_query_range:nn

{ \_\kernel_intarray_item:Nn \g\_\_regex_submatch_prev_intarray {#1} }

{ \_\kernel_intarray_item:Nn \g\_\_regex_submatch_begin_intarray {#1} }

}

(End definition for \_\_regex_replacement_do_one_match:n)

\_\_regex_replacement_exp_not:N

This function lets us navigate around the fact that the primitive \exp_not:n requires a braced argument. As far as I can tell, it is only needed if the user tries to include in the replacement text a control sequence set equal to a macro parameter character, such as \c_parameter_token. Indeed, within an x-expanding assignment, \exp_not:N \# behaves as a single #, whereas \exp_not:n {#} behaves as a doubled ##.

\cs\_\_new:Npn \_\_regex_replacement_exp_not:N #1 { \exp_not:n {#1} }

(End definition for \_\_regex_replacement_exp_not:N)

\_\_regex_replacement_exp_not:V

This is used for the implementation of \u, and it gets redefined for \peek_regex_-replace_once:nnTF.

\cs\_\_new_eq:NN \_\_regex_replacement_exp_not:V \exp_not:V

(End definition for \_\_regex_replacement_exp_not:V)
45.6.2 Query and brace balance

When it is time to extract submatches from the token list, the various tokens are stored in \toks registers numbered from \_regex_min_pos_int inclusive to \_regex_max_pos_int exclusive. The function \_regex_query_range:nn \{\langle min\rangle \} \{\langle max\rangle \} unpacks registers from the position \langle min\rangle to the position \langle max\rangle − 1 included. Once this is expanded, a second x-expansion results in the actual tokens from the query. That second expansion is only done by user functions at the very end of their operation, after checking (and correcting) the brace balance first.

\cs_new:Npn \_regex_query_range:nn #1 #2
\{\exp_after:wN \_regex_query_range_loop:ww \int_value:w \_regex_int_eval:w #1 \exp_after:wN ;

\cs_new:Npn \_regex_query_submatch:n #1
\{ \_regex_query_range:nn { \__kernel_intarray_item:Nn \g__regex_submatch_begin_intarray {#1} }
{ \__kernel_intarray_item:Nn \g__regex_submatch_end_intarray {#1} }
\}

(End definition for \_regex_query_submatch:n.)

\cs_new_protected:Npn \_regex_submatch_balance:n #1
\{ \\int_eval:n
\{ \_regex_intarray_item:NnF \g__regex_balance_intarray \g__regex_submatch_begin_intarray \{#1\}
\{ \_kernel_intarray_item:Nn \g__regex_submatch_end_intarray \{#1\}
\}
\}

(End definition for \_regex_submatch_balance:n.)

Every user function must result in a balanced token list (unbalanced token lists cannot be stored by TeX). When we unpacked the query, we kept track of the brace balance, hence the contribution from a given range is the difference between the brace balances at the \langle max pos\rangle and \langle min pos\rangle. These two positions are found in the corresponding “submatch” arrays.
45.6.3 Framework

The replacement text is built incrementally. We keep track in \l__regex_balance_int of the balance of explicit begin- and end-group tokens and we store in \g__regex_balance_tl some code to compute the brace balance from submatches (see its description). Detect unescaped right braces, and escaped characters, with trailing \prg_do_nothing: because some of the later function look-ahead. Once the whole replacement text has been parsed, make sure that there is no open csname. Finally, define the balance_one_match and do_one_match functions.

\_\_regex_case_replacement:n
This gets redefined for \peek_regex_replace_once:nnTF.

\_\_regex_case_replacement_put:n
Most characters are simply sent to the output by \tl_build_put_right:Nn, unless a particular category code has been requested: then \_\_regex Replacement_c_A:w or a similar auxiliary is called. One exception is right parentheses, which restore the category code in place before the group started. Note that the sequence is non-empty there: it contains an empty entry corresponding to the initial value of \l__regex_replacement_category_tl. The argument \#1 is a single character (including the case of a catcode-other space). In case no specific catcode is requested, we taked into account the current catcode regime (at the time the replacement is performed) as much as reasonable, with all impossible catcodes (escape, newline, etc.) being mapped to “other”.

\_\_regex_case_replacement_normal:n
\_\_regex_case_replacement_normal_aux:N
\_\_regex_case_replacement_normal_aux:n
(End definition for \_\_regex_case_replacement:n.)

(End definition for \_\_regex_case_replacement_put:n.)

(End definition for \_\_regex_case_replacement_normal:n.)
As in parsing a regular expression, we use an auxiliary built from \#1 if defined. Otherwise, check for escaped digits (standing from submatches from 0 to 9): anything else is a raw character.

\cs_new_protected:Npn \__regex_replacement_escaped:N #1
\begin{Verbatim}
\end{Verbatim}

\subsection{Submatches}

Insert a submatch in the replacement text. This is dropped if the submatch number is larger than the number of capturing groups. Unless the submatch appears inside a \texttt{\textbackslash c{...}} or \texttt{\textbackslash u{...}} construction, it must be taken into account in the brace balance. Later on, \#1 will be replaced by a pointer to the 0-th submatch for a given match. There is an \texttt{\textbackslash exp_not:N} here as at the point-of-use of \texttt{\textbackslash g__regex_balance_tl} there is an \texttt{x-type} expansion which is needed to get \#1 in correctly.

(End definition for \__regex_replacement_lbrace:N.)

45.6.6 Characters in replacement

Here, #1 is a letter among EMTUDPLOA and #2#3 denote the next character. Complain if we reach the end of the replacement or if the construction appears inside \{\ldots\} or \u{\ldots\}, and detect the case of a parenthesis. In that case, store the current category in a sequence and switch to a new one.

\cs_new_protected:Npn \__regex_replacement_cat:NNN #1#2#3
{\token_if_eq_meaning:NNTF \prg_do_nothing: #3 { \msg_error:nnn { replacement-catcode-end } #1 #3} \int_compare:nNnTF { \l__regex_replacement_csnames_int } > 0 { \msg_error:nnnn { replacement-catcode-in-cs } #1 #3} \__regex_two_if_eq:NNNNTF #2 #3 \__regex_replacement_normal:n {#1} \seq_push:NV \l__regex_replacement_categories_seq \l__regex_replacement_category_tl \tl_set:Nn \l__regex_replacement_category_tl {#1} \{ \token_if_eq_meaning:NNT \__regex_replacement_escaped:N

539
We now need to change the category code of the null character many times, hence work in a group. The catcode-specific macros below are defined in alphabetical order; if you are trying to understand the code, start from the end of the alphabet as those categories are simpler than active or begin-group.

\__regex_replacement_char:nNN

The only way to produce an arbitrary character–catcode pair is to use the \lowercase or \uppercase primitives. This is a wrapper for our purposes. The first argument is the null character with various catcodes. The second and third arguments are grabbed from the input stream: #3 is the character whose character code to reproduce. We could use \char_generate:nn but only for some catcodes (active characters and spaces are not supported).

\__regex_replacement_c_B:w

An explicit begin-group token increases the balance, unless within a \c{...} or \u{...} construction. Add the desired begin-group character, using the standard \if_false: trick. We eventually x-expand twice. The first time must yield a balanced token list, and the second one gives the bare begin-group token. The \exp_after:wN is not strictly needed, but is more consistent with \l3tl-analysis.
This is not quite catcode-related: when the user requests a character with category “control sequence”, the one-character control symbol is returned. As for the active character, we prepare for two x-expansions.

```latex
\char_set_catcode_math_subscript:N \^^@ \cs_new_protected:Npn \__regex_replacement_c_D:w { \__regex_replacement_char:nNN { \^^@ } }
```

Similar to the begin-group case, the second x-expansion produces the bare end-group token.

```latex
\char_set_catcode_group_end:N \^^@ \cs_new_protected:Npn \__regex_replacement_c_E:w { \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int \int_decr:N \l__regex_balance_int \fi: { \exp_not:n \if_false: \lif_false: \fi: } \exp_not:c {#2} } \exp_not:n { \if_false: { \fi: \^^@ } }
```

Simply \lowercase a letter null byte to produce an arbitrary letter.

```latex
\char_set_catcode_letter:N \^^@ \cs_new_protected:Npn \__regex_replacement_c_L:w { \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int \int_decr:N \l__regex_balance_int \fi: { \exp_not:n \if_false: \lif_false: \fi: \^^@ } }
```

No surprise here, we lowercase the null math toggle.

```latex
\char_set_catcode_math_toggle:N \^^@ \cs_new_protected:Npn \__regex_replacement_c_M:w { \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int \int_decr:N \l__regex_balance_int \fi: { \exp_not:n \if_false: \lif_false: \fi: \^^@ } }
```

    \cs_new_protected:Npn \__regex_replacement_c_U:w
    \__regex_replacement_char:nNN { \^^@ }

(End definition for \__regex_replacement_c_U:w.)
    \group_end:
45.6.7 An error

Simple error reporting by calling one of the messages replacement-c, replacement-g, or replacement-u.

```latex
\cs_new_protected:Npn \__regex_replacement_error:NNN #1#2#3
\msg_error:nnx { regex } { replacement-#1 } {#3} #2 #3
```

(End definition for \__regex_replacement_error:NNN.)

45.7 User functions

\regex_new:N

Before being assigned a sensible value, a regex variable matches nothing.

```latex
\cs_new_protected:Npn \regex_new:N #1
{ \cs_new_eq:NN #1 \c__regex_no_match_regex }
```

(End definition for \regex_new:N. This function is documented on page 54.)

\l_tmpa_regex \l_tmpb_regex \g_tmpa_regex \g_tmpb_regex

The usual scratch space.

```latex
\regex_new:N \l_tmpa_regex \regex_new:N \l_tmpb_regex \regex_new:N \g_tmpa_regex \regex_new:N \g_tmpb_regex
```

(End definition for \l_tmpa_regex and others. These variables are documented on page 59.)

\regex_set:Nn \regex_gset:Nn \regex_const:Nn

Compile, then store the result in the user variable with the appropriate assignment function.

```latex
\cs_new_protected:Npn \regex_set:Nn #1#2
\__regex_compile:n {#2} \tl_set_eq:NN #1 \l__regex_internal_regex
```

```latex
\cs_new_protected:Npn \regex_gset:Nn #1#2
\__regex_compile:n {#2} \tl_gset_eq:NN #1 \l__regex_internal_regex
```

```latex
\cs_new_protected:Npn \regex_const:Nn #1#2
\__regex_compile:n {#2} \tl_const:Nx #1 { \exp_not:o \l__regex_internal_regex }
```

(End definition for \regex_set:Nn, \regex_gset:Nn, and \regex_const:Nn. These functions are documented on page 54.)

\regex_show:n \regex_log:n

User functions: the n variant requires compilation first. Then show the variable with some appropriate text. The auxiliary \regex_show:n is defined in a different section.

```latex
\cs_new_protected:Npn \regex_show:n { \__regex_show:Nn \msg_show:nnxxxx }
```

```latex
\cs_new_protected:Npn \regex_log:n { \__regex_show:Nn \msg_log:nnxxxx }
```

```latex
\cs_new_protected:Npn \regex_show:N \regex_log:N \__regex_show:NN
```

\regcmd{\{\token_to_str:N\#2\}}{\}}
\regcmd{\{\l\__regex_internal_a_tl\}}{\}}

(End definition for \regex_show:n and others. These functions are documented on page 54.)

\regcmd{\regex_match:nn}{\#1}{\#2}{TF}
\regcmd{\regex_match:Nn}{\#1}{\#2}{TF}

Those conditionals are based on a common auxiliary defined later. Its first argument
builds the NFA corresponding to the regex, and the second argument is the query token
list. Once we have performed the match, convert the resulting boolean to \prg_return_-
true: or false.

\cs{\prg_new_protected_conditional:Npnn}{\regex_match:nn}{\#1}{\#2}{#1#2}{T,F,TF}
\cs{\prg_new_protected_conditional:Npnn}{\regex_match:Nn}{\#1}{\#2}{#1}{#2}{T,F,TF}

(End definition for \regex_match:nnTF and \regex_match:NnTF. These functions are documented on
page 55.)

\regcmd{\regex_count:nn}{\#1}{\#2}{N}
\regcmd{\regex_count:Nn}{\#1}{\#2}{N}

Again, use an auxiliary whose first argument builds the NFA.

\cs{\cs_new_protected:Npm}{\regex_count:nn}{\#1}{\#2}{#1}{N}
\cs{\cs_new_protected:Npm}{\regex_count:Nn}{\#1}{\#2}{#1}{N}

(End definition for \regex_count:nnN and \regex_count:NnN. These functions are documented on page
55.)

\regcmd{\regex_match_case:nn}{\#1}{\#2}{\#3}{n}
\regcmd{\regex_match_case:nn}{\#1}{\#2}{\#3}{nTF}

The auxiliary errors if \#1 has an odd number of items, and otherwise it sets \g\__regex_case_int
according to which case was found (zero if not found). The \texttt{true} branch leaves
the corresponding code in the input stream.

\cs{\cs_new_protected:Npm}{\regex_match_case:nn}{\#1}{\#2}{\#3}

544
We define here 40 user functions, following a common pattern in terms of :nnN auxiliaries, defined in the coming subsections. The auxiliary is handed \_\_regex_build:n or \_\_regex_build:N with the appropriate regex argument, then all other necessary arguments (replacement text, token list, etc. The conditionals call \_\_regex_return: to return either true or false once matching has been performed.

\cs_set_protected:Npn \regex_replace_case_once:nNTF #1#2
{|}
\int_if_odd:nTF { \tl_count:n {#1} }
{|}
{ \msg_error:nnxxxx { regex } { case-odd } {#2} { code } {#1} } {\tl_count:n {#1} }
{ \use_ii:nn }

If the input is bad (odd number of items) then take the false branch. Otherwise, use the same auxiliary as \regex_replace_once:nnN, but with more complicated code to build the automaton, and to find what replacement text to use. The \tl_item:nn is only expanded once we know the value of \g__regex_case_int, namely which case matched.

\cs_set_protected:Npn \regex_replace_case_once:nnN #1#2#3
{|}
{ \regex_replace_case_once:nN(TF) } { code } {#2} {#3} }
{ \regex_replace_case_once:nnN #1#2#3 }
{ \regex_replace_case_once:nnN #1#2 } {#1} }{|}
}
If the input is bad (odd number of items) then take the false branch. Otherwise, use the same auxiliary as \texttt{\regex_replace_all:nnN}, but with more complicated code to build the automaton, and to find what replacement text to use.

```
\cs_new_protected:Npn \regex_case_replace_all:nNTF #1#2
    { \int_if_odd:nTF { \tl_count:n {#1} } 
      { \msg_error:nnxxxx { regex } { case-odd } 
        { \token_to_str:N \regex_case_replace_all:n(TF) } { code } 
        { \tl_count:n {#1} } { \tl_to_str:n {#1} } 
        \use_ii:nn }
      { \_regex_replace_all_aux:nnN 
        { \_regex_case_build:x { \_regex_tl_odd_items:n {#1} } } 
        { \_regex_case_replacement:x { \_regex_tl_even_items:n {#1} } } 
        #2 }
      \bool_if:NTF \g__regex_success_bool }
\cs_new_protected:Npn \regex_case_replace_all:nN #1#2
    { \regex_replace_case_all:nNTF {#1} {#2} { } { } }
\cs_new_protected:Npn \regex_case_replace_all:nNF #1#2
    { \regex_replace_case_all:nNTF {#1} {#2} }{ }
```

(End definition for \texttt{\regex_case_replace_all:nNTF}. This function is documented on page 58.)

\subsection{Variables and helpers for user functions}

The number of matches found so far is stored in \texttt{\l__regex_match_count_int}. This is only used in the \texttt{\regex_count:nnN} functions.

```
\int_new:N \l__regex_match_count_int
```
Those flags are raised to indicate begin-group or end-group tokens that had to be added when extracting submatches.

```
\flag_new:n { __regex_begin }
\flag_new:n { __regex_end }
```

(End definition for \verb*{__regex_begin} and \verb*{__regex_end}.)

The end-points of each submatch are stored in two arrays whose index \verb*{submatch} ranges from \verb*{\l__regex_min_submatch_int} (inclusive) to \verb*{\l__regex_submatch_int} (exclusive). Each successful match comes with a 0-th submatch (the full match), and one match for each capturing group: submatches corresponding to the last successful match are labeled starting at \verb*{zeroth_submatch}. The entry \verb*{\l__regex_zeroth_submatch_int} in \verb*{\g__regex_submatch_prev_intarray} holds the position at which that match attempt started: this is used for splitting and replacements.

```
\int_new:N \l__regex_min_submatch_int
\int_new:N \l__regex_submatch_int
\int_new:N \l__regex_zeroth_submatch_int
```

(End definition for \verb*{\l__regex_min_submatch_int}, \verb*{\l__regex_submatch_int}, and \verb*{\l__regex_zeroth_submatch_int}.)

Hold the place where the match attempt begun, the end-points of each submatch, and which regex case the match corresponds to, respectively.

```
\intarray_new:Nn \g__regex_submatch_prev_intarray { 65536 }
\intarray_new:Nn \g__regex_submatch_begin_intarray { 65536 }
\intarray_new:Nn \g__regex_submatch_end_intarray { 65536 }
\intarray_new:Nn \g__regex_submatch_case_intarray { 65536 }
```

(End definition for \verb*{\g__regex_submatch_prev_intarray} and others.)

The first thing we do when matching is to store the balance of begin-group/end-group characters into \verb*{\g__regex_balance_intarray}.

```
\intarray_new:Nn \g__regex_balance_intarray { 65536 }
```

(End definition for \verb*{\g__regex_balance_intarray}.)

Keep track of the number of left/right braces to add when performing a regex operation such as a replacement.

```
\int_new:N \l__regex_added_begin_int
\int_new:N \l__regex_added_end_int
```

(End definition for \verb*{\l__regex_added_begin_int} and \verb*{\l__regex_added_end_int}.)

This function triggers either \verb*{\prg_return_false}: or \verb*{\prg_return_true}: as appropriate to whether a match was found or not. It is used by all user conditionals.

```
\cs_new_protected:Npn \__regex_return: {\if_meaning:w \c_true_bool \g__regex_success_bool \prg_return_true: \else: \prg_return_false: \fi: }
```
To easily extract subsets of the input once we found the positions at which to cut, store the input tokens one by one into successive \texttt{toks} registers. Also store the brace balance (used to check for overall brace balance) in an array.

\begin{verbatim}
\cs_new_protected:Npn \__regex_query_set:n #1 \{ \int_zero:N \l__regex_balance_int \int_zero:N \l__regex_curr_pos_int \__regex_query_set_aux:nN \tl_analysis_map_inline:nn \{ \__regex_query_set_aux:nN \tl_count:n \{ #1 \} \} \tl_analysis_map_inline:nn \{ \__regex_query_set_aux:nN \tl_count:n \{ #1 \} \} \int_set_eq:NN \l__regex_max_pos_int \l__regex_curr_pos_int \}
\cs_new_protected:Npn \__regex_query_set_aux:nN #1#2 \{ \int_incr:N \l__regex_curr_pos_int \__regex_toks_set:Nn \l__regex_curr_pos_int {#1} \__kernel_intarray_gset:Nnn \g__regex_balance_intarray { \l__regex_curr_pos_int } { \l__regex_balance_int } \if_case:w \#2 \exp_stop_f: \or: \int_incr:N \l__regex_balance_int \or: \int_decr:N \l__regex_balance_int \fi: \}
\end{verbatim}

(End definition for \texttt{\__regex_query_set:n} and \texttt{\__regex_query_set_aux:nN}.)

\subsection{Matching}

\texttt{\__regex_if_match:nn} We don't track submatches, and stop after a single match. Build the NFA with \texttt{#1}, and perform the match on the query \texttt{#2}.

\begin{verbatim}
\cs_new_protected:Npn \__regex_if_match:nn #1#2 \{ \group_begin: \__regex_disable_submatches: \__regex_if_match:n \l__regex_match:n \{ \tl_count:n \{ #1 \} \} \group_end:
\end{verbatim}

(End definition for \texttt{\__regex_if_match:nn}.)

\texttt{\__regex_match_case:nnTF \__regex_match_case_aux:nn} The code would get badly messed up if the number of items in \texttt{#1} were not even, so we catch this case, then follow the same code as \texttt{\regex_match:nnTF} but using \texttt{\__regex_case_build:n} and without returning a result.

\begin{verbatim}
\cs_new_protected:Npn \__regex_match_case:nnTF #1#2 \{ \int_if_odd:nTF { \tl_count:n \{ #1 \} } \{ \msg_error:nnxxxx { regex } { case-odd } \} \{ \token_to_str:N \regex_match_case:nnTF \} \}
\end{verbatim}

548
Again, we don’t care about submatches. Instead of aborting after the first “longest match” is found, we search for multiple matches, incrementing \l__regex_match_count_int every time to record the number of matches. Build the NFA and match.
At the end, store the result in the user’s variable.

\begin{verbatim}
\cs_new_protected:Npn \__regex_count:nnN #1#2#3 {
    \group_begin:
    \__regex_disable_submatches:
    \int_zero:N \l__regex_match_count_int
    \__regex_multi_match:n { \int_incr:N \l__regex_match_count_int }
    \__regex_match:n {#2}
    \exp_args:NNNo
    \group_end:
    \int_set:Nn #3 { \int_use:N \l__regex_match_count_int }
}
\end{verbatim}

\textit{(End definition for \__regex_count:nnN.)}

\subsection*{45.7.3 Extracting submatches}

\begin{verbatim}
\cs_new_protected:Npm \__regex_extract_once:nnN #1#2#3 {
    \group_begin:
    \__regex_single_match:
        #1
    \__regex_match:n {#2}
    \__regex_extract:
    \__regex_query_set:n {#2}
    \__regex_group_end_extract_seq:N #3
}
\end{verbatim}

\begin{verbatim}
\cs_new_protected:Npm \__regex_extract_all:nnN #1#2#3 {
    \group_begin:
    \__regex_multi_match:n { \__regex_extract: }
        #1
    \__regex_match:n {#2}
}
\end{verbatim}

549
\_\_regex_split:nnN Splitting at submatches is a bit more tricky. For each match, extract all submatches, and replace the zeroth submatch by the part of the query between the start of the match attempt and the start of the zeroth submatch. This is inhibited if the delimiter matched an empty token list at the start of this match attempt. After the last match, store the last part of the token list, which ranges from the start of the match attempt to the end of the query. This step is inhibited if the last match was empty and at the very end: decrement \l__regex_submatch_int, which controls which matches will be used.

\cs_new_protected:Npn \__regex_split:nnN #1#2#3
{\group_begin:}
\__regex_multi_match:n
{\if_int_compare:w
   \l__regex_start_pos_int < \l__regex_success_pos_int
\__regex_extract:
\__kernel_intarray_gset:Nnn \g__regex_submatch_prev_intarray { \l__regex_zeroth_submatch_int } { 0 }
\__kernel_intarray_gset:Nnn \g__regex_submatch_end_intarray { \l__regex_zeroth_submatch_int }
{ \l__kernel_intarray_item:Nn \g__regex_submatch_begin_intarray { \l__regex_zeroth_submatch_int }
\__kernel_intarray_gset:Nnn \g__regex_submatch_begin_intarray { \l__regex_start_pos_int }
\fi:}{#1}{\__regex_match:n #2}
\__regex_query_set:n #2
\__regex_group_end_extract_seq:N #3

(End definition for \_\_regex_extract_once:nnN and \_\_regex_extract_all:nnN.)
The end-points of submatches are stored as entries of two arrays from \texttt{\_regex_min_submatch_int} to \texttt{\_regex_submatch_int} (exclusive). Extract the relevant ranges into \texttt{\_regex_internal_tl}, separated by \texttt{\_regex_tmp:w \{\}}. We keep track in the two flags \texttt{\_regex_begin} and \texttt{\_regex_end} of the number of begin-group or end-group tokens added to make each of these items overall balanced. At this step, \texttt{\_regex_extract_check:w}, explained later. After complaining about any begin-group or end-group tokens we had to add, we are ready to construct the user’s sequence outside the group.

\begin{verbatim}
\cs_new_protected:Npn \_regex_group_end_extract_seq:N #1 {
  \flag_clear:n { \_regex_begin }
  \flag_clear:n { \_regex_end }
  \cs_set_eq:NN \__regex_tmp:w \scan_stop:
  \__kernel_tl_gset:Nx \g__regex_internal_tl { \int_step_function:nnN { \l__regex_min_submatch_int } { \l__regex_submatch_int - 1 } \_regex_extract_seq_aux:n \__regex_tmp:w }
  \int_set:Nn \l__regex_added_begin_int { \flag_height:n { \_regex_begin } }
  \int_set:Nn \l__regex_added_end_int { \flag_height:n { \_regex_end } }
  \tex_afterassignment:D \_regex_extract_check:w \__kernel_tl_gset:Nx \g__regex_internal_tl { \g__regex_internal_tl \if_false: { \fi: } }
  \int_compare:nNnT { \l__regex_added_begin_int + \l__regex_added_end_int } > 0 {
    \msg_error:nnxxx { regex } { result-unbalanced } { splitting-or-extracting-submatches } { \int_use:N \l__regex_added_begin_int } { \int_use:N \l__regex_added_end_int }
  }
  \group_end:
}
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \_regex_extract_seq_aux:n \_regex_extract_seq_aux:ww {
  \_regex_extract_seq_aux:ww { \_regex_extract_seq_aux:ww }
  \_regex_extract_seq_aux:ww { \_regex_extract_seq_aux:ww }
}
\end{verbatim}

The :n auxiliary builds one item of the sequence of submatches. First compute the brace balance of the submatch, then extract the submatch from the query, adding the appropriate braces and raising a flag if the submatch is not balanced.

\begin{verbatim}
\cs_new:Npn \_regex_extract_seq_aux:n #1 {
  \_regex_tmp:w \{ }
  \exp_after:wN \_regex_extract_seq_aux:ww
  \int_value:w \_regex_submatch_balance:n \{#1\} \; #1;
\end{verbatim}
\cs_new:Npn \__regex_extract_seq_aux:ww #1; #2;
{
  \if_int_compare:w #1 < \c_zero_int
  \prg_replicate:nn {-#1}
  \flag_raise:n { __regex_begin }
  \exp_not:n { \if_false: } \fi: }
  \fi:
  \__regex_query_submatch:n {#2}
\if_int_compare:w #1 > \c_zero_int
  \prg_replicate:nn {#1}
  \flag_raise:n { __regex_end }
  \exp_not:n { \if_false: { \fi: } }
\fi:
\__regex_extract_check:w
\__regex_extract_check:n #1
\tl_if_empty:nF {#1}
\int_incr:N \l__regex_added_begin_int
\int_incr:N \l__regex_added_end_int
\tex_afterassignment:D \__regex_extract_check:w
\__kernel_tl_gset:Nx \g__regex_internal_tl
\exp_after:wN \__regex_extract_check_loop:w
\__regex_tmp:w \__regex_extract_check_end:w #1
\tl_if_empty:nF {#1}
\int_incr:N \l__regex_added_begin_int
\int_incr:N \l__regex_added_end_int
\tex_afterassignment:D \__regex_extract_check:w
\__kernel_tl_gset:Nx \g__regex_internal_tl
\exp_after:wN \__regex_extract_check_loop:w
\__regex_tmp:w \__regex_extract_check_end:w #1
}

(End definition for \__regex_extract_seq_aux:n and \__regex_extract_seq_aux:ww.)

In \__regex_group_end_extract_seq:N we had to expand \g__regex_internal_tl to turn \if_false: constructions into actual begin-group and end-group tokens. This is done with a \__kernel_tl_gset:Nx assignment, and \__regex_extract_check:w is run immediately after this assignment ends, thanks to the \afterassignment primitive. If all of the items were properly balanced (enough begin-group tokens before end-group tokens, so \{ is not) then \__regex_extract_check:w is called just before the closing brace of the \__kernel_tl_gset:Nx (thanks to our sneaky \if_false: { \fi: } construction), and finds that there is nothing left to expand. If any of the items is unbalanced, the assignment gets ended early by an extra end-group token, and our check finds more tokens needing to be expanded in a new \__kernel_tl_gset:Nx assignment. We need to add a begin-group and an end-group tokens to the unbalanced item, namely to the last item found so far, which we reach through a loop.

\cs_new_protected:Npn \__regex_extract_check:w
{\exp_after:wN \__regex_extract_check:n
  \exp_after:wN { \if_false: } \fi: }
\cs_new_protected:Npn \__regex_extract_check:n #1
{\tl_if_empty:nF {#1}
  \int_incr:N \l__regex_added_begin_int
  \int_incr:N \l__regex_added_end_int
  \tex_afterassignment:D \__regex_extract_check:w
  \__kernel_tl_gset:Nx \g__regex_internal_tl
  \exp_after:wN \__regex_extract_check_loop:w
  \__regex_tmp:w \__regex_extract_check_end:w #1
  \tl_if_empty:nF {#1}
  \int_incr:N \l__regex_added_begin_int
  \int_incr:N \l__regex_added_end_int
  \tex_afterassignment:D \__regex_extract_check:w
  \__kernel_tl_gset:Nx \g__regex_internal_tl
  \exp_after:wN \__regex_extract_check_loop:w
  \__regex_tmp:w \__regex_extract_check_end:w #1
}
\__regex_extract_check_loop:w \#1 \__regex_tmp:w \#2
\{ 
  \#2
  \exp_not:o \{#1\}
  \__regex_tmp:w { }
  \__regex_extract_check_loop:w \prg_do_nothing:
\}

Arguments of \__regex_extract_check_end:w are: \#1 is the part of the item before the extra end-group token; \#2 is junk; \#3 is \prg_do_nothing: followed by the not-yet-expanded part of the item after the extra end-group token. In the replacement text, the first brace and the \if_false: { \fi: } construction are the added begin-group and end-group tokens (the latter being not-yet expanded, just like \#3), while the closing brace after \exp_not:o \{#1\} replaces the extra end-group token that had ended the assignment early. In particular this means that the character code of that end-group token is lost.

\__regex_extract_map:N \__regex_extract_map_aux:NNn \__regex_extract_map_loop:w
This receives a seq internal function and maps it over all items in \g__regex_internal_tl. This token list takes the form \__regex_tmp:w {} \langle item_1 \rangle \__regex_tmp:w {} \langle item_2 \rangle \ldots \__regex_tmp:w, and the calling code has set \__regex_tmp:w equal to \__regex_extract_map_loop:w. The loop is otherwise pretty standard, with \prg_do_nothing: to avoid losing braces.

\__regex_extract:w \__regex_extract_aux:w
Our task here is to store the list of end-points of submatches, and store them in appropriate array entries, from \l__regex_zeroth_submatch_int upwards. First, we store in \g__regex_submatch_prev_intarray the position at which the match attempt started. We extract the rest from the comma list \l__regex_success_submatches_tl, which
starts with entries to be stored in \g__regex_submatch_begin_intarray and continues
with entries for \g__regex_submatch_end_intarray.

\begin{verbatim}
\cs_new_protected:Npn \__regex_extract:
{
  \if_meaning:w \c_true_bool \g__regex_success_bool
    \int_set_eq:NN \l__regex_zeroth_submatch_int \l__regex_submatch_int
    \prg_replicate:nn \l__regex_capturing_group_int
      { \__kernel_intarray_gset:Nnn \g__regex_submatch_prev_intarray
        { \l__regex_submatch_int } { 0 }
      }
      \__kernel_intarray_gset:Nnn \g__regex_submatch_case_intarray
      { \l__regex_submatch_int } { 0 }
      \int_incr:N \l__regex_submatch_int
    }
  \else:
    \__kernel_intarray_gset:Nnn \g__regex_submatch_prev_intarray
    { \__regex_int_eval:w \l__regex_zeroth_submatch_int + \l__regex_internal_a_int } {#1}
    \else:
      \__kernel_intarray_gset:Nnn \g__regex_submatch_end_intarray
      { \__regex_int_eval:w \l__regex_zeroth_submatch_int + \l__regex_internal_a_int - \l__regex_capturing_group_int } {#1}
  \fi:
  \__kernel_intarray_gset:Nnn \g__regex_submatch_prev_intarray
  { \l__regex_zeroth_submatch_int } { \l__regex_start_pos_int }
  \__kernel_intarray_gset:Nnn \g__regex_submatch_case_intarray
  { \l__regex_zeroth_submatch_int } { \g__regex_case_int }
  \int_zero:N \l__regex_internal_a_int
  \exp_after:wN \__regex_extract_aux:w \l__regex_success_submatches_tl
  \prg_break_point: \__regex_use_none_delimit_by_q_recursion_stop:w ,
  \q\__regex_recursion_stop
\fi:
\end{verbatim}

(End definition for \__regex_extract: and \__regex_extract_aux:w.)

## 45.7.4 Replacement

Build the NFA and the replacement functions, then find a single match. If the match failed,
simply exit the group. Otherwise, we do the replacement. Extract submatches. Compute
the brace balance corresponding to replacing this match by the replacement (this depends
on submatches). Prepare the replaced token list: the replacement function produces the
tokens from the start of the query to the start of the match and the replacement text for
this match; we need to add the tokens from the end of the match to the end of the query.
Finally, store the result in the user’s variable after closing the group: this step involves
an additional \textit{x}-expansion, and checks that braces are balanced in the final result.

\begin{verbatim}
\cs_new_protected:Npn \__regex_replace_once:nnN \__regex_replace_once_aux:nnN
{ \__regex_replace_once_aux:nnN \__regex_replacement:n {#2} }
\cs_new_protected:Npn \__regex_replace_once_aux:nnN
{ \prg_break: #1 \prg_break_point:
  \if_int_compare:w \l__regex_internal_a_int < \l__regex_capturing_group_int
    \__kernel_intarray_gset:Nnn \g__regex_submatch_begin_intarray
    { \l__regex_zeroth_submatch_int } \l__regex_start_pos_int
    \else:
      \__kernel_intarray_gset:Nnn \g__regex_submatch_end_intarray
      { \l__regex_zeroth_submatch_int } \l__regex_start_pos_int - \l__regex_capturing_group_int
  \fi:
  \int_incr:N \l__regex_internal_a_int
  \__regex_extract_aux:w
\end{verbatim}
Match multiple times, and for every match, extract submatches and additionally store the position at which the match attempt started. The entries from \_\_regex_min_submatch_int to \_\_regex_submatch_int hold information about submatches of every match in order; each match corresponds to \_\_regex_capturing_group_int consecutive entries. Compute the brace balance corresponding to doing all the replacements: this is the sum of brace balances for replacing each match. Join together the replacement texts for each match (including the part of the query before the match), and the end of the query.

\cs_new_protected:Npn \_\_regex_replace_all:nnNN #1#2
  { \_\_regex_replace_all_aux:nnNN (#1) { \_\_regex_replacement:n (#2) } }
At this stage `\l__regex_internal_a_tl` (x-expands to the desired result). Guess from `\l__regex_balance_int` the number of braces to add before or after the result then try expanding. The simplest case is when `\l__regex_internal_a_tl` together with the braces we insert via `\prg_replicate:nn` give a balanced result, and the assignment ends at the `\if_false: \fi:` construction: then `\l__regex_group_end_replace_check:w` sees that there is no material left and we successfully found the result. The harder case is that expanding `\l__regex_internal_a_tl` may produce extra closing braces and end the assignment early. Then we grab the remaining code using; importantly, what follows has not yet been expanded so that `\l__regex_group_end_replace_check:n` grabs everything until the last brace in `\l__regex_group_end_replace_try:`, letting us try again with an extra surrounding pair of braces.

\_l__regex_peek_true_tl True/false code arguments of \peek_regex:nTF or similar.
\_l__regex_peek_false_tl
\_l__regex_peek_true_tl
\_l__regex_peek_false_tl

(End definition for \_l__regex_peek_true_tl and \_l__regex_peek_false_tl.)

\_l__regex_replacement_tl
\_l__regex_input_tl
\_regex_input_item:n Stores each token found as \_regex_input_item:n \{\langle tokens\rangle\}, where the \langle tokens\rangle o-
expand to the token found, as for \tl_analysis_map_inline:nn.
\_l__regex_input_tl
\_regex_input_item:n
\_regex_input_tl

(End definition for \_l__regex_input_tl and \_regex_input_item:n.)

\peek_regex:nTF \peek_regex:NTF \peek_regex_remove_once:nTF \peek_regex_remove_once:NTF

The T and F functions just call the corresponding TF function. The four TF functions differ
along two axes: whether to remove the token or not, distinguished by using \_regex_-_peek_end: or \_regex_peek_remove_end:n (the latter case needs an argument, as we
will see), and whether the regex has to be compiled or is already in an N-type variable,
distinguished by calling \_regex_build_aux:N or \_regex_build_aux:NN. The first
argument of these functions is \_false_bool to indicate that there should be no implicit
insertion of a wildcard at the start of the pattern: otherwise the code would keep looking
further into the input stream until matching the regex.
\cs_new_protected:Npn \peek_regex:nTF #1
\c_false_bool
\_\_regex_peek:nnTF
\_\_regex_peek_aux:nnTF

Store the user’s true/false codes (plus `\group_end:`) into two token lists. Then build the automaton with \#1, without submatch tracking, and aiming for a single match. Then start matching by setting up a few variables like for any regex matching like `\regex_match:nnTF`, with the addition of `\l\_\_regex_input_tl` that keeps track of the tokens seen, to reinsert them at the end. Instead of `\tl_analysis_map_inline:nn` on the input, we call `\peek_analysis_map_inline:n` to go through tokens in the input stream. Since `\_\_regex_match_one_token:nnN` calls `\_\_regex_maplike_break`: we need to catch that and break the `\peek_analysis_map_inline:n` loop instead.

(End definition for `\peek_regex:nnTF` and others. These functions are documented on page 194.)
\cs_new_protected:Npn \__regex_peek_aux:nnTF #1#2#3#4

\__regex_peek_remove_end:n #1
(End definition for \__regex_peek:nnTF and \__regex_peek_aux:nnTF.)

\__regex_end: \__regex_remove_end:n

Once the regex matches (or permanently fails to match) we call \__regex_end:; or \__regex_remove_end:n with argument the last token seen. For \peek_regex:nnTF we reinsert tokens seen by calling \__regex_reinsert:N regardless of the result of the match. For \peek_regex_remove_once:nnTF we reinsert the tokens seen only if the match failed; otherwise we just reinsert the tokens #1, with one expansion. To be more precise, #1 consists of tokens that \exp_not:N -expand and \exp_x:N -expand to the last token seen, for example it is \exp_not:N \langle cs \rangle for a control sequence. This means that just doing \exp_after:wN \l__regex_peek_true_tl #1 would be unsafe because the expansion of \langle cs \rangle would be suppressed.

\__regex_peek_replace:nnTF
\__regex_peek_replace:nn Same as \__regex_peek:nnTF (used for \peek_regex:nTF above), but without disabling submatches, and with a different end. The replacement text #2 is stored, to be analyzed later.
\__regex_peek_replace_end: If the match failed \__regex_peek_reinsert:N reinserts the tokens found. Otherwise, finish storing the submatch information using \__regex_extract:, and store the input into \toks. Redefine a few auxiliaries to change slightly their expansion behaviour as explained below. Analyse the replacement text with \__regex_replacement:n, which as usual defines \__regex_replacement_do_one_match:n to insert the tokens from the
Start of the match attempt to the beginning of the match, followed by the replacement text. The \use:x expands for instance the trailing \_regex_query_range:nn down to a sequence of \_regex_reinsert_item:{⟨tokens⟩} where ⟨tokens⟩ o-expand to a single token that we want to insert. After x-expansion, \use:x does \use:n, so we have \exp_after:wN \l__regex_peek_true_tl \exp:w ... \exp_end:. This is set up such as to obtain \l__regex_peek_true_tl followed by the replaced tokens (possibly unbalanced) in the input stream.

\}
\cs_new_protected:Npn \_regex_query_set_item:n #1
\_regex_peek_replacement_put:n While building the replacement function \_regex_replacement_do_one_match:n, we often want to put simple material, given as \#1, whose x-expansion o-expands to a single token. Normally we can just add the token to \_regex_build_tl, but for \peek_-regex_replace_once:nnTF we eventually want to do some strange expansion that is basically using \exp_after:wN to jump through numerous tokens (we cannot use x-expansion like for \regex_replace_once:nnNTF because it is ok for the result to be unbalanced since we insert it in the input stream rather than storing it. When within a csname we don’t do any such shenanigan because \cs:w ... \cs_end: does all the expansion we need.

\cs_new_protected:Npn \_regex_peek_replacement_put:n #1
\fi:
\else:
\tl_build_put_right:Nn \l__regex_build_tl {#1}
\fi:

(End definition for \_regex_peek_replacement_put:n.)

\_regex_peek_replacement_token:n When hit with \exp:w, \_regex_peek_replacement_token:n \{\(\text{token}\}\} stops \exp_-end: and does \exp_after:wN \{\(\text{token}\)\} \exp:w to continue expansion after it.

\cs_new_protected:Npn \_regex_peek_replacement_token:n #1
\exp_after:wN \exp_end: \exp_after:wN #1 \exp:w }

(End definition for \_regex_peek_replacement_token:n.)

\_regex_peek_replacement_put_submatch_aux:n While analyzing the replacement we also have to insert submatches found in the query. Since query items \_regex_input_item:n \{\(\text{tokens}\)\} expand correctly only when surrounded by \exp:w ... \exp_end:, and since these expansion controls are not there within csnames (because \cs:w ... \cs_end: make them unnecessary in most cases), we have to put \exp:w and \exp:end: by hand here.

\}
(End definition for \__regex_trace_push:nnN, \__regex_trace_pop:nnN, and \__regex_trace:nnx.)

\g__regex_trace_regex_int
No tracing when that is zero.
\int_new:N \g__regex_trace_regex_int
(End definition for \g__regex_trace_regex_int.)
This function lists the contents of all states of the NFA, stored in \texttt{toks} from 0 to \texttt{\_\_regex_max_state_int} (excluded).

\begin{verbatim}
cs_new_protected:Npn \_regex_trace_states:n #1
{
\int_step_inline:nnn
\l__regex_min_state_int
{ \l__regex_max_state_int - 1 }
{
\_regex_trace:nnx { regex } {#1}
{ \low_char:N \texttt{toks} ##1 = { \_\_regex_toks_use:w ##1 } }
}
}
\end{verbatim}

(End definition for \texttt{\_regex_trace_states:n}.)
Chapter 46

l3prg implementation

The following test files are used for this code: m3prg001.lvt,m3prg002.lvt,m3prg003.lvt.

46.1 Primitive conditionals

Those two primitive \TeX conditionals are synonyms. \texttt{\if_bool:N} is defined in \texttt{l3basics}, as it’s needed earlier to define quark test functions.

\begin{verbatim}
\cs_new_eq:NN \if_predicate:w \tex_ifodd:D
\end{verbatim}

(End definition for \texttt{\if_bool:N} and \texttt{\if_predicate:w}. These functions are documented on page \texttt{70}.)

46.2 Defining a set of conditional functions

These are all defined in \texttt{l3basics}, as they are needed “early”. This is just a reminder!

(End definition for \texttt{\prg_set_conditional:Npnn} and others. These functions are documented on page \texttt{62}.)

46.3 The boolean data type

Boolean variables have to be initiated when they are created. Other than that there is not much to say here.

\begin{verbatim}
\cs_new_protected:Npn \bool_new:N #1 { \cs_new_eq:NN #1 \c_false_bool }
\cs_new_protected:Npn \bool_new:Nn #1 #2 { \__kernel_chk_if_free_cs:N #1 \tex_global:D \tex_chardef:D #1 = \bool_if_p:n {#2} }
\cs_generate_variant:Nn \bool_new:N { c }
\end{verbatim}

(End definition for \texttt{\bool_new:N}. This function is documented on page \texttt{65}.)

A merger between \texttt{\tl_const:Nn} and \texttt{\bool_set:Nn}.

\begin{verbatim}
\cs_new_protected:Npm \bool_set:Nn \tl_const:Nn \bool_set:Nn \tl_const:Nn \bool_set:Nn \tl_const:Nn
\end{verbatim}

571
Setting is already pretty easy. When check-declarations is active, the definitions are patched to make sure the boolean exists. This is needed because booleans are not based on token lists nor on T\TeX registers.

\begin{verbatim}
\bool_set_true:N  { \cs_set_eq:NN \c_true_bool }
\bool_set_false:N  { \cs_set_eq:NN \c_false_bool }
\bool_gset_true:N  { \cs_gset_eq:NN \c_true_bool }
\bool_gset_false:N  { \cs_gset_eq:NN \c_false_bool }
\end{verbatim}

The usual copy code. While it would be cleaner semantically to copy the \cs_set_eq:NN family of functions, we copy \tl_set_eq:NN because that has the correct checking code.

\begin{verbatim}
\bool_set_eq:NN \tl_set_eq:NN
\bool_set_eq:cN \tl_set_eq:cN
\bool_set_eq:Nc \tl_set_eq:Nc
\bool_gset_eq:NN \tl_gset_eq:NN
\bool_gset_eq:cN \tl_gset_eq:cN
\end{verbatim}

This function evaluates a boolean expression and assigns the first argument the meaning \c_true_bool or \c_false_bool. Again, we include some checking code. It is important to evaluate the expression before applying the \chardef primitive, because that primitive sets the left-hand side to \scan_stop: before looking for the right-hand side.

\begin{verbatim}
\bool_set:Nn  \exp_last_unbraced:NNNf
\bool_set:cn \exp_last_unbraced:NNNf
\end{verbatim}
46.4 Internal auxiliaries

\q__bool_recursion_tail
\q__bool_recursion_stop

Internal recursion quarks.

\quark_new:N \q__bool_recursion_tail
\quark_new:N \q__bool_recursion_stop

(End definition for \q__bool_recursion_tail and \q__bool_recursion_stop.)

\bool_use_i_delimit_by_q_recursion_stop:nw

Functions to gobble up to a quark.

\cs_new:Npn \__bool_use_i_delimit_by_q_recursion_stop:nw
  \#1 \#2 \q__bool_recursion_stop {\#1}

(End definition for \__bool_use_i_delimit_by_q_recursion_stop:nw.)

\__bool_if_recursion_tail_stop_do:nn

Functions to query recursion quarks.

\__kernel_quark_new_test:N \__bool_if_recursion_tail_stop_do:nn

(End definition for \__bool_if_recursion_tail_stop_do:nn.)

\bool_if_p:N \bool_if_p:c
\bool_if:N \bool_if:c TF
\bool_if:c

Straight forward here. We could optimize here if we wanted to as the boolean can just be input directly.

\prg_new_conditional:Npnn \bool_if:N #1 { p , T , F , TF }
\prg_generate_conditional_variant:Nnn \bool_if:N { c } { p , T , F , TF }

(End definition for \bool_if:NTF. This function is documented on page 65.)

\bool_to_str:N \bool_to_str:c \bool_to_str:n

Expands to true or false with category code letter.

\cs_new:Npn \bool_to_str:N \#1 \#2
  { \if_bool:N #1 \prg_return_true: \else: \prg_return_false: \fi: }
\cs_new:Npn \bool_to_str:n { \bool_if:nTF {#1} { true } { false } }
\cs_generate_variant:Nn \bool_to_str:N { c }
\cs_generate_variant:Nn \bool_to_str:n { c }

(End definition for \bool_to_str:N and \bool_to_str:n. These functions are documented on page 65.)

\bool_show:n \bool_show:c \bool_log:n \bool_log:c \__bool_show:NN

Show the truth value of the boolean.

\cs_new_protected:Npn \bool_show:n
  \{ \msg_show_eval:Nn \bool_to_str:n \}
\cs_new_protected:Npn \bool_show:c

\l\_tmpa\_bool\ 
\l\_tmpb\_bool
\g\_tmpa\_bool
\g\_tmpb\_bool

A few booleans just if you need them.
\bool\_new:N \l\_tmpa\_bool
\bool\_new:N \l\_tmpb\_bool
\bool\_new:N \g\_tmpa\_bool
\bool\_new:N \g\_tmpb\_bool

(End definition for \l\_tmpa\_bool and others. These variables are documented on page 66.)

\bool\_if\_exist\_p:N
\bool\_if\_exist\_p:c
\bool\_if\_exist:N\_TF
\bool\_if\_exist:c\_TF

Copies of the cs functions defined in l3basics.
\prg\_new\_eq\_conditional:NNn \bool\_if\_exist:N \cs\_if\_exist:N
\prg\_new\_eq\_conditional:NNn \bool\_if\_exist:c \cs\_if\_exist:c

(End definition for \bool\_if\_exist:N\_TF. This function is documented on page 66.)

46.5 Boolean expressions

\bool\_if\_p:n
\bool\_if\_p:TF

Evaluating the truth value of a list of predicates is done using an input syntax somewhat similar to the one found in other programming languages with ( and ) for grouping, ! for logical “Not”, && for logical “And” and || for logical “Or”. However, they perform eager evaluation. We shall use the terms Not, And, Or, Open and Close for these operations.

Any expression is terminated by a Close operation. Evaluation happens from left to right in the following manner using a GetNext function:

- If an Open is seen, start evaluating a new expression using the Eval function and call GetNext again.
- If a Not is seen, remove the ! and call a GetNext function with the logic reversed.
- If none of the above, reinsert the token found (this is supposed to be a predicate function) in front of an Eval function, which evaluates it to the boolean value (true) or (false).

The Eval function then contains a post-processing operation which grabs the instruction following the predicate. This is either And, Or or Close. In each case the truth value is used to determine where to go next. The following situations can arise:
\textbf{true} \textit{And} Current truth value is true, logical \textit{And} seen, continue with \texttt{GetNext} to examine truth value of next boolean (sub-)expression.

\textbf{false} \textit{And} Current truth value is false, logical \textit{And} seen, stop using the values of predicates within this sub-expression until the next \texttt{Close}. Then return \textbf{false}.

\textbf{true} \textit{Or} Current truth value is true, logical \textit{Or} seen, stop using the values of predicates within this sub-expression until the nearest \texttt{Close}. Then return \textbf{true}.

\textbf{false} \textit{Or} Current truth value is false, logical \textit{Or} seen, continue with \texttt{GetNext} to examine truth value of next boolean (sub-)expression.

\textbf{true} \textit{Close} Current truth value is true, \texttt{Close} seen, return \textbf{true}.

\textbf{false} \textit{Close} Current truth value is false, \texttt{Close} seen, return \textbf{false}.

\begin{verbatim}
\prg_new_conditional:Nnnn \bool_if:n #1 { T , F , TF }
\{
 \if_predicate:w \bool_if_p:n {#1}
 \prg_return_true:
 \else:
 \prg_return_false:
 \fi:
\}
(End definition for \texttt{\bool_if:n}. This function is documented on page 67.)
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \bool_if_p:n { \exp_args:Nf \__bool_if_p:n }
\cs_new:Npn \__bool_if_p:n #1
{ \tl_if_empty:oT { \use_none:nn #1 . } { \__bool_if_p_aux:w } \group_align_safe_begin:
 \exp_after:wN \group_align_safe_end:
 \exp:w \exp_end_continue_f:w % ( \__bool_if_p:n \use:i:nmmn #1 )
\}
\cs_new:Npn \__bool_if_p_aux:w #1 \use_i:nmmn #2#3
{ \bool_if:NTF #2 \c_true_bool \c_false_bool }
(End definition for \texttt{\bool_if_p:n}, \texttt{\__bool_if_p:n}, and \texttt{\__bool_if_p_aux:w}. This function is documented on page 67.)
\end{verbatim}

575
The `\__bool_get_next:NN` operation. Its first argument is `\use_i:nnnn`, `\use_ii:nnnn`, `\use_{-iii}:nnnn`, or `\use_{-iv}:nnnn` (we call these “states”). In the first state, this function eventually expand to the truth value `\c_true_bool` or `\c_false_bool` of the expression which follows until the next unmatched closing parenthesis. For instance “`\__bool_get_next:NN \use_i:nnnn \c_true_bool \&\& \c_true_bool`” (including the closing parenthesis) expands to `\c_true_bool`. In the second state (after a !) the logic is reversed. We call these two states “normal” and the next two “skipping”. In the third state (after `\c_true_bool||`) it always returns `\c_true_bool`. In the fourth state (after `\c_false_bool\&\&`) it always returns `\c_false_bool` and also stops when encountering `||`, not only parentheses. This code itself is a switch: if what follows is neither ! nor (, we assume it is a predicate.

```latex
\cs_new:Npn \__bool_get_next:NN #1#2
{\use:c
\begin{verbatim}
  \if_meaning:w !#2 ! \else: \if_meaning:w (#2 ( \else: p \fi: \fi:
  :Nw
}\#1 #2}
```

(End definition for \__bool_get_next:NN.)

The `\__bool_!:Nw` operation reverses the logic: it discards the ! token and calls the GetNext operation with the appropriate first argument. Namely the first and second states are interchanged, but after `\c_true_bool||` or `\c_false_bool\&\&` the ! is ignored.

```latex
\cs_new:cpn { \__bool_!:Nw } #1#2
{\exp_after:wN \__bool_get_next:NN
\int_value:w \__bool_get_next:NN #1 \use_ii:nnnn \use_i:nnnn \use_{-iii}:nnnn \use_{-iv}:nnnn}
```

(End definition for \__bool_!:Nw.)

The `\__bool_(:Nw` operation starts a sub-expression after discarding the open parenthesis. This is done by calling GetNext (which eventually discards the corresponding closing parenthesis), with a post-processing step which looks for And, Or or Close after the group.

```latex
\cs_new:cpn { \__bool_(:Nw } #1#2
{\exp_after:wN \__bool_choose:NNN\exp_after:wN #1
\int_value:w \__bool_get_next:NN \use_i:nnnn}
```

(End definition for \__bool_(:Nw.)

The `\__bool_p:Nw` operation starts a sub-expression after discarding the open parenthesis. This is done by calling GetNext (which eventually discards the corresponding closing parenthesis), with a post-processing step which looks for And, Or or Close after the group.

```latex
\cs_new:cpn { \__bool_p:Nw } #1#2
{\exp_after:wN \__bool_choose:NNN\exp_after:wN #1
\int_value:w \__bool_get_next:NN \use_i:nnnn}
```

(End definition for \__bool_p:Nw.)
The arguments are \#1: a function such as \use_i:nnnn, \#2: 0 or 1 encoding the current truth value, \#3: the next operation, And, Or or Close. We distinguish three cases according to a combination of \#1 and \#2. Case 2 is when \#1 is \use_iii:nnnn (state 3), namely after \c_true_bool ||. Case 1 is when \#1 is \use_i:nnnn and \#2 is true or when \#1 is \use_i:nnnn and \#2 is false, for instance for \c_false_bool. Case 0 includes the same with true/false interchanged and the case where \#1 is \use_iv:nnnn namely after \c_false_bool &&.

When seeing ) the current subexpression is done, leave the appropriate boolean.

When seeing | in case 0 go into state 4, equivalent to having seen \c_false_bool &&. In case 1, namely when the argument is true and we are in a normal state continue in the normal state 1. In case 2, namely when skipping alternatives in an Or, continue in the same state. When seeing | in case 0, continue in a normal state; in particular stop skipping for \c_false_bool && because that binds more tightly than ||. In the other two cases start skipping for \c_true_bool ||.

\bool_lazy_all_p:n\bool_lazy_all:nTF\bool_lazy_all:n

Go through the list of expressions, stopping whenever an expression is false. If the end is reached without finding any false expression, then the result is true.
\bool_lazy_and_p:nn
\bool_lazy_and:nnTF

Only evaluate the second expression if the first is \textit{true}. Note that \#2 must be removed as an argument, not just by skipping to the \texttt{\else:} branch of the conditional since \#2 may contain unbalanced \LaTeX{} conditionals.

\begin{verbatim}
\prg_new_conditional:Npnn \bool_lazy_and:nn #1#2 { p , T , F , TF }
\{
    \if_predicate:w \bool_if:nTF {#1} { \bool_if_p:n {#2} } { \c_false_bool }
    \prg_return_true:
\else:
    \prg_return_false:
\fi:
\}
\end{verbatim}

(End definition for \texttt{\bool_lazy_and:nnTF} and \texttt{\_bool_lazy_and:n}. This function is documented on page 68.)

\bool_lazy_or_p:nn
\bool_lazy_or:nnTF

Only evaluate the second expression if the first is \textit{false}.

\begin{verbatim}
\prg_new_conditional:Npnn \bool_lazy_or:nn #1#2 { p , T , F , TF }
\{
    \if_predicate:w \bool_if:nTF {#1} { \c_true_bool } { \bool_if_p:n {#2} }
    \prg_return_true:
\else:
    \prg_return_false:
\fi:
\}
\end{verbatim}

(End definition for \texttt{\bool_lazy_or:nnTF}. This function is documented on page 68.)
\bool_not_p:n

The Not variant just reverses the outcome of \bool_if_p:n. Can be optimized but this is nice and simple and according to the implementation plan. Not even particularly useful to have it when the infix notation is easier to use.

\bool_xor_p:nn
\bool_xor:nn

Exclusive or. If the boolean expressions have same truth value, return false, otherwise return true.

\bool_while_do:Nn
\boolWhileDo:cn
\bool_until_do:Nn
\boolUntilDo:cn

A while loop where the boolean is tested before executing the statement. The “while” version executes the code as long as the boolean is true; the “until” version executes the code as long as the boolean is false.

\bool_do_while:Nn
\boolDoWhile:cn
\bool_do_until:Nn
\boolDoUntil:cn

A do-while loop where the body is performed at least once and the boolean is tested after executing the body. Otherwise identical to the above functions.

\bool_while_do:nn
\boolDoWhile:nn
\bool_until_do:nn
\boolDoUntil:nn

Loop functions with the test either before or after the first body expansion.
\bool_while_do:nn {#1} {#2}
\bool_until_do:nn {#1} {#2}
\bool_do_until:nn {#1} {#2}
\cs_new:Npn \bool_do_while:nn #1#2
\bool_if:nT {#1} { \bool_do_while:nn {#1} {#2} }
\cs_new:Npn \bool_until_do:nn #1#2
\bool_if:nF {#1} {
\bool_until_do:nn {#1} {#2}
}
\cs_new:Npn \bool_do_until:nn #1#2
{#2}
\bool_if:nF {#1} { \bool_do_until:nn {#1} {#2} }
(End definition for \bool_while_do:nn and others. These functions are documented on page 69.)

46.7 Producing multiple copies

\prg_replicate:nn
\prg_replicate:N
\prg_replicate_first:N
\prg_replicate_0:n
\prg_replicate_1:n

\prg_replicate_8:n
\prg_replicate_9:n
\prg_replicate_first_-_n
\prg_replicate_first_0:n
\prg_replicate_first_1:n
\prg_replicate_first_2:n
\prg_replicate_first_3:n
\prg_replicate_first_4:n
\prg_replicate_first_5:n
\prg_replicate_first_6:n
\prg_replicate_first_7:n
\prg_replicate_first_8:n
\prg_replicate_first_9:n

This function uses a cascading csnamed technique by David Kastrup (who else :-)
The idea is to make the input 25 result in first adding five, and then 20 copies of the code to be replicated. The technique uses cascading csnames which means that we start building several csnames so we end up with a list of functions to be called in reverse order. This is important here (and other places) because it means that we can for instance make the function that inserts five copies of something to also hand down ten to the next function in line. This is exactly what happens here: in the example with 25 then the next function is the one that inserts two copies but it sees the ten copies handed down by the previous function. In order to avoid the last function to insert say, 100 copies of the original argument just to gobble them again we define separate functions to be inserted first. These functions also close the expansion of \exp:w, which ensures that \prg_replicate:nn only requires two steps of expansion.

This function has one flaw though: Since it constantly passes down ten copies of its previous argument it severely affects the main memory once you start demanding hundreds of thousands of copies. Now I don’t think this is a real limitation for any ordinary use, and if necessary, it is possible to write \prg_replicate:nn {1000} { \prg_replicate:nn {1000} { (\texttt{code}) } }. An alternative approach is to create a string of m’s with \exp:w which can be done with just four macros but that method has its own problems since it can exhaust the string pool. Also, it is considerably slower than what we use here so the few extra csnames are well spent I would say.

\cs_new:Npn \prg_replicate:nn #1
{ \exp:w
...
Then comes all the functions that do the hard work of inserting all the copies. The first function takes :n as a parameter.

Users shouldn’t ask for something to be replicated once or even not at all but...
46.8 Detecting \TeX’s mode

\mode_if_vertical_p: For testing vertical mode. Strikes me here on the bus with David, that as long as we
are just talking about returning true and false states, we can just use the primitive
conditionals for this and gobbling the \texttt{exp_end}: in the input stream. However this
requires knowledge of the implementation so we keep things nice and clean and use the
return statements.

\texttt{\prg_new_conditional:Npnn \mode_if_vertical: { p , T , F , TF } \prg_return_true: \else: \prg_return_false: \fi:}

(End definition for \texttt{\mode_if_vertical:TF. This function is documented on page 70.)

\mode_if_horizontal_p: For testing horizontal mode.

\texttt{\prg_new_conditional:Npnn \mode_if_horizontal: { p , T , F , TF } \prg_return_true: \else: \prg_return_false: \fi:}

(End definition for \texttt{\mode_if_horizontal:TF. This function is documented on page 70.)

\mode_if_inner_p: For testing inner mode.

\texttt{\prg_new_conditional:Npnn \mode_if_inner: { p , T , F , TF } \prg_return_true: \else: \prg_return_false: \fi:}

(End definition for \texttt{\mode_if_inner:TF. This function is documented on page 70.)

\mode_if_math_p: For testing math mode. At the beginning of an alignment cell, this should be used only
inside a non-expandable function.

\texttt{\prg_new_conditional:Npnn \mode_if_math: { p , T , F , TF } \prg_return_true: \else: \prg_return_false: \fi:}

(End definition for \texttt{\mode_if_math:TF. This function is documented on page 70.)

46.9 Internal programming functions

\texttt{\group_begin: \texttt{\texcatcode:D \texttt{\^^@ = 2 \exp_stop_f:}} \texttt{\cs_new:Npn \group_align_safe_begin: \texttt{\exp:w \if_false: \fi: '^^@ \exp_stop_f:}}}

\texttt{\group_align_safe_end: \texttt{\if_false: \texttt{\fi: part at that place so that the
successive expansions of \texttt{\group_align_safe_begin/end: are always brace balanced.}}}

\texttt{\\texttt{\exp:w \if_false: \{i: \texttt{\^^@ \exp_stop_f:}}}

582
\begin{verbatim}
877: \group_end:
878: \cs_new:Npn \group_align_safe_end:
879: { \if_int_compare:w '{ = \c_zero_int } \fi: }

(End definition for \group_align_safe_begin: and \group_align_safe_end:. These functions are documented on page 71.)

\g__kernel_prg_map_int A nesting counter for mapping.
\int_new:N \g__kernel_prg_map_int

(End definition for \g__kernel_prg_map_int.)

\prg_break_point:Nn \prg_map_break:Nn
These are defined in \texttt{l3basics}, as they are needed “early”. This is just a reminder that is the case!

(End definition for \prg_break_point:Nn and \prg_map_break:Nn. These functions are documented on page 70.)

\prg_break_point: \prg_break: \prg_break:n
Also done in \texttt{l3basics}.

(End definition for \prg_break_point:, \prg_break:, and \prg_break:n. These functions are documented on page 71.)

877: \end{verbatim}

583
Chapter 47

l3sys implementation

47.1 Kernel code

47.1.1 Detecting the engine

\_\_sys\_const:nn

Set the T, F, TF, p forms of \#1 to be constants equal to the result of evaluating the boolean expression \#2.

\sys\_if\_engine\_luatex\_p:
\sys\_if\_engine\_pdftex\_p:
\sys\_if\_engine\_ptex\_p:
\sys\_if\_engine\_uptex\_p:
\sys\_if\_engine\_xetex\_p:
\c\_sys\_engine\_str

\str\_const:Nx \c\_sys\_engine\_str

Set up the engine tests on the basis exactly one test should be true. Mainly a case of looking for the appropriate marker primitive.
\cs_if_exist:NTF \tex_enablecjktoken:D { uptex }

tex
\group_end:
\end{verbatim}

(End definition for \texttt{sys_if_engine_{pdftex:}\texttt{\ldots} and others. These functions are documented on page 79.)

Take the functions defined above, and set up the engine and format names. \texttt{\_sys_engine_exec_str} differs from \texttt{\_sys_engine_str} as it is the actual engine name, not a "filtered" version. It differs for \texttt{ptex} and \texttt{uptex}, which have a leading e, and for \texttt{luatex}, because \LaTeX uses the LuaHBTX engine.

\texttt{\_sys_engine_format_str} is quite similar to \texttt{\_sys_engine_str}, except that it differentiates \texttt{pdflatex} from \texttt{latex} (which is pdfTeX in DVI mode). This differentiation, however, is reliable only if the user doesn’t change \texttt{\tex_pdfoutput:D} before loading this code.
This candidate function is placed there because \sys_if_rand_exist:TF is used in l3fp\-rand.

Currently, randomness exists under pdf\TeX, Lua\TeX, p\TeX and up\TeX.

(End definition for \sys_if_rand_exist:TF. This function is documented on page 310.)

47.1.3 Platform

Setting these up requires the file module (file lookup), so is actually implemented there.

(End definition for \sys_if_platform_unix:TF, \sys_if_platform_windows:TF, and \c_sys_platform_str. These functions are documented on page 74.)

47.1.4 Configurations

Loading the backend code is pretty simply: check that the backend is valid, then load it up.

(End definition for \c_sys_engine_exec_str and \c_sys_engine_format_str. These variables are documented on page 73.)

\}
\cs_new_protected:Npn \sys_get_shell:nnN #1#2#3
\{ \tl_if_in:nnTF {#1} { " }
\{ \msg_error:nnx
\{ kernel \} \{ quote-in-shell \} {#1}
\prg_return_false: \}
\}
\exp_args:Nno \use:nn { \cs_new_protected:Npn \__sys_get_do:Nw #1#2 }
\{ \c__sys_marker_tl \}
\group_end:
\tl_set:No #1 {#2}
\}
\end{verbatim}

(End definition for \sys_get_shell:nnNTF and others. These functions are documented on page 74.)

\c__sys_shell_stream_int
This is not needed for Lua\TeX{}: shell escape there isn’t done using a \TeX{} interface.

\begin{verbatim}
\sys_if_engine_luatex:F
\{ \int_const:Nn \c__sys_shell_stream_int { 18 } \}
\end{verbatim}

(End definition for \c__sys_shell_stream_int.)

\sys_shell_now:n
\sys_shell_now:e
Execute commands through shell escape immediately.

For Lua\TeX{}, we use a pseudo-primitive to do the actual work.
local os_exec = os.execute

local function shellescape(cmd)
  local status, msg = os_exec(cmd)
  if status == nil then
    write_nl("log","runsystem(" .. cmd .. ")...(" .. msg .. ")\n")
  elseif status == 0 then
    write_nl("log","runsystem(" .. cmd .. ")...executed\n")
  else
    write_nl("log","runsystem(" .. cmd .. ")...failed " .. (msg or "") .. "\n")
  end
end

luacmd("__sys_shell_now:e", function()
  shellescape(scan_string())
end, "global", "protected")

---

\sys_if_engine_luatex:TF
{
  \cs_new_protected:Npn \sys_shell_now:n #1
  { \__sys_shell_now:e { \exp_not:n {#1} } }
}
{
  \cs_new_protected:Npn \sys_shell_now:n #1
  { \io_now:Nn \c__sys_shell_stream_int {#1} }
}
\cs_generate_variant:Nn \sys_shell_now:n { x }

(End definition for \sys_shell_now:n and \__sys_shell_now:e. This function is documented on page 75.)

\sys_shell_shipout:n \__sys_shell_shipout:e
Execute commands through shell escape at shipout.

For Lua\TeX, we use the same helper as above but delayed using a late_lua whatsit. Creating a late_lua whatsit works a bit different if we are running under Con\TeXt.

---

local new_latelua = nodes and nodes.nuts and nodes.nuts.pool and nodes.nuts.pool.latelu
local whatsit_id = node.id\'whatsit\'
local latelu_sub = node.subtype\'late_lua\'
local node_new = node.direct.new
local setfield = node.direct.setwhatsitfield or node.direct.setfield
  return function(f)
  local n = node_new(whatsit_id, latelu_sub)
  setfield(n, \'data\', f)
  return n
end
local node_write = node.direct.write

luacmd("__sys_shell_shipout:e", function()
  local cmd = scan_string()
  node_write(new_latelu(function() shellescape(cmd) end))

590
end, "global", "protected")
end

⟨/lua⟩

⟨∗tex⟩

{
  \cs_new_protected:Npn \sys_shell_shipout:n #1
  { \_sys_shell_shipout:e \exp_not:n \{#1\} }
}

{ \cs_new_protected:Npn \sys_shell_shipout:n #1
  { \iow_shipout:Nn \c__sys_shell_stream_int \{#1\} }
}
\cs_generate_variant:Nn \sys_shell_shipout:n { x }

(End definition for \sys_shell_shipout:n and \_sys_shell_shipout:e. This function is documented on page 75.)

47.2 Dynamic (every job) code

\sys_everyjob:
  \_sys_everyjob:n
  \g__sys_everyjob_tl
\cs_new_protected:Npn \sys_everyjob:
{
  \tl_use:N \g__sys_everyjob_tl
  \tl_gclear:N \g__sys_everyjob_tl
}
\cs_new_protected:Npn \_sys_everyjob:n #1
{ \tl_gput_right:Nn \g__sys_everyjob_tl \{#1\} }
\tl_new:N \g__sys_everyjob_tl

(End definition for \sys_everyjob:, \_sys_everyjob:n, and \g__sys_everyjob_tl. This function is documented on page ??.)

47.2.1 The name of the job
\c_sys_jobname_str

Inherited from the \TeX{}3 name for the primitive. This has to be the primitive as it's set in \everyjob. If the user does

\pdflatex \input some-file-name

then \everyjob is inserted before \jobname is changed form texput, and thus we would have the wrong result.

\_sys_everyjob:n
{ \cs_new_eq:NN \c_sys_jobname_str \tex_jobname:D }

(End definition for \c_sys_jobname_str. This variable is documented on page 73.)
47.2.2 Time and date

Copies of the information provided by \TeX. There is a lot of defensive code in package mode: someone may have moved the primitives, and they can only be recovered if we have \texttt{primitive} and it is working correctly. For \texttt{Ini}\TeX of course that is all redundant but does no harm.

\begin{verbatim}
\sys_everyjob:n
{ \group_begin:
\cs_set:Npn \__sys_tmp:w #1
{ \str_if_eq:eeTF { \cs_meaning:N #1 } { \token_to_str:N #1 } { #1 }
{ \cs_if_exist:NTF \tex_primitive:D
{ \bool_lazy_and:nnTF
{ \sys_if_engine_xetex_p: }
{ \int_compare_p:nNn
{ \exp_after:wN \use_none:n \tex_XeTeXrevision:D }
{ 99999 }
} } { 0 }
{ \tex_primitive:D #1 }
} { 0 }
}
\int_const:Nn \c_sys_minute_int
{ \int_mod:nn { \__sys_tmp:w \time } { 60 } }
\int_const:Nn \c_sys_hour_int
{ \int_div_truncate:nn { \__sys_tmp:w \time } { 60 } }
\int_const:Nn \c_sys_day_int
{ \__sys_tmp:w \day }
\int_const:Nn \c_sys_month_int
{ \__sys_tmp:w \month }
\int_const:Nn \c_sys_year_int
{ \__sys_tmp:w \year }
\group_end:
}
\end{verbatim}

(End definition for \texttt{\c_sys_minute_int} and others. These variables are documented on page 72.)

47.2.3 Random numbers

\sys_rand_seed: Unpack the primitive. When random numbers are not available, we return zero after an error (and incidentally make sure the number of expansions needed is the same as with random numbers available).

\begin{verbatim}
\sys_everyjob:n
{ \sys_if_rand_exist:TF
{ \cs_new:Npn \sys_rand_seed: { \tex:D \tex_randomseed:D } }
\cs_new:Npn \sys_rand_seed:
{ \int_value:w
}
\end{verbatim}
\sys_gset_rand_seed:n  
The primitive always assigns the seed globally.

\sys_timer:  
\_sys_elapsedtime:  
\sys_if_timer_exist:TF
\sys_if_timer_exist_p:  
\sys_if_engine_luatex:TF

In \LaTeX{}X, create a pseudo-primitive, otherwise try to locate the real primitive. The elapsed time will be available if this succeeds.
47.2.4 Access to the shell

Expose the engine’s shell escape status to the user.

\c_sys_shell_escape_int

\__sys_everyjob:n
\{ 
\int_const:Nn \c_sys_shell_escape_int 
\{ 
\sys_if_engine_luatex:TF 
\{ 
\tex_directlua:D 
\{ \tex.sprint(status.shell_escape~or~os.execute()) \} 
\} 
\{ \tex_shellescape:D \} 
\} 
\}

(End definition for \c_sys_shell_escape_int. This variable is documented on page 75.)

\sys_if_shell_p:
\sys_if_shell:TF
\sys_if_shell_unrestricted:p:
\sys_if_shell_unrestricted:TF
\sys_if_shell_restricted:p:
\sys_if_shell_restricted:TF

Performs a check for whether shell escape is enabled. The first set of functions return 
true if either of restricted or unrestricted shell escape is enabled, while the other two sets 
of functions return true in only one of these two cases.

\__sys_everyjob:n
\{ 
\__sys_const:nn \sys_if_shell 
\{ \int_compare_p:nNn \c_sys_shell_escape_int > 0 \} 
\__sys_const:nn \sys_if_shell_unrestricted 
\{ \int_compare_p:nNn \c_sys_shell_escape_int = 1 \} 
\__sys_const:nn \sys_if_shell_restricted 
\{ \int_compare_p:nNn \c_sys_shell_escape_int = 2 \} 
\} 

(End definition for \sys_if_shell:TF, \sys_if_shell_unrestricted:TF, and \sys_if_shell_restricted:TF. 
These functions are documented on page 75.)

47.2.5 Held over from l3file

\g_file_curr_name_str

See comments about \c_sys_jobname_str: here, as soon as there is file input/output, 
things get “tided up”.

\__sys_everyjob:n
\{ \cs_gset_eq:NN \g_file_curr_name_str \tex_jobname:D \} 

(End definition for \g_file_curr_name_str. This variable is documented on page 93.)
47.3 Last-minute code

A simple hook to finalise the system-dependent layer. This is forced by the backend loader, which is forced by the main loader, so we do not need to include that here.

\cs_new_protected:Npn \sys_finalise: 
\{ 
\sys_everyjob: 
\tl_use:N \g__sys_finalise_tl 
\tl_gclear:N \g__sys_finalise_tl 
\} 
\cs_new_protected:Npn \__sys_finalise:n #1 
\{ \tl_gput_right:Nn \g__sys_finalise_tl {#1} \} 
\tl_new:N \g__sys_finalise_tl

(End definition for \sys_finalise:, \__sys_finalise:n, and \g__sys_finalise_tl. This function is documented on page 76.)

47.3.1 Detecting the output

This is a simple enough concept: the two views here are complementary.

\__sys_finalise:n 
\{ \str_const:Nx \c_sys_output_str 
\{ \int_compare:nNnTF \{ \cs_if_exist_use:NF \tex_pdfoutput:D \{ 0 \} \} > \{ 0 \} 
\{ pdf \} 
\{ dvi \} \} \__sys_const:nn { sys_if_output_dvi:TF } \__sys_const:nn { sys_if_output_pdf:TF } \__sys_const:nn { c_sys_output_str:TF } \} 
\tl_new:N \g__sys_backend_tl

(End definition for \sys_if_output_dvi:TF, \sys_if_output_pdf:TF, and \c_sys_output_str. These functions are documented on page 73.)

47.3.2 Configurations

As the backend has to be checked and possibly adjusted, the approach here is to create a variable and use that in a one-shot to set a constant.

\__kernel_tl_gset:Nx \g__sys_backend_tl 
\{ \sys_if_engine_xetex:TF \{ xetex \} \} 
\sys_if_engine_pdflatex:TF 
\{ \sys_if_output_pdf:TF \} 
\sys_if_engine_pdftex:TF 
\{ pdftex \}
If there is a class option set, and recognised, we pick it up: these will over-ride anything set automatically but will themselves be over-written if there is a package option.

\__sys_finalise:n
\__if_exist:NT \@classoptionslist
\__if_eq:NNF \@classoptionslist \scan_stop:
\clist_map_inline:Nn \@classoptionslist
\str_case:nnT \#1
\tl_gset:Nn \g__sys_backend_tl { dvipdfmx }
\tl_gset:Nn \g__sys_backend_tl { dvips }
\tl_gset:Nn \g__sys_backend_tl { dvisvgm }
\tl_gset:Nn \g__sys_backend_tl { pdfmode }
\tl_gset:Nn \g__sys_backend_tl { xdvipdfmx }
\clist_remove_all:Nn \@unusedoptionlist \#1

(End definition for \g__sys_backend_tl.)
\tex
\package
Chapter 48

\texttt{\texttt{l3msg}} implementation

\begin{itemize}
\item \texttt{l__msg_internal_tl} A general scratch for the module.
\item \texttt{l__msg_name_str} \texttt{l__msg_text_str} Used to save module info when creating messages.
\item \texttt{s__msg_mark} \texttt{s__msg_stop} Internal scan marks.
\item \texttt{\_msg_use_none_delimit_by_s_stop:w} Functions to gobble up to a scan mark.
\end{itemize}

48.1 Internal auxiliaries

48.2 Creating messages

Messages are created and used separately, so there are two parts to the code here. First, a mechanism for creating message text. This is pretty simple, as there is not actually a lot to do.
\msg_if_exist_p:nn  
 Test whether the control sequence containing the message text exists or not.

9267 \prg_new_conditional:Npnn \msg_if_exist:nn #1#2 { p , T , F , TF } 
9268 \{
9269 \cs_if_exist:cTF { \c__msg_text_prefix_tl #1 / #2 } 
9270 \{ \prg_return_true: \} \{ \prg_return_false: \} 
9271 \}

(End definition for \msg_if_exist:nnTF. This function is documented on page 78.)

\__msg_chk_if_free:nn  
 This auxiliary is similar to \__kernel_chk_if_free_cs:N, and is used when defining messages with \msg_new:nnnn.

9272 \cs_new_protected:Npn \__msg_chk_free:nn #1#2 
9273 \{ \msg_if_exist:nnT {#1} {#2} 
9274 \{ \msg_error:nxx { msg } { already-defined } {#1} {#2} 
9275 \}
9276 \}
9277 
9278 \}
9279 \}

(End definition for \__msg_chk_if_free:nn.)

\msg_new:nnnn  
 Setting a message simply means saving the appropriate text into two functions. A sanity check first.

9280 \cs_new_protected:Npn \msg_new:nnnn #1#2 
9281 \{ \__msg_chk_free:nn {#1} {#2} 
9282 \msg_gset:nnnn {#1} {#2} 
9283 \}
9284 \}
9285 \}
9286 \}
9287 \}
9288 \}
9289 \}
9290 \}
9291 \}
9292 \}
9293 \}
9294 \}
9295 \}
9296 \}
9297 \}
9298 \}
9299 \}
9300 \}
9301 \}
9302 \}
9303 \}
9304 \}

(End definition for \msg_new:nnnn and others. These functions are documented on page 78.)
48.3 Messages: support functions and text

Simple pieces of text for messages.

```
\c__msg_coding_error_text_tl
\c__msg_continue_text_tl
\c__msg_critical_text_tl
\c__msg_fatal_text_tl
\c__msg_no_info_text_tl
\c__msg_on_line_text_tl
\c__msg_return_text_tl
\c__msg_trouble_text_tl
```

```
\tl_const:Nn \c__msg_coding_error_text_tl
\{
\\\nThis~is~a~coding~error.
\\
\}
\tl_const:Nn \c__msg_continue_text_tl
\{ Type~<return>~to~continue \}
\tl_const:Nn \c__msg_critical_text_tl
\{ Reading~the~current~file~'\g_file_curr_name_str'~will~stop. \}
\tl_const:Nn \c__msg_fatal_text_tl
\{ This~is~a~fatal~error:~\LaTeX{}~will~abort. \}
\tl_const:Nn \c__msg_help_text_tl
\{ For~immediate~help~type~H~<return> \}
\tl_const:Nn \c__msg_no_info_text_tl
\{ LaTeX~does~not~know~anything~more~about~this~error,~sorry. \}
\tl_const:Nn \c__msg_return_text_tl
\{ on~line \}
\tl_const:Nn \c__msg_trouble_text_tl
\{ \\\nTry~typing~<return>~to~proceed. \\
If~that~doesn't~work,~type~X~<return>~to~quit. \}

\tl_const:Nn \c__msg_return_text_tl
\{ \\
More~errors~will~almost~certainly~follow: \\\nthe~LaTeX~run~should~be~aborted. \}
```

(End definition for \c__msg_coding_error_text_tl and others.)

```
\msg_line_number:
\msg_line_context:
```

For writing the line number nicely. \msg_line_context: was set up earlier, so this is not new.

```
\cs_new:Npn \msg_line_number: { \int_use:N \tex_inputlineno:D }
\cs_gset:Npn \msg_line_context:
\{
\\\n\c__msg_on_line_text_tl
\\
\c_space_tl
\\
\msg_line_number:
\}
```

(End definition for \msg_line_number: and \msg_line_context:. These functions are documented on page 79.)
48.4 Showing messages: low level mechanism

The low-level interruption macro is rather opaque, unfortunately. Depending on the availability of more information there is a choice of how to set up the further help. We feed the extra help text and the message itself to a wrapping auxiliary, in this order because we must first setup \TeX’s \texttt{\textbackslash{errhelp}} register before issuing an \texttt{\textbackslash{errmessage}}. To deal with the various cases of critical or fatal errors with and without help text, there is a bit of argument-passing to do.

\begin{verbatim}
\cs_new_protected:Npn \__msg_interrupt:Nnnn #1#2#3#4#5

  } \end{verbatim}

First setup \TeX’s \texttt{\textbackslash{errhelp}} register with the extra help #1, then build a nice-looking error message with #2. Everything is done using x-type expansion as the new line markers are different for the two type of text and need to be correctly set up. The auxiliary \texttt{\__msg_interrupt_more_text:n} receives its argument as a line-wrapped string, which is thus unaffected by expansion. We ave to split the main text into two parts as only the “message” itself is wrapped with a leader: the generic help is wrapped at full width. We also have to allow for the two characters used by \texttt{\textbackslash{errmessage}} itself.
\__msg_interrupt:n

The business end of the process starts by producing some visual separation of the message from the main part of the log. The error message needs to be printed with everything made "invisible": \TeX's own information involves the macro in which \errmessage is called, and the end of the argument of the \errmessage, including the closing brace. We use an active ! to call the \errmessage primitive, and end its argument with \use_\fineskip:n { ⟨spaces⟩} which fills the output with spaces. Two trailing closing braces are turned into spaces to hide them as well. The group in which we alter the definition of the active ! is closed before producing the message: this ensures that tokens inserted by typing \stringify in the command-line are inserted after the message is entirely cleaned up.

The \__kernel_iow_with:Nnn auxiliary, defined in l3file, expects an \fineskip⟨integer variable⟩, an integer \fineskip⟨value⟩, and some \fineskip⟨code⟩. It runs the \fineskip⟨code⟩ after ensuring that the \fineskip⟨integer variable⟩ takes the given \fineskip ⟨value⟩, then restores the former value of the \fineskip ⟨integer variable⟩ if needed. We use it to ensure that the \fineskip newlinechar is 10, as needed for \fineskip \iow_newline: to work, and that \fineskip \errorcontextlines is −1, to avoid showing irrelevant context. Note that restoring the former value of these integers requires inserting tokens after the \errmessage, which go in the way of tokens which could be inserted by the user. This is unavoidable.

48.5 Displaying messages

\text{\LaTeX} is handling error messages and so the \TeX\ ones are disabled.

A function for issuing messages: both the text and order could in principle vary. The
module name may be empty for kernel messages, hence the slightly contorted code path
for a space.

\begin{verbatim}

Warnings and information messages have no decoration. Warnings are printed to the terminal while information can either go to the log or both log and terminal.

\__msg_class_new:nn { warning }
\__msg_class_new:nn { warning }
\__msg_class_new:nn { warning }
\__msg_class_new:nn { warning }

(End definition for \msg_error:nnnnnn and others. These functions are documented on page 81.)
"Log" data is very similar to information, but with no extras added. "Term" is used for communicating with the user through the terminal, like diagnostic messages, and debugging. This is similar to "log" messages, but uses the terminal output.

The none message type is needed so that input can be gobbled.

The show message type is used for \seq_show:N and similar complicated data structures. Wrap the given text with a trailing dot (important later) then pass it to \msg_show:n. If there is \\ (or if the whole thing starts with \>) we split there, print the first part and show the second part using \showtokens (the \exp_after:wN ensure a nice display). Note that this primitive adds a leading >- and trailing dot. That is why we included a trailing dot before wrapping and removed it afterwards. If there is no \\- do the same but with an empty second part which adds a spurious but inevitable >-.
\l__msg_class_chk_exist:nT

Checking that a message class exists. We build this from \cs_if_free:cTF rather than \cs_if_exist:cTF because that avoids reading the second argument earlier than necessary.

\cs_new:Npn \__msg_class_chk_exist:nT #1

\l__msg_class_tl \l__msg_current_class_tl

Support variables needed for the redirection system.

\tl_new:N \l__msg_class_tl
\tl_new:N \l__msg_current_class_tl

(End definition for \l__msg_class_tl and \l__msg_current_class_tl.)

\l__msg_redirect_prop

For redirection of individually-named messages

\prop_new:N \l__msg_redirect_prop

(End definition for \l__msg_redirect_prop.)

\l__msg_hierarchy_seq

During redirection, split the message name into a sequence: {/module/submodule}, {/module}, and {}.
Actually using a message is a multi-step process. First, some safety checks on the message
and class requested. The code and arguments are then stored to avoid passing them
around. The assignment to \_\_msg\_use\_code: is similar to \tl\_set:Nn. The message
is eventually produced with whatever \_\_msg\_class\_tl is when \_\_msg\_use\_code: is
called. Here is also a good place to suppress tracing output if the trace package is loaded
since all (non-expandable) messages go through this auxiliary.

The first check is for an individual message redirection. If this applies then no further
redirection is attempted. Otherwise, split the message name into \langle module \rangle,
\langle submodule \rangle and \langle message \rangle (with an arbitrary number of slashes), and store \{/module/submodule\},
{/module} and {} into \_\_msg\_hierarchy\_seq. We then map through this sequence,
applying the most specific redirection.
At this point, the items of `\__msg_hierarchy_seq` are the various levels at which we should look for a redirection. Redirections which are less specific than the argument of `\__msg_use_redirect_module:n` are not attempted. This argument is empty for a class redirection, `/module` for a module redirection, etc. Loop through the sequence to find the most specific redirection, with module `##1`. The loop is interrupted after testing for a redirection for `##1` equal to the argument `#1` (least specific redirection allowed). When a redirection is found, break the mapping, then if the redirection targets the same class, output the code with that class, and otherwise set the target as the new current class, and search for further redirections. Those redirections should be at least as specific as `##1`.

\msg_redirect_name:nnn Named message always use the given class even if that class is redirected further. An empty target class cancels any existing redirection for that message.
(End definition for \msg_redirect_name:nnn. This function is documented on page \pageref{\msg_redirect_name:nnn}.)

If the target class is empty, eliminate the corresponding redirection. Otherwise, add the redirection. We must then check for a loop: as an initialization, we start by storing the initial class in \l__msg_current_class_tl.

\cs_new_protected:Npn \msg_redirect_class:nnn #1
{ \__msg_redirect:nnn { / #1 } }
\cs_new_protected:Npn \msg_redirect_module:nnn #1 #2
{ \__msg_redirect:nnn { / #1 } }
\cs_new_protected:Npn \__msg_redirect:nnn #1#2#3
{\__msg_class_chk_exist:nT {#2}
{\tl_if_empty:nTF {#3}
{\prop_remove:cn { l__msg_redirect_ #2 _prop } {#1}}
{\__msg_class_chk_exist:nT {#3}
{\str_if_eq:VnF \l__msg_class_tl {#1}
{\tl_if_eq:NNTF \l__msg_class_tl \l__msg_current_class_tl
{\prop_put:cnn { l__msg_redirect_ #2 _prop } {#3} {#2}
\msg_warning:nnxxxx { msg } { redirect-loop }}}}}}}}}

Since multiple redirections can only happen with increasing specificity, a loop requires that all steps are of the same specificity. The new redirection can thus only create a loop with other redirections for the exact same module, \#1, and not submodules. After some initialization above, follow redirections with \l__msg_current_class_tl, and keep track in \l__msg_class_loop_seq of the various classes encountered. A redirection from a class to itself, or the absence of redirection both mean that there is no loop. A redirection to the initial class marks a loop. To break it, we must decide which redirection to cancel. The user most likely wants the newly added redirection to hold with no further redirection. We thus remove the redirection starting from \#2, target of the new redirection. Note that no message is emitted by any of the underlying functions: otherwise we may get an infinite loop because of a message from the message system itself.

\msg_new:nnnn { clist } { non-clist }
{ Variable \#1 is not a valid clist. }
{ \c__msg_coding_error_text_tl
  \LaTeX has been asked to show a variable \#1, but this has not-
  been defined yet. }

Some errors are only needed in package mode if debugging is enabled by one of the options enable-debug, check-declarations, log-functions, or on the contrary if debugging is turned off. In format mode the error is somewhat different.

\msg_new:nnnn { debug } { enable-debug }
{ To use \#1 set the \texttt{enable-debug} option. }
{ \LaTeX has been asked to show a variable \#1, but this has not-
  been defined yet. This only happens if one of the options-
  \texttt{enable-debug}, \texttt{check-declarations} or \texttt{log-functions} was-
  given as an option; see the main expl3 documentation.
Some errors only appear in expandable settings, hence don’t need a “more-text” argument.

```

Messages used by the “show” functions.
48.8 Expandable errors

In expansion only context, we cannot use the normal means of reporting errors. Instead, we rely on a low-level \TeX{} error caused by expanding a macro \verb|??| with parameter text “?” (this could be any token) which we used followed by something else (here, a space). This shows the context, which thanks to the odd-looking \verb|\use:n| is

\begin{verbatim}
\msg_new:nnnn { sys } { backend-set }
{ Backend-configuration-already-set. }
{ Run-time-backend-selection-may-only-be-carried-out-once-during-a-run.-
  This-second-attempt-to-set-them-will-be-ignored. }
\msg_new:nnnn { sys } { wrong-backend }
{ Backend-request-inconsistent-with-engine:-using-’#2’-backend. }
{ You-have-requested-backend-’#1’,-but-this-is-not-suitable-for-use-with-the-
  active-engine.-LaTeX-will-use-the-’#2’-backend-instead. }
\end{verbatim}

The command built from the csnname \verb|\__msg_text_prefix_tl |\#1 / \#2 takes four arguments and builds the error text, which is fed to \verb|\__msg_expandable_error:n| with appropriate expansion: just as for usual messages the arguments are first turned to strings, then the message is fully expanded. The module name also has to be determined.

\begin{verbatim}
\exp_args_generate:n { oooo }
\cs_new:Npn \msg_expandable_error:nnnnnn #1#2#3#4#5#6
\exp_args:Nc \__msg_tmp:w { ??? }

Chapter 49

l3file implementation

The following test files are used for this code: m3file001.

49.1 Input operations

49.1.1 Variables and constants

\l__ior_internal_tl Used as a short-term scratch variable.

\tl_new:N \l__ior_internal_tl

(End definition for \l__ior_internal_tl.)

\c__ior_term_ior Reading from the terminal (with a prompt) is done using a positive but non-existent stream number. Unlike writing, there is no concept of reading from the log.

\int_const:Nn \c__ior_term_ior { 16 }

(End definition for \c__ior_term_ior.)

\g__ior_streams_seq A list of the currently-available input streams to be used as a stack.

\seq_new:N \g__ior_streams_seq

(End definition for \g__ior_streams_seq.)

\l__ior_stream_tl Used to recover the raw stream number from the stack.

\tl_new:N \l__ior_stream_tl

(End definition for \l__ior_stream_tl.)

\g__ior Streams_prop The name of the file attached to each stream is tracked in a property list. To get the correct number of reserved streams in package mode the underlying mechanism needs to be queried. For \LaTeX beaux and plain \TeX this data is stored in \count16: with the etex package loaded we need to subtract 1 as the register holds the number of the next stream to use. In \ConTeXt, we need to look at \count38 but there is no subtraction: like the original plain \TeX mechanism it holds the value of the last stream allocated.

\prop_new:N \g__ior Streams_prop
Stream management

Reserving a new stream is done by defining the name as equal to using the terminal.

\ior_new:N\ior_new:c

(The end definition for \ior_new:N. This function is documented on page 86.)

The usual scratch space.

\g_tmpa_ior \g_tmpb_ior

(The end definition for \g_tmpa_ior and \g_tmpb_ior. These variables are documented on page 93.)

Use the conditional version, with an error if the file is not found.

\ior_open:Nn \ior_open:cn

(The end definition for \ior_open:Nn. This function is documented on page 86.)

Data storage.

\l__ior_file_name_tl

(The end definition for \l__ior_file_name_tl.)

An auxiliary searches for the file in the \TeX\, \LaTeX\ 2\epsilon and \LaTeX\ 3 paths. Then pass the file found to the lower-level function which deals with streams. The \texttt{full_name} is empty when the file is not found.

\ior_open:NnTF \ior_open:cnTF

\l__ior_file_name_tl

\ior_open:nnn\ior_open:nn { 0 }

{ }

\cs_if_exist:NTF \contextversion
{ \tex_count:D 38 - }
{ \tex_count:D 16 - %
  \cs_if_exist:NT \loccount { - 1 }
}
{ }
{ \prop_gput:Nnn \g__ior_streams_prop {#1} { Reserved-by-format } }

(End definition for \g__ior_streams_prop.)

49.1.2 Stream management

Reserving a new stream is done by defining the name as equal to using the terminal.

\ior_new:N\ior_new:c

(The end definition for \ior_new:N. This function is documented on page 86.)

The usual scratch space.

\g_tmpa_ior \g_tmpb_ior

(The end definition for \g_tmpa_ior and \g_tmpb_ior. These variables are documented on page 93.)

Use the conditional version, with an error if the file is not found.

\ior_open:Nn \ior_open:cn

(The end definition for \ior_open:Nn. This function is documented on page 86.)

Data storage.

\l__ior_file_name_tl

(The end definition for \l__ior_file_name_tl.)

An auxiliary searches for the file in the \TeX\, \LaTeX\ 2\epsilon and \LaTeX\ 3 paths. Then pass the file found to the lower-level function which deals with streams. The \texttt{full_name} is empty when the file is not found.

\ior_open:NnTF \ior_open:cnTF

\l__ior_file_name_tl

\ior_open:nnn\ior_open:nn { 0 }

{ }

\cs_if_exist:NTF \contextversion
{ \tex_count:D 38 - }
{ \tex_count:D 16 - %
  \cs_if_exist:NT \loccount { - 1 }
}
{ }
{ \prop_gput:Nnn \g__ior_streams_prop {#1} { Reserved-by-format } }

(End definition for \g__ior_streams_prop.)
Streams are reserved using `\newread` before they can be managed by `ior`. To prevent `ior` from being affected by redefinitions of `\newread` (such as done by the third-party package `morewrites`), this macro is saved here under a private name. The complicated code ensures that `\__ior_new:N` is not `\outer` despite plain TeX's `\newread` being `\outer`. For ConTExt, we have to deal with the fact that `\newread` works like our own: it actually checks before altering definition.

\begin{verbatim}
\exp_args:NNf \cs_new_protected:Npn \__ior_new:N { \exp_args:NNc \exp_after:wN \exp_stop_f: \newread }
\cs_if_exist:NT \contextversion {
\cs_new_eq:NN \__ior_new_aux:N \__ior_new:N
\cs_gset_protected:Npn \__ior_new:N #1 {
\cs_undefine:N #1
\__ior_new_aux:N #1
}
\cs__ior_new:N #1
\__kernel_tl_set:Nx \l__ior_stream_tl \int_eval:n {#1}
\__ior_open_stream:Nn #1 {#2}
}
\cs_generate_variant:Nn \__kernel_ior_open:Nn { No }
\end{verbatim}

The stream allocation itself uses the fact that there is a list of all of those available. Life gets more complex as it's important to keep things in sync. That is done using a two-part approach: any streams that have already been taken up by `ior` but are now free are tracked, so we first try those. If that fails, ask plain TeX or \LaTeXε for a new stream and use that number (after a bit of conversion).

\begin{verbatim}
\ior_close:N #1
\seq_gpop:NNTF \g__ior_streams_seq \l__ior_stream_tl {
\__ior_open_stream:Nn #1 {#2}
}
\__ior_new:N #1
\__kernel_tl_set:Nx \l__ior_stream_tl \int_eval:n {#1}
\__ior_open_stream:Nn #1 {#2}
}
\cs_generate_variant:Nn \__kernel_ior_open:Nn { No }
\end{verbatim}

Here, we act defensively in case LuaTeX is in use with an extensionless file name.

\begin{verbatim}
\ior_open_stream:Nn \__ior_open_stream:NN
{ \ior_close:N #1
\seq_gpop:NNTF \g__ior_streams_seq \l__ior_stream_tl { \ior_open_stream:Nn {#2} }
\cs__ior_new:N #1
\__kernel_tl_set:Nx \l__ior_stream_tl \int_eval:n {#1}
\__ior_open_stream:Nn {#2}
}
\end{verbatim}
Closing a stream means getting rid of it at the \TeX\ level and removing from the various data structures. Unless the name passed is an invalid stream number (outside the range \([0, 15]\)), it can be closed. On the other hand, it only gets added to the stack if it was not already there, to avoid duplicates building up.

\begin{verbatim}
\ior_close:N
\ior_close:c
Closing a stream means getting rid of it at the \TeX\ level and removing from the various data structures. Unless the name passed is an invalid stream number (outside the range \([0, 15]\)), it can be closed. On the other hand, it only gets added to the stack if it was not already there, to avoid duplicates building up.
\ior_close:N
\ior_close:c
\end{verbatim}

Seek the stream in the \texttt{\g__ior_streams_prop} list, then show the stream as open or closed accordingly.

\begin{verbatim}
\ior_show:N
\ior_log:N
\__ior_show:NN
Seek the stream in the \texttt{\g__ior_streams_prop} list, then show the stream as open or closed accordingly.
\ior_show:N
\ior_log:N
\__ior_show:NN
\end{verbatim}

Show the property lists, but with some “pretty printing”. See the \texttt{l3msg} module. The first argument of the message is \texttt{ior} (as opposed to \texttt{iow}) and the second is empty if no read stream is open and non-empty (the list of streams formatted using \texttt{msg_show_item_unbraced:nn}) otherwise. The code of the message \texttt{show-streams} takes care of translating \texttt{ior}/\texttt{iow} to English.

\begin{verbatim}
\ior_show_list:
\ior_log_list:
\__ior_list:N
Show the property lists, but with some “pretty printing”. See the \texttt{l3msg} module. The first argument of the message is \texttt{ior} (as opposed to \texttt{iow}) and the second is empty if no read stream is open and non-empty (the list of streams formatted using \texttt{msg_show_item_unbraced:nn}) otherwise. The code of the message \texttt{show-streams} takes care of translating \texttt{ior}/\texttt{iow} to English.
\ior_show_list:
\ior_log_list:
\__ior_list:N
\end{verbatim}
\ior_if_eof:NTF To test if some particular input stream is exhausted the following conditional is provided. The primitive test can only deal with numbers in the range [0,15] so we catch outliers (they are exhausted).

\ior_get:NN \ior_get:NN \ior_get:NN \ior_get:NN \ior_get:NN \ior_get:NTF And here we read from files.
Reading as strings is a more complicated wrapper, as we wish to remove the endline character and restore it afterwards.

```latex
\ior_str_get:NN \__ior_str_get:NN
\ior_str_get:NNTF
\cs_new_protected:Npn \ior_str_get:NN \#1\#2
\{ \ior_str_get:NNF \#1 \#2 \{ \tl_set:Nn \#2 \{ \q_no_value \} \}
\cs_new_protected:Npn \__ior_str_get:NN \#1\#2
\{ \exp_args:Nno \use:n \}
\int_set:Nn \tex_endlinechar:D { -1 }
\tex_readline:D \#1 to \#2
\int_set:Nn \tex_endlinechar:D \}
\{ \int_use:N \tex_endlinechar:D \}
\prg_new_protected_conditional:Npnn \ior_str_get:NN \#1\#2 \{ T , F , TF \}
\ior_if_eof:NTF \#1
\{ \prg_return_false: \}
\{ \__ior_str_get:NN \#1 \#2 \prg_return_true: \}
\}
\end{definition}
\ior_get_term:nN \ior_str_get_term:nN \__ior_get_term:NnN
Getting from the terminal is better with pretty-printing.
\cs_new_protected:Npn \ior_get_term:nN \#1\#2
\{ \__ior_get_term:NnN \__ior_get:NN \{ \#1 \} \#2 \}
\cs_new_protected:Npn \ior_str_get_term:nN \#1\#2
\{ \__ior_get_term:NnN \__ior_str_get:NN \{ \#1 \} \#2 \}
\cs_new_protected:Npn \__ior_get_term:NnN \#1\#2\#3
\{ \group_begin:n \tex_escapechar:D = -1 \scan_stop:
\int_if_blank:nTF \#2
\{ \exp_args:Nnc \#1 \c__ior_term_noprompt_ior \}
\{ \exp_args:Nnc \#1 \c__ior_term_ior \}
\{ \#2 \}
\exp_args:NNNv \group_end:n \tl_set:Nn \#3 \{ \#2 \}
\}
\end{definition}
\c__ior_term_noprompt_ior
For reading without a prompt.
\int_const:Nn \c__ior_term_noprompt_ior \{ -1 \}
\end{definition}
\ior_map_break: \ior_map_break:n
Usual map breaking functions.
\cs_new:Npn \ior_map_break: \{ \}
\cs_new:Npn \ior_map_break:n \{ \}
```
Mapping over an input stream can be done on either a token or a string basis, hence the set up. Within that, there is a check to avoid reading past the end of a file, hence the two applications of \ior_if_eof:N and its lower-level analogue if_eof:w. This mapping cannot be nested with twice the same stream, as the stream has only one “current line”.

\ior_map_variable:NNn \ior_str_map_variable:NNn \__ior_map_variable:NNNn \__ior_map_variable_loop:NNNn

Since the \TeX{} primitive (\read{} or \readline{}) assigns the tokens read in the same way as a token list assignment, we simply call the appropriate primitive. The end-of-loop is checked using the primitive conditional for speed.
There is a lot of similarity here to the input operations, at least for many of the basics. Thus quite a bit is copied from the earlier material with minor alterations.

### 49.2.1 Variables and constants

\l__iow_internal_tl

Used as a short-term scratch variable.

\tl_new:N \l__iow_internal_tl

(End definition for \l__iow_internal_tl)

\c_log_iow \c_term_iow

Here we allocate two output streams for writing to the transcript file only (\c_log_iow) and to both the terminal and transcript file (\c_term_iow). Recent Lua\TeX{} provide write streams; we also use \c_term_iow as the first non-allowed write stream so its value depends on the engine.

\int_const:Nn \c_log_iow { -1 }

\int_const:Nn \c_term_iow { 128 }

\int_const:Nn \c_term_iow { 16 }

(End definition for \c_log_iow and \c_term_iow. These variables are documented on page 93.)

\g__iow_streams_seq

A list of the currently-available output streams to be used as a stack.

\seq_new:N \g__iow_streams_seq

(End definition for \g__iow_streams_seq)

\l__iow_stream_tl

Used to recover the raw stream number from the stack.

\tl_new:N \l__iow_stream_tl

(End definition for \l__iow_stream_tl)

\g__iow_streams_prop

As for reads with the appropriate adjustment of the register numbers to check on.

\prop_new:N \g__iow_streams_prop

\int_step_inline:nnn { 0 } { \cs_if_exist:NTF \contextversion { \tex_count:D 39 ~ } { \tex_count:D 17 ~ } { 627 } }
\cs_if_exist:NT \loccount { - 1 }
}
\foreach
{\prop_gput:Nnn \g__iow_streams_prop {#1} { Reserved-by-format }
}
(End definition for \g__iow_streams_prop.)

49.2.2 Internal auxiliaries
\__iow_use_i_delimit_by_s_stop:nw
Functions to gobble up to a scan mark.
\cs_new:Npn \__iow_use_i_delimit_by_s_stop:nw #1 #2 \s__iow_stop {#1}
(End definition for \__iow_use_i_delimit_by_s_stop:nw.)
\q__iow_nil
Internal quarks.
\quark_new:N \q__iow_nil
(End definition for \q__iow_nil.)

49.3 Stream management
\iow_new:N\iow_new:c
Reserving a new stream is done by defining the name as equal to writing to the terminal:
\cs_new_protected:Npn \iow_new:N { \cs_new_eq:NN #1 \c_term_iow }
\cs_generate_variant:Nn \iow_new:N { c }
(End definition for \iow_new:N. This function is documented on page 86.)
\g_tmpa_iow\g_tmpb_iow
The usual scratch space.
\iow_new:N \g_tmpa_iow
\iow_new:N \g_tmpb_iow
(End definition for \g_tmpa_iow and \g_tmpb_iow. These variables are documented on page 93.)
\__iow_new:N
As for read streams, copy \newwrite, making sure that it is not \outer. For Con\TeXt, we have to deal with the fact that \newwrite works like our own: it actually checks before altering definition.
\exp_args:NNf \cs_new_protected:Npn \__iow_new:N
{ \exp_args:NNc \exp_after:wN \exp_stop_f: { newwrite } }
\cs_if_exist:NT \contextversion
{ \cs_new_eq:NN \__iow_new_aux:N \__iow_new:N
\cs_gset_protected:Npn \__iow_new:N {#1}
{ \cs_undefine:N #1
\__iow_new_aux:N {#1}
} }
\_l\_iow\_file\_name\_tl

Data storage.

\tl\_new:N \l\_iow\_file\_name\_tl

(End definition for \l\_iow\_file\_name\_tl)

\iow\_open:Nn
\iow\_open:cn
\_iow\_open\_stream:Nn
\_iow\_open\_stream:NV

The same idea as for reading, but without the path and without the need to allow for a conditional version.

\cs\_new\_protected:Npn \iow\_open:Nn \#1#2

\{\l\_kernel\_tl\_set:Nx \l\_iow\_file\_name\_tl
\{ \l\_kernel\_file\_name\_sanitize:n \{#2\} \}
\iow\_close:N \#1

}
\end{verbatim}

(End definition for \iow\_show\_list:, \iow\_log\_list:, and \__iow\_list:N. These functions are documented on page 87.)

### 49.3.1 Deferred writing

\begin{verbatim}
\cs_new_protected:Npm \iow\_shipout\_x:Nn \iow\_shipout\_x:Nx \iow\_shipout\_x:cn \iow\_shipout\_x:cx
\cs_new_protected:Npm \iow\_shipout\_x:cn \iow\_shipout\_x:cx
\cs_new_protected:Npm \iow\_shipout\_x:cn \iow\_shipout\_x:cx
\cs_generate\_variant:NN \iow\_shipout\_x:cn \iow\_shipout\_x:cx
\end{verbatim}

First the easy part, this is the primitive, which expects its argument to be braced.

\begin{verbatim}
\cs_new_protected:Npm \iow\_shipout\_x:Nn \iow\_shipout\_x: Nx \iow\_shipout\_x:cn \iow\_shipout\_x:cx
\cs\_generate\_variant:NN \iow\_shipout\_x: N x \iow\_shipout\_x: N x \iow\_shipout\_x: N c \iow\_shipout\_x:cx
\end{verbatim}

(End definition for \iow\_shipout\_x:Nn. This function is documented on page 90.)

With \LaTeX available deferred writing without expansion is easy.

\begin{verbatim}
\cs_new_protected:Npm \iow\_shipout\_x:Nn \iow\_shipout\_x:Nx \iow\_shipout\_x:cn \iow\_shipout\_x:cx
\cs\_generate\_variant:NN \iow\_shipout\_x: N x \iow\_shipout\_x: N x \iow\_shipout\_x: N c \iow\_shipout\_x:cx
\end{verbatim}

(End definition for \iow\_shipout\_x:Nn. This function is documented on page 90.)
49.3.2 Immediate writing

If the integer \#1 is equal to \#2, just leave \#3 in the input stream. Otherwise, pass the old value to an auxiliary, which sets the integer to the new value, runs the code, and restores the integer.

\begin{verbatim}
\cs_new_protected:Npn \__kernel_iow_with:Nnn \#1\#2
{  \int_compare:nNnTF {\#1} = {\#2}  
{ \use:n }  
{ \exp_args:No \__iow_with:nNnn \{ \int_use:N \#1 \} \#1 \{\#2\} }  
} \cs_new_protected:Npn \__iow_with:nNnn \#1\#2\#3\#4
{  \int_set:Nn \#2 \{\#3\} \#4  
\int_set:Nn \#2 \{\#1\}  
}
\end{verbatim}

(End definition for \__kernel_iow_with:Nnn and \__iow_with:nNnn.)

\begin{verbatim}
\textbf{\texttt{iow_now:Nn}} \begin{verbatim}
\ioow_now:Nn \ioow_now:Nx \ioow_now:cn \ioow_now:cx
\end{verbatim}
\end{verbatim}

This routine writes the second argument onto the output stream without expansion. If this stream isn’t open, the output goes to the terminal instead. If the first argument is no output stream at all, we get an internal error. We don’t use the expansion done by \texttt{\write} to get the \texttt{Nx} variant, because it differs in subtle ways from \texttt{x}-expansion, namely, macro parameter characters would not need to be doubled. We set the \texttt{\newlinechar} to 10 using \__kernel_iow_with:Nmn to support formats such as plain \TeX: otherwise, \texttt{iow_now:} would not work. We do not do this for \texttt{iow_shipout:Nn} or \texttt{iow_shipout_x:Nn}, as \TeX looks at the value of the \texttt{\newlinechar} at shipout time in those cases.

\begin{verbatim}
\cs_new_protected:Npn \iow_now:Nn \#1\#2
{ \__kernel_iow_with:Nnn \tex_newlinechar:D { ‘\^^J } \{ \tex_immediate:D \texttt{\write:D \#1 \{ \exp_not:n \{\#2\} \} }  
} \cs_generate_variant:Nn \iow_now:Nn { c, Nx, cx }
\end{verbatim}

(End definition for \iow_now:Nn. This function is documented on page 90.)

\begin{verbatim}
\textbf{\texttt{iow_log:n}} \begin{verbatim}
\ioow_log:n \ioow_log:x \ioow_term:n \ioow_term:x
\end{verbatim}
\end{verbatim}

Writing to the log and the terminal directly are relatively easy.

\begin{verbatim}
\cs_new_protected:Npn \iow_log:x \ioow_log:x \#1\#2
{ \ioow_now:Nx \c_log_iow } \cs_new_protected:Npn \iow_log:n \ioow_log:n \#1\#2
{ \ioow_now:Nn \c_log_iow } \cs_new_protected:Npn \iow_term:x \ioow_term:x \#1\#2
{ \ioow_now:Nx \c_term_iow } \cs_new_protected:Npn \iow_term:n \ioow_term:n \#1\#2
{ \ioow_now:Nn \c_term_iow }  
\end{verbatim}

(End definition for \iow_log:n and \iow_term:n. These functions are documented on page 90.)

49.3.3 Special characters for writing

\begin{verbatim}
\textbf{\texttt{iow_newline:}} \begin{verbatim}
\ioow_newline: \ioow_newline:x
\end{verbatim}
\end{verbatim}

Global variable holding the character that forces a new line when something is written to an output stream.

\begin{verbatim}
\cs_new:Npn \iow_newline: \#1\#2
{ ‘\^^J } \cs_new:Npn \iow_newline:x \#1\#2
{ \ioow_now:Nn \c_term_iow }  
\end{verbatim}

(End definition for \iow_newline:. This function is documented on page 91.)

631
Function to write any escaped char to an output stream.

\cs_new_eq:NN \iow_char:N \cs_to_str:N
\end{definition}  \(\text{This function is documented on page 91.}\)

49.3.4 Hard-wrapping lines to a character count

The code here implements a generic hard-wrapping function. This is used by the messaging system, but is designed such that it is available for other uses.

\l_iow_line_count_int
This is the “raw” number of characters in a line which can be written to the terminal. The standard value is the line length typically used by \TeX\ Live and Mi\TeX.
\begin{verbatim}
\int_new:N \l_iow_line_count_int
\int_set:Nn \l_iow_line_count_int { 78 }
\end{verbatim}
\(\text{This variable is documented on page 92.}\)

\l__iow_newline_tl
The token list inserted to produce a new line, with the ⟨run-on text⟩.
\begin{verbatim}
\tl_new:N \l__iow_newline_tl
\end{verbatim}
\(\text{End definition for \l__iow_newline_tl.}\)

\l__iow_line_target_int
This stores the target line count: the full number of characters in a line, minus any part for a leader at the start of each line.
\begin{verbatim}
\int_new:N \l__iow_line_target_int
\end{verbatim}
\(\text{End definition for \l__iow_line_target_int.}\)

\__iow_set_indent:n \__iow_unindent:w
\l__iow_one_indent_tl \l__iow_one_indent_int
The one_indent variables hold one indentation marker and its length. The \__iow_unindent:w auxiliary removes one indentation. The function \__iow_set_indent:n (that could possibly be public) sets the indentation in a consistent way. We set it to four spaces by default.
\begin{verbatim}
\tl_new:N \l__iow_one_indent_tl
\int_new:N \l__iow_one_indent_int
\cs_new:Npn \__iow_unindent:w { }
\cs_new_protected:Npn \__iow_set_indent:n #1
{ \__kernel_tl_set:Nx \l__iow_one_indent_tl
{ \exp_args:No \__kernel_str_to_other_fast:n { \tl_to_str:n {#1} } } }
\int_set:Nn \l__iow_one_indent_int
{ \str_count:N \l__iow_one_indent_tl }
\exp_last_unbraced:NNo
\cs_set:Npn \__iow_unindent:w \l__iow_one_indent_tl { }
\exp_args:Nx \__iow_set_indent:n \prg_replicate:nn { 4 } { - } }
\end{verbatim}
\(\text{End definition for \__iow_set_indent:n and others.}\)

\l__iow_one_indent_tl \l__iow_one_indent_int
The current indentation (some copies of \l__iow_one_indent_tl) and its number of characters.
\begin{verbatim}
\tl_new:N \l__iow_one_indent_tl
\int_new:N \l__iow_one_indent_int
\end{verbatim}
\(\text{End definition for \l__iow_one_indent_int and \l__iow_one_indent_int.}\)
\_iow_line_tl These hold the current line of text and a partial line to be added to it, respectively.
\_iow_line_part_tl
\_iow_line_break_bool Indicates whether the line was broken precisely at a chunk boundary.
\_iow_wrap_tl
\_iow_wrap_end_marker_tl
\_iow_wrap_newline_marker_tl
\_iow_wrap_allow_break_marker_tl
\_iow_wrap_indent_marker_tl
\_iow_wrap_unindent_marker_tl
\iow_allow_break: \__iow_allow_break: \__iow_allow_break_error:

\_iow_allow_break: We set \iow_allow_break:n to produce an error when outside messages. Within
wrapped message, it is set to \_iow_allow_break: when valid and otherwise to
\_iow_allow_break_error:. The second produces an error expandably.
\iow_indent:n We set \iow_indent:n to produce an error when outside messages. Within wrapped message, it is set to __iow_indent:n when valid and otherwise to __iow_indent_error:n. The first places the instruction for increasing the indentation before its argument, and the instruction for unindenting afterwards. The second produces an error expandably. Note that there are no forced line-break, so the indentation only changes when the next line is started.

\iow_wrap:nnnN \iow_wrap:nxnN The main wrapping function works as follows. First give , \ and other formatting commands the correct definition for messages and perform the given setup #3. The definition of uses an “other” space rather than a normal space, because the latter might be absorbed by \TeX to end a number or other \f-type expansions. Use \ConditionalTracingOf if defined; it is introduced by the trace package and suppresses uninteresting tracing of the wrapping code.

(End definition for \iow_allow_break:, \__iow_allow_break:, and \__iow_allow_break_error:. This function is documented on page 306.)
Then fully-expand the input: in package mode, the expansion uses \protect\linebreak \cprotect\linebreak mechanism in the same way as \typeout. In generic mode this setting is useless but harmless. As soon as the expansion is done, reset \iow_indent:n to its error definition: it only works in the first argument of \l_iow_line_count_int instead).

Afterwards, set the newline marker (two assignments to fully expand, then convert to a string) and initialize the target count for lines (the first line has target count \l_iow_line_count_int instead).

Sanity check.

There is then a loop over the input, which stores the wrapped result in \l__iow_wrap_tl. After the loop, the resulting text is passed on to the function which has been given as a post-processor. The \tl_to_str:N step converts the “other” spaces back to normal spaces. The f-expansion removes a leading space from \l__iow_wrap_tl.

(End definition for \iow_wrap:nnn. This function is documented on page 92.)

\__iow_wrap_chunk:nw
\__iow_wrap_next:nw

The chunk and next auxiliaries are defined indirectly to obtain the expansions of \c_{\-catcode_other_space_tl and \c__iow_wrap_marker_tl in their definition. The next auxiliary calls a function corresponding to the type of marker (its ##2), which can be newline or indent or unindent or end. The first argument of the chunk auxiliary is a target number of characters and the second is some string to wrap. If the chunk is empty simply call next. Otherwise, set up a call to \__iow_wrap_line:nw, including the indentation if the current line is empty, and including a trailing space (#1) before the \__iow_wrap_end_chunk:w auxiliary.

}
}
\cs_set_protected:Npn \__iow_wrap_next:nw #1#2 #1
This is followed by \{⟨string⟩\} ⟨intexpr⟩ ;. It stores the ⟨string⟩ and up to ⟨intexpr⟩ characters from the current chunk into \l__iow_line_part_tl. Characters are grabbed 8 at a time and left in \l__iow_line_part_tl by the line_loop auxiliary. When \k < 8 remain to be found, the line_aux auxiliary calls the line_end auxiliary followed by (the single digit) \k, then \7 - \k empty brace groups, then the chunk’s remaining characters. The line_end auxiliary leaves \k characters from the chunk in the line part, then ends the assignment. Ignore the \use_none:nnnn line for now. If the next character is a space the line can be broken there: store what we found into the result and get the next line. Otherwise some work is needed to find a break-point. So far we have ignored what happens if the chunk is shorter than the requested number of characters: this is dealt with by the end_chunk auxiliary, which gets treated like a character by the rest of the code. It ends up being called either as one of the arguments \#2–\#9 of the line_loop auxiliary or as one of the arguments \#2–\#8 of the line_end auxiliary. In both cases stop the assignment and work out how many characters are still needed. Notice that when we have exactly seven arguments to clean up, a \exp_stop_f: has to be inserted to stop the \exp:w. The weird \use_none:nnnn ensures that the required data is in the right place.
Functions here are defined indirectly: \_iow_wrap_line:nw is eventually called with an “other” space as its argument. The goal is to remove from \l__iow_line_part_tl the part after the last space. In most cases this is done by repeatedly calling the break_loop auxiliary, which leaves “words” (delimited by spaces) until it hits the trailing space: then its argument #3 is ? \_iow_wrap_break_end:w instead of a single token, and that break_end auxiliary leaves in the assignment the line until the last space, then calls \_iow_wrap_line_end:nw to finish up the line and move on to the next. If there is no space in \l__iow_line_part_tl then the break_first auxiliary calls the break_none auxiliary. In that case, if the current line is empty, the complete word (including #4, characters beyond what we had grabbed) is added to the line, making it over-long. Otherwise, the word is used for the following line (and the last space of the line so far is removed because it was inserted due to the presence of a marker).
\cs_new:Npn \__iow_wrap_break_first:w ##1 #1 ##2
{ \use_none:nn #2 \__iow_wrap_break_none:w \__iow_wrap_break_loop:w ##1 #1 #2 }

```

(End definition for \_\_io\_wrap\_trim\_N, \_\_io\_wrap\_trim\_w, and \_\_io\_wrap\_trim\_aux\_w.)

### 49.4 File operations

Used as a short-term scratch variable.

```
\tl\_new:N \l\_\_file\_internal\_t\_l
```

(End definition for \_\_file\_internal\_t\_l.)

The name of the current file should be available at all times: the name itself is set dynamically.

```
\str\_new:N \g\_file\_curr\_dir\_str
\str\_new:N \g\_file\_curr\_ext\_str
\str\_new:N \g\_file\_curr\_name\_str
```

(End definition for \g\_file\_curr\_dir\_str, \g\_file\_curr\_ext\_str, and \g\_file\_curr\_name\_str. These variables are documented on page 92.)

The input list of files is stored as a sequence stack. In package mode we can recover the information from the details held by \LaTeX{} (we must be in the preamble and loaded using \usepackage or \RequirePackage). As \LaTeX{} doesn’t store directory and name separately, we stick to the same convention here. In pre-loading, \_\@curr\_name\_stack is empty so is skipped.
The total list of files used is recorded separately from the current file stack, as nothing is ever popped from this list. The current file name should be included in the file list! We will eventually copy the contents of \@filelist.

For storing the basename and full path whilst passing data internally.

Used in parsing a path into parts: in contrast to the above, these are never used outside of the current module.

The current search path.

Scratch space for comma list conversion.

\g__file_record_seq
\l__file_base_name_tl
\l__file_full_name_tl
\l__file_dir_str
\l__file_ext_str
\l__file_name_str
\l_file_search_path_seq
\l__file_tmp_seq

The variable \l_file_search_path_seq is documented on page 94.

Functions to query recursion quarks.

(End definition for \__file_if_recursion_tail_break:NN and \__file_if_recursion_tail_stop_do:NN.)

\__kernel_file_name_sanitize:n
\__file_name_expand:n
\__file_name_expand_cleanup:Nw
\__file_name_expand_cleanup:w
\__file_name_strip_quotes:n
\__file_name_strip_quotes:nnn
\__file_name_trim_spaces:n
\__file_name_trim_spaces:nw
\__file_name_trim_spaces:aux:n
\__file_name_trim_spaces:aux:w

Expanding the file name uses a \csname-based approach, and relies on active characters (for example from UTF-8 characters) being properly set up to expand to an expansion-safe version using \ifcsname. This is less conservative than the token-by-token approach used before, but it is much faster.

\cs_new:Npn \__kernel_file_name_sanitize:n #1
\exp_after:wN \__file_name_expand_cleanup:Nw
\cs:w __file_name = #1 \cs_end:
\__file_name_expand_end:

We'll use \cs:w to start expanding the file name, and to avoid creating csnames equal to \relax with “common” names, there’s a prefix \__file_name= to the csnames. There’s also a guard token at the end so we can check if there was an error during the process and (try to) clean up gracefully.
With the csname built, we grab it, and grab the remaining tokens delimited by `__file_name expand_end:`. If there are any remaining tokens, something bad happened, so we'll call the error procedure `__file_name expand error:Nw`. If everything went according to plan, then use `token_to_str:N` on the csname built, and call `__file_name expand cleanup:w` to remove the prefix we added a while back. `__file_name expand cleanup:w` takes a leading argument so we don’t have to bother about the value of `\text escapechar:D`.

```
\cs_new:Npn \__file_name_expand_cleanup:Nw #1 #2 \__file_name_expand_end:
{ \tl_if_empty:nF {#2}
  \{ \__file_name_expand_error:Nw #2 \__file_name_expand_end: \}
  \exp_after:wN \__file_name_expand_cleanup:w \token_to_str:N #1
}
```

In non-error cases `__file_name expand cleanup:w` should not expand. It will only do so in case there is a `csname` too much in the file name, so it will throw an error (while expanding), then insert the missing `\cs_end:` and yet another `__file_name expand cleanup:` that will be used as a delimiter by `__file_name expand cleanup:Nw` (or that will expand again if yet another `endcsname` is missing).

```
\cs_new:Npn \__file_name_expand_cleanup_end:
{ \msg_expandable_error:nn { kernel } { filename-missing-endcsname } \cs_end: \__file_name_expand_end: }
```

Now to the error case. `__file_name expand error:Nw` adds an extra `\cs_end:` so that in case there was an extra `csname` in the file name, then `__file_name expand error_aux:Nw` throws the error.

```
\cs_new:Npn \__file_name_expand_error:Nw #1 #2 \__file_name_expand_end:
{ \__file_name_expand_error_aux:Nw #1 #2 \cs_end: \__file_name_expand_end: }
```

Quoting file name uses basically the same approach as for `luaquotejobname`: count the `"` tokens and remove them.

```
\cs_new:Npn \__file_name_strip_quotes:n #1
{ \__file_name_strip_quotes:nw { 0 } \exp_stop_f: #1 \token_to_str:N #1 } \exp_after:wN \token_to_str:N #1
```

644
Spaces need to be trimmed from the start of the name and from the end of any extension. However, the name we are passed might not have an extension: that means we have to look for one. If there is no extension, we still use the standard trimming function but deliberately prevent any spaces being removed at the end.

The same idea as the marker for rescanning token lists: this pair of tokens cannot appear in a file that is being input.

The approach here is similar to that for `\tl_set_rescan:Nnn`. The file contents are grabbed as an argument delimited by `\c__file_marker_tl`. A few subtleties: braces in `\if_false: ... \fi:` to deal with possible alignment tabs, `\tracingnesting` to avoid...
a warning about a group being closed inside the `\scantokens`, and `\prg_return_true:` is placed after the end-of-file marker.

__file_size:n A copy of the primitive where it’s available.

1109 \cs_new_eq:NN \__file_size:n \tex_filesize:D
1109 (End definition for `\__file_size:n`.)

__file_full_name:n File searching can be carried out if the `\pdffilesize` primitive or an equivalent is available. That of course means we need to arrange for everything else to here to be done by expansion too. We start off by sanitizing the name and quoting if required: we may need to remove those quotes, so the raw name is passed too.

646
First, we check if the file is just here: no mapping so we do not need the break part of the broader auxiliary. We are using the fact that the primitive here returns nothing if the file is entirely absent. To avoid unnecessary filesystem lookups, the result of \texttt{pdffilesize} is kept available as an argument. For package mode, \texttt{\input@path} is a token list not a sequence.

Two pars to the auxiliary here so we can avoid doing quoting twice in the event we find the right file.

As \LaTeX{} automatically adds \texttt{.tex} if there is no extension, there is a little clean up to do here. First, make sure we are not in the directory part, saving that. Then check for an extension.
Deal with the fact that the primitive might not be available.
\cs_if_exist:NF \tex_filesize:D
{ \cs_gset:Npn \file_full_name:n #1
  { \msg_expandable_error:nnn { kernel } { primitive-not-available } { \texttt{(pdf)filesize} } }

\cs_generate_variant:Nn \file_get_full_name:nNTF { V }

If \texttt{\tex_filesize:D} is not available, the way to test if a file exists is to try to open it: if it does not exist then \TeX{} reports end-of-file. A search is made looking at each potential path in turn (starting from the current directory). The first location is of course treated as the correct one: this is done by jumping to \prg_break_point:. If nothing is found, \#2 is returned empty. A special case when there is no extension is that once the first location is found we test the existence of the file with \texttt{.tex} extension in that directory, and if it exists we include the \texttt{.tex} extension in the result.

Input of a file with a test for existence. We do not define the T or TF variants because the most useful place to place the \texttt{true code} would be inconsistent with other conditionals.

\begin{verbatim}
\cs_new_protected:Nnn \file_get_full_name:nN #1 \l__file_full_name_tl
\l__file_full_name_tl
\prg_return_true: }
\l__file_full_name_tl
\prg_return_false: }
\end{verbatim}

(End definition for \file_get_full_name:nN. This function is documented on page 97.)
Loading a file is done in a safe way, checking first that the file exists and loading only if it does. Push the file name on the \texttt{\g__file_stack_seq}, and add it to the file list, either \texttt{\g__file_record_seq} or \texttt{@filelist} in package mode.

Keeping a track of the file data is easy enough: we store the separated parts so we do not need to parse them twice.
The main parsing macro \file_parse_full_name:apply:n passes the file name #1 through \_kernel_file_name-sanitize:n so that we have a single normalised way to treat files internally. \file_parse_full_name:n uses the former, with \prg_do-nothing: to leave each part of the name within a pair of braces.

\file_parse_full_name:n \file_parse_full_name_apply:n

\file_parse_full_name_area:n

\file_parse_full_name Area:nw splits the file name into chunks separated by \(/\), until the last one is reached. The last chunk is the file name plus the extension, and everything before that is the path. When \__file_parse_full_name_area:nw is done, it leaves the path within braces after the scan mark \s__file_stop and proceeds parsing the actual file name.

\file_parse_full_name_area:n

(End definition for \file_input:n and others. This function is documented on page 97.)
\_\_file\_parse\_full\_name\_base:nw does roughly the same as above, but it separates the chunks at each period. However here there’s some extra complications: In case #1 is empty, it is assumed that the extension is actually empty, and the file name is #2. Besides, an extra . has to be added to #2 because it is later removed in \_\_file\_parse\_full\_name\_tidy:nnnN. In any case, if there’s an extension, it is returned with a leading ..

```
11461 \cs_new:Npn \_\_file\_parse\_full\_name\_base:nw #1 #2 . #3 \s__file_stop
11462 { \tl_if_empty:nTF {#3}
11463 { \tl_if_empty:nTF {#1}
11464 { \tl_if_empty:nTF {#2}
11465 { \_\_file\_parse\_full\_name\_tidy:nnnN { } { } }
11466 { \_\_file\_parse\_full\_name\_tidy:nnnN { .#2 } { } }
11467 { \_\_file\_parse\_full\_name\_base:nw {#1} { .#2 } }
11468 { \_\_file\_parse\_full\_name\_base:nw { #1 . #2 } #3 \s__file_stop }
11469 }
11470 }
11471 }
```

Now we just need to tidy some bits left loose before. The loop used in the two macros above start with a leading / and . in the file path an name, so here we need to remove them, except in the path, if it is a single /, in which case it’s left as is. After all’s done, pass to #4.

```
11481 \cs_new:Npn \_\_file\_parse\_full\_name\_tidy:nnnN #1 #2 #3 #4
11482 { \exp_args:Nee #4
11483 { \str_if_eq:nnF {#3} { / } { \use_none:n }
11484 #3 \prg_do_nothing:
11485 }
11486 { \use_none:n #1 \prg_do_nothing: }
11487 {#2}
11488 }
```

(End definition for \file\_parse\_full\_name:n and others. These functions are documented on page 95.)

\file\_parse\_full\_name:NNN \file\_parse\_full\_name:VNNN

```
11491 \cs_new_protected:Npn \file\_parse\_full\_name:NNN #1 #2 #3 #4
11492 { \file\_parse\_full\_name\_apply:nN {#1}

11494 }
11495 \cs_new_protected:Npn \_\_file\_full\_name\_assign:nnnNN #1 #2 #3 #4 #5 #6
11496 { \str_set:Nn #4 {#1}
11497 \str_set:Nn #5 {#2}
11498 \str_set:Nn #6 {#3}
11499 }
11500 \cs_generate_variant:Nn \file\_parse\_full\_name:NNN { V }
```

(End definition for \file\_parse\_full\_name:nnNN. This function is documented on page 95.)
A function to list all files used to the log, without duplicates. In package mode, if \@filelist is still defined, we need to take this list of file names into account (we capture it \AtBeginDocument into \g__file_record_seq), turning it to a string (this does not affect the commas of this comma list).

\cs_new_protected:Npn \file_show_list: { \__file_list:N \msg_show:nnxxxx }
\cs_new_protected:Npn \file_log_list: { \__file_list:N \msg_log:nnxxxx }
\cs_new_protected:Npn \__file_list:N #1
{ \seq_clear:N \l__file_tmp_seq
\clist_if_exist:NT \@filelist
{ \exp_args:NNx \seq_set_from_clist:Nn \l__file_tmp_seq { \tl_to_str:N \@filelist }
\seq_concat:NNN \l__file_tmp_seq \l__file_tmp_seq \g__file_record_seq
\seq_remove_duplicates:N \l__file_tmp_seq
\seq_map_function:NN \l__file_tmp_seq \__file_list_aux:n
\}
\}
\cs_new:Npn \__file_list_aux:n #1 { \iow_newline: #1 }

(End definition for \file_show_list: and others. These functions are documented on page 97.)

When used as a package, there is a need to hold onto the standard file list as well as the new one here. File names recorded in \@filelist must be turned to strings before being added to \g__file_record_seq.

\cs_if_exist:NT \@filelist
{ \AtBeginDocument \@filelist
{ \exp_args:NNx \seq_set_from_clist:Nn \l__file_tmp_seq { \tl_to_str:N \@filelist }
\seq_gconcat:NNN \g__file_record_seq \g__file_record_seq \l__file_tmp_seq
\}
\}

\GetIdInfo
\cs_new_protected:Npn \GetIdInfo
{ \tl_clear_new:N \ExplFileDescription
\tl_clear_new:N \ExplFileDate
\}

49.5 GetIdInfo

As documented in expl3.dtx this function extracts file name etc from an svn Id line. This used to be how we got version number and so on in all modules, so it had to be defined in l3bootstrap. Now it’s more convenient to define it after we have set up quite a lot of tools, and l3file seems the least unreasonable place for it.

The idea here is to extract out the information needed from a standard svn Id line, but to avoid a line that would get changed when the file is checked in. Hence the fact that none of the lines here include both a dollar sign and the Id keyword!

\cs_new_protected:Npn \GetIdInfo
{ \tl_clear_new:N \ExplFileDescription
\tl_clear_new:N \ExplFileDate
}
A first check for a completely empty SVN field. If that is not the case, there is a second case when a file created using `svn cp` but has not been checked in. That leaves a special marker `-1` version, which has no further data. Dealing correctly with that is the reason for the space in the line to use `\__file_id_info_auxii:w`.

Here, `#1` is Id, `#2` is the file name, `#3` is the extension, `#4` is the version, `#5` is the check in date and `#6` is the check in time and user, plus some trailing spaces. If `#4` is the marker `-1` value then `#5` and `#6` are empty.

Convert an SVN-style date into a LaTeX-style one.

(End definition for `\GetIdInfo` and others. This function is documented on page 10.)

### 49.6 Checking the version of kernel dependencies

This function is responsible for checking if dependencies of the LaTeX3 kernel match the version preloaded in the LaTeX2ε kernel. If versions don’t match, the function attempts to tell why by searching for a possible stray format file.

The function starts by checking that the kernel date is defined, and if not zero is used to force the error route. The kernel date is then compared with the argument requested
date (usually the packaging date of the dependency). If the kernel date is less than the required date, it’s an error and the loading should abort.

\begin{verbatim}
\cs_new_protected:Npn \__kernel_dependency_version_check:Nn #1 { \exp_args:NV \__kernel_dependency_version_check:nn #1 }
\cs_new_protected:Npn \__kernel_dependency_version_check:nn #1 { \cs_if_exist:NTF \c__kernel_expl_date_tl { \exp_args:NV \__file_kernel_dependency_compare:nnn \c__kernel_expl_date_tl {#1} } { \__file_kernel_dependency_compare:nnn \l__kernel_expl_date_tl {0000-00-00} {#1} } }
\cs_new_protected:Npn \__file_kernel_dependency_compare:nnn #1 #2 #3 { \int_compare:nNnT { \__file_parse_version:w #1 \s__file_stop } < { \__file_parse_version:w #2 \s__file_stop } { \__file_mismatched_dependency_error:nn {#2} {#3} } }
\cs_new:Npn \__file_parse_version:w #1 - #2 - #3 \s__file_stop {#1#2#3}
\__file_mismatched_dependency_error:nn
\end{verbatim}

If the versions differ, then we try to give the user some guidance. This function starts by taking the engine name \c_sys_engine_str and replacing \texttt{tex} by \texttt{latex}, then building a command of the form: \texttt{kpsewhich --all --engine=⟨engine⟩ ⟨format⟩-dev}.fmt to query the format files available. A shell is opened and each line is read into a sequence.

\begin{verbatim}
\cs_new_protected:Npn \__file_mismatched_dependency_error:nn #1 #2 { \exp_args:NNx \ior_shell_open:Nn \g__file_internal_ior { kpsewhich --all --engine=\c_sys_engine_exec_str \c_space_tl \c_sys_engine_format_str \bool_lazy_and:nnT { \tl_if_exist_p:N \development@branch@name } { ! \tl_if_empty_p:N \development@branch@name } { -dev } .fmt } \seq_clear:N \l__file_tmp_seq \ior_map_inline:Nn \g__file_internal_ior { \seq_put_right:Nn \l__file_tmp_seq {##1} } \ior_close:N \g__file_internal_ior \msg_error:nnnn { kernel } { mismatched-support-file } {#1} {#2}
\end{verbatim}

And finish by ending the current file.

\begin{verbatim}
\tex_endinput:D
\end{verbatim}

50.3 Lua functions for internal use

Most of the emulation of pdfTeX here is based heavily on Heiko Oberdiek’s pdftex-cmds package.

$ltx.utils$ Create a table for the kernel’s own use.

(ltx.utils) This function is documented on page 99.

End definition for $ltx.utils$. Local copies of global tables.

End definition for $ltx.utils$. Local copies of standard functions.

Since $token.create$ only returns useful values after the tokens has been added to TeX’s hash table, we define a variant which defines it first if necessary.
local \texttt{is\_defined} = \texttt{token.is\_defined}
local \texttt{set\_char} = \texttt{token.set\_char}
local \texttt{runtoks} = \texttt{tex.runtoks}
local \texttt{let\_token} = \texttt{token\_create\!'let'}

\begin{verbatim}
function \texttt{token\_create\_safe}(s)
  local \texttt{orig\_token} = \texttt{token\_create}(s)
  if \texttt{is\_defined}(s, true) then
    return \texttt{orig\_token}
  end
  \texttt{set\_char}(s, 0)
  local \texttt{new\_token} = \texttt{token\_create}(s)
  \texttt{runtoks}(function()
    \texttt{put\_next}(\texttt{let\_token}, \texttt{new\_token}, \texttt{orig\_token})
  end)
  return \texttt{new\_token}
end
\end{verbatim}

\begin{verbatim}
local \texttt{true\_tok} = \texttt{token\_create\_safe\!'prg\_return\_true:'}
local \texttt{false\_tok} = \texttt{token\_create\_safe\!'prg\_return\_false:'}
\end{verbatim}

In Con\TeX t lmtx \texttt{token\_command\_id} does not exist, but it can easily be emulated with Con\TeX t’s \texttt{tokens\_commands}.

\begin{verbatim}
local \texttt{command\_id} = \texttt{token\_command\_id}
if not \texttt{command\_id} and \texttt{tokens} and \texttt{tokens\_commands} then
  local \texttt{id\_map} = \texttt{tokens\_commands}
  function \texttt{command\_id}(name)
    return \texttt{id\_map}[name]
  end
end
\end{verbatim}

Deal with Con\TeX t: doesn’t use \texttt{kpse} library.

\texttt{escapehex} An internal auxiliary to convert a string to the matching hex escape. This works on a byte basis: extension to handled UTF-8 input is covered in pdftexcmds but is not currently required here.

\begin{verbatim}
local function \texttt{escapehex}(str)
  return (\gsub(str, ".", function (ch) return format("\%02X", byte(ch)) end))
end
\end{verbatim}

(End definition for escapehex.)

\texttt{ltx\_utils\_filedump} Similar comments here to the next function: read the file in binary mode to avoid any line-end weirdness.

\begin{verbatim}
local function \texttt{filedump}(name,offset,length)
  local file = \texttt{kpse\_find}(name,"\text",true)
  if not file then return end
  local f = \texttt{open}(file,"rb")
  if not f then return end
  if offset and offset > 0 then
    f:seek("set", offset)
  end
end
\end{verbatim}

667
local data = f:read(length or 'a')
f:close()
return escapehex(data)
end
ltxutils.filedump = filedump

(End definition for ltx.utils.filedump. This function is documented on page 99.)

md5.HEX Hash a string and return the hash in uppercase hexadecimal format. In some engines, this is build-in. For traditional LuaTeX, the conversion to hexadecimal has to be done by us.

local md5_HEX = md5.HEX
if not md5_HEX then
  local md5_sum = md5.sum
  function md5_HEX(data)
    return escapehex(md5_sum(data))
  end
  md5.HEX = md5_HEX
end

(End definition for md5.HEX. This function is documented on page ??.)

ltx.utils.filemd5sum Read an entire file and hash it: the hash function itself is a build-in. As Lua is byte-based there is no work needed here in terms of UTF-8 (see pftexcmds and how it handles strings that have passed through LuaTeX). The file is read in binary mode so that no line ending normalisation occurs.

local function filemd5sum(name)
  local file = kpse_find(name, "tex", true) if not file then return end
  local f = open(file, "rb") if not f then return end
  local data = f:read("*a")
f:close()
return md5_HEX(data)
end
ltxutils.filemd5sum = filemd5sum

(End definition for ltx.utils.filemd5sum. This function is documented on page 99.)

ltx.utils.filemoddate There are two cases: If the C standard library is C99 compliant, we can use %z to get the timezone in almost the right format. We only have to add primes and replace a zero or missing offset with Z.

Of course this would be boring, so Windows does things differently. There we have to manually calculate the offset. See procedure makepdftime in utils.c of pdfTeX.

local filemoddate
if os_date'%%z':match'\([-\]+\)%%d%%d%%d%%d$' then
  local pattern = lpeg.Cs(16 *
    (lpeg.Cg(lpeg.S'\+\-') * '0000' * lpeg.Cc'Z')
    + 3 * lpeg.Cc'\n' * 2 * lpeg.Cc'\n'
    + lpeg.Cc'Z')
    * -1)
  function filemoddate(name)
    local file = kpse_find(name, "tex", true)
    if not file then return end
    local date = lfs_attr(file, "modification")
end

668
if not date then return end
return pattern:match(os_date("D:%Y%m%d%H%M%S%z", date))
end
else
  local function filemoddate(name)
    local file = kpse_find(name, "tex", true)
    if not file then return end
    local date = lfs_attr(file, "modification")
    if not date then return end
    local d = os_date("%t", date)
    local u = os_date("!%t", date)
    local off = 60 * (d.hour - u.hour) + d.min - u.min
    if d.year ~= u.year then
      if d.year > u.year then
        off = off + 1440
      else
        off = off - 1440
      end
    elseif d.yday ~= u.yday then
      if d.yday > u.yday then
        off = off + 1440
      else
        off = off - 1440
      end
    end
    local timezone
    if off == 0 then
      timezone = "Z"
    elseif off < 0 then
      timezone = "-"
      off = -off
    else
      timezone = "+
    end
    timezone = format("%s%02d'%02d'", timezone, hours // 60, hours % 60)
    return format("D:%04d%02d%02d%02d%02d%02d%s", d.year, d.month, d.day, d.hour, d.min, d.sec, timezone)
  end
  ltxutils.filemoddate = filemoddate

  ltx.utils.filesize
  A simple disk lookup.
  local function filesize(name)
    local file = kpse_find(name, "tex", true)
    if file then
      local size = lfs_attr(file, "size")
      if size then
        return size
      end
    end
  end

ltx.utils.filesize
(End definition for ltx.utils.filemoddate. This function is documented on page 99.)
luadef  An internal function for defining control sequences form Lua which behave like primitives. This acts as a wrapper around token.set_lua which accepts a function instead of an index into the functions table.

local luacmd do
    local set_lua = token.set_lua
    local undefined_cs = command_id'undefined_cs'
    if not context and not luatexbase then require'ltluatex' end
    if luatexbase then
        local new_luafunction = luatexbase.new_luafunction
        local functions = lua.get_functions_table()
        function luacmd(name, func, ...)
            local id
            local tok = token_create(name)
            if tok.command == undefined_cs then
                id = new_luafunction(name)
                set_lua(name, id, ...)
            else
                id = tok.index or tok.mode
            end
            functions[id] = func
        end
    elseif context then
        local register = context.functions.register
        local functions = context.functions.known
        function luacmd(name, func, ...)
            local tok = token_create(name)
            if tok.command == undefined_cs then
                token.set_lua(name, register(func), ...)
            else
                functions[tok.index or tok.mode] = func
            end
        end
    end
(End definition for luadef.)

try_require  Loads a Lua module. This function loads the module similarly to the standard Lua global function require, with a few differences. On success, try_require returns true, module. If the module cannot be found, it returns false, err_msg. If the module is found, but something goes wrong when loading it, the function throws an error.

local function try_require(name)
    if package_loaded[name] then
        return true, package_loaded[name]
    end
    local failure_details = {}
    for _, searcher in ipairs(package_searchers) do

670
local loader, data = searcher(name)
if type(loader) == 'function' then
    package_loaded[name] = loader(name, data) or true
    return true, package_loaded[name]
elseif type(loader) == 'string' then
    failure_details[#failure_details + 1] = loader
end
return false, table_concat(failure_details, '\n')

(End definition for try_require.)

\_lua_load_module_p:n Check to see if we can load a module using require. If we can load the module, then we
load it immediately. Otherwise, we save the error message in \l_@@_err_msg_str.

local char_given = command_id'char_given'
local c_true_bool = token_create(1, char_given)
local c_false_bool = token_create(0, char_given)
local c_str_cctab = token_create('c_str_cctab').mode
luacmd('\_lua_load_module_p:n', function()
    local success, result = try_require(scan_string())
    if success then
        set_macro(c_str_cctab, '\_lua_err_msg_str', '')
        put_next(c_true_bool)
    else
        set_macro(c_str_cctab, '\_lua_err_msg_str', result)
        put_next(c_false_bool)
    end
end)
(End definition for \_lua_load_module_p:n.)

50.4 Preserving iniTeX Lua data for runs

The Lua state is not dumped when a forat is written, therefore any Lua variables
filled doing format building need to be restored in order to be accessible during normal
runs.

We provide some kernel-internal helpers for this. They will only be available if
luatexbase is available. This is not a big restriction though, because ConTeXt (which
does not use luatexbase) does not load expl3 in the format.

local register_luadata, get_luadata
if luatexbase then
    local register = token_create'@expl@luadata@bytecode'.index
    if status.ini_version then
        register_luadata = register_luadata
    end
register_luadata is only available during format generation. It accept a string which
uniquely identifies the data object and has to be provided to retrieve it later. Additionally
it accepts a function which is called in the pre_dump callback and which has to return a
string that evaluates to a valid Lua object to be preserved.
local luadata, luadata_order = {}, {}

function register_luadata(name, func)
  if luadata[name] then
    error(format("LaTeX error: data name %q already in use", name))
  end
  luadata[name] = func
  luadata_order[#luadata_order + 1] = func and name
end

(End definition for register_luadata. This function is documented on page ??.)

The actual work is done in pre_dump. The luadata_order is used to ensure that the order is consistent over multiple runs.

luatexbase.add_to_callback("pre_dump", function()
  if next(luadata) then
    local str = "return {
    for i=1, #luadata_order do
      local name = luadata_order[i]
      str = format('%s[%q]=%s,, str, name, luadata[name]()
    end
    lua.bytecode[register] = assert(load(str .. "})")
  end
  end, "ltx.luadata")
else
  get_luadata

get_luadata is only available if data should be restored. It accept the identifier which was used when the data object was registered and returns the associated object. Every object can only be retrieved once.

local luadata = lua.bytecode[register]
if luadata then
  lua.bytecode[register] = nil
  luadata = luadata()
end
function get_luadata(name)
  if not luadata then return end
  local data = luadata[name]
  luadata[name] = nil
  return data
end
end

(End definition for get_luadata. This function is documented on page ??.)

</lua>
</package>
Chapter 51

\texttt{l3legacy Implementation}

A friendly wrapper. We need to use the \texttt{if:w} approach here, rather than testing against \texttt{iftrue/iffalse} as the latter approach fails for primitive conditionals such as \texttt{ifmode}. The \texttt{reverse_if:N} here means that we get a slightly more useful error if the name is undefined.

\begin{verbatim}
\prg_new_conditional:Npnn \legacy_if:n #1 { p , T , F , TF } { \exp_after:wN \reverse_if:N \cs:w if#1 \cs_end: \prg_return_false: \else: \prg_return_true: \fi: }
\end{verbatim}

(End definition for \texttt{\legacy_if:nTF}. This function is documented on page 101.)

\texttt{\legacy_if_set_true:n \ legacy_if_set_false:n \ legacy_if_gset_true:n \ legacy_if_gset_false:n}

A friendly wrapper.

\begin{verbatim}
\cs_new_protected:Npm \legacy_if_set_true:n #1 \cs_set_eq:cN { if#1 } \if_true: \cs_new_protected:Npm \legacy_if_set_false:n #1 \cs_set_eq:cN { if#1 } \if_false: \cs_new_protected:Npm \legacy_if_gset_true:n #1 \cs_gset_eq:cN { if#1 } \if_true: \cs_new_protected:Npm \legacy_if_gset_false:n #1 \cs_gset_eq:cN { if#1 } \if_false: }
\end{verbatim}

(End definition for \texttt{\legacy_if_set_true:n} and others. These functions are documented on page 101.)

\texttt{\legacy_if_set:nn \ legacy_if_gset:nn}

A more elaborate wrapper.

\begin{verbatim}
\cs_new_protected:Npm \legacy_if_set:nn #1#2 \{ \bool_if:nTF {#2} \legacy_if_set_true:n \legacy_if_set_false:n \{#1\} \}
\cs_new_protected:Npm \legacy_if_gset:nn #1#2
\end{verbatim}
{ \bool_if:nTF {#2} \legacy_if_gset_true:n \legacy_if_gset_false:n

(#1)

(End definition for \legacy_if_set:nn and \legacy_if_gset:nn. These functions are documented on page 101.)

Chapter 52

l3tl implementation

A token list variable is a \TeX macro that holds tokens. By using the ε-\TeX primitive \texttt{\unexpanded} inside a \TeX \texttt{\edef} it is possible to store any tokens, including \texttt{#}, in this way.

52.1 Functions

\texttt{\__kernel_tl_set:Nx} \texttt{\__kernel_tl_gset:Nx} These two are supplied to get better performance for macros which would otherwise use \texttt{\tl_set:Nx} or \texttt{\tl_gset:Nx} internally.

\texttt{\cs_new_eq:NN \__kernel_tl_set:Nx \cs_set_nopar:Npx}
\texttt{\cs_new_eq:NN \__kernel_tl_gset:Nx \cs_gset_nopar:Npx}

\texttt{(End definition for \__kernel_tl_set:Nx and \__kernel_tl_gset:Nx.)}

\texttt{\tl_new:N} \texttt{\tl_new:c} Creating new token list variables is a case of checking for an existing definition and doing the definition.

\texttt{\cs_new_protected:Npm \tl_new:N \#1}
\texttt{\__kernel_chk_if_free_cs:N \#1}
\texttt{\cs_gset_eq:NN \#1 \c_empty_tl}
\texttt{
}
\texttt{\cs_generate_variant:Nn \tl_new:N { c }}

\texttt{(End definition for \tl_new:N. This function is documented on page 103.)}

\texttt{\tl_const:Nn} \texttt{\tl_const:Nx} \texttt{\tl_const:cn} \texttt{\tl_const:cx} Constants are also easy to generate. They use \texttt{\cs_gset_nopar:Npx} instead of \texttt{\__kernel_tl_gset:Nx} so that the correct scope checking is applied if l3debug is used.

\texttt{\cs_new_protected:Npm \tl_const:Nn \#1\#2}
\texttt{\__kernel_chk_if_free_cs:N \#1}
\texttt{\cs_gset_nopar:Npx \#1 \{ \__kernel_exp_not:w \#2 \} }
\texttt{

(End definition for \_tl_if_recursion_tail_break:nN and \_tl_if_recursion_tail_stop:nTF.)

52.5 Reassigning token list category codes

The rescanning code needs a special token list containing the same character (chosen here to be a colon) with two different category codes: it cannot appear in the tokens being rescanned since all colons have the same category code.

\tl_set_rescan:NNn
\tl_set_rescan:NNo
\tl_set_rescan:NNx
\tl_set_rescan:ccn
\tl_set_rescan:ccx
\tl_gset_rescan:NNn
\tl_gset_rescan:NNo
\tl_gset_rescan:NNx
\tl_gset_rescan:ccn
\tl_gset_rescan:ccx
\_tl_rescan:nn
\_tl_rescan_aux:
\_tl_set_rescan:NNn
\_tl_set_rescan_multi:NNn
\_tl_set_rescan:NNv

In a group, after some initial setup explained below and the user setup #3 (followed by \scan_stop: to be safe), there is a call to \_tl_set_rescan:NNn. This shared auxiliary defined later distinguishes single-line and multi-line “files”. In the simplest case of multi-line files, it calls (with the same arguments) \_tl_set_rescan_multi:NNn, whose code is included here to help understand the approach. This function rescans its argument #1, closes the group, and performs the assignment.

One difficulty when rescanning is that \scantokens treats the argument as a file, and without the correct settings a \TeX error occurs:

! File ended while scanning definition of ...

A related minor issue is a warning due to opening a group before the \scantokens and closing it inside that temporary file; we avoid that by setting \tracingnesting. The standard solution to the “File ended” error is to grab the rescanned tokens as a delimited argument of an auxiliary, here \_tl_rescan:NNn, that performs the assignment, then let \TeX “execute” the end of file marker. As usual in delimited arguments we use \prg_do_-nothing: to avoid stripping an outer set braces: this is removed by using o-expanding assignments. The delimiter cannot appear within the rescanned token list because it contains twice the same character, with different catcodes.
For \_\_\_tl_set_rescan:NNnn we cannot simply call \__\_\_tl_set_rescan:NNnn \prg_do_nothing: \use:n because that would leave the end-of-file marker after the result of rescanning. If that rescanned result is code that looks further in the input stream for arguments, it would break.

For multi-line files the only subtlety is that \newlinechar should be equal to \endlinechar because \newlinechar characters become new lines and then become \endlinechar characters when writing to an abstract file and reading back. This equality is ensured by setting \newlinechar equal to \endlinechar. Prior to this, \endlinechar is set to \-1 if it was \32 (in particular true after \ExplSyntaxOn) to avoid unreasonable line-breaks at every space for instance in error messages triggered by the user setup. Another side effect of reading back from the file is that spaces (catcode 10) are ignored at the beginning of lines, and spaces and tabs (character code 32 and 9) are ignored at the end of lines.

The two \if_false: \... \fi: are there to prevent alignment tabs to cause a change of tabular cell while rescanning. We put the “opening” one after \group_begin: so that if one accidentally f-expands \tl_set_rescan:nnn braces remain balanced. This is essential in e-type arguments when \expanded is not available.
The function `\_\_\_tl_set_rescan:nNN` calls `\_\_\_tl_set_rescan_multi:nNN` or `\_\_\_tl_set_rescan_single:nNN` `{ }` depending on whether its argument is a single-line fragment of code/data or is made of multiple lines by testing for the presence of a `\newlinechar` character. If `\newlinechar` is out of range, the argument is assumed to be a single line.

For a single line, no `\endlinechar` should be added, so it is set to −1, and spaces should not be removed. Trailing spaces and tabs are a difficult matter, as \TeX removes these at a very low level. The only way to preserve them is to re-scan not the argument but the argument followed by a character with a reasonable category code. Here, 11 (letter) and 12 (other) are accepted, as these are convenient, suitable for delimiting an argument, and it is very unlikely that none of the ASCII characters are in one of these categories. To avoid selecting one particular character to put at the end, whose category code may have been modified, there is a loop through characters from ' (ASCII 39) to ~ (ASCII 127). The choice of starting point was made because this is the start of a very long range of characters whose standard category is letter or other, thus minimizing the number of steps needed by the loop (most often just a single one). If no valid character is found (very rare), fall-back on `\_\_\_tl_set_rescan_multi:nNN`.

Otherwise, once a valid character is found (let us use ' in this explanation) run some code very similar to `\_\_\_tl_set_rescan_multi:nNN` but with ' added at both ends of the input. Of course, we need to define the auxiliary `\_\_\_tl_set_rescan_single:NNww` on the fly to remove the additional ' that is just before ;; (by which we mean `\c\_\_\_tl_set_rescan_marker_tl`). Note that the argument must be delimited by ' with the current catcode; this is done thanks to `\char_generate:nn`. Yet another issue is that the re-scanned token list may contain a comment character, in which case the ' we expected is not there. We fix this as follows: rather than just :: we set `\everyeof` to `::\{\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\langle\ associate.

\begin{verbatim}
\cs_new_protected:Npn \_\_\_tl_set_rescan:nNN #1
{ \int_compare:nNnTF \tex_newlinechar:D < 0
  { \use_ii:nn }
  { \exp_args:Nnf \tl_if_in:nnTF {#1}
    { \char_generate:nn { \tex_newlinechar:D } { 12 } }
  }
{ \__tl_set_rescan_multi:nNN }
\end{verbatim}

(End definition for `\tl_set_rescan:Nnn` and others. These functions are documented on page 118.)
52.6 Modifying token list variables

All of the replace functions call \_\_tl_replace:NNNNNnn with appropriate arguments. The first two arguments are explained later. The next controls whether the replacement function calls itself (\_\_tl_replace_next:w) or stops (\_\_tl_replace_wrap:w) after
To implement the actual replacement auxiliary \tl_replace_all:Nnn for local or global replacements. Finally, the three arguments \{\tl_var\} \{\pattern\} \{\replacement\} provided by the user. When describing the auxiliary functions below, we denote the contents of the \{\tl_var\} by \{\token_list\}. 

\cs_new_protected:Npm \tl_replace_once:Nnn
\cs_generate_variant:Nn \tl_replace_all:Nnn { c }
\cs_generate_variant:Nn \tl_greplace_once:Nnn { c }
\cs_new_protected:Npn \tl_greplace_all:Nnn { \__tl_replace:NnNNNnn \q__tl_mark {?} \__tl_replace_next:w \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \tl_replace_all:Nnn { \__tl_replace:NnNNNnn \q__tl_mark {?} \__tl_replace_wrap:w \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \tl_greplace_once:Nnn { \__tl_replace:NnNNNnn \q__tl_mark {?} \__tl_replace_next:w \__kernel_tl_set:Nx }
\cs_new_protected:Npn \tl_replace_once:Nnn { \__tl_replace:NnNNNnn \q__tl_mark ? \__tl_replace_next:w \__kernel_tl_gset:Nx }

(End definition for \tl_replace_all:Nnn and others. These functions are documented on page 117.)

The first replacement. Next comes an \texttt{x}-type assignment function \texttt{tl_set:Nx} or \texttt{tl_gset:Nx} for local or global replacements. Finally, the three arguments \texttt{\{\tl_var\} \{\pattern\} \{\replacement\}} provided by the user. When describing the auxiliary functions below, we denote the contents of the \texttt{\{\tl_var\}} by \texttt{\{\token_list\}}. 

\statement{\_\_\_tl_replace:NnNNNnn}{\_\_\_tl_replace_auxi:NnNNNnn}{\_\_\_tl_replace_auxii:NnNNNnn}{\_\_\_tl_replace_next:w}{\_\_\_tl_replace_next_aux:w}{\_\_\_tl_replace_wrap:w}

To implement the actual replacement auxiliary \texttt{\_\_\_tl_replace_auxii:NnNNNnn} we need a \texttt{\{\delimiter\}} with the following properties:

- all occurrences of the \texttt{\{\pattern\}} \#6 in \texttt{\{\token_list\}} \texttt{\{\delimiter\}} belong to the \texttt{\{\token_list\}} and have no overlap with the \texttt{\{\delimiter\}},
- the first occurrence of the \texttt{\{\delimiter\}} in \texttt{\{\token_list\}} \texttt{\{\delimiter\}} is the trailing \texttt{\{\delimiter\}}.

We first find the building blocks for the \texttt{\{\delimiter\}}, namely two tokens \texttt{\langle A\rangle} and \texttt{\langle B\rangle} such that \texttt{\langle A\rangle} does not appear in \#6 and \#6 is not \texttt{\langle B\rangle} (this condition is trivial if \#6 has more than one token). Then we consider the delimiters \texttt{\langle A\rangle} and \texttt{\langle A\rangle} \texttt{\langle A\rangle} \texttt{\langle A\rangle} \texttt{\langle B\rangle} \texttt{\langle B\rangle} \texttt{\langle B\rangle}, for \texttt{n \geq 1}, where \texttt{\langle A\rangle^n} denotes \texttt{n} copies of \texttt{\langle A\rangle}, and we choose as our \texttt{\{\delimiter\}} the first one which is not in the \texttt{\{\token_list\}}.

Every delimiter in the set obeys the first condition: \#6 does not contain \texttt{\langle A\rangle} hence cannot be overlapping with the \texttt{\{\token_list\}} and the \texttt{\{\delimiter\}}, and it cannot be within the \texttt{\{\delimiter\}} since it would have to be in one of the two (\texttt{\langle B\rangle}) hence be equal to this single token (or empty, but this is an error case filtered separately). Given the particular form of these delimiters, for which no prefix is also a suffix, the second condition is actually a consequence of the weaker condition that the \texttt{\{\delimiter\}} choose does not appear in the \texttt{\{\token_list\}}. Additionally, the set of delimiters is such that a \texttt{\{\token_list\}} of \texttt{n} tokens can contain at most \texttt{O(n^{3/2})} of them, hence we find a \texttt{\{\delimiter\}} with at most \texttt{O(n^{3/2})} tokens in a time at most \texttt{O(n^{5/2})}. Bear in mind that these upper bounds are reached only in very contrived scenarios: we include the case \texttt{\langle A\rangle} in the list of delimiters to try, so that the \texttt{\{\delimiter\}} is simply \texttt{\q__tl_mark} in the most common situation where neither the \texttt{\{\token_list\}} nor the \texttt{\{\pattern\}} contains \texttt{\q__tl_mark}.

Let us now add, optimizing for this most common case. First, two special cases: an empty \texttt{\{\pattern\}} \#6 is an error, and if \#1 is absent from both the \texttt{\{token_list\}} \#5 and the \texttt{\{pattern\}} \#6 then we can use it as the \texttt{\{delimiter\}} through \texttt{\__\_\_tl_replace_\_\_\_tl_replace_\_\_\_tl_replace_auxii:NnNNNnn \#1}. Otherwise, we end up calling \texttt{\__\_\_tl_replace:NnNNNnn} repeatedly with the first two arguments \texttt{\__\_\_tl_mark \{?\}, \? \{?\}, \? \{?\}}, and so on, until \#6 does not contain the control sequence \#1, which we take as our \texttt{\langle A\rangle}. The argument \#2 only serves to collect \texttt{\?} characters for \#1. Note that the order of the tests means that the
first two are done every time, which is wasteful (for instance, we repeatedly test for the emptiness of #6). However, this is rare enough not to matter. Finally, choose (B) to be \q__tl_nil or \q__tl_stop such that it is not equal to #6.

The \_\_tl_replace_auxi:NnnNNNnn auxiliary receives \{⟨A⟩\} and \{⟨A⟩"n⟨B⟩\} as its arguments, initially with n = 1. If “⟨A⟩ ⟨A⟩"n⟨B⟩ ⟨A⟩"n⟨B⟩” is in the ⟨token list⟩ then increase n and try again. Once it is no longer in the ⟨token list⟩ we take it as our ⟨delimiter⟩ and pass this to the auxii auxiliary.

\exp_args:Nc \_\_tl_replace:NnNNNnn {#2} {#2?}
\}
The auxiliary \_\_tl_replace_auxii:nNNNnn receives the following arguments:

\{⟨delimiter⟩\} \{⟨function⟩\} \{⟨assignment⟩\}
\{tl var\} \{⟨pattern⟩\} \{⟨replacement⟩\}

All of its work is done between \group_align_safe_begin: and \group_align_safe_end: to avoid issues in alignments. It does the actual replacement within #3 #4 {...}, an x-expanding ⟨assignment⟩ #3 to the ⟨tl var⟩ #4. The auxiliary \_\_tl_replace_next:w is called, followed by the ⟨token list⟩, some tokens including the ⟨delimiter⟩ #1, followed by the ⟨pattern⟩ #5. This auxiliary finds an argument delimited by #5 (the presence of a trailing #5 avoids runaway arguments) and calls \_\_tl_replace_wrap:w to test whether this #5 is found within the ⟨token list⟩ or is the trailing one.

If on the one hand it is found within the ⟨token list⟩, then #1 cannot contain the ⟨delimiter⟩ #1 that we worked so hard to obtain, thus \_\_tl_replace_wrap:w gets #1 as its own argument #1, and protects it against the x-expanding assignment. It also finds \exp_not:n as #2 and does nothing to it, thus letting through \exp_not:n \{⟨replacement⟩\} into the assignment. Note that \_\_tl_replace_next:w and \_\_tl_replace_wrap:w are always called followed by two empty brace groups. These are safe
because no delimiter can match them. They prevent losing braces when grabbing delimited arguments, but require the use of \exp_not:o and \use_none:nn, rather than simply \exp_not:n. Afterwards, \_\_tl_replace_next:w is called to repeat the replacement, or \_\_tl_replace_wrap:w if we only want a single replacement. In this second case, ##1 is the (remaining tokens) in the (token list) and ##2 is some (ending code) which ends the assignment and removes the trailing tokens #5 using some \if_false: { \fi: } trickery because #5 may contain any delimiter.

If on the other hand the argument ##1 of \_\_tl_replace_next:w is delimited by the trailing (pattern) #5, then ##1 is “{ } { } (token list) (delimiter) (ending code)”, hence \_\_tl_replace_wrap:w finds “{ } { } (token list)” as ##1 and the (ending code) as ##2. It leaves the (token list) into the assignment and unbraces the (ending code) which removes what remains (essentially the (delimiter) and (replacement)).

### 52.7 Token list conditionals

These functions check whether the token list in the argument is empty and execute the proper code from their argument(s).

```latex
\prg_new_conditional:Npnn \tl_if_empty:N #1 { p , T , F , TF }
\{ \if_meaning:w #1 \c_empty_tl \prg_return_true: \else:\prg_return_false: \fi: \}
\prg_generate_conditional_variant:Nnn \tl_if_empty:N { c } { p , T , F , TF }
```

(End definition for \texttt{\tl_if_empty:NTF}. This function is documented on page 105.)

The \texttt{if:w} triggers the expansion of \texttt{\tl_to_str:n} which converts the argument to a string: this is empty if and only if the argument is. Then \texttt{if:w} \texttt{\scan_stop: ... \scan_stop:} is true if and only if the string ... is empty. It could be tempting to use \texttt{if:w} \texttt{\scan_stop: #1 \scan_stop:} directly. But this fails on a token list expanding to anything starting with \texttt{\scan_stop:} leaving everything that follows in the input stream.

```latex
\prg_new_conditional:Npnn \tl_if_empty:n #1 { p , TF , T , F }
\{ \if:w \scan_stop: \tl_to_str:n {#1} \scan_stop: \prg_return_true: \else:\prg_return_false: \fi: \}
\prg_generate_conditional_variant:Nnn \tl_if_empty:n { V } { p , TF , T , F }
```

(End definition for \texttt{\tl_if_empty:nTF}. This function is documented on page 105.)

The auxiliary function \texttt{\_\_\_\_tl_if_empty_if:o} is for use in various token list conditionals which reduce to testing if a given token list is empty after applying a simple function to it. The test for emptiness is based on \texttt{\tl_if_empty:nTF}, but the expansion is hard-coded for efficiency, as this auxiliary function is used in several places. We don’t put \texttt{\prg_return_true:} and so on in the definition of the auxiliary, because that would prevent an optimization applied to conditionals that end with this code. Also the
\__tl_if_empty_if:o is expanded once in \tl_if_empty:oTF for efficiency as well (and to reduce code doubling).

\cs_new:Npn \_\_tl_if_empty_if:o #1

\end{verbatim}

(End definition for \texttt{\textbackslash tl\_if\_in:nnTF}.)

Treating correctly cases like \texttt{\textbackslash tl\_if\_in:nnTF} \{a\ state\} \{states\}, where \texttt{\#1#2} contains \texttt{\#2} before the end, requires special care. To cater for this case, we insert \{\} between the two token lists. This marker may not appear in \texttt{\#2} because of \TeX{} limitations on what can delimit a parameter, hence we are safe. Using two brace groups makes the

689
test work also for empty arguments. The \if_false: constructions are a faster way to do \group_align_safe_begin: and \group_align_safe_end:. The \scan_stop: ensures that f-expanding \if_false: does not lead to unbalanced braces.

```
\prg_new_protected_conditional:Nppnn \tl_if_in:nn #1#2 { T , F , TF }
{ \scan_stop: \if_false: { \fi: \cs_set:Npn \__tl_tmp:w ##1 #2 { } \tl_if_empty:oTF { \__tl_tmp:w #1 {} {} #2 } \if_false: } \fi: }
\prg_generate_conditional_variant:Nnn \tl_if_in:nn { V , o , no } { T , F , TF }
```

(End definition for \tl_if_in:nTF. This function is documented on page 106.)

\tl_if_novalue_p:n \tl_if_novalue:nTF \__tl_if_novalue:w Tests whether ##1 matches -NoValue- exactly (with suitable catcodes): this is similar to \quark_if_nil:nTF. The first argument of \__tl_if_novalue:w is empty if and only if ##1 starts with -NoValue-, while the second argument is empty if ##1 is exactly -NoValue- or if it has a question mark just following -NoValue-. In this second case, however, the material after the first ?! remains and makes the emptiness test return false.

```
\cs_set_protected:Npn \__tl_tmp:w #1 { \prg_new_conditional:Npnn \tl_if_novalue:n ##1 { p , T , F , TF } { \__tl_if_empty_if:o { \__tl_if_novalue:w {} ##1 {} ? ! #1 ? ? ! } \prg_return_true: \else: \prg_return_false: \fi: } \cs_new:Npn \__tl_if_novalue:w ##1 #1 ##2 ? ##3 ? ! { ##1 ##2 } }
\exp_args:No \__tl_tmp:w { \c_novalue_tl }
```

(End definition for \tl_if_novalue:nTF and \__tl_if_novalue:w. This function is documented on page 106.)

\tl_if_single_p:N \tl_if_single:nTF
\tl_if_single_p:n \tl_if_single:nTF
\__tl_if_single:nnw Expand the token list and feed it to \tl_if_single:nTF.

```
\cs_set_protected:Npn \__tl_tmp:w #1 { \prg_new_conditional:Npnn \tl_if_single:n ##1 { p , T , F , TF } { \__tl_if_empty_if:o { \__tl_if_novalue:w {} #1 {} ? ! #1 ? ? ! } \prg_return_true: \else: \prg_return_false: \fi: } \cs_new:Npn \__tl_if_single:nnw #1 #1 #2 ? #3 ? ! { #1 #1 #2 } }
\exp_args:No \__tl_tmp:w { \c_novalue_tl }
```

(End definition for \tl_if_single:nTF. This function is documented on page 106.)

\tl_if_single_p:n \tl_if_single:nTF \__tl_if_single:nnw
This test is similar to \tl_if_empty:nTF. Expanding \use_none:nn #1 ?? once yields an empty result if #1 is blank, a single ? if #1 has a single item, and otherwise yields some tokens ending with ???. Then, \__kernel_tl_to_str:w makes sure there are no odd category codes. An earlier version would compare the result to a single ? using string comparison, but the Lua call is slow in LuaTeX. Instead, \__tl_if_single:nnw picks

690
the second token in front of it. If \#1 is empty, this token is the trailing \texttt{?} and the \texttt{\if:w test yields false}. If \#1 has a single item, the token is \texttt{\scan_stop:} and the \texttt{\if:w test yields true}. Otherwise, it is one of the characters resulting from \texttt{\tl_to_str:n} and the \texttt{\if:w test yields false}. Note that \texttt{\if:w and \__kernel_tl_to_str:w} are primitives that take care of expansion.

\begin{verbatim}
\prg_new_conditional:Npnn \tl_if_single:n #1 { p , T , F , TF } \{ \if:w \scan_stop: \exp_after:wN \__tl_if_single:nnw \__kernel_tl_to_str:w \exp_after:wN { \use_none:nn #1 ?? } \scan_stop: ? \s__tl_stop \prg_return_true: \else: \prg_return_false: \fi: \}
\cs_new:Npn \__tl_if_single:nnw #1#2#3 \s__tl_stop {#2}
\end{verbatim}

(End definition for \texttt{\tl_if_single:nTF} and \texttt{\__tl_if_single:nw}. This function is documented on page \pageref{page106}.)

There are four cases: empty token list, token list starting with a normal token, with a brace group, or with a space token. If the token list starts with a normal token, remove it and check for emptiness. For the next case, an empty token list is not a single token. Finally, we have a non-empty token list starting with a space or a brace group. Applying f-expansion yields an empty result if and only if the token list is a single space.

\begin{verbatim}
\prg_new_conditional:Npnn \tl_if_single_token:n #1 { p , T , F , TF } \{ \tl_if_head_is_N_type:nTF {#1} \{ \__tl_if_empty_if:o { \use_none:n #1 } \} \{ \tl_if_empty:nTF {#1} \{ \if_false: \} \{ \__tl_if_empty_if:o { \exp:w \exp_end_continue_f:w #1 } \} \} \prg_return_true: \else: \prg_return_false: \fi: \}
\end{verbatim}

(End definition for \texttt{\tl_if_single_token:nTF}. This function is documented on page \pageref{page106}.)

The aim here is to allow the case statement to be evaluated using a known number of expansion steps (two), and without needing to use an explicit “end of recursion” marker. That is achieved by using the test input as the final case, as this is always true. The trick is then to tidy up the output such that the appropriate case code plus either the \texttt{true} or \texttt{false} branch code is inserted.

\begin{verbatim}
\end{verbatim}

This function is documented on page \pageref{page106}.

\begin{verbatim}
\cs_new:Npn \__tl_case:NnTF #1#2#3 { \__tl_case:Nn \__tl_case:cn \__tl_case:nTF \__tl_case:end:nw \__tl_case:Nn \__tl_case:cn \__tl_case:nTF \__tl_case:end:nw
\end{verbatim}

(End definition for \texttt{\__tl_case:NnTF}. This function is documented on page \pageref{page106}.)
To tidy up the recursion, there are two outcomes. If there was a hit to one of the cases searched for, then #1 is the code to insert, #2 is the next case to check on and #3 is all of the rest of the cases code. That means that #4 is the true branch code, and #5 tidies up the spare \s__tl_mark and the false branch. On the other hand, if none of the cases matched then we arrive here using the “termination” case of comparing the search with itself. That means that #1 is empty, #2 is the first \s__tl_mark and so #4 is the false code (the true code is mopped up by #3).

Expandable loop macro for token lists. We use the internal scan mark \s__tl_stop (defined later), which is not allowed to show up in the token list #1 since it is internal to \l3tl. This allows us a very fast test of whether some ⟨item⟩ is the end-marker \s__tl_stop, namely call \__tl_use_none_delimit_by_s_stop:w ⟨item⟩ ⟨function⟩ \s__tl_stop, which calls ⟨function⟩ if the ⟨item⟩ is the end-marker. To speed up the loop even more, only test one out of eight items, and once we hit one of the eight end-markers, go more slowly through the last few items of the list using \__tl_map_function_end:w.

(End definition for \tl_case:NnTF and others. This function is documented on page 107.)

52.8 Mapping over token lists
\prg_break_point:Nn \tl_map_break: { }

\__tl_act:NNNn \__tl_act_count_normal:N \__tl_act_count_group:n \__tl_act_count_space:n {#1}
\cs_new:Npn \__tl_act_count_normal:n #1 { 1 + }
\cs_new:Npn \__tl_act_count_normal:N #1 {\texttt{1} + }
\end{verbatim}

The token count is computed through an \texttt{\int_eval:n} construction. Each \texttt{1+} is output to the \texttt{left}, into the integer expression, and the sum is ended by the \texttt{\exp_end:} inserted by \texttt{\__tl_act_count_normal:n} (which is technically implemented as \texttt{\c_zero_int}). Somewhat a hack!
\texttt{\textbackslash tl\_reverse\_items:n}\hfill\texttt{\_\textbackslash tl\_reverse\_items:nwNwn}\hfill\texttt{\_\textbackslash tl\_reverse\_items:wn}

Reversal of a token list is done by taking one item at a time and putting it after \texttt{\_\_tl\_stop}.

\begin{verbatim}
\cs_new:Npn \__tl_reverse_items:nwNwn #1 ?
\__tl_mark \__tl_reverse_items:nwNwn
\__tl_mark \__tl_reverse_items:wn
\__tl_stop { {#1} #5 }
\end{verbatim}

\texttt{\textbackslash tl\_trim\_spaces:n}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:nn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:nwNwn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:own}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:nnwNwn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:ownwNwn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:nnwNwnwNwn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:ownwNwnwNwn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:nnwNwnwNwnwNwn}\hfill\texttt{\_\textbackslash tl\_trim\_spaces:ownwNwnwNwnwNwn}

Trimming spaces from around the input is deferred to an internal function whose first argument is the token list to trim, augmented by an initial \texttt{\_\_tl\_trim\_mark:} and whose second argument is a \texttt{(continuation)}, which receives as a braced argument \texttt{\_\_tl\_trim-} \\
trimmed token list. The control sequence \texttt{\_\_tl\_trim\_mark:} expands to nothing \\
in a single expansion. In the case at hand, we take \texttt{\_\_kernel\_exp\_not:w \exp\_after:wN} \\
as our continuation, so that space trimming behaves correctly within an \texttt{x}-type expansion.

\begin{verbatim}
\cs_new:Npn \tl\_trim\_spaces:n #1
{ \__tl\_trim\_spaces:nn
\__kernel\_exp\_not:w \exp\_after:wN }
\end{verbatim}

Trimming spaces from around the input is done using delimited arguments and quarks, 
and to get spaces at odd places in the definitions, we nest those in \texttt{\_\_tl\_tmp:w}, which 
then receives a single space as its argument: \texttt{#1} is \texttt{\_\_tl\_tmp:w}. Removing leading spaces is done 
with \texttt{\_\_tl\_trim\_spaces\_auxi:w}, which loops until \texttt{\_\_tl\_trim\_mark:} matches the

696
end of the token list: then #1 is the token list and #3 is \texttt{\_\_tl_trim_spaces_auxii:w}. This hands the relevant tokens to the loop \texttt{\_\_tl_trim_spaces_auxiii:w}, responsible for trimming trailing spaces. The end is reached when \texttt{\_\_tl_nil} matches the one present in the definition of \texttt{\_\_tl_trim_spaces:n}. Then \texttt{\_\_tl_trim_spaces_auxiv:w} puts the token list into a group, with a lingering \texttt{\_\_tl_trim_mark} at the start (which will expand to nothing in one step of expansion), and feeds this to the (continuation).

\begin{verbatim}

52.11 The first token from a token list

Finding the head of a token list expandably always strips braces, which is fine as this is consistent with for example mapping over a list. The empty brace groups in \tl_head:n ensure that a blank argument gives an empty result. The result is returned within the \unexpanded primitive. The approach here is to use \if_false: to allow us to use } as the closing delimiter: this is the only safe choice, as any other token would not be able to parse its own code. If the \expanded primitive is available it is used to get a fast and safe code variant in which we don’t have to ensure that the left-most token is an internal to not break in an \f-type expansion. If \expanded isn’t available, using a marker, we can see if what we are grabbing is exactly the marker, or there is anything else to deal with. If there is, there is a loop. If not, tidy up and leave the item in the output stream. More detail in http://tex.stackexchange.com/a/70168.

\begin{verbatim}
\cs_if_exist:NTF \tex_expanded:D
\cs_new:Npn \tl_head:n #1
\{ \__kernel_exp_not:w \tex_expanded:D
\{ \{ \if_false: \{ \fi: \__tl_head_aux:n #1 \} \} \}
\cs_new:Npn \__tl_head_aux:n #1
\{ \__kernel_exp_not:w \#1\}
\exp_after:wN \use_none:n \exp_after:wN { \if_false: } \fi:
\}
\}
\cs_new:Npn \tl_head:n #1 #2 \q_stop {#1}
\cs_new:Npn \__tl_tl_head:w #1#2 \s__tl_stop {#1}
\cs_new:Npn \tl_head:N { \exp_args:No \tl_head:n }
\cs_generate_variant:Nn \tl_head:n { V , v , f }
\end{verbatim}

To correctly leave the tail of a token list, it’s important not to absorb any of the tail part
as an argument. For example, the simple definition

```latex
\cs_new:Npn \tl_tail:n #1 \tl_tail:w #1 \q_stop
\cs_new:Npn \tl_tail:w #1#2 \q_stop
```

would give the wrong result for `\tl_tail:n { a \{ bc \}}` (the braces would be stripped). Thus the only safe way to proceed is to first check that there is an item to grab (i.e. that the argument is not blank) and assuming there is to dispose of the first item. As with `\tl_head:n`, the result is protected from further expansion by `\unexpanded`. While we could optimise the test here, this would leave some tokens “banned” in the input, which we do not have with this definition.

```latex
\exp_args:Nno \use:n { \cs_new:Npn \tl_tail:n #1 }
\exp_after:wN \__kernel_exp_not:w
\tl_if_blank:nTF {#1}
{ { } }
{ \exp_after:wN { \use_none:n #1 } }
\cs_generate_variant:Nn \tl_tail:n { V , v , f }
\cs_new:Npn \tl_tail:N { \exp_args:No \tl_tail:n }
```

(End definition for `\tl_head:N` and others. These functions are documented on page 113.)

Accessing the first token of a token list is tricky in three cases: when it has category code 1 (begin-group token), when it is an explicit space, with category code 10 and character code 32, or when the token list is empty (obviously).

Forgetting temporarily about this issue we would use the following test in `\tl_if_head_eq_charcode:nN`. Here, `\tl_head:w` yields the first token of the token list, then passed to `\exp_not:N`.

```latex
\if_charcode:w \exp_after:wN \exp_not:N \tl_head:w #1 \q_nil \q_stop
\exp_not:N #2
\prg_return_true:
\else:
\prg_return_false:
\fi:
```

The two first special cases are detected by testing if the token list starts with an N-type token (the extra ? sends empty token lists to the true branch of this test). In those cases, the first token is a character, and since we only care about its character code, we can use `\str_head:n` to access it (this works even if it is a space character). An empty argument results in `\tl_head:w` leaving two tokens: `^` and `\__tl_if_head_eq_empty_arg:w` which will result in the `\if_charcode:w` test being false and remove `\exp_not:N` and #2.

```latex
\prg_new_conditional:Npnn \tl_if_head_eq_charcode:nN #1#2 { p , T , F , TF }
{ }
\tl_if_charcode:w
\prg_return_true:
\else:
\prg_return_false:
\fi:
\prg_generate_conditional_variant:Nnn \tl_if_head_eq_charcode:nN { f } { p , TF , T , F }
```

699
For \textbackslash{}tl\_if\_head\_eq\_catcode:nN, again we detect special cases with a \textbackslash{}tl\_if\_head\_is\_N\_type:n. Then we need to test if the first token is a begin-group token or an explicit space token, and produce the relevant token, either \texttt{c\_group\_begin\_token} or \texttt{c\_space\_token}. Again, for an empty argument, a hack is used, removing the token given by the user and leaving two tokens in the input stream which will make the \textbackslash{}if\_catcode:w test return false.

\begin{verbatim}
\prg_new_conditional:Nppnn \tl\_if\_head\_eq\_catcode:nN \#1 \#2 { p , T , F , TF }
\{
  \if\_catcode:w
  \tl\_if\_head\_is\_N\_type:nTF { \#1 ? } \\
  { \__\_tl\_head\_exp\_not:w \#1 { ^ \__\_tl\_head\_eq\_empty\_arg:w } \__\_tl\_stop } \\
  { \\
    \tl\_if\_head\_is\_group:nTF {\#1} \\
    \c\_group\_begin\_token \\
    \c\_space\_token 
  }
\}
\exp\_not:N \#2
\prg\_not:N #2
\prg\_return\_true:
\else:
\prg\_return\_false:
\fi:
\}
\prg\_generate\_conditional\_variant:Nnn \tl\_if\_head\_eq\_catcode:nN \{ o \} \{ p , T , F , F \}
\end{verbatim}

For \textbackslash{}tl\_if\_head\_eq\_meaning:nN, again, detect special cases. In the normal case, use \texttt{tl\_head:w}, with no \texttt{exp\_not:N} this time, since \texttt{if\_meaning:w} causes no expansion. With an empty argument, the test is true, and \texttt{use\_none:nnn} removes \#2 and \texttt{prg\_return\_true:} and \texttt{else:} (it is safe this way here as in this case \texttt{prg\_new\_conditional:Nppnn} didn’t optimize these two away). In the special cases, we know that the first token is a character, hence \texttt{if\_charcode:w} and \texttt{if\_catcode:w} together are enough. We combine them in some order, hopefully faster than the reverse. Tests are not nested because the arguments may contain unmatched primitive conditionals.

\begin{verbatim}
\prg\_new\_conditional:Nppnn \tl\_if\_head\_eq\_meaning:nN \#1\#2 { p , T , F , TF }
\{
  \tl\_if\_head\_is\_N\_type:nTF { \#1 ? } \\
  \__\_tl\_head\_exp\_not:w \#1 { ^ \__\_tl\_if\_head\_eq\_meaning\_normal:nN } \\
  { \__\_tl\_if\_head\_eq\_meaning\_special:nN \#1 } #2
}\cs\_new:Npn \__\_tl\_if\_head\_eq\_meaning\_normal:nN \#1 \#2
\{ \exp\_after:wN \if\_meaning:w \\
  \__\_tl\_head:w \#1 { ?? \use\_none:nnn } \__\_tl\_stop \#2 \\
  \prg\_return\_true:
\else:
\prg\_return\_false:
\fi:
\}
\cs\_new:Npn \__\_tl\_if\_head\_eq\_meaning\_special:nN \#1 \#2
\{ \\
  \if\_charcode:w \str\_head:n \#1 } \exp\_not:N \#2 \\
  \exp\_after:wN \use\_ii:nn
\end{verbatim}
\begin{verbatim}
\else:
\prg_return_false:
\fi:
\use_none:n
{
\if_catcode:w \exp_not:N #2
\tl_if_head_is_group:nTF {#1}
{ \c_group_begin_token }
{ \c_space_token }
\prg_return_true:
\else:
\prg_return_false:
\fi:
}

Both \texttt{\tl_if_head_eq_charcode:nN} and \texttt{\tl_if_head_eq_catcode:nN} will need to get the first token of their argument and apply \texttt{\exp_not:N} to it. \texttt{\_\_\_\_tl_head_exp_not:w} does exactly that.

\begin{verbatim}
\cs_new:Npn \_\_\_\_tl_head_exp_not:w #1 #2 \s__tl_stop
{ \exp_not:N #1 }
\end{verbatim}

If the argument of \texttt{\tl_if_head_eq_charcode:nN} and \texttt{\tl_if_head_eq_catcode:nN} was empty \texttt{\_\_\_\_tl_if_head_eq_empty_arg:w} will be left in the input stream. This macro has to remove \texttt{\exp_not:N} and the following token from the input stream to make sure no unbalanced if-construct is created and leave tokens there which make the two tests return false.

\begin{verbatim}
\cs_new:Npn \_\_\_\_tl_if_head_eq_empty_arg:w \exp_not:N #1
{ ? }
\end{verbatim}

(End definition for \texttt{\tl_if_head_eq_meaning:nNTF} and others. These functions are documented on page 107.)

A token list can be empty, can start with an explicit space character (catcode 10 and charcode 32), can start with a begin-group token (catcode 1), or start with an \texttt{N}-type argument. In the first two cases, the line involving \texttt{\_\_\_\_tl_if_head_is_N_type_auxi:w} produces \texttt{f} (and otherwise nothing). In the third case (begin-group token), the lines involving \texttt{\token_to_str:N} produce a single closing brace. The category code test is thus true exactly in the fourth case, which is what we want. One cannot optimize by moving one of the \texttt{\scan_stop:} to the beginning: if \texttt{#1} contains primitive conditionals, all of its occurrences must be dealt with before the \texttt{\if:w} tries to skip the true branch of the conditional.

\begin{verbatim}
\prg_new_conditional:Npnn \tl_if_head_is_N_type:n #1 { p , T , F , TF }
{
 if:w
 \if false: { \fi: \_\_\_\_tl_if_head_is_N_type_auxi:w \prg_do_nothing: #1 - }
 { \exp_after:wN { \token_to_str:N #1 } }
 \scan_stop: \scan_stop:
 \prg_return_true:
\else:
\prg_return_false:
\fi:
}
\exp_args:Nno \use:n { \cs_new:Npn \_\_\_\_tl_if_head_is_N_type_auxi:w #1 - }
\end{verbatim}

701

52.12 Token by token changes

The \_\_tl_act... functions may be applied to any token list. Hence, we use a private quark, to allow any token, even quarks, in the token list. Only \s_tl_act_stop may not appear in the token lists manipulated by \_\_tl_act:NNNn functions.

To help control the expansion, \_\_tl_act:NNNn should always be preceded by \exp:w and ends by producing \exp_end: once the result has been obtained. This way no internal token of it can be accidentally end up in the input stream. Because \s_tl_act_stop can’t appear without braces around it in the argument #1 of \_\_tl_act_loop:w, we can use this marker to set up a fast test for leading spaces.

(End definition for \_\_tl_act_stop.)
\_\_tl\_act:NNNn loops over tokens, groups, and spaces in \#4. \{s\_@@\_act\_stop\} serves as the end of token list marker, the ? after it avoids losing outer braces. The result is stored as an argument for the dummy function \_\_tl\_act\_result:n.

\cs_new:Npn \_\_tl\_use\_none\_delimit\_by\_s\_act\_stop:w #1 \_\_tl\_act\_stop \{ \}

\cs_new:Npn \_\_tl\_act\_reverse\_output:n #1 #2 \_\_tl\_act\_result:n #3

(End definition for \_\_tl\_act:NNNn and others.)

\tl_reverse:n
\tl_reverse:o
\tl_reverse:V
\_\_tl\_reverse\_normal:nNN
\_\_tl\_reverse\_group\_preserve:nn
\_\_tl\_reverse\_space:n

The goal here is to reverse without losing spaces nor braces. This is done using the general internal function \_\_tl\_act:NNNn. Spaces and “normal” tokens are output on the left of the current output. Grouped tokens are output to the left but without any reversal within the group.
52.13 Using a single item

The idea here is to find the offset of the item from the left, then use a loop to grab the correct item. If the resulting offset is too large, then \_\_tl_if_recursion_tail\_break:N\_N terminates the loop, and returns nothing at all.
\texttt{\cs_new:Npn \tl_item:Nn \{{ \exp_args:Nf \__tl_item:nn \{ \int_eval:n \{ #1 - 1 \} \} \}}}

\texttt{\cs_new:Npn \__tl_range_collect_group:nN \{ \__tl_range_items:nnNn \}}

To avoid checking for the end of the token list at every step, start by counting the number \texttt{l} of items and “normalizing” the bounds, namely clamping them to the interval \([0,l]\) and dealing with negative indices. More precisely, \texttt{\__tl_range_items:nnNn} receives the number of items to skip at the beginning of the token list, the index of the last item to keep, a function which is either \texttt{\__tl_range:w} or the token list itself. If nothing should be kept, leave \{\}: this stops the \texttt{f}-expansion of \texttt{\tl_head:f} and that function produces an empty result. Otherwise, repeatedly call \texttt{\__tl_range_skip:w} to delete \texttt{#1} items from the input stream (the extra brace group avoids an off-by-one shift). For the braced version \texttt{\__tl_range_braced:w} sets up \texttt{\__tl_range_collect_braced:w} which stores items one by one in an argument after the semicolon. Depending on the first token of the tail, either just move it (if it is a space) or also decrement the number of items left to find. Eventually, the result is a brace group followed by the rest of the token list, and \texttt{\tl_head:f} cleans up and gives the result in \texttt{\exp_not:n}.

\section*{52.14 Viewing token lists}

Showing token list variables is done after checking that the variable is defined (see \_\_kernel_register_show:N).

\begin{verbatim}
\cs_new:Npn \___tl_range_collect:Nnn #1#2 { { #1 #2 } }
\cs_new:Npn \___tl_range_collect_group:nn #1#2 { { #1 {#2} } }
\cs_generate_variant:Nn \___tl_range_collect:nn { ff }
\end{verbatim}

\textit{(End definition for \_\_tl_range:Nnn and others. These functions are documented on page 116.)}

\begin{verbatim}
\cs_new:Npn \___tl_range_normalize:nn #1#2
{\int_eval:n {\if_int_compare:w #1 < \c_zero_int
  \if_int_compare:w #1 < -#2 \exp_stop_f:
    \else:
    #1 + #2 + 1
  \fi:
}{\else:
  \if_int_compare:w #1 < #2 \exp_stop_f:
    #1
  \else:
    #2
  \fi:
}}}
\end{verbatim}

\textit{(End definition for \_\_tl_range_normalize:nn.)}
Many \texttt{show} functions are based on \texttt{tl\_show:n}. The argument of \texttt{tl\_show:n} is line-
wrapped using \texttt{iow\_wrap:nnnN} but with a leading >- and trailing period, both removed
before passing the wrapped text to the \texttt{showtokens} primitive. This primitive shows the
result with a leading >- and trailing period.

The token list \texttt{\_tl\_internal\_a\_tl} containing the result of all these manip-
ulations is displayed to the terminal using \texttt{tex\_showtokens:D} and an odd \texttt{exp\_after:wn} which expand the closing brace to improve the output slightly. The calls to
\texttt{\_kernel\_iow\_with:Nnn} ensure that the \texttt{newlinechar} is set to 10 so that the \texttt{iow\_newline}: inserted by the line-wrapping code are correctly recognized by \TeX, and that
\texttt{errorcontextlines} is -1 to avoid printing irrelevant context.

\begin{verbatim}
\cs_new_protected:Npn \tl\_show:n #1
  { \iow\_wrap:nnnN { >~ \tl\_to\_str:n {#1} . } { } { } \__tl\_show:n }
\cs_new_protected:Npn \__tl\_show:n #1
  { \tl\_set:Nf \l\__tl\_internal\_a\_tl { \__tl\_show:w #1 \s\__tl\_stop } \__kernel\_iow\_with:Nnn \tex\_newlinechar:D { 10 } \__kernel\_iow\_with:Nnn \tex\_errorcontextlines:D { -1 } \tex\_showtokens:D \exp\_after:wn \exp\_after:wn \exp\_after:wn { \exp\_after:wn \l\_tl\_internal\_a\_tl } }
\cs_new:Npn \__tl\_show:w #1 > #2 . \s\__tl\_stop {#2}
\end{verbatim}

\texttt{tl\_log:n} Logging is much easier, simply line-wrap. The >- and trailing period is there to match
the output of \texttt{tl\_show:n}.

\begin{verbatim}
\cs_new_protected:Npn \tl\_log:n #1
  { \iow\_wrap:nnnN { > \tl\_to\_str:n {#1} . } { } { } \iow\_log:n }
\end{verbatim}

\texttt{\_kernel\_chk\_tl\_type:NnnT} Helper for checking that \#1 has the correct internal structure to be of a certain type.
Make sure that it is defined and that it is a token list, namely a macro with no \texttt{long} nor
\texttt{protected} prefix. Then compare \#1 to an attempt at reconstructing a valid structure
of the given type using \#2 (see implementation of \texttt{seq\_show:N} for instance). If that is
successful run the requested code \#4.

\begin{verbatim}
\cs_new_protected:Npn \__kernel\_chk\_tl\_type:NnnT \#1#2#3#4
  { \exp\_args:Nf \tl\_if\_empty:nTF \exp\_args:Nf \{ \cs\_prefix\_spec:N \#1 \cs\_parameter\_spec:N \#1 \} }
\end{verbatim}

\texttt{End definition for \texttt{tl\_show:n}, \texttt{tl\_log:n}, and \texttt{\_tl\_show:w}. These functions are documented on page 110.)

\texttt{End definition for \texttt{tl\_log:n}. This function is documented on page 110.)

\texttt{End definition for \texttt{\_kernel\_chk\_tl\_type:NnnT}. This function is documented on page 111.)

709
\begin{verbatim}
{ \tl_set:Nx \l__tl_internal_a_tl {#3}
  \tl_if_eq:NNTF #1 \l__tl_internal_a_tl
  {#4}
  {
    \msg_error:nxxxx { kernel } { bad-type }
    { \token_to_str:N #1 } { \tl_to_str:N #1 }
    {#2} { \tl_to_str:N \l__tl_internal_a_tl }
  }
}
\end{verbatim}

(End definition for \__kernel_chk_tl_type:NnnT.)

\section*{52.15 Internal scan marks}
\texttt{\s__tl_nil} \hfill \texttt{\s__tl_mark} \hfill \texttt{\s__tl_stop}

Internal scan marks. These are defined here at the end because the code for \texttt{\scan_new:N} depends on some \l3tl functions.

\begin{verbatim}
\scan_new:N \s__tl_nil
\scan_new:N \s__tl_mark
\scan_new:N \s__tl_stop
\end{verbatim}

(End definition for \s__tl_nil, \s__tl_mark, and \s__tl_stop.)

\section*{52.16 Scratch token lists}
\texttt{\g_tmpa_tl} \hfill \texttt{\g_tmpb_tl}

Global temporary token list variables. They are supposed to be set and used immediately, with no delay between the definition and the use because you can’t count on other macros not to redefine them from under you.

\begin{verbatim}
\tl_new:N \g_tmpa_tl
\tl_new:N \g_tmpb_tl
\end{verbatim}

(End definition for \g_tmpa_tl and \g_tmpb_tl. These variables are documented on page 120.)

\texttt{\l_tmpa_tl} \hfill \texttt{\l_tmpb_tl}

These are local temporary token list variables. Be sure not to assume that the value you put into them will survive for long—see discussion above.

\begin{verbatim}
\tl_new:N \l_tmpa_tl
\tl_new:N \l_tmpb_tl
\end{verbatim}

(End definition for \l_tmpa_tl and \l_tmpb_tl. These variables are documented on page 119.)

We finally clean up a temporary control sequence that we have used at various points to set up some definitions.

\begin{verbatim}
\cs_undefine:N \__tl_tmp:w
\end{verbatim}

(\package)
Chapter 53

13str implementation

53.1 Internal auxiliaries

\q__str_recursion_stop
Internal recursion quarks.
\quark_new:N \q__str_recursion_tail
\quark_new:N \q__str_recursion_stop
(End definition for \q__str_recursion_tail and \q__str_recursion_stop.)

\_str_if_recursion_tail_break:NN
\_str_if_recursion_tail_stop_do:Nn
Functions to query recursion quarks.
\__kernel_quark_new_test:N \_str_if_recursion_tail_break:NN
\__kernel_quark_new_test:N \_str_if_recursion_tail_stop_do:Nn
(End definition for \_str_if_recursion_tail_break:NN and \_str_if_recursion_tail_stop_do:Nn.)
53.2 Creating and setting string variables

A string is simply a token list. The full mapping system isn’t set up yet so do things by hand.

\str_new:N  \str_new:c
\str_use:N  \str_use:c
\str_clear:N  \str_clear:c
\str_gclear:N  \str_gclear:c
\str_clear_new:N  \str_clear_new:c
\str_gclear_new:N  \str_gclear_new:c
\str_set_eq:NN  \str_set_eq:cN  \str_set_eq:Nc  \str_set_eq:cc
\str_gset_eq:NN  \str_gset_eq:cN  \str_gset_eq:Nc  \str_gset_eq:cc
\str_concat:NNN  \str_concat:ccc
\str_gconcat:NNN  \str_gconcat:ccc

Simply convert the token list inputs to ⟨strings⟩.

\str_set:Nn  \str_set:NV  \str_set:Nx  \str_set:cn
\str_gset:Nn  \str_gset:NV  \str_gset:Nx  \str_gset:cn
\str_const:Nn  \str_const:NV  \str_const:Nx  \str_const:cn
\str_put_left:Nn  \str_put_left:NV  \str_put_left:Nx  \str_put_left:cn
\str_gput_left:Nn  \str_gput_left:NV  \str_gput_left:Nx  \str_gput_left:cn
\str_put_right:Nn  \str_put_right:NV  \str_put_right:Nx  \str_put_right:cn
\str_gput_right:Nn  \str_gput_right:NV  \str_gput_right:Nx  \str_gput_right:cn

(End definition for \str_new:N and others. These functions are documented on page 122.)
53.3 Modifying string variables

Start by applying \texttt{tl_to_str:n} to convert the old and new token lists to strings, and also apply \texttt{tl_to_str:N} to avoid any issues if we are fed a token list variable. Then the code is a much simplified version of the token list code because neither the delimiter nor the replacement can contain macro parameters or braces. The delimiter \texttt{s__str________mark} cannot appear in the string to edit so it is used in all cases. Some \texttt{x}-expansion is unnecessary. There is no need to avoid losing braces nor to protect against expansion. The ending code is much simplified and does not need to hide in braces.

\begin{verbatim}
\cs_new_protected:Npn \str_replace_once:Nnn { \__str_replace:NNNnn \prg_do_nothing: \__kernel_tl_set:Nx }
\cs_new_protected:Npn \str_greplace_once:Nnn { \__str_replace:NNNnn \prg_do_nothing: \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \str_replace_all:Nnn { \__str_replace:NNNnn \__str_replace_next:w \__kernel_tl_set:Nx }
\cs_new_protected:Npn \str_greplace_all:Nnn { \__str_replace:NNNnn \__str_replace_next:w \__kernel_tl_gset:Nx }
\cs_generate_variant:Nn \str_replace_once:Nnn { c }
\cs_generate_variant:Nn \str_greplace_once:Nnn { c }
\cs_generate_variant:Nn \str_replace_all:Nnn { c }
\cs_generate_variant:Nn \str_greplace_all:Nnn { c }
\cs_new_protected:Npn \__str_replace:NNNnn #1#2#3#4#5
{ \tl_if_empty:nTF {#4}
  { \msg_error:nnx { kernel } { empty-search-pattern } {#5} }
  { \use:x
    { \exp_not:n { \__str_replace_aux:NNNNn #1 \#2 \#3 }
      { \tl_to_str:n {\#4} } { \tl_to_str:n {\#5} }
    }
  }
}
\cs_new_protected:Npn \__str_replace_aux:NNNNn #1\#2\#3\#4\#5\#6
{ \cs_set:Npn \__str_replace_next:w #1\#5 \#1\#1\#6 \#1 }
\cs_new_protected:Npn \__str_replace_next:w \#2 \#3
{ \__str_use_none_delimit_by_s_stop:w
  \#4
}
\end{verbatim}
Removal is just a special case of replacement.

\prg_new_eq_conditional:NNn \str_if_exist:N \tl_if_exist:N
\end{verbatim}
(End definition for \str_remove_all:Nn and \str_gremove_all:Nn. These functions are documented on page 130.)

\subsection{String comparisons}
\begin{verbatim}
\prg_new_eq:NN \__str_if_eq:nn \tex_strcmp:D
\end{verbatim}
(End definition for \__str_if_eq:nn.)

String comparisons rely on the primitive \texttt{(pdf)strcmp}, so we define a new name for it.
\begin{verbatim}
\cs_new_eq:NN \__str_if_eq:nn \tex_strcmp:D
\end{verbatim}
(End definition for \__str_if_eq:nn.)
Simply rely on \_\_str_if_eq:nn, which expands to -1, 0 or 1. The ee version is created directly because it is more efficient.

Modern engines provide a direct way of comparing two token lists, but returning a number. This set of conditionals therefore makes life a bit clearer. The nn and ee versions are created directly as this is most efficient. Since \_\_str_if_eq:nn will expand to 0 as an explicit character with category 12 if the two lists match (and either -1 or 1 if they don’t) we can use \if:w here which is faster than using \if_int_compare:w.

Note that \str_if_eq:NNTF is different from \tl_if_eq:NNTF because it needs to ignore category codes.

Everything here needs to be detokenized but beyond that it is a simple token list test. It would be faster to fine-tune the T, F, TF variants by calling the appropriate variant of \tl_if_eq:NNTF directly but that takes more code.

(End definition for \str_compare:nnTF. This function is documented on page 125.)

53.5 Mapping over strings

The inline and variable mappings are similar to the usual token list mappings but start out by turning the argument to an “other string”. Doing the same for the expandable function mapping would require \__kernel_str_to_other:n, quadratic in the string length. To deal with spaces in that case, \__str_map_function:w replaces the following space by a braced space and a further call to itself. These are received by \__str_map_function:nn, which passes the space to #1 and calls \__str_map_function:w to deal with the next space. The space before the braced space allows to optimize the \q__str_recursion_tail test. Of course we need to include a trailing space (the question mark is needed to avoid losing the space when \TeX{} tokenizes the line). At the cost of about three more auxiliaries this code could get a 9 times speed up by testing only every 9-th character for whether it is \q__str_recursion_tail (also by converting 9 spaces at a time in the \str_map_function:nN case).

For the map_variable functions we use a string assignment to store each character because spaces are made catcode 12 before the loop.

(End definition for \str_case:nnTF and others. These functions are documented on page 124.)
53.6 Accessing specific characters in a string

First apply \texttt{tl_to_str:n}, then replace all spaces by “other” spaces, 8 at a time, storing the converted part of the string between the \texttt{s__str_mark} and \texttt{s__str_stop} markers. The end is detected when \texttt{__str_to_other_loop:w} finds one of the trailing \texttt{A}, distinguished from any contents of the initial token list by their category. Then \texttt{__str_to_other_end:w} is called, and finds the result between \texttt{s__str_mark} and the first \texttt{A} (well, there is also the need to remove a space).
The difference with \__kernel_str_to_other:n is that the converted part is left in the input stream, making these commands only restricted-expandable.

The \str_item:nn hands its argument with spaces escaped to \__str_item:nn, and makes sure to turn the result back into a proper string (with category code 10 spaces) eventually. The \str_item_ignore_spaces:nn function does not escape spaces, which are thus ignored by \__str_item:nn since everything else is done with undelimited arguments. Evaluate the \langle index \rangle argument \#2 and count characters in the string, passing those two numbers to \__str_item:w for further analysis. If the \langle index \rangle is negative, shift it by the \langle count \rangle to know the how many character to discard, and if that is still negative give an empty result. If the \langle index \rangle is larger than the \langle count \rangle, give an empty result, and otherwise discard \langle index \rangle – 1 characters before returning the following one. The shift by -1 is obtained by inserting an empty brace group before the string in that case: that brace group also covers the case where the \langle index \rangle is zero.

\__str_skip_end:w
\__str_skip_end:NNNNNNNN
\__str_skip_end:w

\exp_end:

Removes \texttt{max(#1,0)} characters from the input stream, and then leaves \exp_end:. This should be expanded using \exp:w. We remove characters 8 at a time until there are at most 8 to remove. Then we do a dirty trick: the \if_case:w construction leaves between 0 and 8 times the \or: control sequence, and those \or: become arguments of \__str_skip_end:NNNNNNNN. If the number of characters to remove is 6, say, then there are two \or: left, and the 8 arguments of \__str_skip_end:NNNNNNNN are the two \or:, and 6 characters from the input stream, exactly what we wanted to remove. Then close the \if_case:w conditional with \fi:, and stop the initial expansion with \exp_end: (see places where \__str_skip_exp_end:w is called).

\int_value:w \int_eval:w
\fi:
Sanitize the string. Then evaluate the arguments. At this stage we also decrement the
(start index), since our goal is to know how many characters should be removed. Then
limit the range to be non-negative and at most the length of the string (this avoids
needing to check for the end of the string when grabbing characters), shifting negative
numbers by the appropriate amount. Afterwards, skip characters, then keep some more,
and finally drop the end of the string.
\__str_range_normalize:nn

This function converts an \textit{(index)} argument into an explicit position in the string (a result of 0 denoting “out of bounds”). Expects two explicit integer arguments: the \textit{(index)} \#1 and the string count \#2. If \#1 is negative, replace it by \#1 + \#2 + 1, then limit to the range \([0, \#2]\).

      \if_int_compare:w #1 < #2 \exp_stop_f:
        #1
      \else:
        #2
      \fi:
    \fi:
  }
\end{verbatim}

\textit{(End definition for \str_range:nn and others. These functions are documented on page 129.)}

\__str_collect_delimit_by_q_stop:w
\__str_collect_loop:wn
\__str_collect_loop:wnNNNNNNN
\__str_collect_end:wn
\__str_collect_end:nnnnnnnnw

Collects \texttt{max(#1,0)} characters, and removes everything else until \texttt{s__str_stop}. This is somewhat similar to \__str_skip_exp_end:w, but accepts integer expression arguments. This time we can only grab 7 characters at a time. At the end, we use an \texttt{\if_case:w} trick again, so that the 8 first arguments of \__str_collect_end:nnnnnnnnw are some \texttt{or:}, followed by an \texttt{\fi:}, followed by \#1 characters from the input stream. Simply leaving this in the input stream closes the conditional properly and the \texttt{or:} disappear.

\begin{verbatim}
\cs_new:Npn \__str_collect_delimit_by_q_stop:w #1; 
  \__str_collect_loop:wn #1 ; { } 
\cs_new:Npn \__str_collect_loop:wn #1 ; 
  { 
    \if_int_compare:w #1 > 7 \exp_stop_f:
      \exp_after:wN \__str_collect_loop:wnNNNNNNN
    \else:
      \exp_after:wN \__str_collect_end:wn \fi:
    \fi:
    \exp_after:wN \__str_collect_loop:wnNNNNNNN \int_value:w \int_eval:n { #1 - 7 } ; { #2 #3#4#5#6#7#8#9 }
\cs_new:Npn \__str_collect_end:wn #1 ; 
  { 
    \exp_after:wN \__str_collect_loop:wnNNNNNNN #1; #2 #3#4#5#6#7#8#9
  }
\end{verbatim}
53.7 Counting characters

To speed up this function, we grab and discard 9 space-delimited arguments in each iteration of the loop. The loop stops when the last argument is one of the trailing X\langle number\rangle, and that \langle number\rangle is added to the sum of 9 that precedes, to adjust the result.

\begin{verbatim}
\cs_new:Npn \str_count_spaces:N { \exp_args:No \str_count_spaces:n }
\cs_generate_variant:Nn \str_count_spaces:N { c }
\cs_new:Npn \str_count_spaces:n #1 { \int_eval:n { \exp_after:wN \__str_count_spaces_loop:w \tl_to_str:n {#1} ~ X 7 ~ X 6 ~ X 5 ~ X 4 ~ X 3 ~ X 2 ~ X 1 ~ X 0 ~ X -1 ~ \s__str_stop } }\end{verbatim}

(End definition for \str_count_spaces:N, \str_count_spaces:c, and \__str_count_spaces_loop:w. These functions are documented on page 127.)

\begin{verbatim}
\cs_new:Npn \str_count:N { \exp_args:No \str_count:n }
\cs_generate_variant:Nn \str_count:N { c }
\end{verbatim}

724
The first character in a string

The \_ignore\_spaces variant applies \tl\_to\_str:n then grabs the first item, thus skipping spaces. As usual, \str\_head:N expands its argument and hands it to \str\_head:n. To circumvent the fact that T\TeX{} skips spaces when grabbing undelimited macro parameters, \__str\_head:w takes an argument delimited by a space. If \#1 starts with a non-space character, \__str\_use\_i\_delimit\_by\_s\_stop:nw leaves that in the input stream. On the other hand, if \#1 starts with a space, the \__str\_head:w takes an empty argument, and the single (initially braced) space in the definition of \__str\_head:w makes its way to the output. Finally, for an empty argument, the (braced) empty brace group in the definition of \str\_head:n gives an empty result after passing through \__str\_use\_i\_delimit\_by\_s\_stop:nw.
53.9 String manipulation

Case changing for programmatic reasons is done by first detokenizing input then doing a simple loop that only has to worry about spaces and everything else. The output is detokenized to allow data sharing with text-based case changing. Similarly, for 8-bit engines the multi-byte information is shared.

\prop_gput:Nnn \g__str_alias_prop \{ hexadecimal \} \{ hex \}
\bool_lazy_any:nTF
{ \sys_if_engine_luatex_p: }
{ \sys_if_engine_xetex_p: }
{ \g__str_alias_prop \{ default \} \{ \}
{ \prop_gput:Nnn \g__str_alias_prop \{ default \} \{ utf8 \}
{ }
(End definition for \g__str_alias_prop.)

\g__str_error_bool In conversion functions with a built-in conditional, errors are not reported directly to the user, but the information is collected in this boolean, used at the end to decide on which branch of the conditional to take.
\bool_new:N \g__str_error_bool

(End definition for \g__str_error_bool.)

\str_byte Conversions from one ⟨encoding⟩/(escaping) pair to another are done within x-expanding assignments. Errors are signalled by raising the relevant flag.
\flag_new:n \str_byte
\flag_new:n \str_error

(End definition for \str_byte and \str_error. These variables are documented on page ??.)
54.2 String conditionals

\_\_str\_if\_contains\_char:NN\T
\_\_str\_if\_contains\_char:NN\T\F
\_\_str\_if\_contains\_char:nn\T
\_\_str\_if\_contains\_char_aux:nn
\_\_str\_if\_contains\_char_auxi:nn\T
\_\_str\_if\_contains\_char_true:

\_\_str\_if\_contains\_char:nn\T \{ (token list) \} \{ (char) \}

Expects the \{token list\} to be an \{other string\}: the caller is responsible for ensuring that no (too-)special catcodes remain. Loop over the characters of the string, comparing character codes. The loop is broken if character codes match. Otherwise we return “false”.

\prg\_new\_conditional:Npnn \_\_str\_if\_contains\_char:nn #1\#2 \{ T , TF \}
\exp\_after:wN \_\_str\_if\_contains\_char\_aux:nn \exp\_after:wN \{#1\} \{#2\}
\prg\_break:n \{ ? \fi: \}
\prg\_break\_point:
\prg\_return\_false:

\cs\_new:Npn \_\_str\_if\_contains\_char\_auxi:nn #1\#2
\prg\_new\_conditional:Npnn \_\_str\_if\_contains\_char:nn #1\#2 \{ TF \}
\exp\_after:wN \_\_str\_if\_contains\_char\_true:
\exp\_after:wN \{#1\} \{#2\}
\prg\_break\_point:
\prg\_return\_false:
\cs\_new:Npn \_\_str\_if\_contains\_char\_auxi:nn #1\#2
\if\_charcode:w #1 \#2
\exp\_after:wN \_\_str\_if\_contains\_char\_true:
\fi:
\cs\_new:Npn \_\_str\_if\_contains\_char\_auxi:nn \{#1\}
\prg\_break:n \{ \prg\_return\_true: \use\_none:n \} \}

(End definition for \_\_str\_if\_contains\_char:nn\T and others.)

\_\_str\_octal\_use:NTF
\_\_str\_octal\_use:NTF \{ (token) \} \{ (true code) \} \{ (false code) \}

If the \{token\} is an octal digit, it is left in the input stream, followed by the \{true code\}. Otherwise, the \{false code\} is left in the input stream.

\TeX\hacksnote: This function will fail if the escape character is an octal digit. We are thus careful to set the escape character to a known value before using it. \TeX\ dutifully detects octal digits for us: if \#1 is an octal digit, then the right-hand side of the comparison is ’1\#1, greater than 1. Otherwise, the right-hand side stops as ’1, and the conditional takes the false branch.

\prg\_new\_conditional:Npnn \_\_str\_octal\_use:NN #1 \{ TF \}
\if\_int\_compare:w 1 < ’1 \token\_to\_str:N #1 \exp\_stop\_f:
\prg\_return\_true:
\else:
\prg\_return\_false:
\fi:

(End definition for \_\_str\_octal\_use:NTF.)
\_\_str_hexadecimal\_use:NTF \TeX{} detects uppercase hexadecimal digits for us (see \_\_str_octal\_use:NTF), but not the lowercase letters, which we need to detect and replace by their uppercase counterpart.

\begin{verbatim}
\prg_new_conditional:Npnn \__str_hexadecimal_use:N #1 { TF }
  { \if_int_compare:w 1 < "1 \token_to_str:N #1 \exp_stop_f:
  \#1 \prg_return_true:
  \else:
  \if_case:w \int_eval:n { \exp_after:wN ' \token_to_str:N #1 - 'a }
  A \or: B \or: C \or: D \or: E \or: F \else:
  \prg_return_false:
  \exp_after:wN \use_none:n
  \fi:
  \prg_return_true:
  \fi:
}(End definition for \_\_str_hexadecimal\_use:NTF.)
\end{verbatim}

54.3 Conversions

54.3.1 Producing one byte or character

For each integer \( N \) in the range \([0, 255]\), we create a constant token list which holds three character tokens with category code \texttt{other}: the character with character code \( N \), followed by the representation of \( N \) as two hexadecimal digits. The value \(-1\) is given a default token list which ensures that later functions give an empty result for the input \(-1\).

\begin{verbatim}
\group_begin:
\__kernel_tl_set:Nx \l__str_internal_tl { \tl_to_str:n { 0123456789ABCDEF } }
\tl_map_inline:Nn \l__str_internal_tl { \tl_map_inline:Nn \l__str_internal_tl { \tl_const:cx { c__str_byte_ \int_eval:n {"##1##1} _tl } { \char_generate:nn {"##1##1} { 12 } #1 ##1 } }
\group_end:
\tl_const:cn { c__str_byte_-1_tl } { { } \use_none:n { } }
(End definition for c__str_byte_0_tl and others.)
\end{verbatim}

 Those functions must be used carefully: feeding them a value outside the range \([-1, 255]\) will attempt to use the undefined token list variable \texttt{c__str_byte_{number}}\_tl. Assuming that the argument is in the right range, we expand the corresponding token list, and pick either the byte (first token) or the hexadecimal representations (second and third tokens). The value \(-1\) produces an empty result in both cases.
\cs_new:Npn \__str_output_byte:n \#1
{ \__str_output_byte:w \#1 \__str_output_end: }
\cs_new:Npn \__str_output_byte:w
{
\exp_after:wN \exp_after:wN
\exp_after:wN \use_i:nnn
\cs:w c__str_byte_ \int_eval:w
}
\cs_new:Npn \__str_output_hexadecimal:n \#1
{
\exp_after:wN \exp_after:wN
\exp_after:wN \use_none:n
\cs:w c__str_byte_ \int_eval:n {#1} _tl \cs_end:
}
\cs_new:Npn \__str_output_end:
{ \scan_stop: _tl \cs_end: }

(End definition for \__str_output_byte:n and others.)

\__str_output_byte_pair_be:n \__str_output_byte_pair_le:n
\__str_output_byte_pair:nnN
Convert a number in the range [0, 65535] to a pair of bytes, either big-endian or little-endian.
\cs_new:Npn \__str_output_byte_pair_be:n \#1
{\exp_args:Nf \__str_output_byte_pair:nnN
 { \int_div_truncate:nn { #1 } { "100 } } {#1} \use:nn}
\cs_new:Npn \__str_output_byte_pair_le:n \#1
{\exp_args:Nf \__str_output_byte_pair:nnN
 { \int_div_truncate:nn { #1 } { "100 } } {#1} \use_ii_i:nn}
\cs_new:Npn \__str_output_byte_pair:nnN \#1\#2\#3
{\#3
 { \__str_output_byte:n { #1 } }
 { \__str_output_byte:n { #2 - #1 * "100 } }
}

(End definition for \__str_output_byte_pair_be:n, \__str_output_byte_pair_le:n, and \__str_output_byte_pair:nnN)

54.3.2 Mapping functions for conversions

This maps the function \#1 over all characters in \g__str_result_tl, which should be a byte string in most cases, sometimes a native string.
\cs_new_protected:Npn \__str_convert_gmap:N \#1
{ \__kernel_tl_gset:Nx \g__str_result_tl
 { \exp_after:wN \__str_convert_gmap_loop:NN
 \exp_after:wN \g__str_result_tl { ? \prg_break: }
 \prg_break_point: }
}

735
This maps the function \#1 over all character codes in \( \texttt{g__str_result_tl} \), which must be in the internal representation.

\begin{verbatim}
\cs_new_protected:Npn \__str_convert_gmap_internal:N \#1
{ \__kernel_tl_gset:Nx \g__str_result_tl
{ \exp_after:wN \__str_convert_gmap_internal_loop:Nww
\exp_after:wN \#1
\g__str_result_tl \s__str \s__str_stop \prg_break: \s__str
\prg_break_point: }
}
\end{verbatim}

\end{verbatim}

(End definition for \__str_convert_gmap_internal:N and \__str_convert_gmap_internal_loop:Nw.)

54.3.3 Error-reporting during conversion

When converting using the function \str_set_convert:Nnnn, errors should be reported to the user after each step in the conversion. Errors are signalled by raising some flag (typically \texttt{@@_error}), so here we test that flag: if it is raised, give the user an error, otherwise remove the arguments. On the other hand, in the conditional functions \str_{-}set_convert:NnnnTF, errors should be suppressed. This is done by changing \__str_{-}if_flag_error:nnx into \__str_{-}if_flag_no_error:nnx locally.

\begin{verbatim}
\cs_new_protected:Npn \__str_if_flag_error:nnx \#1
{ \flag_if_raised:nTF {#1} { \msg_error:nnx { str } } \use_none:nn }
\end{verbatim}

\end{verbatim}

(End definition for \__str_{-}if_flag_error:nnx and \__str_{-}if_flag_no_error:nnx.)

\begin{verbatim}
\cs_new_protected:Npn \__str_if_flag_no_error:nnx \#1\#2 \#3\#4
{ \flag_if_raised:nTF {#1} { \bool_gset_true:N \g__str_error_bool } }
\end{verbatim}

(End definition for \__str_{-}if_flag_no_error:nnx.)

\begin{verbatim}
\cs_new_protected:Npn \__str_if_flag_times:nT
{ \flag_if_raised:nTF \#1 \msg_error:nnx { str } }
\end{verbatim}

(End definition for \__str_{-}if_flag_times:nT.)

At the end of each conversion step, we raise all relevant errors as one error message, built on the fly. The height of each flag indicates how many times a given error was encountered. This function prints \#2 followed by the number of occurrences of an error if it occurred, nothing otherwise.
54.3.4 Framework for conversions

Most functions in this module expect to be working with “native” strings. Strings can also be stored as bytes, in one of many encodings, for instance UTF8. The bytes themselves can be expressed in various ways in terms of \TeX tokens, for instance as pairs of hexadecimal digits. The questions of going from arbitrary Unicode code points to bytes, and from bytes to tokens are mostly independent.

Conversions are done in four steps:

- “unescape” produces a string of bytes;
- “decode” takes in a string of bytes, and converts it to a list of Unicode characters in an internal representation, with items of the form
  \[ \langle \text{bytes} \rangle \s__str \langle \text{Unicode code point} \rangle \s__str \]
  where we have collected the \langle \text{bytes} \rangle which combined to form this particular Unicode character, and the \langle \text{Unicode code point} \rangle is in the range \[0, "10FFFF]\];
- “encode” encodes the internal list of code points as a byte string in the new encoding;
- “escape” escapes bytes as requested.

The process is modified in case one of the encoding is empty (or the conversion function has been set equal to the empty encoding because it was not found): then the unescape or escape step is ignored, and the decode or encode steps work on tokens instead of bytes. Otherwise, each step must ensure that it passes a correct byte string or internal string to the next step.

The input string is stored in \g__str_result_tl, then we: unescape and decode; encode and escape; exit the group and store the result in the user’s variable. The various conversion functions all act on \g__str_result_tl. Errors are silenced for the conditional functions by redefining \__str_if_flag_error:nnx locally.

\str_set_convert:Nnnn
\str_gset_convert:Nnnn
\str_set_convert:Nnnn\TF
\str_gset_convert:Nnnn\TF
\__str_convert:nNNnnn
\cs_new_protected:Npn \__str_if_flag_times:nT \#1\#2
  { \flag_if_raised:nT \{\#1\} \{ \#2-(x \flag_height:n \{\#1\} ) \} }

(End definition for \__str_if_flag_times:nT.)
\__str_convert:wwwnn
\__str_convert:NNnNN

The task of \__str_convert:wwwnn is to split \{encoding\}/\{escaping\} pairs into their components, \#1 and \#2. Calls to \__str_convert:nnn ensure that the corresponding conversion functions are defined. The third auxiliary does the main work.

- \#1 is the encoding conversion function;
- \#2 is the escaping function;
- \#3 is the escaping name for use in an error message;
- \#4 is \prg_do_nothing: for unescaping/decoding, and \use_ii_i:nn for encoding/escaping;
- \#5 is the default encoding function (either “decode” or “encode”), for which there should be no escaping.

Let us ignore the native encoding for a second. In the unescaping/decoding phase, we want to do \#2\#1 in this order, and in the encoding/escaping phase, the order should be reversed: \#4\#2\#1 does exactly that. If one of the encodings is the default (native), then the escaping should be ignored, with an error if any was given, and only the encoding, \#1, should be performed.

#2 #3 \g__str_result_tl
\}

(End definition for \str_set_convert:Nnnn and others. These functions are documented on page 136.)
\__str_convert:nnn
\__str_convert:nnnn

The arguments of \__str_convert:nnn are: enc or esc, used to build filenames, the type of the conversion (unescape, decode, encode, escape), and the encoding or escaping name. If the function is already defined, no need to do anything. Otherwise, filter out all non-alphanumerics in the name, and lowercase it. Feed that, and the same three arguments, to \__str_convert:nnnn. The task is then to make sure that the conversion function \#3_\#1 corresponding to the type \#3 and filtered name \#1 is defined, then set our initial conversion function \#3_\#4 equal to that.

How do we get the \#3_\#1 conversion to be defined if it isn’t? Two main cases.

First, if \#1 is a key in \g__str_alias_prop, then the value \l__str_internal_tl tells us what file to load. Loading is skipped if the file was already read, i.e., if the conversion command based on \l__str_internal_tl already exists. Otherwise, try to load the file; if that fails, there is an error, use the default empty name instead.

Second, \#1 may be absent from the property list. The \cs_if_exist:cF test is automatically false, and we search for a file defining the encoding or escaping \#1 (this should allow third-party .def files). If the file is not found, there is an error, use the default empty name instead.

In all cases, the conversion based on \l__str_internal_tl is defined, so we can set the \#3_\#1 function equal to that. In some cases (e.g., utf16be), the \#3_\#1 function is actually defined within the file we just loaded, and it is different from the \l__str_internal_tl-based function: we mustn’t clobber that different definition.

54.3.5 Byte unescape and escape

Strings of bytes may need to be stored in auxiliary files in safe “escaping” formats. Each such escaping is only loaded as needed. By default, on input any non-byte is filtered out, while the output simply consists in letting bytes through.

In the case of 8-bit engines, every character is a byte. For Unicode-aware engines, test the character code; non-bytes cause us to raise the flag \texttt{str\_byte}. Spaces have already been given the correct category code when this function is called.

\begin{verbatim}
\bool_lazy_any:nTF
\sys_if_engine_luatex_p:
\sys_if_engine_xetex_p:
\}
\cs_new:Npn \__str_filter_bytes:n #1
{
  \__str_filter_bytes_aux:N #1
  { ? \prg_break: }
  \prg_break_point:
}
\cs_new:Npn \__str_filter_bytes_aux:N #1
{
  \use_none:n #1
  \if_int_compare:w '#1 < 256 \exp_stop_f:
    #1
  \else:
    \flag_raise:n { str\_byte }
  \fi:
  \__str_filter_bytes_aux:N
}
\cs_new_eq:NN \__str_filter_bytes:n \use:n 
\end{verbatim}

The simplest unescaping method removes non-bytes from \texttt{g\_str\_result\_tl}.

\begin{verbatim}
\bool_lazy_any:nTF
\sys_if_engine_luatex_p:
\sys_if_engine_xetex_p:
\}
\cs_new_protected:Npn \__str_convert_unescape_: 
{ 
  \flag_clear:n { str\_byte }
  \_kernel_tl_gset:Nx \g\_str\_result\_tl
  { \exp_args:No \__str_filter_bytes:n \g\_str\_result\_tl }
  \_str\_if\_flag\_error:nxx { str\_byte } { non-byte } { bytes }
}
\cs_new_eq:NN \__str_convert_unescape_bytes: \__str_convert_unescape_: 
\end{verbatim}

(End definition for \texttt{\_str\_convert\_unescape:} and \texttt{\_str\_convert\_unescape\_bytes:})
The simplest form of escape leaves the bytes from the previous step of the conversion unchanged.

(End definition for \_\_str_convert_escape_: and \_\_str_convert_escape_bytes:)

54.3.6 Native strings

Convert each character to its character code, one at a time.

The conversion from an internal string to native character tokens basically maps \char_generate:nn through the code-points, but in non-Unicode-aware engines we use a fallback character ? rather than nothing when given a character code outside [0, 255]. We detect the presence of bad characters using a flag and only produce a single error after the x-expanding assignment.

(End definition for \_\_str_convert_decode_: and \_\_str_decode_native_char:N)

(End definition for \_\_str_convert_encode_: and \_\_str_encode_native_char:n)
This engine only supports 8-bit characters: valid character codes are in the range \([0, 255]\). To manipulate arbitrary Unicode, use LuaTeX or XeTeX.

\begin{verbatim}
End definition for \_\_str_convert_encode_: and \_\_str_encode_native_char:n.)
\end{verbatim}

54.3.7 \texttt{clist}

\begin{verbatim}
\_\_str_convert_decode_clist: \_\_str_convert_decode_clist:n
Convert each integer to the internal form. We first turn \texttt{g\_\_str_result_tl} into a clist variable, as this avoids problems with leading or trailing commas.
\end{verbatim}

\begin{verbatim}
\cs_new_protected:Npn \_\_str_convert_decode_clist:
{ \clist_gset:No \texttt{g\_\_str_result_tl} \texttt{g\_\_str_result_tl}
\__kernel_tl_gset:Nx \texttt{g\_\_str_result_tl}

\texttt{g\_\_str_result_tl} \_\_str_decode_clist_char:n
}\texttt{g\_\_str_result_tl}}
\cs_new:Npn \__str_decode_clist_char:n #1
{ #1 \s\_\_str \texttt{int_eval:n} \texttt{(#1)} \s\_\_str }
\end{verbatim}

\begin{verbatim}
End definition for \_\_str_convert_decode_clist: and \_\_str_decode_clist_char:n.)
\end{verbatim}

54.3.8 8-bit encodings

It is not clear in what situations 8-bit encodings are used, hence it is not clear what should be optimized. The current approach is reasonably efficient to convert long strings, and it scales well when using many different encodings.

The data needed to support a given 8-bit encoding is stored in a file that consists of a single function call

\begin{verbatim}
\_\_str_declare_eight_bit_encoding:nnnn {\langle name\rangle} {\langle modulo\rangle} {\langle mapping\rangle} {\langle missing\rangle}
\end{verbatim}

This declares the encoding \texttt{\langle name\rangle} to map bytes to Unicode characters according to the \texttt{\langle mapping\rangle}, and map those bytes which are not mentioned in the \texttt{\langle mapping\rangle} either to the replacement character (if they appear in \texttt{\langle missing\rangle}), or to themselves. The \texttt{\langle mapping\rangle} argument is a token list of pairs \texttt{\langle byte\rangle} \texttt{\langle Unicode\rangle} expressed in uppercase hexadecimal notation. The \texttt{\langle missing\rangle} argument is a token list of \texttt{\langle byte\rangle}. Every \texttt{\langle byte\rangle} which does
not appear in the \textit{mapping} nor the \textit{missing} lists maps to itself in Unicode, so for instance the \texttt{latin1} encoding has empty \textit{mapping} and \textit{missing} lists. The \textit{(modulo)} is a (decimal) integer between 256 and 558 inclusive, modulo which all Unicode code points supported by the encodings must be different.

We use two integer arrays per encoding. When decoding we only use the \texttt{decode} integer array, with entry \( n + 1 \) (offset needed because integer array indices start at 1) equal to the Unicode code point that corresponds to the \( n \)-th byte in the encoding under consideration, or \(-1\) if the given byte is invalid in this encoding. When encoding we use both arrays: upon seeing a code point \( n \), we look up the entry \((1 \text{ plus}) \, n \) modulo some number \( M \) in the \texttt{encode} array, which tells us the byte that might encode the given Unicode code point, then we check in the \texttt{decode} array that indeed this byte encodes the Unicode code point we want. Here, \( M \) is an encoding-dependent integer between 256 and 558 (it turns out), chosen so that among the Unicode code points that can be validly represented in the given encoding, no pair of code points have the same value modulo \( M \).

Loop through both lists of bytes to fill in the \texttt{decode} integer array, then fill the \texttt{encode} array accordingly. For bytes that are invalid in the given encoding, store \(-1\) in the \texttt{decode} array.

\begin{verbatim}
\_str_declare_eight_bit_encoding:nnnn \_str_declare_eight_bit_aux:NNnnn \_str_declare_eight_bit_loop:Nn
\end{verbatim}
The map from bytes to Unicode code points is in the decode array corresponding to the given encoding. Define \_\_str\_tmp:w and pass it successively all bytes in the string. It produces an internal representation with suitable \s__str inserted, and the corresponding code point is obtained by looking it up in the integer array. If the entry is \(-1\) then issue a replacement character and raise the flag indicating that there was an error.

\begin{verbatim}
\cs_new_protected:Npn \__str_convert_decode_eight_bit:n #1
\cs_set:Npx \__str_tmp:w
\exp_not:N \__str_decode_eight_bit_aux:Nn
\exp_not:c { g__str_decode_#1_intarray }
\flag_clear:n { str_error }
\__str_convert_gmap:N \__str_tmp:w
\__str_if_flag_error:nnx { str_error } { decode-8-bit } {#1}
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \__str_decode_eight_bit_aux:Nn #1#2
\#2 \s__str
\exp_args:Nf \__str_decode_eight_bit_aux:n
{ \intarray_item:Nn #1 { 1 + '#2 } }
\s__str
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \__str_decode_eight_bit_aux:n #1
\if_int_compare:w #1 < \c_zero_int
\flag_raise:n { str_error }
\int_value:w \c__str_replacement_char_int
\else:
#1
\fi:
\end{verbatim}

(End definition for \__str\_convert\_decode\_eight\_bit\_n, \__str\_decode\_eight\_bit\_aux\_Nn, and \__str\_decode\_eight\_bit\_aux\_Nn.)

It is not practical to make an integer array with indices in the full Unicode range, so we work modulo some number, which is simply the size of the encode integer array for the
given encoding. This gives us a candidate byte for representing a given Unicode code point. Of course taking the modulo leads to collisions so we check in the decode array that the byte we got is indeed correct. Otherwise the Unicode code point we started from is simply not representable in the given encoding.

\begin{verbatim}
\int_new:N \l__str_modulo_int
\cs_new_protected:Npn \__str_convert_encode_eight_bit:n #1
{ \cs_set:Npx \__str_tmp:w
  { \exp_not:N \__str_encode_eight_bit_aux:NNn \exp_not:c { g__str_encode_#1_intarray } \exp_not:c { g__str_decode_#1_intarray } }
\flag_clear:n { str_error }
\__str_convert_gmap_internal:N \__str_tmp:w
\__str_if_flag_error:nnx { str_error } { encode-8-bit } {#1}
}
\cs_new:Npn \__str_encode_eight_bit_aux:NNn #1#2#3
{ \int_compare:nNnTF { \intarray_item:Nn #3 { 1 + \int_mod:nn {#3} { \intarray_count:N #1 } } } = {#2}
  { \__str_output_byte:n {#1} }
  { \flag_raise:n { str_error } }
}\end{verbatim}

(End definition for \__str_convert_encode_eight_bit:n, \__str_encode_eight_bit_aux:nnN, and \_\_str_encode_eight_bit_aux:NNn.)

### 54.4 Messages

General messages, and messages for the encodings and escapings loaded by default ("native", and "bytes").

\begin{verbatim}
\msg_new:nnn { str } { unknown-esc } { Escaping-scheme-"#1"-(filtered:"#2")-unknown. }
\msg_new:nnn { str } { unknown-enc } { Encoding-scheme-"#1"-(filtered:"#2")-unknown. }
\msg_new:nnnn { str } { native-escaping } { The-"native"-encoding-scheme-does-not-support-any-escaping. }

{ \LaTeX-was-asked-to-convert-a-string-to-that-encoding,-but-that-
  string-contains-a-character-that '#1'-does-not-support. }

54.5 Escaping definitions

Several of those encodings are defined by the pdf file format. The following byte storage methods are defined:

- **bytes** (default), non-bytes are filtered out, and bytes are left untouched (this is defined by default);
- **hex** or **hexadecimal**, as per the \pdfTeX primitive \pdfescapehex
- **name**, as per the \pdfTeX primitive \pdfescapename
- **string**, as per the \pdfTeX primitive \pdfescapestring
- **url**, as per the percent encoding of urls.
54.5.1 Unescape methods

Take chars two by two, and interpret each pair as the hexadecimal code for a byte. Anything else than hexadecimal digits is ignored, raising the flag. A string which contains an odd number of hexadecimal digits gets 0 appended to it: this is equivalent to appending a 0 in all cases, and dropping it if it is alone.

\cs_new_protected:Npn \__str_convert_unescape_hex: 
\group_begin: 
\flag_clear:n { str_error } 
\int_set:Nn \tex_escapechar:D { 92 } 
\__kernel_tl_gset:Nx \g__str_result_tl 
\{ 
\__str_output_byte:w " \exp_last_unbraced:Nf \__str_unescape_hex_auxi:N \{ \tl_to_str:N \g__str_result_tl \} 
0 { ? 0 - 1 \prg_break: } 
\prg_break_point: 
\__str_output_end: 
\} \__str_if_flag_error:nnx { str_error } { unescape-hex } { } 
\group_end: 
\cs_new:Npn \__str_unescape_hex_auxi:N #1

\__str_hexadecimal_use:NTF #1 
\{ \__str_unescape_hex_auxii:N \} 
\{ \flag_raise:n { str_error } \__str_unescape_hex_auxii:N \} 
\} 
\cs_new:Npn \__str_unescape_hex_auxii:N #1 
\use_none:n #1 
\__str_hexadecimal_use:NTF #1 
\{ \__str_output_end: \__str_output_byte:w " \__str_unescape_hex_auxi:N \} 
\{ \flag_raise:n { str_error } \__str_unescape_hex_auxii:N \} 
\} 
\msg_new:nnnn { str } { unescape-hex } { String invalid in escaping 'hex': only hexadecimal digits allowed. } 
\{ Some characters in the string you asked to convert are not hexadecimal digits (0-9, A-F, a-f) nor spaces. \} 
(End definition for \__str_convert_unescape_hex:, \__str_unescape_hex_auxi:N, and \__str_unescape_hex_auxii:N.)
The \_str_convert_unescape_name: function replaces each occurrence of # followed by two hexadecimal digits in \_str_result_tl by the corresponding byte. The url function is identical, with escape character % instead of #. Thus we define the two together. The arguments of \_str_tmp:w are the character code of # or % in hexadecimal, the name of the main function to define, and the name of the auxiliary which performs the loop.

The looping auxiliary #3 finds the next escape character, reads the following two characters, and tests them. The test \_str_hexadecimal_use:NTF leaves the upper-case digit in the input stream, hence we surround the test with \_str_output_byte:w " and \_str_output_end:. If both characters are hexadecimal digits, they should be removed before looping: this is done by \use_i:nn. If one of the characters is not a hexadecimal digit, then feed "#1 to \_str_output_byte:w to produce the escape character, raise the flag, and call the looping function followed by the two characters (remove \use_i:nnn).

\cs_set_protected:Npn \_str_tmp:w #1#2#3
\cs_new_protected:cpn { __str_convert_unescape_#2: }
{ }
\group_begin:
\flag_clear:n { str_byte }
\flag_clear:n { str_error }
\int_set:Nn \tex_escapechar:D { 92 }
\__kernel_tl_gset:Nx \g__str_result_tl
{ \exp_after:wN #3 \g__str_result_tl
#1 ? { ? \prg_break: } }
\__str_if_flag_error:nnx { str_byte } { non-byte } { #2 }
\__str_if_flag_error:nnx { str_error } { unescape-#2 } { }
\group_end:
\cs_new:Npn #3 ##1#1##2##3
{ \__str_filter_bytes:n {##1} \use_none:n ##3 \__str_output_byte:w " \__str_hexadecimal_use:NTF ##2 \__str_hexadecimal_use:NTF ##3
{ } \flag_raise:n { str_error }
* 0 + '#1 \use_i:nn
) }
{ \flag_raise:n { str_error }
0 + '#1 \use_i:nn
}
\__str_output_end:
\use_i:nnn #3 #2#3
The string escaping is somewhat similar to the name and url escapings, with escape character \. The first step is to convert all three line endings, ^{^J}, ^{^M}, and ^{^M^{^J}} to the common ^{^J}, as per the PDF specification. This step cannot raise the flag.

Then the following escape sequences are decoded.

\n Line feed (10)
\r Carriage return (13)
\t Horizontal tab (9)
\b Backspace (8)
\f Form feed (12)
\( Left parenthesis
\) Right parenthesis
\ Backslash
\ddd (backslash followed by 1 to 3 octal digits) Byte ddd (octal), subtracting 256 in case of overflow.

If followed by an end-of-line character, the backslash and the end-of-line are ignored. If followed by anything else, the backslash is ignored, raising the error flag.
54.5.2 Escape methods

Currently, none of the escape methods can lead to errors, assuming that their input is made out of bytes.

\__str_convert_escape_hex:
<table>
<thead>
<tr>
<th>__str_escape_hex_char:N</th>
<th>Loop and convert each byte to hexadecimal.</th>
</tr>
</thead>
</table>
\__str_convert_escape_name:
| \__str_escape_name_char:n | \__str_if_escape_name:nTF | \c__str_escape_name_not_str | For each byte, test whether it should be output as is, or be “hash-encoded”. Roughly, bytes outside the range \[2A, 7E\] are hash-encoded. We keep two lists of exceptions: characters in \c__str_escape_name_not_str are not hash-encoded, and characters in the \c__str_escape_name_str are encoded. |
| \c__str_escape_name_str |
\prg_return_false:
\else:

  \prg_return_false: \prg_return_true:
\fi:
\fi:
\fi:
\fi:
(End definition for \__str_convert_escape_name: and others.)

Any character below (and including) space, and any character above (and including) del, are converted to octal. One backslash is added before each parenthesis and backslash.

\prg_new_conditional:Npnn \__str_if_escape_string:N #1 { TF }
\prg_new_protected:Nppn \__str_if_escape_string:N #1 { TF }
(End definition for \__str_convert_escape_string: and others.)

This function is similar to \__str_convert_escape_name:, escaping different characters.
54.6 Encoding definitions

The native encoding is automatically defined. Other encodings are loaded as needed. The following encodings are supported:

- utf-8;
- utf-16, big-, little-endian, or with byte order mark;
- utf-32, big-, little-endian, or with byte order mark;
- the iso 8859 code pages, numbered from 1 to 16, skipping the inexistent iso 8859-12.

54.6.1 utf-8 support

Loop through the internal string, and convert each character to its utf-8 representation. The representation is built from the right-most (least significant) byte to the left-most (most significant) byte. Continuation bytes are in the range [128, 191], taking 64 different values, hence we roughly want to express the character code in base 64, shifting the first digit in the representation by some number depending on how many continuation bytes there are. In the range [0, 127], output the corresponding byte directly. In the range [128, 2047], output the remainder modulo 64, plus 128 as a continuation byte, then output the quotient (which is in the range [0, 31]), shifted by 192. In the next range, [2048, 65535], split the character code into residue and quotient modulo 64, output the residue as a first continuation byte, then repeat; this leaves us with a quotient in the range [0, 15], which we output shifted by 224. The last range, [65536, 1114111], follows the same pattern: once we realize that dividing twice by 64 leaves us with a number larger than 15, we repeat, producing a last continuation byte, and offset the quotient by 240 for the leading byte.

How is that implemented? \_\_str_encode_utf_vii_loop:wwnnw takes successive quotients as its first argument, the quotient from the previous step as its second argument (except in step 1), the bound for quotients that trigger one more step or not, and finally the offset used if this step should produce the leading byte. Leading bytes can be in
the ranges $[0, 127]$, $[192, 223]$, $[224, 239]$, and $[240, 247]$ (really, that last limit should be 244 because Unicode stops at the code point 1114111). At each step, if the quotient $\#1$ is less than the limit $\#2$ for that range, output the leading byte ($\#1$ shifted by $\#4$) and stop. Otherwise, we need one more step: use the quotient of $\#1$ by 64, and $\#1$ as arguments for the looping auxiliary, and output the continuation byte corresponding to the remainder $\#2 - 64\#1 + 128$. The bizarre construction $-1 + 0 \times \#2$ removes the spurious initial continuation byte (better methods welcome).

\begin{verbatim}
\cs_new_protected:cpn { __str_convert_encode_utf8: }
\cs_new:Npn __str_convert_gmap_internal:N __str_convert_encode_utf_viii_char:n #1 ( \__str_convert_gmap_secret:N __str_convert_encode_utf_viii_char:n #1 )

\l__str_missing_flag
\l__str_extra_flag
\l__str_overlong_flag
\l__str_overflow_flag
When decoding a string that is purportedly in the utf-8 encoding, four different errors can occur, signalled by a specific flag for each (we define those flags using \flag_clear-_new:n rather than \flag_new:n, because they are shared with other encoding definition files).

- “Missing continuation byte”: a leading byte is not followed by the right number of continuation bytes.
- “Extra continuation byte”: a continuation byte appears where it was not expected, \textit{i.e.}, not after an appropriate leading byte.
- “Overlong”: a Unicode character is expressed using more bytes than necessary, for instance, “C0“80 for the code point 0, instead of a single null byte.
- “Overflow”: this occurs when decoding produces Unicode code points greater than 1114111.

We only raise one \texttt{ETEX} error message, combining all the errors which occurred. In the short message, the leading comma must be removed to get a grammatically correct sentence. In the long text, first remind the user what a correct utf-8 string should look like, then add error-specific information.

(End definition for \_\_str_missing_flag and others.)
Decoding is significantly harder than encoding. As before, lower some flags, which are tested at the end (in bulk, to trigger at most one \texttt{LATEX3} error, as explained above). We expect successive multi-byte sequences of the form \textit{(start byte)} \textit{(continuation bytes)}. The \texttt{start} auxiliary tests the first byte:

- \texttt{[0,"7F]}: the byte stands alone, and is converted to its own character code;
- \texttt{["80,"BF]}: unexpected continuation byte, raise the appropriate flag, and convert that byte to the replacement character \texttt{"FFFD};
- \texttt{["C0,"FF]}: this byte should be followed by some continuation byte(s).

In the first two cases, \texttt{use:none_delimit_by_q_stop:w} removes data that only the third case requires, namely the limits of ranges of Unicode characters which can be expressed with 1, 2, 3, or 4 bytes.

We can now concentrate on the multi-byte case and the \texttt{continuation} auxiliary. We expect \texttt{#3} to be in the range \texttt{["80,"BF]}. The test for this goes as follows: if the character code is less than \texttt{"80}, we compare it to \texttt{"C0}, yielding \texttt{false}; otherwise to \texttt{"C0}, yielding \texttt{true} in the range \texttt{["80,"BF]} and \texttt{false} otherwise. If we find that the byte is not a continuation range, stop the current slew of bytes, output the replacement character, and continue parsing with the \texttt{start} auxiliary, starting at the byte we just tested. Once we know that the byte is a continuation byte, leave it behind us in the input stream, compute what code point the bytes read so far would produce, and feed that number to the \texttt{aux} function.

The \texttt{aux} function tests whether we should look for more continuation bytes or not. If the number it receives as \texttt{#1} is less than the maximum \texttt{#4} for the current range, then we are done: check for an overlong representation by comparing \texttt{#1} with the maximum \texttt{#3} for the previous range. Otherwise, we call the \texttt{continuation} auxiliary again, after shifting the “current code point” by \texttt{#4} (maximum from the range we just checked).

Two additional tests are needed: if we reach the end of the list of range maxima and we are still not done, then we are faced with an overflow. Clean up, and again insert the code point \texttt{"FFFD} for the replacement character. Also, every time we read a byte, we need to check whether we reached the end of the string. In a correct UTF-8 string, this happens automatically when the \texttt{start} auxiliary leaves its first argument in the input stream: the end-marker begins with \texttt{prg_break:}, which ends the loop. On the other hand, if the end is reached when looking for a continuation byte, the \texttt{use:none:n \#3} construction removes the first token from the end-marker, and leaves the \texttt{end} auxiliary, which raises the appropriate error flag before ending the mapping.

54.6.2 utf-16 support

The definitions are done in a category code regime where the bytes 254 and 255 used by the byte order mark have catcode 12.

When the endianness is not specified, it is big-endian by default, and we add a byte-order mark. Convert characters one by one in a loop, with different behaviours depending on the character code.

- [0, "D7FF]: converted to two bytes;
- ["D800", "DFFF"] are used as surrogates: they cannot be converted and are replaced by the replacement character;
- ["E000", "FFFF"]: converted to two bytes;
- ["10000", "10FFFF"]: converted to a pair of surrogates, each two bytes. The magic "D7C0 is "D800 - "10000/400.

For the duration of this operation, \_\_str_tmp:w is defined as a function to convert a number in the range [0, "FFFF"] to a pair of bytes (either big endian or little endian), by feeding the quotient of the division of #1 by "100, followed by #1 to \_\_str_encode_utf_xvi_be:nn or its le analog: those compute the remainder, and output two bytes for the quotient and remainder.
When encoding a Unicode string to utf-16, only one error can occur: code points in the range ["D800","DFFF"], corresponding to surrogates, cannot be encoded. We use the all-purpose flag `@@_error` to signal that error.

When decoding a Unicode string which is purportedly in utf-16, three errors can occur: a missing trail surrogate, an unexpected trail surrogate, and a string containing an odd number of bytes.
In-the-UTF-16-encoding,-each-Unicode-character-is-encoded-as-

\}
\}
\text{(End definition for \text{l__str_missing_flag}, \text{l__str_extra_flag}, and \text{l__str_end_flag}.)}

As for utf-8, decoding UTF-16 is harder than encoding it. If the endianness is unknown,
check the first two bytes: if those are *FE and *FF in either order, remove them and use
the corresponding endianness, otherwise assume big-endianness. The three endianness
cases are based on a common auxiliary whose first argument is 1 for big-endian and 2 for
little-endian, and whose second argument, delimited by the scan mark \text{s__str_stop},
is expanded once (the string may be long; passing \text{\g__str_result_tl} as an argument
before expansion is cheaper).

The \text{\_str_decode_utf_xvi:Nw} function defines \text{\_str_tmp:w} to take two argu-
ments and return the character code of the first one if the string is big-endian, and the
second one if the string is little-endian, then loops over the string using \text{\_str_decode_-
utf_xvi_pair:NN} described below.
Bytes are read two at a time. At this stage, \@@_tmp:w \#1\#2 expands to the character code of the most significant byte, and we distinguish cases depending on which range it lies in:

- \[ "D8", "DB" \] signals a lead surrogate, and the integer expression yields 1 (\$-\text{\LaTeX}\$ rounds ties away from zero);
- \[ "DC", "DF" \] signals a trail surrogate, unexpected here, and the integer expression yields 2;
- any other value signals a code point in the Basic Multilingual Plane, which stands for itself, and the \if_case:w \construction expands to nothing (cases other than 1 or 2), leaving the relevant material in the input stream, followed by another call to the _pair auxiliary.

The case of a lead surrogate is treated by the _quad auxiliary, whose arguments \#1, \#2, \#4 and \#5 are the four bytes. We expect the most significant byte of \#4\#5 to be in the range \[ "DC", "DF" \] (trail surrogate). The test is similar to the test used for continuation bytes.
in the UTF-8 decoding functions. In the case where \#4\#5 is indeed a trail surrogate, leave \#1\#2\#4\#5 _s_str (code point) _s_str, and remove the pair \#4\#5 before looping with \_s_str_decode_utf_xvi_pair:NN. Otherwise, of course, complain about the missing surrogate.

The magic number "D7F7 is such that "D7F7×"400 = "D800×"400+"DC00−"10000. Every time we read a pair of bytes, we test for the end-marker \q__str_nil. When reaching the end, we additionally check that the string had an even length. Also, if the end is reached when expecting a trail surrogate, we treat that as a missing surrogate.

764
There can be no error when encoding in UTF-32. When decoding, the string may not have length $4n$, or it may contain code points larger than "$10FFFF". The latter case often happens if the encoding was in fact not UTF-32, because most arbitrary strings are not valid in UTF-32.

The structure is similar to UTF-16 decoding functions. If the endianness is not given, test the first 4 bytes of the string (possibly \_\_str_stop if the string is too short) for the presence of a byte-order mark. If there is a byte-order mark, use that endianness, and remove the 4 bytes, otherwise default to big-endian, and leave the 4 bytes in place. The \_\_str_decode_utf_xxxii:Nw auxiliary receives 1 or 2 as its first argument indicating endianness, and the string to convert as its second argument (expanded or not). It sets
\_\_str_tmp:w to expand to the character code of either of its two arguments depending
on endianness, then triggers the _loop auxiliary inside an x-expanding assignment to
\g__str_result_tl.

The _loop auxiliary first checks for the end-of-string marker \s__str_stop, calling
the _end auxiliary if appropriate. Otherwise, leave the (4 bytes) \s__str behind, then
check that the code point is not overflowing: the leading byte must be 0, and the following
byte at most 16.

In the ending code, we check that there remains no byte: there should be nothing
left until the first \s__str_stop. Break the map.

54.7 PDF names and strings by expansion

To convert to PDF names by expansion, we work purely on UTF-8 input. The first step is to make a string with "other" spaces, after which we use a simple token-by-token approach. In Unicode engines, we break down everything before one-byte codepoints, but for 8-bit engines there is no need to worry. Actual escaping is covered by the same code as used in the non-expandable route.

Chapter 55

\textbf{l3quark} implementation

The following test files are used for this code: \texttt{m3quark001.lvt}.

\section*{55.1 Quarks}

\begin{verbatim}
\quark_new:N
Allocate a new quark.
{ \__kernel_chk_if_free_cs:N #1 \cs_gset_nopar:Npn #1 {#1} }

(End definition for \texttt{\quark_new:N}. This function is documented on page 139.)
\end{verbatim}

\begin{verbatim}
\q_nil \q_mark \q_no_value \q_stop
Some "public" quarks. \texttt{\q_stop} is an "end of argument" marker, \texttt{\q_nil} is a empty value
and \texttt{\q_no_value} marks an empty argument.
\end{verbatim}

\begin{verbatim}
\quark_new:N \q_recursion_tail \quark_new:N \q_recursion_stop
Quarks for ending recursions. Only ever used there! \texttt{\q_recursion_tail} is appended to
whatever list structure we are doing recursion on, meaning it is added as a proper list
item with whatever list separator is in use. \texttt{\q_recursion_stop} is placed directly after
the list.
\end{verbatim}

\begin{verbatim}
\s__quark
Private scan mark used in l3quark. We don’t have l3scan yet, so we declare the scan mark
here and add it to the scan mark pool later.
\end{verbatim}
Private quark use for some tests.

When doing recursions, it is easy to spend a lot of time testing if the end marker has been found. To avoid this, a dedicated end marker is used each time a recursion is set up. Thus if the marker is found everything can be wrapped up and finished off. The simple case is when the test can guarantee that only a single token is being tested. In this case, there is just a dedicated copy of the standard quark test. Both a gobbling version and one inserting end code are provided.

See \quark_nil:nTF for the details. Expanding \__quark_if_recursion_tail:w once in front of the tokens chosen here gives an empty result if and only if \q_recursion_tail is exactly \q_recursion_tail. 

(End definition for \__quark.)

\__quark_nil

\quark_if_recursion_tail_stop:N
\quark_if_recursion_tail_stop:Do:Nn

\quark_if_recursion_tail_stop:n
\quark_if_recursion_tail_stop:o
\quark_if_recursion_tail_stop:Do:nn
\quark_if_recursion_tail_stop:Do:on
\__quark_if_recursion_tail:w

See \quark_nil:nTF for the details. Expanding \__quark_if_recursion_tail:w once in front of the tokens chosen here gives an empty result if and only if \#1 is exactly \q_recursion_tail.

(End definition for \quark_if_recursion_tail_stop:N and \quark_if_recursion_tail_stop:Do:Nn. These functions are documented on page 140.)

(End definition for \quark_if_recursion_tail_stop:n, \quark_if_recursion_tail_stop:Do:nn, and \__quark_if_recursion_tail:w. These functions are documented on page 140.)

786
Analagues of the \quark_if_recursion_tail_stop... functions. Break the mapping using \#2.

\cs_new:Npn \quark_if_recursion_tail_break:NN #1#2
\begin{verbatim}
16213 \cs_new:Npn \quark_if_recursion_tail_break:NN #1#2
16214 \{
16215 \if_meaning:w \q_recursion_tail #1
16216 \exp_after:wN #2
16217 \fi:
16218 \}
\end{verbatim}
\begin{verbatim}
16219 \cs_new:Npn \quark_if_recursion_tail_break:nN #1#2
16220 \{
16221 \tl_if_empty:oT
16222 { \__quark_if_recursion_tail:w {} #1 {} ?! \q_recursion_tail ??! }
16223 {#2}
16224 }
\end{verbatim}

(End definition for \quark_if_recursion_tail_break:NN and \quark_if_recursion_tail_break:nN. These functions are documented on page 141.)

\quark_if_nil_p:N \quark_if_nil:NTF \quark_if_no_value_p:N \quark_if_no_value:NTF \quark_if_no_value_p:c \quark_if_no_value:n \quark_if_no_value:c \quark_if_no_value:V \quark_if_no_value:o

Here we test if we found a special quark as the first argument. We better start with \q_no_value as the first argument since the whole thing may otherwise loop if \#1 is wrongly given a string like aabc instead of a single token.\footnote{It may still loop in some circumstances however!}

\begin{verbatim}
16225 \prg_new_conditional:Npnn \quark_if_nil:N #1 { p, T , F , TF }
16226 \{
16227 \if_meaning:w \q_nil #1
16228 \prg_return_true:
16229 \else:
16230 \prg_return_false:
16231 \fi:
16232 \}
\end{verbatim}
\begin{verbatim}
16233 \prg_new_conditional:Npnn \quark_if_no_value:N #1 { p, T , F , TF }
16234 \{
16235 \if_meaning:w \q_no_value #1
16236 \prg_return_true:
16237 \else:
16238 \prg_return_false:
16239 \fi:
16240 \}
\end{verbatim}
\begin{verbatim}
16241 \prg_generate_conditional_variant:Nnn \quark_if_no_value:N { c } { p , T , F , TF }
\end{verbatim}

(End definition for \quark_if_nil:NTF and \quark_if_no_value:NTF. These functions are documented on page 139.)

\quark_if_nil_p:n \quark_if_nil_p:V \quark_if_nil_p:o \quark_if_nil:n \quark_if_nil:v \quark_if_no_value:p:n \quark_if_no_value:p:V \quark_if_no_value:p:o \_\quark_if_nil:w \_\quark_if_no_value:w \_\quark_if_empty_if:o

Let us explain \quark_if-nil:nTF. Expanding \_\quark_if-nil:w once is safe thanks to the trailing \q_nil ??. The result of expanding once is empty if and only if both delimited arguments \#1 and \#2 are empty and \#3 is delimited by the last tokens ?!. Thanks to the leading {}, the argument \#1 is empty if and only if the argument of \quark_if-nil:n starts with \q_nil. The argument \#2 is empty if and only if this \q-nil is followed immediately by \? or by {}, coming either from the trailing tokens in the definition of \quark_if-nil:n, or from its argument. In the first case, \_\quark_if-nil:w is followed by \{}\q-nil \}? \q-nil ??!, hence \#3 is delimited by the final ?!, and the test returns true as wanted. In the second case, the result is not empty since...
the first ?! in the definition of \texttt{\quark\_if\_nil:n} stop #3. The auxiliary here is the same as \texttt{\_tl\_if\_empty\_if:o}, with the same comments applying.

\begin{verbatim}
\prg_new_conditional:Npnn \quark\_if\_nil:n \#1 { p, T , F , TF }
\{

\cs\_new:Npn \__quark\_if\_no\_value:w \q\_no\_value \#2 \? \#3 \? ! \{ \#1 \#2 \}
\prg\_generate\_conditional\_variant:Nnn \quark\_if\_no\_value:n \#1 \{ p, T , F , TF \}
\{
    \__quark\_if\_empty\_if:o
    { \__quark\_if\_no\_value:w \#1 \{} \{} \q\_no\_value \? \? \! }
    \prg\_return\_true:
    \else:
    \prg\_return\_false:
\fi:
\}
\cs\_new:Npn \__quark\_if\_no\_value:w \q\_no\_value \#2 \? \#3 \? ! \{ \#1 \#2 \}
\end{verbatim}

(End definition for \texttt{\quark\_if\_nil:nTF} and others. These functions are documented on page \pageref{page}.)

The function \texttt{\__kernel\_quark\_new\_test:N} defines #1 in a similar way as \texttt{\quark\_if\_recursion\_tail\_...} functions (as described below), using \texttt{\q\_⟨namespace⟩\_recursion\_tail} as the test quark and \texttt{\q\_⟨namespace⟩\_recursion\_stop} as the delimiter quark, where the ⟨namespace⟩ is determined as the first \_delimited part in #1.

There are six possible function types which this function can define, and which is defined depends on the signature of the function being defined:

:nn gives an analogue of \texttt{\quark\_if\_recursion\_tail\_stop:nn}

:NN gives an analogue of \texttt{\quark\_if\_recursion\_tail\_break:NN}

Any other signature causes an error, as does a function without signature.
Similar to \__kernel_quark_new_test:N, but defines quark branching conditionals like \quark_if_nil:nTF that test for the quark \q__\langle namespace\rangle_⟨name⟩. The ⟨namespace⟩ and ⟨name⟩ are determined from the conditional #1, which must take the rather rigid form \__⟨namespace⟩_quark_if_⟨name⟩:⟨arg spec⟩. There are only two cases for the ⟨arg spec⟩ here:

:n gives an analogue of \quark_if_nil:nTF

:N gives an analogue of \quark_if_nil:NTF

Any other signature causes an error, as does a function without signature. We use low-level emptiness tests as l3tl is not available yet when these functions are used; thankfully we only care about whether strings are empty so a simple \if_meaning:w \q_nil (string) \q_nil suffices.
These macros implement the six possibilities mentioned above, passing the right arguments to \_\_quark_new_test_aux_do:nNNnnNNnn, which defines some auxiliaries, and then to \_\_quark_new_test_define_t1:nNnNNNn (n(n) variants) or to \_\_quark_new_test_define_ifx:nNNnnNNn (N(n)) which define the main conditionals.

(End definition for \_\_kernel_quark_new_test:n and others.)
\__quark_new_test_aux_do:nNNnnnnNNn makes the control sequence names which will
to be used by \__quark_test_define_aux:NNNNnnNNn, and then later by \__quark_new_test_define_tl:nNnNn or \__quark_new_test_define_ifx:nNnNn. The control sequences defined here are analogous to \__quark_if_recursion_tail:w and to \use-(none|i)_delimit_by_q_recursion_stop:(w).

The name is composed by the name-space and the name of the quarks. Suppose \__kernel_quark_new_test:N was used with:

\__kernel_quark_new_test:N \__test_quark_tail:w

then the first auxiliary will be \__test_quark_recursion_tail:w, and the second one will be \__test_use_none_delimit_by_q_recursion_stop:w.

Note that the actual quarks are not defined here. They should be defined separately using \quark_new:N.

Finally, these two macros define the main conditional function using what’s been set up before.

(End definition for \__quark_new_test_aux_do:nNNnnnnNNn and \__quark_test_define_aux:NNNNnnNNn.)

791
These macros implement the two possibilities for branching quark conditionals, passing
the right arguments to \texttt{\_\_quark\_new\_conditional\_aux\_do:NNnnn}, which defines some
auxiliaries and defines the main conditionals.

\begin{verbatim}
\cs_set:Npn \__quark_new_conditional_n:Nnnn { \__quark_new_conditional_aux_do:NNnnn \use_i:nn }
\cs_set:Npn \__quark_new_conditional_N:Nnnn { \__quark_new_conditional_aux_do:NNnnn \use_ii:nn }
\end{verbatim}

Similar to the previous macros, but branching conditionals only require one auxiliary, so
we take a shortcut. In \texttt{\_\_quark\_new\_conditional\_define:NNNNn}, \#4 is \texttt{\_\_i:nn} to
define the \texttt{n}-type function (which needs an auxiliary) and is \texttt{\_\_ii:nn} to define the
\texttt{N}-type function.

\begin{verbatim}
\cs_new:Npn \__quark_new_conditional_aux_do:NNnnn #1 #2 #3 #4
{ \exp_args:Ncc \__quark_new_conditional_define:NNNNn
{ __ #4 _if_quark_ #3 :w } { q__ #4 _ #3 } #2 #1 }
\end{verbatim}

\begin{verbatim}

{ #4 { \cs_gset:Npn #1 ##1 #2 ##2 ? ##3 ?! { ##1 ##2 } } { } \exp_args:Nno \use:n { \prg_new_conditional:Npnn #3 ##1 {#5} }
{ #4 { \__quark_if_empty_if:o { #1 {} ##1 {} ?! #2 ??! } }
{ \if_meaning:w #2 ##1 } \prg_return_true: \else: \prg_return_false: \fi: }
}
\end{verbatim}

\begin{verbatim}
\cs_set:Npn \__quark_tmp:w #1#2
{ \cs_new:Npn \__quark_module_name:N ##1
{ \exp_last_unbraced:Nf \__quark_module_name:w
{ \cs_to_str:N ##1 } #1 \s__quark }
\cs_new:Npn \__quark_module_name:w ##1 #1 ##2 \s__quark
{ \__quark_module_name_loop:w ##1 #2 \use_none:n { } #2 \s__quark }
\end{verbatim}

\begin{verbatim}
\cs_set:Npn \__quark_tmp:w #1#2
{ \cs_new:Npn \__quark_module_name:N ##1
{ \exp_last_unbraced:Nf \__quark_module_name:w
{ \cs_to_str:N ##1 } #1 \s__quark }
\cs_new:Npn \__quark_module_name:w ##1 #1 ##2 \s__quark
{ \__quark_module_name_loop:w ##1 #2 \use_none:n { } #2 \s__quark }
\end{verbatim}
\cs_new:Npn \__quark_module_name_loop:w ##1 #2
  {
    \use_i_ii:nnn \if_meaning:w \prg_do_nothing:
    ##1 \prg_do_nothing: \prg_do_nothing:
    \exp_after:wN \__quark_module_name_loop:w
  \else:
    \__quark_module_name_end:w ##1
    \fi:
  }
\cs_new:Npn \__quark_module_name_end:w
  ##1 \fi: ##2 \s__quark { \fi: ##1 }
\exp_after:wN \__quark_tmp:w \tl_to_str:n { : _ }

(End definition for \__quark_module_name:N and others.)

\__quark_quark_conditional_name:N \__quark_quark_conditional_name:w
\__quark_quark_conditional_name:N
Determines the quark name that the quark conditional function \#1
queries, as the part of the function name between \quark_if_and
the trailing : Again we define it through \__quark_tmp:w, which receives : as \#1
and \quark_if_ as \#2. The auxiliary \__quark_quark_conditional_name:w
returns the part between the first \quark_if_ and the next ;, and we apply this auxiliary
to the function name followed by : (in case the function name is lacking a signature), and
\quark_if_: so that \__quark_quark_conditional_name:N returns an empty string if
\quark_if_ is not present.
\cs_set:Npn \__quark_tmp:w #1 #2 \s__quark
  {
    \cs_new:Npn \__quark_quark_conditional_name:N ##1
      {
        \exp_last_unbraced:Nf \__quark_quark_conditional_name:w
          { \cs_to_str:N ##1 } #1 #2 #1 \s__quark
      }
\exp_after:wN \__quark_tmp:w \tl_to_str:n { : _ }

(End definition for \__quark_quark_conditional_name:N and \__quark_quark_conditional_name:w.)

794
Chapter 56

l3seq implementation

The following test files are used for this code: m3seq002,m3seq003.

\begin{package}
\@@=seq

A sequence is a control sequence whose top-level expansion is of the form "\s__-seq \__seq_item:n {⟨item⟩} ... \__seq_item:n {⟨itemₙ⟩}" , with a leading scan mark followed by \( n \) items of the same form. An earlier implementation used the structure "\seq_elt:w ⟨item⟩ \seq_elt_end: ... \seq_elt:w ⟨itemₙ⟩ \seq_elt_end:". This allowed rapid searching using a delimited function, but was not suitable for items containing \{ \}, \} and # tokens, and also lead to the loss of surrounding braces around items

\begin{verbatim}
\__seq_item:n = \__seq_item:n {⟨item⟩}
\end{verbatim}

The internal token used to begin each sequence entry. If expanded outside of a mapping or manipulation function, an error is raised. The definition should always be set globally.

\begin{verbatim}
\__seq_push_item_def:n \__seq_push_item_def:x
\__seq_pop_item_def:
\end{verbatim}

Saves the definition of \__seq_item:n and redefines it to accept one parameter and expand to \( ⟨code⟩ \). This function should always be balanced by use of \__seq_pop_item_def:n.

\begin{verbatim}
\__seq_pop_item_def:
\end{verbatim}

Restores the definition of \__seq_item:n most recently saved by \__seq_push_item_def:n. This function should always be used in a balanced pair with \__seq_push_item_def:n.

\begin{verbatim}
\s__seq
\end{verbatim}

This private scan mark.

\begin{verbatim}
\s__seq
\end{verbatim}

(End definition for \s__seq.)

\begin{verbatim}
\s__seq
\begin{verbatim}
\s__seq
\end{verbatim}

Private scan marks.

(End definition for \s__seq and \s__seq_stop.)
The delimiter is always defined, but when used incorrectly simply removes its argument and hits an undefined control sequence to raise an error.

\cs_new:Npn \__seq_item:n { \msg_expandable_error:nn { seq } { misused } \use_none:n } 

(End definition for \__seq_item:n.)

Scratch space for various internal uses.

\tl_new:N \l__seq_internal_a_tl
\tl_new:N \l__seq_internal_b_tl

(End definition for \l__seq_internal_a_tl and \l__seq_internal_b_tl.)

Scratch function for internal use.

\cs_new_eq:NN \__seq_tmp:w ?

(End definition for \__seq_tmp:w.)

A sequence with no item, following the structure mentioned above.

\tl_const:Nn \c_empty_seq { \s__seq }

(End definition for \c_empty_seq. This variable is documented on page 154.)

56.1 Allocation and initialisation

Sequences are initialized to \c_empty_seq.

\cs_new_protected:Npn \seq_new:N #1 { \__kernel_chk_if_free_cs:N #1 \cs_gset_eq:NN #1 \c_empty_seq }

\cs_generate_variant:Nn \seq_new:N { c }

Clearing a sequence is similar to setting it equal to the empty one.

\cs_new_protected:Npn \seq_clear:N #1 { \seq_set_eq:NN \c_empty_seq { \seq_clear:N #1 } \cs_gset_eq:NN \c_empty_seq }

\cs_generate_variant:Nn \seq_clear:N { c }

Once again we copy code from the token list functions.

\cs_new_protected:Npn \seq_clear_new:N #1 { \seq_if_exist:NTF #1 { \seq_clear:N #1 } { \seq_new:N #1 } }
\cs_generate_variant:Nn \seq_clear_new:N { c }

\cs_new_protected:Npn \seq_gclear_new:N #1 { \seq_if_exist:NTF #1 { \seq_gclear:N #1 } { \seq_new:N #1 } }
\cs_generate_variant:Nn \seq_gclear_new:N { c }

\cs_new_protected:Npn \seq_gclear_new:c #1 { \seq_if_exist:NTF #1 { \seq_gclear:N #1 } { \seq_new:c #1 } }
\cs_generate_variant:Nn \seq_gclear_new:c { c }

\cs_new_protected:Npn \seq_gclear_new:cc #1 { \seq_if_exist:NTF #1 { \seq_gclear:N #1 } { \seq_new:cc #1 } }
\cs_generate_variant:Nn \seq_gclear_new:cc { c }
End definition for `\seq_clear_new:N` and `\seq_gclear_new:N`. These functions are documented on page 143.

\seq_set_eq:NN
\seq_set_eq:cN
\seq_set_eq:Nc
\seq_set_eq:cc
\seq_gset_eq:NN
\seq_gset_eq:cN
\seq_gset_eq:Nc
\seq_gset_eq:cc

Copying a sequence is the same as copying the underlying token list.

\seq_set_from_clist:NN
\seq_set_from_clist:cN
\seq_set_from_clist:Nc
\seq_set_from_clist:cc
\seq_gset_from_clist:NN
\seq_gset_from_clist:cN
\seq_gset_from_clist:Nc
\seq_gset_from_clist:cc

Setting a sequence from a comma-separated list is done using a simple mapping.

\seq_const_from_clist:Nn
\seq_const_from_clist:cn

Almost identical to `\seq_set_from_clist:Nn`. This function is documented on page 144.
When the separator is empty, everything is very simple, just map \seq_wrap_item:n through the items of the last argument. For non-trivial separators, the goal is to split a given token list at the marker, strip spaces from each item, and remove one set of outer braces if after removing leading and trailing spaces the item is enclosed within braces. After \tl_replace_all:Nnn, the token list \l__seq_internal_a_tl is a repetition of the pattern \seq_set_split_auxi:w \prg_do_nothing: (item with spaces) \seq_set_split_end:. Then, x-expansion causes \seq_set_split_auxi:w to trim spaces, and leaves its result as \seq_set_split_auxii:w (trimmed item) \seq_set_split_end:. This is then converted to the \l3seq internal structure by another x-expansion. In the first step, we insert \prg_do_nothing: to avoid losing braces too early: that would cause space trimming to act within those lost braces. The second step is solely there to strip braces which are outermost after space trimming.
When concatenating sequences, one must remove the leading \s__seq of the second sequence. The result starts with \s__seq (of the first sequence), which stops f-expansion.

When adding to the left of a sequence, remove \s__seq. This is done by \__seq_put_left_aux:w, which also stops f-expansion.
Since there is no trailing marker, adding an item to the right of a sequence simply means wrapping it in \__seq_item:n.

\cs_new_protected:Npn \seq_put_right:Nn #1#2 { \tl_put_right:Nn #1 { \__seq_item:n {#2} } }
\cs_new_protected:Npn \seq_gput_right:Nn #1#2 { \tl_gput_right:Nn #1 { \__seq_item:n {#2} } }
\cs_generate_variant:Nn \seq_gput_right:Nn { NV , Nv , No , Nx }
\cs_generate_variant:Nn \seq_gput_right:Nn { c , cV , cv , co , cx }
\cs_generate_variant:Nn \seq_put_right:Nn { NV , Nv , No , Nx }
\cs_generate_variant:Nn \seq_put_right:Nn { c , cV , cv , co , cx }

(End definition for \seq_put_right:Nn and \seq_gput_right:Nn. These functions are documented on page 145.)

56.3 Modifying sequences

This function converts its argument to a proper sequence item in an x-expansion context.

\cs_new:Npn \__seq_wrap_item:n #1 { \exp_not:n { \__seq_item:n {#1} } }

(End definition for \__seq_wrap_item:n.)

An internal sequence for the removal routines.

\seq_new:N \l__seq_remove_seq

(End definition for \l__seq_remove_seq.)

Removing duplicates means making a new list then copying it.

\cs_new_protected:Npn \seq_remove_duplicates:N { \__seq_remove_duplicates:NN \seq_set_eq:NN }
\cs_new_protected:Npn \seq_gremove_duplicates:N { \__seq_remove_duplicates:NN \seq_gset_eq:NN }
\cs_new_protected:Npn \__seq_remove_duplicates:NN #1#2 { \seq_clear:N \l__seq_remove_seq \seq_map_inline:Nn #2 { \seq_if_in:NnF \l__seq_remove_seq {##1} { \seq_put_right:Nn \l__seq_remove_seq {##1} } } #1 \l__seq_remove_seq }
\cs_generate_variant:Nn \seq_remove_duplicates:N { c }
\cs_generate_variant:Nn \seq_gremove_duplicates:N { c }

(End definition for \seq_remove_duplicates:N, \seq_gremove_duplicates:N, and \__seq_remove_duplicates:NN. These functions are documented on page 148.)

The idea of the code here is to avoid a relatively expensive addition of items one at a time to an intermediate sequence. The approach taken is therefore similar to that in \__seq_pop_right:NNN, using a “flexible” x-type expansion to do most of the work. As \tl_if_eq:nnT is not expandable, a two-part strategy is needed. First, the x-type expansion uses \str_if_eq:nnT to find potential matches. If one is found, the expansion is halted and the necessary set up takes place to use the \tl_if_eq:nnT test. The x-type is started
again, including all of the items copied already. This happens repeatedly until the entire sequence has been scanned. The code is set up to avoid needing and intermediate scratch list: the lead-off x-type expansion (#1 #2 {#2}) ensures that nothing is lost.

\begin{verbatim}
\cs_new_protected:Npn \seq_remove_all:Nn { \l__seq_remove_all_aux:Nn \__kernel_tl_set:Nx }
\cs_new_protected:Npn \seq_gremove_all:Nn { \l__seq_remove_all_aux:Nn \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \__seq_remove_all_aux:NNn #1#2#3
{ \__seq_push_item_def:n
{ \str_if_eq:nnT {##1} {#3} }
{ \__seq_wrap_item:n {##1} }
\tl_set:Nn \l__seq_internal_b_tl {##1}
#1 #2
{ \__seq_wrap_item:n {##1} }
\tl_set:Nn \l__seq_internal_a_tl \l__seq_internal_b_tl
\exp_not:o {#2}
\tl_if_eq:NNT \l__seq_internal_a_tl \l__seq_internal_b_tl
{ \use_none:nn }
\tl_set:Nn \l__seq_internal_b_tl {##1}
\__seq_pop_item_def: }
\cs_generate_variant:Nn \seq_remove_all:Nn { c }
\cs_generate_variant:Nn \seq_gremove_all:Nn { c }
\end{verbatim}

These functions are documented on page 148.

\seq_reverse:N \seq_reverse:c
\seq_greverse:N \seq_greverse:c
\seq_reverse:NN \seq_reverse_item:nwn

Previously, \seq_reverse:N was coded by collecting the items in reverse order after an \exp_stop_f: marker.

\begin{verbatim}
\cs_new_protected:Npn \seq_reverse:N #1
{ \cs_set_eq:NN \@@_item:n \@@_reverse_item:nw
\tl_set:Nf #2 { #2 \exp_stop_f: } }
\cs_new:Npn \@@_reverse_item:nw #1 #2 \exp_stop_f:
{ #2 \exp_stop_f: \@@_item:n {#1} }
\end{verbatim}

At first, this seems optimal, since we can forget about each item as soon as it is placed after \exp_stop_f:. Unfortunately, \TeX's usual tail recursion does not take place in this case: since the following \_\_seq_reverse_item:nw only reads tokens until \exp_stop_f:, and never reads the \_\_seq_remove_all_aux:NNn \#1\#2\#3 left by the previous call, \TeX cannot remove that previous call from the stack, and in particular must retain the various macro parameters in memory, until the end of the replacement text is reached. The stack is thus
only flushed after all the \_seq_reverse_item:nw are expanded. Keeping track of the arguments of all those calls uses up a memory quadratic in the length of the sequence. \TeX can then not cope with more than a few thousand items.

Instead, we collect the items in the argument of \exp_not:n. The previous calls are cleanly removed from the stack, and the memory consumption becomes linear.

\begin{verbatim}
\cs_new_protected:Npn \seq_reverse:N { \__seq_reverse:NN \__kernel_tl_set:Nx }
\cs_new_protected:Npn \seq_greverse:N { \__seq_reverse:NN \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \__seq_reverse:NN #1 #2 { \cs_set_eq:NN \__seq_tmp:w \__seq_item:n \cs_set_eq:NN \__seq_item:n \__seq_reverse_item:nwn #1 #2 \exp_not:n { } \cs_set_eq:NN \__seq_item:n \__seq_tmp:w }
\cs_generate_variant:Nn \seq_reverse:N { c }
\cs_generate_variant:Nn \seq_greverse:N { c }
\end{verbatim}

(End definition for \seq_reverse:N and others. These functions are documented on page 148.)

\seq_sort:Nn \seq_sort:cn \seq_gsort:Nn \seq_gsort:cn

Implemented in l3sort.

(End definition for \seq_sort:Nn and \seq_gsort:Nn. These functions are documented on page 148.)

56.4 Sequence conditionals

\seq_if_empty_p:N \seq_if_empty_p:c \seq_if_empty:NTF \seq_if_empty:cTF

Similar to token lists, we compare with the empty sequence.

\begin{verbatim}
\prg_new_conditional:Npnn \seq_if_empty:N #1 { p , T , F , TF } { \if_meaning:w #1 \c_empty_seq \prg_return_true: \else: \prg_return_false: \fi: }
\end{verbatim}

(End definition for \seq_if_empty:NTF. This function is documented on page 148.)

\seq_shuffle:N \seq_shuffle:c \seq_gshuffle:N \seq_gshuffle:c \_seq_shuffle:NN \_seq_shuffle_item:n \g__seq_internal_seq

We apply the Fisher–Yates shuffle, storing items in \toks registers. We use the primitive \tex_uniformdeviate:D for speed reasons. Its non-uniformity is of order its argument divided by \(2^{28}\), not too bad for small lists. For sequences with more than 13 elements there are more possible permutations than possible seeds (\(13! > 2^{28}\)) so the question of uniformity is somewhat moot. The integer variables are declared in l3int: load-order issues.

\begin{verbatim}
\cs_if_exist:NTF \tex_uniformdeviate:D 802
\end{verbatim}
The approach here is to define \__seq_item:n to compare its argument with the test sequence. If the two items are equal, the mapping is terminated and \group_end: \prg_return_true: is inserted after skipping over the rest of the recursion. On the other hand, if there is no match then the loop breaks, returning \prg_return_false:. Everything is inside a group so that \__seq_item:n is preserved in nested situations.
56.5 Recovering data from sequences

The two pop functions share their emptiness tests. We also use a common emptiness test for all branching get and pop functions.

Getting an item from the left of a sequence is pretty easy: just trim off the first item after \seq_item:n at the start. We append a \q_no_value item to cover the case of an empty sequence.
\begin{verbatim}
\_kernel_tl_set:Nx #2
{ \exp_after:wN \_seq_get_left:wnw
  #1 \_seq_item:n { \q_no_value } \s__seq_stop }
}
\cs_new:Npn \_seq_get_left:wnw #1 \_seq_item:n #2#3 \s__seq_stop
{ \exp_not:n {#2} }
\cs_generate_variant:Nn \seq_get_left:NN { c }

The approach to popping an item is pretty similar to that to get an item, with the only
difference being that the sequence itself has to be redefined. This makes it more sensible
to use an auxiliary function for the local and global cases.
\begin{verbatim}
\cs_new_protected:Npn \seq_pop_left:NN
{ \__seq_pop:NNNN \__seq_pop_left:NNN \tl_set:Nn }
\cs_new_protected:Npn \seq_gpop_left:NN
{ \__seq_pop:NNNN \__seq_pop_left:NNN \tl_gset:Nn }
\cs_new_protected:Npn \__seq_pop_left:NNN #1#2#3
{ \exp_after:wN \__seq_pop_left:wnwNNN #2 \s__seq_stop #1#2#3 }
\cs_new_protected:Npn \__seq_pop_left:wnwNNN
#1 \__seq_item:n #2#3 \s__seq_stop #4#5#6
{ #4 #5 { #1 #3 }
\tl_set:Nn #6 {#2} }
\cs_generate_variant:Nn \seq_pop_left:NN { c }
\cs_generate_variant:Nn \seq_gpop_left:NN { c }
\end{verbatim}
\end{verbatim}

(End definition for \seq_get_left:NN and \_seq_get_left:wnw. This function is documented on page 145.)

\begin{verbatim}
\_seq_pop_left:NN \_seq_pop_left:cN \_seq_gpop_left:NN
\_seq_pop_left:wmwNNN
\_seq_get_right:NN \_seq_get_right:cN \_seq_get_right_loop:nw
\_seq_get_right_end:NnN
\_kernel_tl_set:Nx #2
{ \exp_after:wN \use_i_ii:nnn
  \exp_after:wN \__seq_get_right_loop:nw
  \exp_after:wN \q_no_value
  #1
  \_seq_get_right_end:NnN \_seq_item:n }
}
\cs_new:Npn \__seq_get_right_loop:nw #1#2 \_seq_item:n
{ \exp_after:wN \_seq_get_right_loop:nw
#1 \_seq_item:n #2 \_seq_item:n }
\cs_new:Npn \_seq_get_right_loop:nw #1#2 \_seq_item:n
{ \use_none:n {#1}
  \_seq_get_right_loop:nw
  \exp_not:n {#2} }
\cs_new:Npn \_seq_get_right_end:NnN \_seq_item:n
{ \exp_not:n {#1} }
\cs_generate_variant:Nn \seq_get_right:NN { c }
\cs_generate_variant:Nn \seq_gpop_left:NN { c }
\end{verbatim}
\end{verbatim}

(End definition for \seq_pop_left:NN and others. These functions are documented on page 145.)

First remove \s__seq and prepend \q_no_value. The first argument of \_seq_get_right_loop:nw is the last item found, and the second argument is empty until the end of
the loop, where it is code that applies \exp_not:n to the last item and ends the loop.
\begin{verbatim}
\cs_new_protected:Npn \seq_get_right:NN
{ \_kernel_tl_set:Nx #2
  \exp_after:wN \use_i_ii:nnn
  \exp_after:wN \_seq_get_right_loop:nw
  \exp_after:wN \q_no_value
  #1
  \_seq_get_right_end:NnN \_seq_item:n }
}
\cs_new:Npn \_seq_get_right_loop:nw #1#2 \_seq_item:n
{ \_seq_get_right_loop:nw
#1 \_seq_item:n #2 \_seq_item:n }
\cs_new:Npn \_seq_get_right_end:NnN \_seq_item:n
{ \exp_not:n {#1} }
\cs_generate_variant:Nn \seq_get_right:NN { c }
\end{verbatim}
\end{verbatim}

(End definition for \seq_get_right:NN and others. These functions are documented on page 145.)
The approach to popping from the right is a bit more involved, but does use some of the same ideas as getting from the right. What is needed is a “flexible length” way to set a token list variable. This is supplied by the \texttt{\{ \if_false: \} \fi:} construct. Using an \texttt{x}-type expansion and a “non-expanding” definition for \texttt{\__seq_item:n}, the left-most \(n - 1\) entries in a sequence of \(n\) items are stored back in the sequence. That needs a loop of unknown length, hence using the strange \texttt{\if_false:} way of including braces. When the last item of the sequence is reached, the closing brace for the assignment is inserted, and \texttt{\tl_set:Nn \#3} is inserted in front of the final entry. This therefore does the pop assignment. One more iteration is performed, with an empty argument and \texttt{\use_none:nn}, which finally stops the loop.

Getting from the left or right with a check on the results. The first argument to \texttt{\__seq_pop_TF:NNNN} is left unused.
More or less the same for popping.

\seq_pop_left:NNTF
\seq_pop_left:cNTF
\seq_gpop_left:NNTF
\seq_gpop_left:cNTF
\seq_pop_right:NNTF
\seq_gpop_right:NNTF
\seq_gpop_right:cNTF

The idea here is to find the offset of the item from the left, then use a loop to grab
the correct item. If the resulting offset is too large, then the argument delimited by
\__seq_item:n is \prg_break: instead of being empty, terminating the loop and re-
turning nothing at all.

\cs_new:Npn \seq_item:Nn #1 { \exp_after:wN \__seq_item:wNn #1 \s__seq_stop #1 }
\cs_new:Npn \__seq_item:wNn \s__seq #1 \s__seq_stop #2#3
{ \exp_args:Nf \__seq_item:nwn { \exp_args:Nf \__seq_item:n { \int_eval:n {#3} } #2 } #1 \prg_break: \__seq_item:n { } \prg_break_point: }
\cs_new:Npn \__seq_item:nN #1#2
{ \int_compare:nNnTF {#1} < 0 { \int_eval:n { \seq_count:N #2 + 1 + #1 } } #1 }
\cs_new:Npn \__seq_item:nwn #1#2 \__seq_item:n #3
{ #2 \int_compare:nNnTF {#1} = 1 { \prg_break:n { \exp_not:n {#3} } } { \exp_args:Nf \__seq_item:nwn { \int_eval:n {#1 - 1} } #2 } }
\cs_generate_variant:Nn \seq_item:Nn { c }

(End definition for \seq_get_left:NNTF and \seq_get_right:NNTF. These functions are documented on
page 147.)
Importantly, \texttt{\seq_item:Nn} only evaluates its argument once.

\begin{verbatim}
\seq_if_empty:NF #1
\{ \seq_item:Nn {\int_rand:nn { 1 } { \seq_count:N #1 } } \}
\}
\cs_generate_variant:Nn \seq_item:N { c }
\end{verbatim}

(End definition for \texttt{\seq_rand_item:N}. This function is documented on page 146.)

\subsection*{56.6 Mapping over sequences}

\begin{verbatim}
\seq_map_break:
\seq_map_break:n
\end{verbatim}

To break a function, the special token \texttt{\prg_break_point:Nn} is used to find the end of the code. Any ending code is then inserted before the return value of \texttt{\seq_map_break:n} is inserted.

\begin{verbatim}
\cs_new:Npn \seq_map_break:
\seq_map_break:n
\end{verbatim}

(End definition for \texttt{\seq_map_break:} and \texttt{\seq_map_break:n}. These functions are documented on page 150.)

\begin{verbatim}
\seq_map_function:NN
\seq_map_function:cN
\__seq_map_function:Nw
\end{verbatim}

The idea here is to apply the code of \texttt{#2} to each item in the sequence without altering the definition of \texttt{\__seq_item:n}. The even-numbered arguments of \texttt{\__seq_map_function:Nw} delimited by \texttt{\__seq_item:n} are almost always empty, except at the end of the loop where it is \texttt{\prg_break:}. This allows to break the loop without needing to do a (relatively-expensive) quark test.

\begin{verbatim}
\cs_new:Npn \__seq_map_function:Nw #1
\end{verbatim}

\begin{verbatim}
\seq_generate_variant:Nn \seq_map_function:NN { c }
\end{verbatim}
_.seq_push_item_def:n
_.seq_push_item_def:x
_.seq_push_item_def:
_.seq_pop_item_def:
The definition of _.seq_item:n needs to be saved and restored at various points within the mapping and manipulation code. That is handled here: as always, this approach uses global assignments.

\cs_new_protected:Npn \_.seq_push_item_def:n
\cs_gset:Npn \_.seq_item:n ##1
\cs_new_protected:Npn \_.seq_push_item_def:x
\cs_gset:Npx \_.seq_item:n ##1
\cs_new_protected:Npn \_.seq_push_item_def:
\int_gincr:N \g__kernel_prg_map_int
\cs_gset_eq:cN { __seq_map_ \int_use:N \g__kernel_prg_map_int :w }
\_.seq_item:n
\cs_new_protected:Npn \_.seq_pop_item_def:
\cs_gset_eq:Nc \_.seq_item:n
\int_gdecr:N \g__kernel_prg_map_int

(End definition for \_.seq_push_item_def:n, \_.seq_push_item_def:x, and \_.seq_pop_item_def:.)

\seq_map_inline:Nn
\seq_map_inline:cn
The idea here is that \_.seq_item:n is already “applied” to each item in a sequence, and so an in-line mapping is just a case of redefining \_.seq_item:n.

\cs_new_protected:Npn \seq_map_inline:Nn #1#2
\__seq_push_item_def:n {#2}
#1
\prg_break_point:Nn \seq_map_break: { \_.seq_pop_item_def: }
\cs_generate_variant:Nn \seq_map_inline:Nn { c }

(End definition for \seq_map_inline:Nn. This function is documented on page 149.)

\seq_map_tokens:Nn
\seq_map_tokens:cn
\__seq_map_tokens:nw
This is based on the function mapping but using the same tricks as described for \prop_map_tokens:Nn. The idea is to remove the leading \s__seq and apply the tokens such that they are safe with the break points, hence the \use:n.

\cs_new:Npn \seq_map_tokens:Nn #1#2
\exp_last_unbraced:Nno
\use_i:nn { \_.seq_map_tokens:nw {#2} } #1
\prg_break:
\_.seq_item:n { } \_.seq_item:n { } \_.seq_item:n { } \_.seq_item:n { } \_.seq_item:n { }
\_.seq_item:n { } \_.seq_item:n { }
\prg_break_point:
\prg_break_point:Nn \seq_map_break: { }

809
\seq_map_variable:NNn \seq_map_variable:Ncn \seq_map_variable:cNn \seq_map_variable:ccn

This is just a specialised version of the in-line mapping function, using an x-type expansion for the code set up so that the number of # tokens required is as expected.

\seq_map_variable:NNn \seq_map_variable:Ncn \seq_map_variable:cNn \seq_map_variable:ccn

Similar to \seq_map_function:NN but we keep track of the item index as a ; delimited argument of \seq_map_indexed:Nw.
Very similar to \seq_set_filter:NNn. We could actually merge the two within a single function, but it would have weird semantics.

\seq_set_map:NNn
\seq_gset_map:NNn
\__seq_set_map:NNNn
Similar to \seq_set_map:NNn, but prevents expansion of the <inline function>.

\seq_count:N
\seq_count:c
\__seq_count:w
\__seq_count_end:w
Since counting the items in a sequence is quite common, we optimize it by grabbing 8 items at a time and correspondingly adding 8 to an integer expression. At the end of the loop, #9 is \__seq_count_end:w instead of being empty. It removes \texttt{8+} and instead
places the number of \_\_seq_item:n that \_\_seq_count:w grabbed before reaching the end of the sequence.

\begin{verbatim}
\cs_new:Npn \seq_count:N #1
\{ 
\int_eval:n
\{ 
\exp_after:wN \use_i:nn
\exp_after:wN \_\_seq_count:w
#1
\_\_seq_count_end:w \_\_seq_item:n 7
\_\_seq_count_end:w \_\_seq_item:n 6
\_\_seq_count_end:w \_\_seq_item:n 5
\_\_seq_count_end:w \_\_seq_item:n 4
\_\_seq_count_end:w \_\_seq_item:n 3
\_\_seq_count_end:w \_\_seq_item:n 2
\_\_seq_count_end:w \_\_seq_item:n 1
\_\_seq_count_end:w \_\_seq_item:n 0
\prg_break_point:
\}
\}
\cs_new:Npn \_\_seq_count:w
#1 \_\_seq_item:n #2 \_\_seq_item:n #3 \_\_seq_item:n #4 \_\_seq_item:n
#5 \_\_seq_item:n #6 \_\_seq_item:n #7 \_\_seq_item:n #8 \_\_seq_item:n
\{ \#9 \_\_seq_count:w \}
\cs_new:Npn \_\_seq_count_end:w 8 + \_\_seq_count:w #1#2 \prg_break_point: {#1}
\cs_generate_variant:Nn \seq_count:N { c }
\end{verbatim}

(End definition for \seq_count:N, \_\_seq_count:w, and \_\_seq_count_end:w. This function is documented on page 151.)

\subsection{56.7 Using sequences}

\seq_use:Nnnn \seq_use:cn
\_\_seq_use:NNnNnn \_\_seq_use_setup:w \_\_seq_use:nwwwnn \_\_seq_use:Nn \_\_seq_use:cn

See \clist_use:Nnnn for a general explanation. The main difference is that we use \_\_seq_item:n as a delimiter rather than commas. We also need to add \_\_seq_item:n at various places, and \s__seq.

\begin{verbatim}
\cs_new:Npn \seq_use:Nnnn #1#2#3#4
\{ 
\seq_if_exist:NTF #1
\{ 
\int_case:nnF { \seq_count:N #1 }
\{ 0 \} \}
\{ 1 \} \{ \exp_after:wN \_\_seq_use:NNnNnn \#1 ? \{ \} \{ \} \}
\{ 2 \} \{ \exp_after:wN \_\_seq_use:NNnNnn \#1 (#2) \}
\}
\{ 
\exp_after:wN \_\_seq_use_setup:w \#1 \_\_seq_item:n
\s__seq_setup:Nn \_\_seq_item:n \{ #3 \}
\s__seq_setup:Nn \_\_seq_item:n \{ #4 \}
\s__seq_stop \}
\}
\end{verbatim}

56.8 Sequence stacks

The same functions as for sequences, but with the correct naming.

\seq_push:Nn Pushing to a sequence is the same as adding on the left.
\seq_push:NV
\seq_push:Nv
\seq_push:No
\seq_push:Nx
\seq_push:cn
\seq_push:cV
\seq_push:co
\seq_push:cx
\seq_gpush:Nn
\seq_gpush:NV
\seq_gpush:Nv
\seq_gpush:No
\seq_gpush:Nx
\seq_gpush:cn
\seq_gpush:cV
\seq_gpush:co
\seq_gpush:cx

(End definition for \seq_push:Nn and \seq_gpush:Nn. These functions are documented on page 153.)

\seq_get:NN In most cases, getting items from the stack does not need to specify that this is from the left. So alias are provided.
\seq_get:cN
\seq_pop:cN
\seq_pop:NN
\seq_pop:CN
\seq_gpop:NN
\seq_gpop:CN

813
More copies.

(End definition for \seq_get::NN, \seq_pop::NN, and \seq_gpop::NN. These functions are documented on page 152.)

56.9 Viewing sequences

Apply the general \_kernel_chk_tl_type:NnnT.

(End definition for \seq_get::NNTF, \seq_pop::NNTF, and \seq_gpop::NNTF. These functions are documented on page 152.)
56.10 Scratch sequences

\l_tmpa_seq Temporary comma list variables.
\l_tmpb_seq \seq_new:N \l_tmpa_seq
\g_tmpa_seq \seq_new:N \l_tmpb_seq
\g_tmpb_seq \seq_new:N \g_tmpa_seq
\seq_new:N \g_tmpb_seq

(End definition for \l_tmpa_seq and others. These variables are documented on page 155.)

\endinput
Chapter 57

l3int implementation

The following test files are used for this code: m3int001, m3int002, m3int03.

\c_max_register_int
Done in l3basics.

(End definition for \c_max_register_int. This variable is documented on page 167.)

\__int_to_roman:w
\if_int_compare:w
Done in l3basics.

(End definition for \__int_to_roman:w and \if_int_compare:w. This function is documented on page 168.)

\or:
Done in l3basics.

(End definition for \or:. This function is documented on page 168.)

\int_value:w
\__int_eval:w
\__int_eval_end:
\if_int_odd:w
\if_case:w
Here are the remaining primitives for number comparisons and expressions.

\cs_new_eq:NN \int_value:w \tex_number:D
\cs_new_eq:NN \__int_eval:w \tex_numexpr:D
\cs_new_eq:NN \__int_eval_end: \tex_relax:D
\cs_new_eq:NN \if_int_odd:w \tex_ifodd:D
\cs_new_eq:NN \if_case:w \tex_ifcase:D

(End definition for \int_value:w and others. These functions are documented on page 168.)

\s__int_mark
\s__int_stop
Scan marks used throughout the module.

\scan_new:N \s__int_mark
\scan_new:N \s__int_stop

(End definition for \s__int_mark and \s__int_stop.)

\__int_use_none_delimit_by_s_stop:w
Function to gobble until a scan mark.

\cs_new:Npn \__int_use_none_delimit_by_s_stop:w #1 \s__int_stop { }

(End definition for \__int_use_none_delimit_by_s_stop:w)

\q__int_recursion_tail
\q__int_recursion_stop
Quarks for recursion.

\quark_new:N \q__int_recursion_tail
\quark_new:N \q__int_recursion_stop
57.1 Integer expressions

\texttt{\int_eval:n} \texttt{\int_eval:w} Wrapper for \texttt{\int_eval:w}: can be used in an integer expression or directly in the input stream. It is very slightly faster to use \texttt{\the} rather than \texttt{\number} to turn the expression to a number. When debugging, we introduce parentheses to catch early termination (see \texttt{l3debug}).

\begin{verbatim}
\cs_new:Npn \int_eval:n #1
\cs_new:Npn \int_eval:w { \tex_the:D \__int_eval:w #1 \__int_eval_end: }
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \__int_eval:w { \tex_the:D \__int_eval:w }
\end{verbatim}

\begin{verbatim}
\cs_set:Npn \int_max:nn #1#2
\cs_set:Npn \int_min:nn #1#2
\cs_set:Npn \__int_maxmin:wwN #1#2
\end{verbatim}

\texttt{\int_abs:n} \texttt{\int_abs:N} Functions for \texttt{min}, \texttt{max}, and absolute value with only one evaluation. The absolute value is obtained by removing a leading sign if any. All three functions expand in two steps.

\begin{verbatim}
\cs_new:Npn \int_abs:n #1
\cs_new:Npn \int_abs:N { \if_meaning:w - #1 \else: \exp_after:wN #1 \fi: }
\cs_set:Npn \int_max:nn #1#2
\cs_set:Npn \int_min:nn #1#2
\cs_set:Npn \__int_maxmin:wwN #1#2
\end{verbatim}
\int_value:w \exp_after:wN \__int_maxmin:wwN
\int_value:w \__int_eval:w \#1 \exp_after:wN ;
\int_value:w \__int_eval:w \#2 ;
> \exp_stop_f:
}
cs_set:Npn \int_min:nn \#1 \#2
{
\int_value:w \exp_after:wN \__int_maxmin:wwN
\int_value:w \__int_eval:w \#1 \exp_after:wN ;
\int_value:w \__int_eval:w \#2 ;
< \exp_stop_f:
}
cs_new:Npn \__int_maxmin:wwN \#1 ; \#2 ; \#3
{
\if_int_compare:w \#1 \#3 \#2 ~ \#1
\else:
\#2
\fi:
\exp_stop_f:
}
\cs_new:Npn \int_div_truncate:nn \#1 \#2
{
\int_value:w \__int_eval:w
\exp_after:wN \__int_div_truncate:NwNw
\int_value:w \__int_eval:w \#1 \exp_after:wN ;
\int_value:w \__int_eval:w \#2 ;
\__int_eval_end:
}
cs_new:Npn \__int_div_truncate:NwNw \#1 \#2 ; \#3 \#4 ;
{
\if_meaning:w 0 \#1
0
\else:
\#2
\fi:
\__int_eval_end:
}
\cs_new:Npn \__int_div_truncate:NwNw \#1 \#2 ; \#3 \#4;
{
\if_meaning:w \#1 \#2 \#1
0
\else:
\#2
\fi:
\__int_eval_end:
}
\cs_new:Npn \__int_div_truncate:NwNw \#1 \#2 ; \#3 \#4;
{
\if_meaning:w \#1 \#1 \#1
0
\else:
\#2
\fi:
\__int_eval_end:
}
\cs_new:Npn \__int_div_truncate:NwNw \#1 \#2 ; \#3 \#4;
{
\exp_after:wN \__int_div_truncate:NwNw
\int_value:w \__int_eval:w \#1 \exp_after:wN ;
\int_value:w \__int_eval:w \#2 ;
\__int_eval_end:
}

(End definition for \int_abs:n and others. These functions are documented on page 157.)

As \__int_eval:w rounds the result of a division we also provide a version that truncates the result. We use an auxiliary to make sure numerator and denominator are only evaluated once: this comes in handy when those are more expressions are expensive to evaluate (e.g., \tl_count:n). If the numerator \#1\#2 is 0, then we divide 0 by the denominator (this ensures that 0/0 is correctly reported as an error). Otherwise, shift the numerator \#1\#2 towards 0 by (\#3\#4−1)/2, which we round away from zero. It turns out that this quantity exactly compensates the difference between \varepsilon-TEX’s rounding and the truncating behaviour that we want. The details are thanks to Heiko Oberdiek: getting things right in all cases is not so easy.
For the sake of completeness:

\cs_new:Npn \int_div_round:nn #1#2
\lbrace \int_value:w \__int_eval:w ( #1 ) / ( #2 ) \__int_eval_end: \rbrace

Finally there’s the modulus operation.

\cs_new:Npn \int_mod:nn #1#2
\lbrace
\int_value:w \__int_eval:w \exp_after:wN \__int_mod:ww
\int_value:w \__int_eval:w #1 \exp_after:wN ;
\int_value:w \__int_eval:w #2 ;
\__int_eval_end:
\rbrace

\cs_new:Npn \__int_mod:ww #1; #2;
{ #1 - ( \__int_div_truncate:NwNw #1 ; #2 ; ) * #2 }

\_kernel_int_add:nnn

Equivalent to \texttt{\int_eval:n \{\#1+\#2+\#3\}} except that overflow only occurs if the final result overflows $[-2^{31} + 1, 2^{31} - 1]$. The idea is to choose the order in which the three numbers are added together. If \#1 and \#2 have opposite signs (one is in $[-2^{31} + 1, -1]$ and the other in $[0, 2^{31} - 1]$) then \#1+\#2 cannot overflow so we compute the result as \#1+\#2+\#3. If they have the same sign, then either \#3 has the same sign and the order does not matter, or \#3 has the opposite sign and any order in which \#3 is not last will work. We use \#1+\#3+\#2.

\cs_new:Npn \__kernel_int_add:nnn #1#2#3
\lbrace
\int_value:w \__int_eval:w #1
\if_int_compare:w #2 < \c_zero_int \exp_after:wN \reverse_if:N \fi:
\if_int_compare:w #1 < \c_zero_int + #2 + #3 \else: + #3 + #2 \fi:
\__int_eval_end:
\rbrace

(End definition for \texttt{\int_div_truncate:nn} and others. These functions are documented on page 157.)

819

57.2 Creating and initialising integers

\texttt{\int_new:N} Two ways to do this: one for the format and one for the \LaTeX\ 2e package. In plain \TeX, \texttt{\newcount} (and other allocators) are \texttt{outer}: to allow the code here to work in “generic” mode this is therefore accessed by name. (The same applies to \texttt{\newbox, \newdimen} and so on.)

\cs_new_protected:Npn \int_new:N #1
\lbrace
\__kernel_chk_if_free_cs:N #1
\cs:w newcount \cs_end: #1
\rbrace

(End definition for \texttt{\int_new:N}. This function is documented on page 158.)
As stated, most constants can be defined as \texttt{chardef} or \texttt{mathchardef} but that’s engine dependent. As a result, there is some set up code to determine what can be done. No full engine testing just yet so everything is a little awkward. We cannot use \texttt{int_gset:Nn} because (when \texttt{check-declarations} is enabled) this runs some checks that constants would fail.

\begin{verbatim}
\cs_new_protected:Npn \int_const:Nn #1#2
{ \exp_args:Nx \__int_const:nN { \int_eval:n {#2} } #1 }

\end{verbatim}

Create a register if needed, otherwise clear it.
Setting equal means using one integer inside the set function of another. Check that assigned integer is local/global. No need to check that the other one is defined as TeX does it for us.

Adding and subtracting to and from a counter. Including here the optional by would slow down these operations by a few percent.

Incrementing and decrementing of integer registers is done with the following functions.
\int_set:Nn \int_set:cn \int_gset:Nn \int_gset:cn

As integers are register-based \TeX{} issues an error if they are not defined. While the = sign is optional, this version with = is slightly quicker than without, while adding the optional space after = slows things down minutely.

\cs_new_protected:Npn \int_set:Nn #1#2
{ \_\_int_compare_error: \_\_int_compare_error:Nw #1#2 \s__int_stop
  \if_int_compare:w \c_zero_int \c_zero_int \fi:

}

\cs_new_protected:Npn \__int_compare_error: \_\_int_compare_error:Nw
{ \_\_int_compare_error: \_\_int_compare_error:Nw \c_zero_int \fi:
  \msg_expandable_error:nnn { kernel } { unknown-comparison } {#1}
  \prg_return_false:
}

(End definition for \int_incr:N and others. These functions are documented on page 159.)

57.4 Using integers

\int_use:N \int_use:c

Here is how counters are accessed. We hand-code the c variant for some speed gain.

\cs_new_eq:NN \int_use:N \tex_the:D
\cs_new:Npn \int_use:c #1 { \tex_the:D \cs:w #1 \cs_end: }

(End definition for \int_use:N. This function is documented on page 159.)

57.5 Integer expression conditionals

Those functions are used for comparison tests which use a simple syntax where only one set of braces is required and additional operators such as \texttt{!=} and \texttt{>=} are supported. The tests first evaluate their left-hand side, with a trailing \_\_int_compare_error:. This marker is normally not expanded, but if the relation symbol is missing from the test’s argument, then the marker inserts = (and itself) after triggering the relevant \TeX{} error. If the first token which appears after evaluating and removing the left-hand side is not a known relation symbol, then a judiciously placed \_\_int_compare_error:Nw gets expanded, cleaning up the end of the test and telling the user what the problem was.

822
Comparison tests using a simple syntax where only one set of braces is required, additional operators such as \texttt{!=} and \texttt{>=} are supported, and multiple comparisons can be performed at once, for instance \texttt{0 < 5 <= 1}. The idea is to loop through the argument, finding one operand at a time, and comparing it to the previous one. The looping auxiliary \texttt{\_\_int\_compare:Nw} reads one \texttt{\langle operand\rangle} and one \texttt{\langle comparison\rangle} symbol, and leaves roughly

\begin{verbatim}
    \prg_return_false: \fi:
    \reverse_if:N \if_int_compare:w \langle operand\rangle \langle comparison\rangle
\end{verbatim}

in the input stream. Each call to this auxiliary provides the second operand of the last call's \texttt{\_\_int\_compare:w}. If one of the \texttt{\langle comparisons\rangle} is \texttt{false}, the \texttt{true} branch of the \LaTeX{} conditional is taken (because of \texttt{\reverse_if:N}), immediately returning \texttt{false} as the result of the test. There is no \LaTeX{} conditional waiting the first operand, so we add an \texttt{\if\_false:} and expand by hand with \texttt{\int\_value:w}, thus skipping \texttt{\prg\_return\_false:} on the first iteration.

Before starting the loop, the first step is to make sure that there is at least one relation symbol. We first let \LaTeX{} evaluate this left hand side of the (in)equality using \texttt{\_\_int\_eval:w}. Since the relation symbols \texttt{<}, \texttt{>}, \texttt{=} and \texttt{!} are not allowed in integer expressions, they would terminate the expression. If the argument contains no relation symbol, \texttt{\_\_int\_compare_error:} is expanded, inserting \texttt{=} and itself after an error. In all cases, \texttt{\_\_int\_compare:w} receives as its argument an integer, a relation symbol, and some more tokens. We then setup the loop, which is ended by the two odd-looking items \texttt{e} and \texttt{\texttt{-end_}}, with a trailing \texttt{\_\_int\_stop} used to grab the entire argument when necessary.

The goal here is to find an \texttt{\langle operand\rangle} and a \texttt{\langle comparison\rangle}. The \texttt{\langle operand\rangle} is already evaluated, but we cannot yet grab it as an argument. To access the following relation symbol, we remove the number by applying \texttt{\_\_int\_to\_roman:w}. Since the roman numeral representation is then empty. Then probe the first two tokens with \texttt{\_\_int\_compare:NNw} to determine the relation symbol, building a control sequence from it (\texttt{\token\_to\_str:N} gives better errors if \texttt{#1} is not a character). All the extended forms have an extra \texttt{=} hence the test for that as a second token. If the relation symbol is unknown, then the control sequence is turned by \LaTeX{} into \texttt{\scan\_stop:}, ignored thanks to \texttt{\unexpanded}, and \texttt{\_\_int\_compare_error:Nw} raises an error.
When the last \(\textit{operand}\) is seen, \texttt{\_\_int_compare:NNw} receives \texttt{e} and \texttt{=nd\_} as arguments, hence calling \texttt{\_\_int_compare_end_=:NNw} to end the loop: return the result of the last comparison (involving the operand that we just found). When a normal relation is found, the appropriate auxiliary calls \texttt{\_\_int_compare:nnN} where \texttt{#1} is \texttt{\if_int_compare:w} or \texttt{\reverse_if:N \if_int_compare:w}, \texttt{#2} is the \(\langle\text{operand}\rangle\), and \texttt{#3} is one of \langle\text{<\rangle}, \text{=} or \langle\text{>\rangle}. As announced earlier, we leave the \(\langle\text{operand}\rangle\) for the previous conditional. If this conditional is true the result of the test is known, so we remove all tokens and return \texttt{false}. Otherwise, we apply the conditional \texttt{#1} to the \(\langle\text{operand}\rangle\texttt{#2} and the comparison \texttt{#3}, and call \texttt{\_\_int_compare:Nw} to look for additional operands, after evaluating the following expression.

The actual comparisons are then simple function calls, using the relation as delimiter for a delimited argument and discarding \texttt{\_\_int_compare_error:Nw} \(\langle\text{token}\rangle\) responsible for error detection.
More efficient but less natural in typing.

\prg_new_conditional:Npnn \int_compare:nNn #1#2#3 { p , T , F , TF }
    \{ \if_int_compare:w \__int_eval:w #1 \__int_eval:w #2 \__int_eval:w #3 \__int_eval_end:
      \prg_return_true:
    \else:
      \prg_return_false:
    \fi:
\}

For integer cases, the first task to fully expand the check condition. The overall idea is then much the same as for \tl_case:nnTF as described in \l3tl.

\cs_new:Npn \int_case:nnTF #1 #2 #3 #4
    { \__int_case:nw {#1} #2 {#1} { } \s__int_mark {#3} \s__int_mark {#4} \s__int_stop }
\cs_new:Npn \__int_case:nw #1#2#3
    \int_compare:nNnTF {#1} = {#2}
    { \__int_case_end:nw {#3} }
    { \__int_case:nw {#1} }
\cs_new:Npn \__int_case_end:nw #1#2#3 \s__int_mark #4#5 \s__int_stop
    \exp_end: #1 #4

A predicate function.

\prg_new_conditional:Npnn \int_if_odd:n #1 { p , T , F , TF }
    \{ \if_int_odd:w \__int_eval:w #1 \__int_eval_end:
      \prg_return_true:
    \}
\prg_new_conditional:Npnn \int_if_even:n #1 { p , T , F , TF }
    \{ \if_int_even:w \__int_eval:w #1 \__int_eval_end:
      \prg_return_true:
    \}
57.6 Integer expression loops

These are quite easy given the above functions. The while versions test first and then execute the body. The do_while does it the other way round.

\begin{enumerate}
\item \texttt{\textbackslash int\_while\_do:nn} \texttt{\textbackslash int\_until\_do:nn} \texttt{\textbackslash int\_do\_while:nn} \texttt{\textbackslash int\_do\_until:nn}
\end{enumerate}

As above but not using the more natural syntax.

\begin{enumerate}
\item \texttt{\textbackslash int\_while\_do:nNnn} \texttt{\textbackslash int\_until\_do:nNnn} \texttt{\textbackslash int\_do\_while:nNnn} \texttt{\textbackslash int\_do\_until:nNnn}
\end{enumerate}
End definition for \texttt{\int_while_do:nNnn} and others. These functions are documented on page 162.

\section{Integer step functions}

Before all else, evaluate the initial value, step, and final value. Repeating a function by steps first needs a check on the direction of the steps. After that, do the function for the start value then step and loop around. It would be more symmetrical to test for a step size of zero before checking the sign, but we optimize for the most frequent case (positive step).

\begin{verbatim}
\cs_new:Npn \int_step_function:nnnN #1#2#3
{ \exp_after:wN \__int_step:wwwN \int_value:w \__int_eval:w #1 \exp_after:wN ; \int_value:w \__int_eval:w #2 \exp_after:wN ; \int_value:w \__int_eval:w #3 ; }
\cs_new:Npn \__int_step:wwwN #1; #2; #3; #4
{ \int_compare:nNnTF {#2} > \c_zero_int {
\__int_step:NwnnN > }
{ \int_compare:nNnTF {#2} = \c_zero_int {
\msg_expandable_error:nnn { kernel } { zero-step } {#4}
\end{verbatim}
The approach here is to build a function, with a global integer required to make the nesting safe (as seen in other in line functions), and map that function using \texttt{\int_step_function:nnnN}. We put a \texttt{\prg_break_point:Nn} so that map_break functions from other modules correctly decrement \texttt{\g__kernel_prg_map_int} before looking for their own break point. The first argument is \texttt{\scan_stop:}, so that no breaking function recognizes this break point as its own.
57.8 Formatting integers

\texttt{\textbackslash int\_to\_arabic:n} Nothing exciting here.

\texttt{\textbackslash int\_to\_arabic:n} For conversion of integers to arbitrary symbols the method is in general as follows. The input number (#1) is compared to the total number of symbols available at each place (#2). If the input is larger than the total number of symbols available then the modulus is needed, with one added so that the positions don’t have to number from zero. Using an \texttt{f}-type expansion, this is done so that the system is recursive. The actual conversion function therefore gets a ‘nice’ number at each stage. Of course, if the initial input was small enough then there is no problem and everything is easy.

\texttt{\textbackslash int\_to\_alph:n} These both use the above function with input functions that make sense for the alphabet in English.

Converting from base ten (#1) to a second base (#2) starts with computing #1: if it is a complicated calculation, we shouldn’t perform it twice. Then check the sign, store it, either – or \c_empty_tl, and feed the absolute value to the next auxiliary function.

Here, the idea is to provide a recursive system to deal with the input. The output is built up after the end of the function. At each pass, the value in #1 is checked to see if it is less than the new base (#2). If it is, then it is converted directly, putting the sign back in front. On the other hand, if the value to convert is greater than or equal to the new base then the modulus and remainder values are found. The modulus is converted to a symbol and put on the right, and the remainder is carried forward to the next round.

}
\end{verbatim}
Convert to a letter only if necessary, otherwise simply return the value unchanged. It would be cleaner to use \texttt{\int_case:nn}, but in our case, the cases are contiguous, so it is forty times faster to use the \texttt{\if_case:w} primitive. The first \texttt{\exp_after:wN} expands the conditional, jumping to the correct case, the second one expands after the resulting character to close the conditional. Since \texttt{#1} might be an expression, and not directly a single digit, we need to evaluate it properly, and expand the trailing \texttt{\fi:}.

\begin{verbatim}
\cs_new:Npn \__int_to_letter:n #1

(End definition for \__int_pass_signs:wn and \__int_pass_signs_end:wn.)

\int_from_alph:n \__int_from_alph:nN \__int_from_alph:N
First take care of signs then loop through the input using the recursion quarks. The \__int_from_alph:nN auxiliary collects in its first argument the value obtained so far, and the auxiliary \__int_from_alph:N converts one letter to an expression which evaluates to the correct number.

\cs_new:Npn \int_from_alph:n #1
\begin{verbatim}
{ \int_eval:n
{ \exp_after:wN \__int_pass_signs:wn \tl_to_str:n {#1}
\s__int_stop { \__int_from_alph:nN { 0 } }
\q__int_recursion_tail \q__int_recursion_stop
}
}
\end{verbatim}
\cs_new:Npn \__int_from_alph:nN #1#2
\begin{verbatim}
{ \__int_if_recursion_tail_stop_do:Nn #2 {#1}
\exp_args:Nf \__int_from_alph:nN
{ \int_eval:n { #1 * 26 + \__int_from_alph:N #2 } }
}
\end{verbatim}
\cs_new:Npn \__int_from_alph:N #1
\begin{verbatim}
{ '#1 - \int_compare:nNnTF { '#1 } < { 91 } { 64 } { 96 } }
\end{verbatim}
(End definition for \int_from_alph:n, \__int_from_alph:nN, and \__int_from_alph:N. This function is documented on page 165.)

\int_from_base:nn \__int_from_base:nnN \__int_from_base:N
Leave the signs into the integer expression, then loop through characters, collecting the value found so far in the first argument of \__int_from_base:nnN. To convert a single character, \__int_from_base:N checks first for digits, then distinguishes lower from upper case letters, turning them into the appropriate number. Note that this auxiliary does not use \int_eval:n, hence is not safe for general use.

\cs_new:Npn \int_from_base:nn #1#2
\begin{verbatim}
{ \int_eval:n
{ \exp_after:wN \__int_pass_signs:wn \tl_to_str:n {#1}
\s__int_stop { \__int_from_base:nn { 0 } }
\q__int_recursion_tail \q__int_recursion_stop
}
}
\end{verbatim}

835
\cs_new:Npn \__int_from_base:nnN #1#2#3
\{\__int_if_recursion_tail_stop_do:Nn #3 {#1}\}

\langle /package \rangle
Chapter 58

\textbf{l3flag implementation}

\textit{The following test files are used for this code: m3flag001.}

\section{Non-expandable flag commands}

The height $h$ of a flag (initially zero) is stored by setting control sequences of the form $\textbackslash\text{flag }\langle\text{name}\rangle\langle\text{integer}\rangle$ to \texttt{relax} for $0 \leq \langle\text{integer}\rangle < h$. When a flag is raised, a “trap” function $\text{flag }\langle\text{name}\rangle$ is called. The existence of this function is also used to test for the existence of a flag.

\texttt{\textbackslash flag\_new:n}

For each flag, we define a “trap” function, which by default simply increases the flag by 1 by letting the appropriate control sequence to \texttt{relax}. This can be done expandably!

\texttt{\textbackslash flag\_clear:n}

\texttt{\_\_flag\_clear:wn}

Undefine control sequences, starting from the 0 flag, upwards, until reaching an undefined control sequence. We don’t use \texttt{\textbackslash cs\_undefine:c} because that would act globally. When the option \texttt{check-declarations} is used, check for the function defined by \texttt{\textbackslash flag\_new:n}. 

\texttt{(End definition for \textbackslash flag\_new:n. This function is documented on page 170.)}
58.2 Expandable flag commands

\flag_exist_p:n

A flag exist if the corresponding trap \flag \{flag name\}:n is defined.

\flag_if_exist:nTF

Test if the flag has a non-zero height, by checking the 0 control sequence.

\flag_height:n

Extract the value of the flag by going through all of the control sequences starting from 0.
\exp_after:wN \__flag_height_end:wn
\fi:
#1 ; {#2}
}
\cs_new:Npn \__flag_height_end:wn #1 ; #2 {#1}
(End definition for \flag_height:n, \__flag_height_loop:wn, and \__flag_height_end:wn. This function is documented on page 171.)

\flag_raise:n Simply apply the trap to the height, after expanding the latter.
\cs_new:Npn \flag_raise:n #1
{\cs:w flag~#1 \exp_after:wN \cs_end:
\int_value:w \flag_height:n {#1} ;
}
(End definition for \flag_raise:n. This function is documented on page 171.)

\package
Chapter 59

\textbf{l3clist implementation}

\textit{The following test files are used for this code: m3clist002.}

\texttt{\{+package\}}
\texttt{\{@@=clist\}}

\texttt{\c_empty_clist} An empty comma list is simply an empty token list.

\texttt{\cs_new_eq:NN \c_empty_clist \c_empty_tl}
(End definition for \texttt{\c_empty_clist}. This variable is documented on page \texttt{181}.)

\texttt{\l__clist_internal_clist} Scratch space for various internal uses. This comma list variable cannot be declared as such because it comes before \texttt{\clist_new:N}
\texttt{\tl_new:N \l__clist_internal_clist}
(End definition for \texttt{\l__clist_internal_clist}.)

\texttt{\s__clist_mark} \texttt{\s__clist_stop} Internal scan marks.
\texttt{\scan_new:N \s__clist_mark}
\texttt{\scan_new:N \s__clist_stop}
(End definition for \texttt{\s__clist_mark} and \texttt{\s__clist_stop}.)

\texttt{\__clist_use_none_delimit_by_s_mark:w} \texttt{\__clist_use_none_delimit_by_s_stop:w} \texttt{\__clist_use_i_delimit_by_s_stop:nw} Functions to gobble up to a scan mark.

\texttt{\cs_new:Npm \__clist_use_none_delimit_by_s_mark:w \#1 \s__clist_mark { }}
\texttt{\cs_new:Npm \__clist_use_none_delimit_by_s_stop:w \#1 \s__clist_stop { }}
\texttt{\cs_new:Npm \__clist_use_i_delimit_by_s_stop:nw \#1 \#2 \s__clist_stop {##1}}
(End definition for \texttt{\__clist_use_none_delimit_by_s_mark:w}, \texttt{\__clist_use_none_delimit_by_s_stop:w}, \texttt{\__clist_use_i_delimit_by_s_stop:nw}, \texttt{\__clist_use_i_delimit_by_s_stop:nw}, \texttt{\l__clist_use_i_delimit_by_s_stop:nw}, and \texttt{\l__clist_use_i_delimit_by_s_stop:nw}.)

\texttt{\__clist_tmp:w} A temporary function for various purposes.
\texttt{\cs_new_protected:Npm \__clist_tmp:w { }}
(End definition for \texttt{\__clist_tmp:w}.)

843
59.1 Removing spaces around items

\texttt{\_\_clist\_trim\_next:w} Called as \texttt{\exp:w \_\_clist\_trim\_next:w \prg\_do\_nothing: \langle comma list \rangle \ldots} it expands to \texttt{\{\langle trimmed item\rangle\} ...} where the \texttt{\langle trimmed item\rangle} is the first non-empty result from removing spaces from both ends of comma-delimited items in the \texttt{\langle comma list\rangle}. The \texttt{\prg\_do\_nothing:} marker avoids losing braces. The test for blank items is a somewhat optimized \texttt{\tl\_if\_empty:oTF} construction; if blank, another item is sought, otherwise trim spaces.

\begin{verbatim}
\cs_new:Npn \_\_clist\_trim\_next:w \__clist\_wrap\_item:w \prg\_do\_nothing: #1 ,
\tl_if_empty:oTF \{ \use\_none:nn #1 ? \}
\{ \_\_clist\_trim\_next:w \prg\_do\_nothing: \}
\{ \_\_clist\_trim\_spaces\_apply:o {#1} \exp\_end: \}
\end{verbatim}

(End definition for \texttt{\_\_clist\_trim\_next:w}.)

\texttt{\_\_clist\_sanitize:n \_\_clist\_sanitize:Nn} The auxiliary \texttt{\_\_clist\_sanitize:Nn} receives a delimiter (\texttt{\c_empty_tl} the first time, afterwards a comma) and that item as arguments. Unless we are done with the loop it calls \texttt{\_\_clist\_wrap\_item:w} to unbrace the item (using a comma delimiter is safe since \texttt{#2} came from removing spaces from an argument delimited by a comma) and possibly re-brace it if needed.

\begin{verbatim}
\cs_new:Npn \_\_clist\_sanitize:n \prg\_do\_nothing: \__clist\_wrap\_item:w \prg\_do\_nothing: \__clist\_trim\_next:w \prg\_do\_nothing: \__clist\_sanitize:Nn \exp\_after:wN \exp\_after:wN \c_empty_tl #1 , \exp\_after:wN \__clist\_trim\_next:w \prg\_do\_nothing: }\exp\_after:wN \s__clist\_stop \prg\_break: , \prg\_break\_point:
\end{verbatim}

(End definition for \texttt{\_\_clist\_sanitize:n} and \texttt{\_\_clist\_sanitize:Nn}.)

\texttt{\_\_clist\_if\_wrap:nTF \_\_clist\_if\_wrap:w} True if the argument must be wrapped to avoid getting altered by some clist operations. That is the case whenever the argument

- starts or end with a space or contains a comma,
- is empty, or
- consists of a single braced group.

If the argument starts or ends with a space or contains a comma then one of the three arguments of \texttt{\_\_clist\_if\_wrap:w} will have its end delimiter (partly) in one of the three copies of \texttt{#1} in \texttt{\_\_clist\_if\_wrap:nTF}; this has a knock-on effect meaning that the result of the expansion is not empty; in that case, wrap. Otherwise, the argument is safe unless it starts with a brace group (or is empty) and it is empty or consists of a single \texttt{n}-type argument.

\begin{verbatim}
\prg\new\conditional:Npnn \_\_clist\_if\_wrap:n #1 { TF }
\end{verbatim}

844
{\tl_if_empty:oTF
  {\_\_clist_if_wrap:w
    \s\_\_clist_mark ? \_\_clist_mark ? #1 - \s\_\_clist_mark ? - #1
    \s\_\_clist_mark , - \s\_\_clist_mark #1 ,
  }
  {\tl_if_head_is_group:nTF { #1 { } }
    {\tl_if_empty:nTF {#1}
      { \prg_return_true: }
      { \tl_if_empty:oTF { \use_none:n #1}
        { \prg_return_true: }
        { \prg_return_false: }
      }
      { \prg_return_false: }
    }
    { \prg_return_false: }
  }
  }
  \cs_new:Npn \__clist_if_wrap:w #1 \s\__clist_mark ? ~ #2 ~ \s\__clist_mark #3 , { }
}(End definition for \_\_clist_if_wrap:nTF and \_\_clist_if_wrap:w)

\_\_clist_wrap_item:w Safe items are put in \exp_not:n, otherwise we put an extra set of braces.
\cs_new:Npn \__clist_wrap_item:w #1 ,
  { \__clist_if_wrap:nTF {#1} { \exp_not:n { {#1} } } { \exp_not:n {#1} } }
(End definition for \_\_clist_wrap_item:w)

59.2 Allocation and initialisation

\clist_new:N, \clist_new:c Internally, comma lists are just token lists.
\cs_new_eq:NN \clist_new:N \tl_new:N
\cs_new_eq:NN \clist_new:c \tl_new:c
(End definition for \clist_new:N. This function is documented on page 173.)

\clist_const:Nn, \clist_const:cn, \clist_const:Nx, \clist_const:cx Creating and initializing a constant comma list is done by sanitizing all items (stripping spaces and braces).
\cs_new_protected:Npn \clist_const:Nn #1#2
  { \tl_const:Nx #1 { \__clist_sanitize:n {#2} } }
\cs_generate_variant:Nn \clist_const:Nn { c , Nx , cx }
(End definition for \clist_const:Nn. This function is documented on page 173.)

\clist_clear:N, \clist_clear:c Clearing comma lists is just the same as clearing token lists.
\cs_new_eq:NN \clist_clear:N \tl_clear:N
\cs_new_eq:NN \clist_clear:c \tl_clear:c
\cs_new_eq:NN \clist_gclear:N \tl_gclear:N
\cs_new_eq:NN \clist_gclear:c \tl_gclear:c

845
\clist_clear_new:N
\clist_clear_new:c
\clist_gclear_new:N
\clist_gclear_new:c

Once again a copy from the token list functions.

\cs_new_eq:NN \clist_clear_new:N \tl_clear_new:N
\cs_new_eq:NN \clist_clear_new:c \tl_clear_new:c
\cs_new_eq:NN \clist_gclear_new:N \tl_gclear_new:N
\cs_new_eq:NN \clist_gclear_new:c \tl_gclear_new:c

(End definition for \clist_clear_new:N and \clist_gclear_new:N. These functions are documented on page 173.)

\clist_set_eq:NN
\clist_set_eq:cN
\clist_set_eq:Nc
\clist_set_eq:cc
\clist_gset_eq:NN
\clist_gset_eq:cN
\clist_gset_eq:Nc
\clist_gset_eq:cc
\__clist_set_from_seq:NNNN
\__clist_set_from_seq:n

Setting a comma list from a comma-separated list is done using a simple mapping. Safe
items are put in \exp_not:n, otherwise we put an extra set of braces. The first comma
must be removed, except in the case of an empty comma-list.

\cs_new_protected:Npn \clist_set_from_seq:NN { \__clist_set_from_seq:NNNN \clist_clear:N \__kernel_tl_set:Nx }
\cs_new_protected:Npn \clist_gset_from_seq:NN { \__clist_set_from_seq:NNNN \clist_gclear:N \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \__clist_set_from_seq:NNNN #1#2#3#4
{ \seq_if_empty:NTF #4
{ #1 #3 }
{ #2 #3
\exp_after:wN \use_none:n \exp:w \exp_end_continue_f:w
\seq_map_function:NN #4 \__clist_set_from_seq:n
}
}
\cs_generate_variant:Nn \clist_set_from_seq:NN { Nc }
\cs_generate_variant:Nn \clist_set_from_seq:NN { c , cc }
\cs_generate_variant:Nn \clist_gset_from_seq:NN { Nc }
\cs_generate_variant:Nn \clist_gset_from_seq:NN { c , cc }

(End definition for \clist_set_eq:NN and \clist_gset_eq:NN. These functions are documented on page 173.)
Concatenating comma lists is not quite as easy as it seems, as there needs to be the correct addition of a comma to the output. So a little work to do.

\begin{verbatim}
cs_new_protected:Npn \clist_concat:NNN { \__clist_concat:NNNN \__kernel_tl_set:Nx }
cs_new_protected:Npn \clist_gconcat:NNN { \__clist_concat:NNNN \__kernel_tl_gset:Nx }
cs_new_protected:Npn \__clist_concat:NNNN #1#2#3#4 {
  \exp_not:o #1 #2 {
    \exp_not:o #3 {
      \clist_if_empty:NF #3 { \clist_if_empty:NF #4 { , } }
    }
  }
}
cs_generate_variant:Nn \clist_concat:NNN { ccc }
cs_generate_variant:Nn \clist_gconcat:NNN { ccc }
\end{verbatim}

(Copies of the \texttt{cs} functions defined in \texttt{l3basics}.

\begin{verbatim}
cs_new_protected:Npn \clist_set:Nn #1#2 { \__kernel_tl_set:Nx #1 { \__clist_sanitize:n {#2} } }
cs_new_protected:Npn \clist_gset:Nn #1#2 { \__kernel_tl_gset:Nx #1 { \__clist_sanitize:n {#2} } }
cs_generate_variant:Nn \clist_set:Nn { NV , No , Nx , c , cV , co , cx }
cs_generate_variant:Nn \clist_gset:Nn { NV , No , Nx , c , cV , co , cx }
\end{verbatim}

(End definition for \texttt{\clist_set:Nn} and \texttt{\clist_gset:Nn}. These functions are documented on page 174.)

\begin{verbatim}
cs_new_protected:Npm \clist_put_left:Nn \clist_put_left:NV \clist_put_left:No \clist_put_left:Nx \clist_put_left:cn \clist_put_left:cV \clist_put_left:co \clist_put_left:cx
\end{verbatim}

Everything is based on concatenation after storing in \texttt{l__clist_internal_clist}. This avoids having to worry here about space-trimming and so on.

\begin{verbatim}
cs_new_protected:Npm \clist_put_left:NN \clist_put_left:NV \clist_put_left:No \clist_put_left:Nx \clist_put_left:cn \clist_put_left:cV \clist_put_left:co \clist_put_left:cx
\end{verbatim}

(End definition for \texttt{\clist_put_left:NN} and \texttt{\clist_put_left:NV}. These functions are documented on page 174.)

\section{Adding data to comma lists}

\begin{verbatim}
cs_new_protected:Npm \clist_if_exist:N \cs_if_exist:N { TF , T , F , p }
cs_new_protected:Npm \clist_if_exist:c \cs_if_exist:c { TF , T , F , p }
\end{verbatim}

(End definition for \texttt{\clist_if_exist:NTF}. This function is documented on page 174.)

(End definition for \texttt{\clist_set_from_seq:NN} and others. These functions are documented on page 173.)
59.4 Comma lists as stacks

Getting an item from the left of a comma list is pretty easy: just trim off the first item using the comma. No need to trim spaces as comma-list variables are assumed to have “cleaned-up” items. (Note that grabbing a comma-delimited item removes an outer pair of braces if present, exactly as needed to uncover the underlying item.)

An empty clist leads to \texttt{\textbackslash q_no_value}, otherwise grab until the first comma and assign to the variable. The second argument of \texttt{\_clist_pop:wNNN} is a comma list ending in a comma and \texttt{\_s\_clist_mark}, unless the original clist contained exactly one item: then the argument is just \texttt{\_s\_clist_mark}. The next auxiliary picks either \texttt{\exp_not:n} or \texttt{\use_none:n} as \texttt{#2}, ensuring that the result can safely be an empty comma list.
\clist_pop:NN \clist_pop:cN \clist_gpop:NN \clist_gpop:cN

The same, as branching code: very similar to the above.

\clist_get:NN \clist_get:cN \clist_gpop:NN \clist_gpop:cN

(End definition for \clist_pop:NN and others. These functions are documented on page 179.)
Pushing to a comma list is the same as adding on the left.

---

59.5 Modifying comma lists

An internal comma list and a sequence for the removal routines.

Removing duplicates means making a new list then copying it.

---

850
The method used here for safe items is very similar to \texttt{\tl_replace_all:Nnn}. However, if the item contains commas or leading/trailing spaces, or is empty, or consists of a single brace group, we know that it can only appear within braces so the code would fail; instead just convert to a sequence and do the removal with \texttt{l3seq} code (it involves somewhat elaborate code to do most of the work expandably but the final token list comparisons non-expandably).

For “safe” items, build a function delimited by the \texttt{⟨item⟩} that should be removed, surrounded with commas, and call that function followed by the expanded comma list, and another copy of the \texttt{⟨item⟩}. The loop is controlled by the argument grabbed by \texttt{\__clist_remove_all:w}: when the item was found, the \texttt{\s__clist_mark} delimiter used is the one inserted by \texttt{\__clist_tmp:w}, and \texttt{\__clist_use_none_delimit_by_s_stop:w} is deleted. At the end, the final \texttt{⟨item⟩} is grabbed, and the argument of \texttt{\__clist_tmp:w} contains \texttt{\s__clist_mark}: in that case, \texttt{\__clist_remove_all:w} removes the second \texttt{\s__clist_mark} (inserted by \texttt{\__clist_tmp:w}), and lets \texttt{\__clist_use_none_delimit_by_s_stop:w} act.

No brace is lost because items are always grabbed with a leading comma. The result of the first assignment has an extra leading comma, which we remove in a second assignment. Two exceptions: if the clist lost all of its elements, the result is empty, and we shouldn’t remove anything; if the clist started up empty, the first step happens to turn it into a single comma, and the second step removes it.
\begin{verbatim}
\cs_new:Npn \__clist_remove_all: { \exp_after:wN \__clist_remove_all:w \__clist_tmp:w , }
\cs_new:Npn \__clist_remove_all:w #1 , \s__clist_mark \__clist_remove_all:w #2 , { \exp_not:n {#1} }
\cs_generate_variant:Nn \clist_remove_all:Nn { c , NV , cV }
\cs_generate_variant:Nn \clist_gremove_all:Nn { c , NV , cV }

(End definition for \clist_remove_all:Nn and others. These functions are documented on page 175.)
\end{verbatim}

\begin{verbatim}
\clist_reverse:N \clist_reverse:c
\clist_greverse:N \clist_greverse:c
\end{verbatim}

Use \clist_reverse:n in an x-expanding assignment. The extra work that \clist_reverse:n does to preserve braces and spaces would not be needed for the well-controlled case of N-type comma lists, but the slow-down is not too bad.

\begin{verbatim}
\cs_new_protected:Npn \clist_reverse:N #1 { \__kernel_tl_set:Nx #1 { \exp_args:No \clist_reverse:n {#1} } }
\cs_new_protected:Npn \clist_greverse:N #1 { \__kernel_tl_gset:Nx #1 { \exp_args:No \clist_reverse:n {#1} } }
\cs_generate_variant:Nn \clist_reverse:N { c }
\cs_generate_variant:Nn \clist_greverse:N { c }

(End definition for \clist_reverse:N and \clist_greverse:N. These functions are documented on page 175.)
\end{verbatim}

The reversed token list is built one item at a time, and stored between \s__clist_stop and \s__clist_mark, in the form of “? followed by zero or more instances of “(item),”. We start from a comma list “⟨item1⟩, ..., ⟨itemn⟩”. During the loop, the auxiliary \__clist_reverse:wwNww receives “⟨itemi⟩” as #1, “⟨itemi+1⟩, ..., ⟨itemn⟩” as #2, \__clist_reverse:wwNww as #3, what remains until \s__clist_stop as #4, and “⟨itemi−1⟩, ..., ⟨item1⟩,” as #5. The auxiliary moves #1 just before #5, with a comma, and calls itself (#3). After the last item is moved, \__clist_reverse:wwNww receives “⟨s__clist_mark \__clist_reverse:wwNww !” as its argument #1, thus \__clist_reverse_end:ww as its argument #3. This second auxiliary cleans up until the marker !, removes the trailing comma (introduced when the first item was moved after \s__clist_stop), and leaves its argument #1 within \exp_not:n. There is also a need to remove a leading comma, hence \exp_not:o and \use_none:n.

\begin{verbatim}
\cs_new:Npn \__clist_reverse:wwNww \__clist_reverse_end:ww
\__clist_reverse:n
\__clist_reverse:wNww
\__clist_reverse_end:w

\end{verbatim}

(End definition for \clist_reverse:n, \__clist_reverse:wNww, and \__clist_reverse_end:w. This function is documented on page 175.)
59.6 Comma list conditionals

Simple copies from the token list variable material.

As usual, we insert a token (here ?) before grabbing any argument: this avoids losing braces. The argument of \texttt{\tl_if_empty:OTF} is empty if \texttt{#1} is ? followed by blank spaces (besides, this particular variant of the emptiness test is optimized). If the item of the comma list is blank, grab the next one. As soon as one item is non-blank, exit: the second auxiliary grabs \texttt{\prg_return_false} as \texttt{#2}, unless every item in the comma list was blank and the loop actually got broken by the trailing \texttt{s\_clist_mark \prg_return_false} item.

For “safe” items, we simply surround the comma list, and the item, with commas, then use the same code as for \texttt{\tl_if_in:Nn}. For “unsafe” items we follow the same route as \texttt{\seq_if_in:Nn}, mapping through the list a comparison function. If found, return \texttt{true} and remove \texttt{\prg_return_false}.
If the variable is empty, the mapping is skipped (otherwise, that comma-list would be seen as consisting of one empty item). Then loop over the comma-list, grabbing eight comma-delimited items at a time. The end is marked by \s__clist_stop, which may not appear in any of the items. Once the last group of eight items has been reached, we go through them more slowly using \__clist_map_function_end:w. The auxiliary function \__clist_map_function:Nw is also used in some other clist mappings.

\begin{Verbatim}
\cs_new:Npn \clist_map_function:NN #1#2 \\
\{ \\
\clist_if_empty:NF #1 \\
{ \exp_after:wN \__clist_map_function:Nw \exp_after:wN #2 \exp_after:wN #1 , \\
\s__clist_stop , \s__clist_stop , \s__clist_stop , \s__clist_stop , \\
\s__clist_stop , \s__clist_stop , \s__clist_stop , \s__clist_stop , \\
\prg_break_point:Nn \clist_map_break: { } }
\}
\end{Verbatim}

(End definition for \clist_if_in:NnTF, \clist_if_in:nnTF, and \__clist_if_in_return:nnN. These functions are documented on page 176.)

59.7 Mapping over comma lists
The \texttt{\clist_map_function:nN} function is a bit more awkward, since spaces must be trimmed from each item. Space trimming is again based on \texttt{\clist_trim_next:w}. The auxiliary \texttt{\clist_map_function_n:Nn} receives as arguments the function, and the next non-empty item (after space trimming but before brace removal). One level of braces is removed by \texttt{\clist_map_unbrace:wn}.

\begin{verbatim}
\cs_new:Npn \clist_map_function:nN #1#2
  { \exp_after:wN \__clist_map_function_n:Nn \exp_after:wN #2
    \exp:w \__clist_trim_next:w \prg_do nothing: #1 ,
    \s__clist_stop \clist_map_break: , \prg_break_point:Nn \clist_map_break: { } }
\end{verbatim}

(End definition for \texttt{\clist_map_function:nN}, \texttt{\clist_map_function_n:Nn}, and \texttt{\clist_map_unbrace:wn}. This function is documented on page 177.)

\section*{Inline mapping}

Inline mapping is done by creating a suitable function “on the fly”: this is done globally to avoid any issues with \TeX{}’s groups. We use a different function for each level of nesting.

Since the mapping is non-expandable, we can perform the space-trimming needed by the \texttt{n} version simply by storing the comma-list in a variable. We don’t need a different comma-list for each nesting level: the comma-list is expanded before the mapping starts.

\begin{verbatim}
\cs_new_protected:Npn \clist_map_inline:Nn #1#2
  { \clist_if_empty:NF #1
    \int_gincr:N \g__kernel_prg_map_int
    \cs_gset_protected:cpn
      \__clist_map_int_use:N \g__kernel_prg_map_int :w
      #1 \#2
    \exp_last_unbraced:Nco \__clist_map_function:Nw
    \{ \__clist_map_int_use:N \g__kernel_prg_map_int :w \}
  }
\end{verbatim}

(End definition for \texttt{\clist_map_function:nN}, \texttt{\clist_map_function_n:Nn}, and \texttt{\clist_map_unbrace:wn}. This function is documented on page 177.)
The \texttt{\clist_map_inline:nn} function is a straightforward application of \texttt{\clist_map_tokens:Nn}, calling \texttt{\__clist_map_variable:Nnn} for each item to assign the variable and run the user's code. The \texttt{n}-type version is not implemented in terms of the \texttt{n}-type function \texttt{\clist_map_tokens:Nn}, because here we are allowed to clean up the \texttt{n}-type comma list non-expandingly.

\begin{verbatim}
\cs_new_protected:Npn \clist_map_variable:NNn #1#2#3
{ \clist_map_tokens:Nn #1 { \__clist_map_variable:Nnn #2 {#3} } }
\cs_generate_variant:Nn \clist_map_variable:NNn { c }
\cs_new_protected:Npn \__clist_map_variable:Nnn #1#2#3
{ \tl_set:Nn #1 {#3} #2 }
\cs_new_protected:Npn \clist_map_variable:nNn #1
{ \clist_set:Nn \l__clist_internal_clist {#1} \clist_map_variable:NNn \l__clist_internal_clist }
\end{verbatim}

(End definition for \texttt{\clist_map_variable:NNn}, \texttt{\clist_map_variable:nNn}, and \texttt{\__clist_map_variable:Nnn}. These functions are documented on page 177.)

\texttt{\clist_map_tokens:Nn}

Essentially a copy of \texttt{\clist_map_function:NN} with braces added.

\begin{verbatim}
\cs_new:Npn \clist_map_tokens:cn
{ \clist_if_empty:NF #1
{ \exp_last_unbraced:Nno \__clist_map_tokens:nw {#2} #1 , \__clist_stop , \__clist_stop , \__clist_stop , \__clist_stop , \prg_break_point:Nn \clist_map_break:
{ \int_gdec:N \g_kernel_prg_map_int } }
}
\end{verbatim}

856
\newcommand*{\clist_map_tokens:nn}{\__clist_map_tokens_n:nw {#2} \prg_do_nothing: #1 , \s__clist_stop \clist_map_break: , \prg_break_point:Nn \clist_map_break: { } \__clist_map_tokens_n:nw {#1} \prg_do_nothing:}

(End definition for \clist_map_tokens:nn and \__clist_map_tokens_n:nw. This function is documented on page 177.)

\newcommand*{\clist_map_break}{\prg_map_break:Nn \clist_map_break: { } \prg_map_break:Nn \clist_map_break: }

(End definition for \clist_map_break: and \clist_map_break:n. These functions are documented on page 177.)

\newcommand*{\clist_count:N}{\int_eval:n \clist_map_function:NN #1 \__clist_count:n}
\newcommand*{\clist_count:n}{\int_eval:n \clist_map_function:NN \__clist_count:w}
\newcommand*{\__clist_count:n}{\int_eval:n \clist_map_function:NN \__clist_count:w}
\newcommand*{\__clist_count:w}{\int_eval:n \clist_map_function:NN \__clist_count:n}

Counting the items in a comma list is done using the same approach as for other token count functions: turn each entry into a +1 then use integer evaluation to actually do the mathematics. In the case of an n-type comma-list, we could of course use \clist_map_function:nN, but that is very slow, because it carefully removes spaces. Instead, we loop manually, and skip blank items (but not {}), hence the extra spaces.

\newcommand*{\__clist_count:n}{\int_eval:n \clist_map_function:NN #1}
\newcommand*{\__clist_count:w}{\int_eval:n \clist_map_function:NN \__clist_count:n}
\newcommand*{\__clist_count:n}{\int_eval:n \clist_map_function:NN \__clist_count:w}

(End definition for \clist_count:N, \__clist_count:n, and \__clist_count:w. This function is documented on page 177.)
59.8 Using comma lists

First check that the variable exists. Then count the items in the comma list. If it has
none, output nothing. If it has one item, output that item, brace stripped (note that
space-trimming has already been done when the comma list was assigned). If it has two,
place the \langle separator between two \rangle in the middle.

Otherwise, \__clist_use:wwwwnn takes the following arguments: 1: a \langle separator \rangle,
2, 3, 4: three items from the comma list (or quarks), 5: the rest of the comma list, 6:
a \langle continuation \rangle function (use_ii or use_iii with its \langle separator \rangle argument), 7: junk,
and 8: the temporary result, which is built in a brace group following \s__clist_stop.
The \langle separator \rangle and the first of the three items are placed in the result, then we use
the \langle continuation \rangle, placing the remaining two items after it. When we begin this loop,
the three items really belong to the comma list, the first \s__clist_mark is taken as a
delimiter to the use_ii function, and the continuation is use_ii itself. When we reach
the last two items of the original token list, \s__clist_mark is taken as a third item,
and now the second \s__clist_mark serves as a delimiter to use_ii, switching to the
other \langle continuation \rangle, use_iii, which uses the \langle separator between final two \rangle.
Items are grabbed by \clist_use:Nw, which detects blank items with a \tl_if_empty:otF test (in which case it recurses). Non-blank items are either the end of the list, in which case the argument \#1 of \clist_use:Nw is used to properly end the list, or are normal items, which must be trimmed and properly unbraced. As we find successive items, the long list of \clist_use:Nw calls gets shortened and we end up calling \clist_use_more:w once we have found 3 items. This auxiliary leaves the first-found item and the general separator, and calls \clist_use:Nw to find more items. A subtlety is that we use \clist_use_end:w both in the case of a two-item list and for the last two items of a general list: to get the correct separator, \clist_use_more:w replaces the separator-of-two by the last-separator when called, namely as soon as we have found three items.
\input{sections/chapter9}

\section*{59.9 Using a single item}

To avoid needing to test the end of the list at each step, we first compute the \langle length\rangle of the list. If the item number is 0, less than \langle length\rangle, or more than \langle length\rangle, the result is empty. If it is negative, but not less than \langle length\rangle, add \langle length\rangle + 1 to the item number before performing the loop. The loop itself is very simple, return the item if the counter reached 1, otherwise, decrease the counter and repeat.
\int_compare:NnTF \#1 = 0 {
  \clist_use_i_delimit_by_s_stop:nw \not:n \#2 
} \exp_args:Nf \clist_item_N_loop:nw \int_eval:n \#1 - 1 
\cs_generate_variant:Nn \clist_item:Nn { c }

(End definition for \clist_item:Nn, \clist_item:nn, and \clist_item_N_loop:nw. This function is documented on page 180.)

\clist_item:nn
\clist_item_n:nw
\clist_item_n_loop:nw
\clist_item_n_end:n
\clist_item_n_strip:n
\clist_item_n_strip:w

This starts in the same way as \clist_item:Nn by counting the items of the comma list. The final item should be space-trimmed before being brace-stripped, hence we insert a couple of odd-looking \prg_do_nothing: to avoid losing braces. Blank items are ignored.

\cs_new:Npn \clist_item:nn #1#2
\__clist_item:ffnN { \clist_count:n {#1} } \int_eval:n \#2 \prg_do_nothing: \__clist_item_n:nw \__clist_item_n_end:n #2 \s__clist_stop
\cs_new:Npn \__clist_item_n_strip:n #1 \__clist_item_n_strip:w { \exp_not:n {#1} }

(End definition for \clist_item:nn and others. This function is documented on page 180.)

\clist_rand_item:n
\clist_rand_item:N
\clist_rand_item:c
\clist_rand_item:nn

The N-type function is not implemented through the n-type function for efficiency: for instance comma-list variables do not require space-trimming of their items. Even testing for emptiness of an n-type comma-list is slow, so we count items first and use that both for the emptiness test and the pseudo-random integer. Importantly, \clist_item:Nn and \clist_item:nn only evaluate their argument once.

\cs_new:Npn \clist_rand_item:n #1 \int_compare:nNnF \#1 = 0 {
  \__clist_rand_item:nn \clist_count:n {#1} \#1 
} \exp_args:Nf \__clist_rand_item:nn \int_eval:n \#1 - 1 
\cs_new:Npn \__clist_rand_item:nn #1 #2 \int_compare:nNnF \#1 = 0 {
  \__clist_rand_item:nn \clist_count:n {#1} {#1} 
} \exp_args:Nf \__clist_rand_item:nn \int_eval:n \#1 \#2 
\int_compare:nNnF \#1 = 0 {
  \clist_item:nn \#2 \int_rand:n {#1} 
}
59.10 Viewing comma lists

Apply the general \_kernel chk tl type:NnnT with exp_not:o #2 serving as a dummy code to prevent a check performed by this auxiliary.

A variant of the above: no existence check, empty first argument for the message.
59.11 Scratch comma lists

\l_tmpa_clist Temporary comma list variables.
\l_tmpb_clist \clist_new:N \l_tmpa_clist
\g_tmpa_clist \clist_new:N \l_tmpb_clist
\g_tmpb_clist \clist_new:N \g_tmpa_clist
\g_tmpb_clist \clist_new:N \g_tmpb_clist

(End definition for \l_tmpa_clist and others. These variables are documented on page 181.)

\char_value_sfcode:n #1

(End definition for \char_set_mathcode:nn and others. These functions are documented on page 186.)

\l_char_active_seq
\l_char_special_seq

Two sequences for dealing with special characters. The first is characters which may be active, the second longer list is for “special” characters more generally. Both lists are escaped so that for example bulk code assignments can be carried out. In both cases, the order is by ASCII character code (as is done in for example \ExplSyntaxOn).

\seq_new:N \l_char_special_seq
\seq_set_split:Nnn \l_char_special_seq { }
60.3 Creating character tokens

Four simple functions with very similar definitions, so set up using an auxiliary. These
are similar to LuaTeX’s `\letcharcode` primitive.

\__char_int_to_roman:w

For efficiency in 8-bit engines, we use the faster primitive approach to making roman
numerals.

\__char_generate:nn
\__char_generate_aux:nn
\__char_generate_auxii:nn
\__char_TMP_tl
\__char_invalid_catcode:

The aim here is to generate characters of (broadly) arbitrary category code. Where
possible, that is done using engine support (Xe\TeX, Lua\TeX). There are though various
issues which are covered below. At the interface layer, turn the two arguments into
integers up-front so this is only done once.
Before doing any actual conversion, first some special case filtering. Spaces are out here as LuaTeX emulation only makes normal (charcode 32 spaces). However, `\^\S` is filtered out separately as that can’t be done with macro emulation either, so is flagged up separately. That done, hand off to the engine-dependent part.

```
\cs_new:Npn \__char_generate_aux:w #1 ; #2 ;
\begin{Verbatim}
\begin{verbatim}
\if_int_odd:w 0
  \if_int_compare:w #2 < 1 \exp_stop_f: 1 \fi:
\if_int_compare:w #2 = 5 \exp_stop_f: 1 \fi:
\if_int_compare:w #2 = 9 \exp_stop_f: 1 \fi:
\if_int_compare:w #2 > 13 \exp_stop_f: 1 \fi: \exp_stop_f:
\msg_expandable_error:nn { char }
  \{ invalid-catcode \}
  \else:
\if_int_odd:w 0
  \if_int_compare:w #1 < \c_zero_int 1 \fi:
\if_int_compare:w #1 > \c_max_char_int 1 \fi: \exp_stop_f:
\msg_expandable_error:nn { char }
  \{ out-of-range \}
  \else:
\if_int_compare:w #2#1 = 100 \exp_stop_f:
  \msg_expandable_error:nn { char } { null-space }
  \else:
  \__char_generate_aux:nnw {#1} {#2}
\fi:
\fi:
\fi:
\exp_end:
\end{verbatim}
\end{Verbatim}
```

Engine-dependent definitions are now needed for the implementation. For LuaTeX and XeTeX there is engine-level support. They can do cases that macro emulation can’t. All of those are filtered out here using a primitive-based boolean expression to avoid fixing the category code of the null character used in the false branch (for 8-bit engines). The final level is the basic definition at the engine level: the arguments here are integers so there is no need to worry about them too much. Older versions of XeTeX cannot generate active characters so we filter that: at some future stage that may change: the slightly odd ordering of auxiliaries reflects that.

```
\group_begin:
\begin{Verbatim}
\begin{verbatim}
\char_set_catcode_active:N \^^L
\cs_set:Npn \^L { }

\texttt{\{ }

\texttt{\#3}

\texttt{\exp_after:wN \exp_end:}

\texttt{\tex_Ucharcat:D \#1 \exp_stop_f: \#2 \exp_stop_f:}

\texttt{\}}

\texttt{\cs_if_exist:NF \tex_expanded:D}
For engines where \texttt{Ucharcat} isn’t available or emulated, we have to work in macros, and cover only the 8-bit range. The first stage is to build up a \texttt{tl} containing \texttt{\label{}} with each category code that can be accessed in this way, with an error set up for the other cases. This is all done such that it can be quickly accessed using a \texttt{\if_case:w} low-level conditional. There are a few things to notice here. As \texttt{\label{}} is \texttt{\outer} we need to locally set it to avoid a problem. To get open/close braces into the list, they are set up using \texttt{\if_false:} pairing and are then \texttt{x}--type expanded together into the desired form.

For making spaces, there needs to be an \texttt{o}--type expansion of a \texttt{\use:n} (or some other tokenization) to avoid dropping the space.

Convert the above temporary list into a series of constant token lists, one for each character code, using \texttt{\tex_lowercase:D} to convert \texttt{\label{}} in each case. The \texttt{x}--type expansion ensures that \texttt{\tex_lowercase:D} receives the contents of the token list. \texttt{\label{}} is awkward.
hence this is done in three parts: up to \textasciitilde\textasciitilde{L}, \textasciitilde{L} itself and above \textasciitilde{L}. Notice that at this stage \textasciitilde{\&} is active.

\texttt{\cs_set_protected:Npn \_char_tmp:n #1}
\texttt{\char_set_lccode:nn { 0 } {#1}}
\texttt{\char_set_lccode:nn { 32 } {#1}}

```

872
\__char_str_change_case:n \c_catcode_other_space_tl

Create a space with category code 12: an “other” space.

\tl_const:Nx \c_catcode_other_space_tl { \char_generate:nn { \char_generate:nn { \char_lowercase:N } { 12 } } { 12 } }

(End definition for \c_catcode_other_space_tl. This function is documented on page 183.)

60.4 Generic tokens

Internal scan marks.

\scan_new:N \s__token_mark
\scan_new:N \s__token_stop

(End definition for \s__token_mark and \s__token_stop.)

These are all defined in \l3basics, as they are needed “early”. This is just a reminder!

(End definition for \token_to_meaning:N and \token_to_str:N. These functions are documented on page 187.)

We define these useful tokens. For the brace and space tokens things have to be done
by hand: the formal argument spec. for \cs_new_eq:NN does not cover them so we do
things by hand. (As currently coded it would work with \cs_new_eq:NN but that’s not
really a great idea to show off: we want people to stick to the defined interfaces and that
includes us.) So that these few odd names go into the log when appropriate there is a
need to hand-apply the \__kernel_chk_if_free_cs:N check.

(End definition for \c_group_begin_token and others. These functions are documented on page 187.)
60.5 Token conditionals

\token_if_group_begin_p:N  \token_if_group_begin:NTF
Check if token is a begin group token. We use the constant \c_group_begin_token for this.

\token_if_group_end_p:N   \token_if_group_end:NTF
Check if token is an end group token. We use the constant \c_group_end_token for this.

\token_if_math_toggle_p:N \token_if_math_toggle:NTF
Check if token is a math shift token. We use the constant \c_math_toggle_token for this.

\token_if_alignment_p:N   \token_if_alignment:NTF
Check if token is an alignment tab token. We use the constant \c_alignment_token for this.
\texttt{\token_if_parameter_p:N} \texttt{\token_if_parameter:NTF} Check if token is a parameter token. We use the constant \texttt{\c_parameter_token} for this. We have to trick \LaTeX{} a bit to avoid an error message: within a group we prevent \texttt{\c_-parameter_token} from behaving like a macro parameter character. The definitions of \texttt{\prg_new_conditional:Npnn} are global, so they remain after the group.

\begin{verbatim}
\group_begin:
\cs_set_eq:NN \c_parameter_token \scan_stop:
\prg_new_conditional:Npnn \token_if_parameter:N #1 { p , T , F , TF }
\begin{verbatim}
{ \if_catcode:w \exp_not:N #1 \c_parameter_token
  \prg_return_true: \else: \prg_return_false: \fi:}
\end{verbatim}
\group_end:
\end{verbatim}

(End definition for \texttt{\token_if_parameter:NTF}. This function is documented on page 188.)

\texttt{\token_if_math_superscript_p:N} \texttt{\token_if_math_superscript:NTF} Check if token is a math superscript token. We use the constant \texttt{\c_math_superscript_token} for this.

\begin{verbatim}
\prg_new_conditional:Npnn \token_if_math_superscript:N #1 { p , T , F , TF }
\begin{verbatim}
{ \if_catcode:w \exp_not:N #1 \c_math_superscript_token
  \prg_return_true: \else: \prg_return_false: \fi:}
\end{verbatim}
\end{verbatim}

(End definition for \texttt{\token_if_math_superscript:NTF}. This function is documented on page 188.)

\texttt{\token_if_math_subscript_p:N} \texttt{\token_if_math_subscript:NTF} Check if token is a math subscript token. We use the constant \texttt{\c_math_subscript_token} for this.

\begin{verbatim}
\prg_new_conditional:Npnn \token_if_math_subscript:N #1 { p , T , F , TF }
\begin{verbatim}
{ \if_catcode:w \exp_not:N #1 \c_math_subscript_token
  \prg_return_true: \else: \prg_return_false: \fi:}
\end{verbatim}
\end{verbatim}

(End definition for \texttt{\token_if_math_subscript:NTF}. This function is documented on page 188.)

\texttt{\token_if_space_p:N} \texttt{\token_if_space:NTF} Check if token is a space token. We use the constant \texttt{\c_space_token} for this.

\begin{verbatim}
\prg_new_conditional:Npnn \token_if_space:N #1 { p , T , F , TF }
\begin{verbatim}
{ \if_catcode:w \exp_not:N #1 \c_space_token
  \prg_return_true: \else: \prg_return_false: \fi:}
\end{verbatim}
\end{verbatim}

(End definition for \texttt{\token_if_space:NTF}. This function is documented on page 188.)

\texttt{\token_if_letter_p:N} \texttt{\token_if_letter:NTF} Check if token is a letter token. We use the constant \texttt{\c_catcode_letter_token} for this.

\begin{verbatim}
\prg_new_conditional:Npnn \token_if_letter:N #1 { p , T , F , TF }
\begin{verbatim}
{ \if_catcode:w \exp_not:N #1 \c_catcode_letter_token
  \prg_return_true: \else: \prg_return_false: \fi:}
\end{verbatim}
\end{verbatim}

(End definition for \texttt{\token_if_letter:NTF}. This function is documented on page 189.)
\token_if_other_p:N \token_if_other:NTF
Check if token is an other char token. We use the constant \c_catcode_other_token
for this.
\prg_new_conditional:Npnn \token_if_other:N #1 { p , T , F , TF }
\{ \if_catcode:w \exp_not:N #1 \c_catcode_other_token
\prg_return_true: \else: \prg_return_false: \fi:
\}
(End definition for \token_if_other:NTF. This function is documented on page 189.)
\token_if_active_p:N \token_if_active:NTF
Check if token is an active char token. We use the constant \c_catcode_active_tl
for this. A technical point is that \c_catcode_active_tl is in fact a macro expanding to
\exp_not:N *, where * is active.
\prg_new_conditional:Npnn \token_if_active:N #1 { p , T , F , TF }
\{ \if_catcode:w \exp_not:N #1 \c_catcode_active_tl
\prg_return_true: \else: \prg_return_false: \fi:
\}
(End definition for \token_if_active:NTF. This function is documented on page 189.)
\token_if_eq_meaning_p:NN \token_if_eq_meaning:NN
Check if the tokens \#1 and \#2 have same meaning.
\prg_new_conditional:Npnn \token_if_eq_meaning:NN #1#2 { p , T , F , TF }
\{ \if_meaning:w #1 #2
\prg_return_true: \else: \prg_return_false: \fi:
\}
(End definition for \token_if_eq_meaning:NN. This function is documented on page 189.)
\token_if_eq_catcode_p:NN \token_if_eq_catcode:NN
Check if the tokens \#1 and \#2 have same category code.
\prg_new_conditional:Npnn \token_if_eq_catcode:NN #1#2 { p , T , F , TF }
\{ \if_catcode:w \exp_not:N #1 \exp_not:N #2
\prg_return_true: \else: \prg_return_false: \fi:
\}
(End definition for \token_if_eq_catcode:NN. This function is documented on page 189.)
\token_if_eq_charcode_p:NN \token_if_eq_charcode:NN
Check if the tokens \#1 and \#2 have same character code.
\prg_new_conditional:Npnn \token_if_eq_charcode:NN #1#2 { p , T , F , TF }
\{ \if_charcode:w \exp_not:N #1 \exp_not:N #2
\prg_return_true: \else: \prg_return_false: \fi:
\}
(End definition for \token_if_eq_charcode:NN. This function is documented on page 189.)
\token_if_macro_p:N \token_if_macro:NTF
When a token is a macro, \token_to_meaning:N always outputs something like
\long macro:#1->#1 so we could naively check to see if the meaning contains ->.
However, this can fail the five \...mark primitives, whose meaning has the form
\...mark:\langle user material\rangle. The problem is that the \langle user material\rangle can contain ->.
However, only characters, macros, and marks can contain the colon character. The
idea is thus to grab until the first ;, and analyse what is left. However, macros can have
any combination of \texttt{\emph{long}}, \texttt{\emph{protected}} or \texttt{\emph{outer}} (not used in \LaTeX) before the string \texttt{\emph{macro}}: We thus only select the part of the meaning between the first \texttt{ma} and the first following \texttt{:}. If this string is \texttt{cro}, then we have a macro. If the string is \texttt{rk}, then we have a mark. The string can also be \texttt{cro parameter character} for a colon with a weird category code (namely the usual category code of \texttt{#}). Otherwise, it is empty.

This relies on the fact that \texttt{\emph{long}}, \texttt{\emph{protected}}, \texttt{\emph{outer}} cannot contain \texttt{ma}, regardless of the escape character, even if the escape character is \texttt{m}.

Both \texttt{ma} and \texttt{:} must be of category code 12 (other), so are detokenized.

\begin{verbatim}
\use:x
{\prg_new_conditional:Npn \exp_not:N \token_if_macro:N ##1
  { p , T , F , TF }
  { \exp_not:N \exp_after:wN \exp_not:N \__token_if_macro_p:w
    \exp_not:N \token_to_meaning:N ##1 \tl_to_str:n { ma : }
    \s__token_stop }
\cs_new:Npn \exp_not:N \__token_if_macro_p:w
  ##1 \tl_to_str:n { ma } ##2 \c_colon_str ##3 \s__token_stop
}
\prg_new_conditional:Npn \exp_not:N \__token_if_macro_p:w
  ##1 \tl_to_str:n { ma } ##2 \c_colon_str ##3 \s__token_stop
}
\{ str_if_eq:nnTF { #2 } { cro } \{ \prg_return_true: \}
  \{ \prg_return_false: \}
\}
\end{verbatim}

(End definition for \texttt{\token_if_macro:NTF} and \texttt{\__token_if_macro_p:w}. This function is documented on page 189.)

\texttt{\token_if_cs_p:N} \texttt{\token_if_cs:NTF}

Check if token has same catcode as a control sequence. This follows the same pattern as for \texttt{\token_if_letter:N} etc. We use \texttt{\scan_stop:} for this.

\begin{verbatim}
\prg_new_conditional:Npn \exp_not:N \token_if_cs:N #1 { p , T , F , TF }
  { \if_catcode:w \exp_not:N #1 \scan_stop:
    \prg_return_false: \else: \prg_return_true: \fi: }
\prg_new_conditional:Npn \exp_not:N \token_if_cs:N #1 { p , T , F , TF }
  { \if_catcode:w \exp_not:N #1 \scan_stop:
    \prg_return_false: \else: \prg_return_true: \fi: }
\end{verbatim}

(End definition for \texttt{\token_if_cs:NTF}. This function is documented on page 189.)

\texttt{\token_if_expandable_p:N} \texttt{\token_if_expandable:NTF}

Check if token is expandable. We use the fact that \TeX temporarily converts \texttt{\exp_not:N \langle \text{token} \rangle} into \texttt{\scan_stop:} if \texttt{\langle \text{token} \rangle} is expandable. An \texttt{undefined} token is not considered as expandable. No problem nesting the conditionals, since the third \texttt{#1} is only skipped if it is non-expandable (hence not part of \TeX’s conditional apparatus).

\begin{verbatim}
\prg_new_conditional:Npn \exp_not:N \token_if_expandable:N #1 { p , T , F , TF }
  { \exp_after:wN \if_meaning:w \exp_not:N #1 #1
    \prg_return_false: \else:
    \if_cs_exist:N #1 \prg_return_true: \else:
    \prg_return_false: \fi: }
\prg_new_conditional:Npn \exp_not:N \token_if_expandable:N #1 { p , T , F , TF }
  { \exp_after:wN \if_meaning:w \exp_not:N #1 #1
    \prg_return_false: \else:
    \if_cs_exist:N #1 \prg_return_true: \else:
    \prg_return_false: \fi: }
\end{verbatim}

877
These auxiliary functions are used below to define some conditionals which detect whether the \texttt{meaning} of their argument begins with a particular string. Each auxiliary takes an argument delimited by a string, a second one delimited by \texttt{\_\_token_stop}, and returns the first one and its delimiter. This result is eventually compared to another string. Note that the “font” auxiliary is delimited by a space followed by “font”. This avoids an unnecessary check for the \texttt{font} primitive below.

\begin{verbatim}
\group_begin:
\cs_set_protected:Npn \_\_token_tmp:w #1 \_{ #2 }
\tl_to_str:n {#1} \s__token_stop
\end{verbatim}

Each of these conditionals tests whether its argument’s \texttt{meaning} starts with a given string. This is essentially done by having an auxiliary grab an argument delimited by the string and testing whether the argument was empty. Of course, a copy of this string must first be added to the end of the \texttt{meaning} to avoid a runaway argument in case it does not contain the string. Two complications arise. First, the escape character is not fixed, and cannot be included in the delimiter of the auxiliary function (this function cannot be defined on the fly because tests must remain expandable): instead the first argument of the auxiliary (plus the delimiter to avoid complications with trailing spaces) is compared using \texttt{\str_if_eq:eeTF} to the result of applying \texttt{\token_to_str:N} to a control sequence. Second, the \texttt{meaning} of primitives such as \texttt{\dimen} or \texttt{\dimendef} starts in the same way as registers such as \texttt{\dimen123}, so they must be tested for.

Characters used as delimiters must have catcode 12 and are obtained through \texttt{\tl_to_str:n}. This requires doing all definitions within x-expansion. The temporary function \texttt{\_\_token_tmp:w} used to define each conditional receives three arguments: the name of the conditional, the auxiliary’s delimiter (also used to name the auxiliary), and the string to which one compares the auxiliary’s result. Note that the \texttt{meaning} of a protected long macro starts with \texttt{protected\long macro}, with no space after \texttt{protected} but a space after \texttt{long}, hence the mixture of \texttt{\token_to_str:N} and \texttt{\tl_to_str:n}.

For the first six conditionals, \texttt{\cs_if_exist:cTF} turns out to be \texttt{false} (thanks to the leading space for \texttt{font}), and the code boils down to a string comparison between
the result of the auxiliary on the `\meaning` of the conditional’s argument ###1, and #3. Both are evaluated at run-time, as this is important to get the correct escape character.

The other five conditionals have additional code that compares the argument ###1 to two \TeX\ primitives which would wrongly be recognized as registers otherwise. Despite using \TeX\’s primitive conditional construction, this does not break when ###1 is itself a conditional, because branches of the conditionals are only skipped if ###1 is one of the two primitives that are tested for (which are not \TeX\ conditionals).

```latex
\group_begin:
\cs_set_protected:Npn \__token_tmp:w #1#2#3
\{\use:x
\{\prg_new_conditional:Npnn \exp_not:c { token_if_ #1 :N } ###1

\}
\}
\}
```

879
We filter out macros first, because they cause endless trouble later otherwise.

Primitives are almost distinguished by the fact that the result of \token_to_-meaning:N is formed from letters only. Every other token has either a space (e.g., the letter A), a digit (e.g., \count123) or a double quote (e.g., \char"A).

Ten exceptions: on the one hand, \tex_undefined:D is not a primitive, but its meaning is undefined, only letters; on the other hand, \space, \italiccorr, \hyphen, \firstmark, \topmark, \botmark, \splitfirstmark, \splitbotmark, and \nullfont are primitives, but have non-letters in their meaning.

We start by removing the two first (non-space) characters from the meaning. This removes the escape character (which may be nonexistent depending on \endlinechar), and takes care of three of the exceptions: \space, \italiccorr and \hyphen, whose meaning is at most two characters. This leaves a string terminated by some \s__token_stop.

The meaning of each one of the five \...mark primitives has the form \langle letters \rangle;\langle user material \rangle. In other words, the first non-letter is a colon. We remove everything after the first colon.

We are now left with a string, which we must analyze. For primitives, it contains only letters. For non-primitives, it contains either \" or a space, or a digit. Two exceptions remain: \tex_undefined:D, which is not a primitive, and \nullfont, which is a primitive.

Spaces cannot be grabbed in an undelimited way, so we check them separately. If there is a space, we test for \nullfont. Otherwise, we go through characters one by one, and stop at the first character less than 'A' (this is not quite a test for “only letters”, but is close enough to work in this context). If this first character is : then we have a primitive, or \tex_undefined:D, and if it is " or a digit, then the token is not a primitive.

For LuaTeX we use a different implementation which just looks at the command code for the token and compaes it to a list of non-primitives. Again, \nullfont is a special case because it is the only primitive with the normally non-primitive set_font command code.

For LuaMetaTeX some of the command names are different, so we check for both versions. The first one is always the LuaTeX version.

882
The aim here is to allow the case statement to be evaluated using a known number of expansion steps (two), and without needing to use an explicit “end of recursion” marker. That is achieved by using the test input as the final case, as this is always true. The trick is then to tidy up the output such that the appropriate case code plus either the `true` or `false` branch code is inserted.

```latex
\cs_new:Npn \token_case_catcode:Nn #1#2
{ \exp:w \__token_case:NNnTF \token_if_eq_catcode:NNTF #1 {#2} { } { } }
\cs_new:Npn \token_case_catcode:NnT #1#2#3
{ \exp:w \__token_case:NNnTF \token_if_eq_catcode:NNTF #1 {#2} {#3} { } }
\cs_new:Npn \token_case_catcode:NnF #1#2
{ \exp:w \__token_case:NNnTF \token_if_eq_catcode:NNTF #1 {#2} { } }
\cs_new:Npn \token_case_catcode:NnTF
{ \exp:w \__token_case:NNnTF \token_if_eq_catcode:NNTF }
\cs_new:Npn \__token_case:NNnTF #1#2#3#4#5
{ \__token_case:NNw #1 #2 #3 #2 { } \s__token_mark {#4} \s__token_mark {#5} \s__token_stop }
\cs_new:Npn \__token_case:NNw #1#2#3#4
{ #1 #2 #3
  { \__token_case_end:nw {#4} }
  { \__token_case:NNw #1 #2 } }
```

(End definition for `token_if_primitive:NNTF` and others. This function is documented on page 191.)
To tidy up the recursion, there are two outcomes. If there was a hit to one of the cases searched for, then \#1 is the code to insert, \#2 is the next case to check on and \#3 is all of the rest of the cases code. That means that \#4 is the true branch code, and \#5 tidies up the spare \texttt{\_token\_mark} and the false branch. On the other hand, if none of the cases matched then we arrive here using the “termination” case of comparing the search with itself. That means that \#1 is empty, \#2 is the first \texttt{\_token\_mark} and so \#4 is the false code (the true code is mopped up by \#3).

\begin{verbatim}
\cs_new:Npn \_token_case_end:nw #1#2#3 \_token\_mark #4#5 \_token\_stop
 { \exp_end: #1 #4 }
\end{verbatim}

(End definition for \texttt{\_token\_case\_catcode:NnTF} and others. These functions are documented on page 191.)

### 60.6 Peeking ahead at the next token

Peeking ahead is implemented using a two part mechanism. The outer level provides a defined interface to the lower level material. This allows a large amount of code to be shared. There are four cases:

1. peek at the next token;
2. peek at the next non-space token;
3. peek at the next token and remove it;
4. peek at the next non-space token and remove it.

\texttt{\_peek\_token}

Storage tokens which are publicly documented: the token peeked.

\texttt{\_peek\_search\_token}

The token to search for as an implicit token: \texttt{cf. \_peek\_search\_tl}.

\texttt{\_peek\_search\_tl}

The token to search for as an explicit token: \texttt{cf. \_peek\_search\_token}.

\texttt{\_peek\_true:w}

Functions used by the branching and space-stripping code.
\s__peek_mark
\s__peek_stop

Internal scan marks.

\scan_new:N \s__peek_mark
\scan_new:N \s__peek_stop

(End definition for \s__peek_mark and \s__peek_stop.)

\_peek_use_none_delimit_by_s_stop:w

Functions to gobble up to a scan mark.

\_peek_use_none_delimit_by_s_stop:w #1 \s__peek_stop { }

(End definition for \_peek_use_none_delimit_by_s_stop:w.)

\peek_after:Nw \peek_gafter:Nw

Simple wrappers for \futurelet: no arguments absorbed here.

\peek_after:Nw { \tex_futurelet:D \l_peek_token }
\peek_gafter:Nw { \tex_global:D \tex_futurelet:D \g_peek_token }

(End definition for \peek_after:Nw and \peek_gafter:Nw. These functions are documented on page 191.)

\_peek_true_remove:w

A function to remove the next token and then regain control.

\_peek_true_remove:w

\_peek_true_remove:w

\_peek_remove_spaces:n \_peek_remove_spaces:

Repeatedly use \_peek_true_remove:w to remove a space and call \_peek_true_remove:w.

\_peek_remove_spaces:n #1
\_peek_remove_spaces:n \_peek_false:w { \exp_not:n {#1} }
\group_align_safe_begin:
\_peek_true_aux:w
\_peek_remove_spaces:
\_peek_remove_spaces:
\if_meaning:w \l_peek_token \c_space_token
\exp_after:wN \_peek_true_remove:w
\else:
\group_align_safe_end:
\exp_after:wN \_peek_false:w
\fi:

(End definition for \_peek_remove_spaces:n and \_peek_remove_spaces:. This function is documented on page 193.)
Here we expand the input, removing spaces and `\scan_stop:` tokens until we reach a non-expandable token. At that stage we re-insert the payload. To deal with the problem of & tokens, we have to put the align-safe group in the correct place.

Here we can nest conditionals as `\l_peek_token` is only skipped over in the nested one if it’s a space: no problems with conditionals or outer tokens.

To deal with undefined control sequences in the same way \TeX{} does, we need to check for expansion manually.

The generic functions store the test token in both implicit and explicit modes, and the `true` and `false` code as token lists, more or less. The two branches have to be absorbed here as the input stream needs to be cleared for the peek function itself. Here, `#1` is `\__peek_true_remove:w` when removing the token and `\__peek_true_aux:w` otherwise.
\cs_new_protected:Npn \__peek_token_generic_aux:NNNTF #1#2#3#4#5

\__peek_execute_branches_meaning:
The meaning test is straight forward.
\cs_new:Npn \__peek_execute_branches_meaning:
{\if_meaning:w \l_peek_token \l__peek_search_token
 \exp_after:wN \__peek_true:w
\else:
 \exp_after:wN \__peek_false:w
\fi:
}

(End definition for \__peek_execute_branches_meaning:)
control sequences which are not equal to a non-active character token (e.g., macro, primitive);

• active characters which are not equal to a non-active character token (e.g., macro, primitive);

• explicit non-active character tokens, or control sequences or active characters set equal to a non-active character token.

The first two cases are not distinguishable simply using \TeX's \texttt{\futurelet}, because we can only access the \texttt{\meaning} of tokens in that way. In those cases, detected thanks to a comparison with \texttt{\scan_stop}:, we grab the following token, and compare it explicitly with the explicit search token stored in \texttt{\l__peek_search_tl}. The \texttt{\exp_not:N} prevents outer macros (coming from non-\TeX\ code) from blowing up. In the third case, \texttt{\l__peek_token} is good enough for the test, and we compare it again with the explicit search token. Just like the peek token, the search token may be of any of the three types above, hence the need to use the explicit token that was given to the peek function.

\peek_N_type:TF  
\__peek_execute_branches_N_type:  
\__peek_N_type:w  
\__peek_N_type_aux:nnw  
All tokens are N-type tokens, except in four cases: begin-group tokens, end-group tokens, space tokens with character code 32, and outer tokens. Since \l_peek_token might be outer, we cannot use the convenient \bool_if:nTF function, and must resort to the old trick of using \ifodd to expand a set of tests. The false branch of this test is taken if the token is one of the first three kinds of non-N-type tokens (explicit or implicit), thus we call \__peek_false:w. In the true branch, we must detect outer tokens, without impacting performance too much for non-outer tokens. The first filter is to search for outer in the \meaning of \l_peek_token. If that is absent, \__peek_use_none_delimit_by_s_stop:w cleans up, and we call \__peek_true:w. Otherwise, the token can be a non-outer macro or a primitive mark whose parameter or replacement text contains outer, it can be the primitive \outer, or it can be an outer token. Macros and marks would have ma in the part before the first occurrence of outer; the meaning of \outer has nothing after outer, contrarily to outer macros; and that covers all cases, calling \__peek_true:w or \__peek_false:w as appropriate. Here, there is no \langle search token \rangle, so we feed a dummy \scan_stop: to the \__peek_token_generic:NTF function.

\_End definition for \peek_N_type:TF and others. This function is documented on page 193.
Chapter 61

\textbf{l3prop implementation}

The following test files are used for this code: m3prop001, m3prop002, m3prop003, m3prop004, m3show001.

\begin{verbatim}
\@=prop
\end{verbatim}

A property list is a macro whose top-level expansion is of the form

\begin{verbatim}
\__prop \__prop_pair:wn \langle key \rangle \__prop \{\langle value \rangle}\}
\end{verbatim}

\ldots

\begin{verbatim}
\__prop_pair:wn \langle key \rangle \__prop \{\langle value \rangle}\}
\end{verbatim}

where \__prop is a scan mark (equal to \scan_stop:), and \__prop_pair:wn can be used to map through the property list.

\__prop The internal token used at the beginning of property lists. This is also used after each \langle key \rangle (see \__prop_pair:wn).

(End definition for \__prop.)

\__prop_pair:wn \__prop_pair:wn \__prop \langle key \rangle \__prop \{\langle item \rangle}\}

The internal token used to begin each key-value pair in the property list. If expanded outside of a mapping or manipulation function, an error is raised. The definition should always be set globally.

(End definition for \__prop_pair:wn.)

\l__prop_internal_tl Token list used to store new key-value pairs to be inserted by functions of the \prop_put:Nnn family.

(End definition for \l__prop_internal_tl.)
\__prop_split:NnTF \__prop_split:NnTF \langle property list \rangle \langle \{key\} \{true code\}\{false code\} \rangle

Splits the \langle property list \rangle at the \langle key \rangle, giving three token lists: the \langle extract \rangle of \langle property list \rangle before the \langle key \rangle, the \langle value \rangle associated with the \langle key \rangle and the \langle extract \rangle of \langle property list \rangle after the \langle value \rangle. Both \langle extracts \rangle retain the internal structure of a property list, and the concatenation of the two \langle extracts \rangle is a property list. If the \langle key \rangle is present in the \langle property list \rangle then the \langle true code \rangle is left in the input stream, with \#1, \#2, and \#3 replaced by the first \langle extract \rangle, the \langle value \rangle, and the second extract. If the \langle key \rangle is not present in the \langle property list \rangle then the \langle false code \rangle is left in the input stream, with no trailing material. Both \langle true code \rangle and \langle false code \rangle are used in the replacement text of a macro defined internally, hence macro parameter characters should be doubled, except \#1, \#2, and \#3 which stand in the \langle true code \rangle for the three extracts from the property list. The \langle key \rangle comparison takes place as described for \str_if_eq:nn.

\s__prop

A private scan mark is used as a marker after each key, and at the very beginning of the property list.

1968 \scan_new:N \s__prop

(End definition for \s__prop.)

\__prop_pair:wn

The delimiter is always defined, but when misused simply triggers an error and removes its argument.

1968 \cs_new:Npn \__prop_pair:wn \#1 \s__prop \#2

{ \msg_expandable_error:nn \{ prop \} \{ misused \} }

(End definition for \__prop_pair:wn.)

\l__prop_internal_tl

Token list used to store the new key–value pair inserted by \prop_put:Nnn and friends.

1968 \tl_new:N \l__prop_internal_tl

(End definition for \l__prop_internal_tl.)

\c_empty_prop

An empty prop.

1968 \tl_const:Nn \c_empty_prop \{ \s__prop \}

(End definition for \c_empty_prop. This variable is documented on page 206.)

61.1 Internal auxiliaries

\s__prop_mark

Internal scan marks.

1968 \scan_new:N \s__prop_mark

1968 \scan_new:N \s__prop_stop

(End definition for \s__prop_mark and \s__prop_stop.)

\q__prop_recursion_tail

Internal recursion quarks.

1968 \quark_new:N \q__prop_recursion_tail

1968 \quark_new:N \q__prop_recursion_stop

(End definition for \q__prop_recursion_tail and \q__prop_recursion_stop.)

\__prop_if_recursion_tail_stop:n

Functions to query recursion quarks.

1968 \__kernel_quark_new_test:N \__prop_if_recursion_tail_stop:n

1968 \cs_generate_variant:Nn \__prop_if_recursion_tail_stop:n \{ o \}

(End definition for \__prop_if_recursion_tail_stop:n and \__prop_if_recursion_tail_stop:o.)
61.2 Allocation and initialisation

\prop_new:N Property lists are initialized with the value \c_empty_prop.
\prop_new:c
\begin{verbatim}
\__kernel_chk_if_free_cs:N #1
\cs_gset_eq:NN #1 \c_empty_prop
\end{verbatim}
\begin{verbatim}
\cs_generate_variant:Nn \prop_new:N { c }
\end{verbatim}
(End definition for \prop_new:N. This function is documented on page 199.)

\prop_clear:N The same idea for clearing.
\prop_clear:c
\prop_gclear:N
\prop_gclear:c
\begin{verbatim}
\cs_new_protected:Npn \prop_clear:N #1 {
\prop_set_eq:NN #1 \c_empty_prop }
\end{verbatim}
\begin{verbatim}
\cs_generate_variant:Nn \prop_clear:N { c }
\end{verbatim}
\begin{verbatim}
\cs_new_protected:Npn \prop_gclear:N #1 {
\prop_gset_eq:NN #1 \c_empty_prop }
\end{verbatim}
\begin{verbatim}
\cs_generate_variant:Nn \prop_gclear:N { c }
\end{verbatim}
(End definition for \prop_clear:N and \prop_gclear:N. These functions are documented on page 199.)

\prop_clear_new:N Once again a simple variation of the token list functions.
\prop_clear_new:c
\prop_gclear_new:N
\prop_gclear_new:c
\begin{verbatim}
\cs_new_protected:Npn \prop_clear_new:N #1 {
\prop_if_exist:NTF #1 { \prop_clear:N #1 } { \prop_new:N #1 }
\end{verbatim}
\begin{verbatim}
\cs_generate_variant:Nn \prop_clear_new:N { c }
\end{verbatim}
\begin{verbatim}
\cs_new_protected:Npn \prop_gclear_new:N #1 {
\prop_if_exist:NTF #1 { \prop_gclear:N #1 } { \prop_new:N #1 }
\end{verbatim}
\begin{verbatim}
\cs_generate_variant:Nn \prop_gclear_new:N { c }
\end{verbatim}
(End definition for \prop_clear_new:N and \prop_gclear_new:N. These functions are documented on page 199.)

\prop_set_eq:NN These are simply copies from the token list functions.
\prop_set_eq:cN
\prop_set_eq:Nc
\prop_set_eq:cc
\prop_gset_eq:NN
\prop_gset_eq:cN
\prop_gset_eq:Nc
\prop_gset_eq:cc
\begin{verbatim}
\cs_new_protected:Npn \prop_set_eq:NN \tl_set_eq:NN
\cs_new_protected:Npn \prop_set_eq:Nc \tl_set_eq:Nc
\cs_new_protected:Npn \prop_set_eq:cc \tl_set_eq:cc
\end{verbatim}
(End definition for \prop_set_eq:NN and \prop_gset_eq:NN. These functions are documented on page 200.)

\l_tmpa_prop We can now initialize the scratch variables.
\l_tmpb_prop
\g_tmpa_prop
\g_tmpb_prop
\begin{verbatim}
\prop_new:N \l_tmpa_prop
\prop_new:N \l_tmpb_prop
\prop_new:N \g_tmpa_prop
\prop_new:N \g_tmpb_prop
\end{verbatim}
(End definition for \l_tmpa_prop and others. These variables are documented on page 206.)

\l__prop_internal_prop Property list used by \prop_concat:NNN, \prop_set_from_keyval:Nn and others.
\begin{verbatim}
\prop_new:N \l__prop_internal_prop
\end{verbatim}

Combine two property lists. We cannot use a simple \_\_prop_concat:NNN because there may be some duplicate keys between the two property lists.

\begin{verbatim}
\cs_new_protected:Npn \prop_concat:NNN { \__prop_concat:NNNN \prop_set_eq:NN }
\cs_generate_variant:Nn \prop_concat:NNN { ccc }
\cs_new_protected:Npn \prop_gconcat:NNN { \__prop_concat:NNNN \prop_gset_eq:NN }
\cs_generate_variant:Nn \prop_gconcat:NNN { ccc }
\cs_new_protected:Npn \__prop_concat:NNNN #1#2#3#4
{ \prop_set_eq:NN \l__prop_internal_prop #3 \prop_map_inline:Nn #4 { \prop_put:Nnn \l__prop_internal_prop {##1} {##2} } #1 #2 \l__prop_internal_prop }
\end{verbatim}

To avoid tracking throughout the loop the variable name and whether the assignment is local/global, do everything in a scratch variable and empty it afterwards to avoid wasting memory. Loop through items separated by commas, with \texttt{prg_do_nothing}: to avoid losing braces. After checking for termination, split the item at the first and then at the second = (which ought to be the first of the trailing = that we added). For both splits trim spaces and call a function (first \texttt{\__prop_from_keyval_key:w} then \texttt{\__prop_from_keyval_value:w}), followed by the trimmed material, \texttt{\s__prop_mark}, the subsequent part of the item, and the trailing =’s and \texttt{\s__prop_stop}. After finding the ⟨key⟩ just store it after \texttt{\s__prop_stop}. After finding the ⟨value⟩ ignore completely empty items (both trailing = were used as delimiters and all parts are empty); if the remaining part #2 consists exactly of the second trailing = (namely there was exactly one = in the item) then output one key–value pair for the property list; otherwise complain about a missing or extra =.

\begin{verbatim}
\cs_new_protected:Npn \prop_set_from_keyval:Nn #1
{ \prop_clear:N #1 \prop_put_from_keyval:Nn #1 }
\cs_generate_variant:Nn \prop_set_from_keyval:Nn { c }
\cs_new_protected:Npn \prop_gset_from_keyval:Nn #1
{ \prop_gclear:N #1 \prop_gput_from_keyval:Nn #1 }
\cs_generate_variant:Nn \prop_gset_from_keyval:Nn { c }
\cs_new_protected:Npn \prop_const_from_keyval:Nn #1#2
{ \prop_set_from_keyval:Nn \l__prop_internal_prop {#2} \tl_const:Nx #1 { \exp_not:o \l__prop_internal_prop } \prop_clear:N \l__prop_internal_prop }
\end{verbatim}
{\bool_if:NTF \l__kernel_keyval_allow_blank_keys_bool
 { \__prop_keyval_parse:NNNn \c_true_bool }
 { \__prop_keyval_parse:NNNn \c_false_bool }
\prop_put:Nnn
}
\cs_generate_variant:Nn \prop_put_from_keyval:Nn { c }
\cs_new_protected:Npn \prop_gput_from_keyval:Nn
 { \bool_if:NTF \l__kernel_keyval_allow_blank_keys_bool
 { \__prop_keyval_parse:NNNn \c_true_bool }
 { \__prop_keyval_parse:NNNn \c_false_bool }
\prop_gput:Nnn }
\cs_generate_variant:Nn \prop_gput_from_keyval:Nn { c }
\cs_new_protected:Npn \__prop_missing_eq:n
 { \msg_error:nnn { prop } { prop-keyval } }
\cs_new_protected:Npn \__prop_keyval_parse:NNNn #1#2#3#4
 { \bool_set_eq:NN \l__kernel_keyval_allow_blank_keys_bool #1
 \keyval_parse:nnn \__prop_missing_eq:n { #2 #3 } {#4}
 \bool_set_eq:NN \l__kernel_keyval_allow_blank_keys_bool #1
\cs_set:Npn \__prop_split:NnTF #1#2
 { \exp_args:NNo \__prop_split_aux:NnTF #1 { \tl_to_str:n {#2} } }
\cs_new_protected:Npn \__prop_split_aux:NnTF #1#2#3#4
 { \cs_set:Npn \__prop_split_aux:w ##1
 \__prop_pair:wn {#2} #3 \__prop_mark #4 #5 \__prop_stop
 {#4 {\use_i:nn} {\use_ii:nn} \__prop_set_from_keyval:Nn and others. These functions are documented on page 200.}
}

\section{Accessing data in property lists}

This function is used by most of the module, and hence must be fast. It receives a \langle property list \rangle, a \langle key \rangle, a \langle true code \rangle and a \langle false code \rangle. The aim is to split the \langle property list \rangle at the given \langle key \rangle into the \langle extract \rangle before the key–value pair, the \langle value \rangle associated with the \langle key \rangle and the \langle extract \rangle after the key–value pair. This is done using a delimited function, whose definition is as follows, where the \langle key \rangle is turned into a string.

\begin{verbatim}
\cs_set:Npn \__prop_split_aux:w #1
 \__prop_pair:wn \langle key \rangle {\langle value \rangle} \__prop_mark #3 #4 \__prop_stop
 {#4 {(true code)\} {false code})}}
\end{verbatim}

If the \langle key \rangle is present in the property list, \__prop_split_aux:w's #1 is the part before the \langle key \rangle, #2 is the \langle value \rangle, #3 is the part after the \langle key \rangle, #4 is \use_i:nn, and #5 is additional tokens that we do not care about. The \langle true code \rangle is left in the input stream, and can use the parameters #1, #2, #3 for the three parts of the property list as desired. Namely, the original property list is in this case #1 \__prop_pair:wn \langle key \rangle \__prop_set_from_keyval:Nn and others. These functions are documented on page 200.

If the \langle key \rangle is not there, then the \langle function \rangle is \use_ii:nn, which keeps the \langle false code \rangle.

\begin{verbatim}
\cs_new_protected:Npn \__prop_split:NnTF #1\#2
 { \exp_args:NNo \__prop_split_aux:NnTF \#1\{ \tl_to_str:n \{\#2\} \}
\cs_new_protected:Npn \__prop_split_aux:NnTF \#1\#2\#3\#4
 { \cs_set:Npn \__prop_split_aux:w \#1\#2\#3\#4
\end{verbatim}

895
Deleting from a property starts by splitting the list. If the key is present in the property list, the returned value is ignored. If the key is missing, nothing happens.

Getting an item from a list is very easy: after splitting, if the key is in the property list, just set the token list variable to the return value, otherwise to \texttt{\textbackslash q_no_value}.

Popping a value also starts by doing the split. If the key is present, save the value in the token list and update the property list as when deleting. If the key is missing, save \texttt{\textbackslash q_no_value} in the token list.
\prop_item:Nn \prop_item:cn \_prop_item:nnn

Getting the value corresponding to a key in a property list in an expandable fashion simply uses `\prop_map_tokens:Nn` to go through the property list. The auxiliary `\_prop_item:nnn` receives the search string `#1`, the key `#2` and the value `#3` and returns as appropriate.

\prop_count:N \prop_count:c \_prop_count:nn

Counting the key–value pairs in a property list is done using the same approach as for other count functions: turn each entry into a `+1` then use integer evaluation to actually do the mathematics.

\prop_to_keyval:N \prop_to_keyval:exp_after:wN \_prop_to_keyval:nn \_prop_to_keyval:nw

Each property name and value pair will be returned in the form `{⟨name⟩}=⟨value⟩}. As one of the main use cases for this macro is to pass the ⟨property list⟩ on to a key–value parser, we have to make sure that the behaviour is as good as possible. Using a
space before the opening brace we get the correct brace stripping behaviour for most of the key–value parsers available in \LaTeX. If \texttt{\texttt{\tex\_expanded:D}} is available this function makes use of it, so there are two different implementations here. They both start with \texttt{\texttt{\_\_kernel\_exp\_not:w}} to start the expansion context to expand in two steps. If the \langle property list \rangle is empty they just leave an empty set of braces in the input stream for \texttt{\texttt{\_\_kernel\_exp\_not:w}}.

\begin{verbatim}
\cs_if_exist:NTF \tex\_expanded:D
\{
\end{verbatim}

The variant using \texttt{\texttt{\texttt{\tex\_expanded:D}}} can just iterate over the \langle property list \rangle and remove the leading comma afterwards. Only the value has to be protected in \texttt{\texttt{\_\_kernel\_exp\_not:w}} as the property name is always a string. After the loop the leading comma is removed by \texttt{\texttt{\use\_none:n}} and afterwards \texttt{\texttt{\_\_kernel\_exp\_not:w}} eventually finds the opening brace of its argument.

\begin{verbatim}
\cs_new:Npn \prop\_to\_keyval:N #1
\{
\__kernel\_exp\_not:w
\prop\_if\_empty:NTF #1
\{
\}
\exp\_after:wN \exp\_after:wN \exp\_after:wN
\{
\tex\_expanded:D
\{
\__kernel\_exp\_not:w \{ \use\_none:n \}
\prop\_map\_function:NN #1 \_\_prop\_to\_keyval:nn
\}
\}
\cs_new:Npn \_\_prop\_to\_keyval:nn { , ~ {#1} =~ { \__kernel\_exp\_not:w {#2} } }
\end{verbatim}

The other variant will iterate over the \langle property list \rangle and has to output the result in a group after the marker \_\_prop\_to\_keyval\_exp\_after:wN. As a result this is considerably slower than the \texttt{\texttt{\texttt{\tex\_expanded:D}}} using variant as it has to read the entire contents of the \langle property list \rangle for each item. Since the marker is just \texttt{\texttt{\exp\_after:wN}} with another name, after the loop the leading comma is gobbled by \texttt{\texttt{\use\_none:n}}, leaving the result as the argument to \texttt{\texttt{\_\_kernel\_exp\_not:w}}.

\begin{verbatim}
\cs_new:Npn \_\_prop\_to\_keyval:nnw #1#2 #3 \_\_prop\_to\_keyval\_exp\_after:wN #4
\end{verbatim}

898
Popping an item from a property list, keeping track of whether the key was present or not, is implemented as a conditional. If the key was missing, neither the property list, nor the token list are altered. Otherwise, \texttt{\prg_return\_true:} is used after the assignments.

\begin{verbatim}
\prg_new_protected_conditional:Npnn \prop_pop:NnN #1#2#3 { T , F , TF }
\prg_new_protected_conditional:Npnn \prop_gpop:NnN #1#2#3 { T , F , TF }
\end{verbatim}

Since the branches of \texttt{\_\_prop\_split:NnTF} are used as the replacement text of an internal macro, and since the \texttt{(key)} and new \texttt{(value)} may contain arbitrary tokens, it is not safe to include them in the argument of \texttt{\_\_prop\_split:NnTF}. We thus start by storing in \texttt{\l__prop\_internal\_tl} tokens which (after \texttt{x}\texttt{-expansion}) encode the key–value pair. This variable can safely be used in \texttt{\_\_prop\_split:NnTF}. If the \texttt{(key)} was absent, append the new key–value to the list. Otherwise concatenate the extracts \texttt{##1} and \texttt{##3} with the new key–value pair \texttt{\l__prop\_internal\_tl}. The updated entry is placed at the same spot as the original \texttt{(key)} in the property list, preserving the order of entries.

\begin{verbatim}
\cs_new_protected:Npn \prop_put:Nnn { \__prop_put:NNnn \__kernel_tl_set:Nx }
\cs_new_protected:Npn \prop_gput:Nnn { \__prop_put:NNnn \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \__prop_put:NNnn #1#2#3#4
{ \tl_set:Nn \l__prop_internal_tl { \exp_not:N \__prop_pair:wn \tl_to_str:n {#3} \s__prop { \exp_not:n {#4} } } \__prop_split:NnTF #2 {#3} { #1 #2 { \exp_not:n {##1} \l__prop_internal_tl \exp_not:n {##3} } } { #1 #2 { \exp_not:o {#2} \l__prop_internal_tl } } }
\end{verbatim}
Adding conditionally also splits. If the key is already present, the three brace groups
given by \_\_prop_split:NNTF are removed. If the key is new, then the value is added,
being careful to convert the key to a string using \tl_to_str:n.

\prop_if_exist_p:N
\prop_if_exist_p:c
\prop_if_exist:NTF
\prop_if_exist:cTF

(End definition for \prop_if_exist:NTF. This function is documented on page 202.)

61.4 Property list conditionals

\prop_if_empty_p:N
\prop_if_empty_p:c
\prop_if_empty:NTF
\prop_if_empty:cTF

Same test as for token lists.

(End definition for \prop_if_empty:NTF. This function is documented on page 202.)
Testing expandably if a key is in a property list requires to go through the key–value pairs one by one. This is rather slow, and a faster test would be

```
\prg_new_protected_conditional:Npnn \prop_if_in:Nn #1 #2
{ \@@_split:NnTF #1 {#2}{ \prg_return_true:}{ \prg_return_false:} }
```

but ``\_\_prop_split:NnTF`` is non-expandable. Instead, we use ``\prop_map_tokens:Nn`` to compare the search key to each key in turn using ``\str_if_eq:ee``, which is expandable.

```
\prg_new_protected_conditional:Npnn \prop_if_in:NnTF #1 #2 { p , T , F , TF }
{ \exp_args:NNo \prop_map_tokens:Nn #1
\exp_after:wN \__prop_split:NnTF
\exp_after:wN { \tl_to_str:n {#2} }
\prg_return_false: }
\cs_new:Npn \__prop_split:NnTF #1#2
{ \str_if_eq:eeT {#1} {#2}
\prop_map_break:n { \use_i:nn \prg_return_true: } }
\prg_generate_conditional_variant:Nnn \prop_if_in:NnTF
{ NV , No , c , cV , co } { p , T , F , TF }
```

(End definition for ``\prop_if_empty:NTF``. This function is documented on page 203.)

61.5 Recovering values from property lists with branching

Getting the value corresponding to a key, keeping track of whether the key was present or not, is implemented as a conditional (with side effects). If the key was absent, the token list is not altered.

```
\prg_new_protected_conditional:Npnn \prop_get:NnN #1#2#3 { T , F , TF }
{ \exp_args:NNo \prop_map_tokens:Nn #1
\exp_after:wN \__prop_get:NnN
\exp_after:wN { \tl_to_str:n {#2} }
\prg_return_false: }
\cs_new:Npn \__prop_get:NnN #1#2#3
{ \str_if_eq:eeT {#1} {#2}
\prop_map_break:n { \use_i:nn \prg_return_true: } }
\prg_generate_conditional_variant:Nnn \prop_get:NnN
{ NV , Nv , No , c , cV , cv , co } { T , F , TF }
```

(End definition for ``\prop_get:NnNTF``. This function is documented on page 203.)
61.6 Mapping over property lists

The even-numbered arguments of \__prop_map_function:Nw are keys, hence have string catcodes, except at the end where they are \fi: \prop_map_break:. The \fi: ends the \if_false: \langle \ even \rangle \fi: construction and we jump out of the loop. No need for any quark test.

\begin{verbatim}
\cs_new:Npn \prop_map_function:NN #1#2
\exp_after:wN \use_i_ii:nnn
\exp_after:wN \__prop_map_function:Nw
\exp_after:wN #2
#1
\__prop_pair:wn \fi: \prop_map_break: \s__prop { }
\__prop_pair:wn \fi: \prop_map_break: \s__prop { }
\__prop_pair:wn \fi: \prop_map_break: \s__prop { }
\__prop_pair:wn \fi: \prop_map_break: \s__prop { }
\prg_break_point:Nn \prop_map_break: { }
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \__prop_map_function:Nw #1
\__prop_pair:wn #2 \s__prop #3
\__prop_pair:wn #4 \s__prop #5
\__prop_pair:wn #6 \s__prop #7
\__prop_pair:wn #8 \s__prop #9
\if_false: #2 \fi: #1 {#2} {#3}
\if_false: #4 \fi: #1 {#4} {#5}
\if_false: #6 \fi: #1 {#6} {#7}
\if_false: #8 \fi: #1 {#8} {#9}
\__prop_map_function:Nw #1
\end{verbatim}

\begin{verbatim}
\cs_generate_variant:Nn \prop_map_function:NN { Nc , c , cc }
\end{verbatim}

(End definition for \prop_map_function:NN and \__prop_map_function:Nw. This function is documented on page 201.)

\begin{verbatim}
\prop_map_inline:Nn
\prop_map_inline:cn
\end{verbatim}

Mapping in line requires a nesting level counter. Store the current definition of \__prop_pair:wn, and define it anew. At the end of the loop, revert to the earlier definition. Note that besides pairs of the form \__prop_pair:wn \langle \text{key} \rangle \s__prop \{ \langle \text{value} \rangle \}, there are a leading and a trailing tokens, but both are equal to \scan_stop:, hence have no effect in such inline mapping. Such \scan_stop: could have affected ligatures if they appeared during the mapping.

\begin{verbatim}
\cs_new:protected:Npn \prop_map_inline:Nn #1#2
\cs_gset_eq:cN
\__prop_pair:wn \int_use:N \g__kernel_prg_map_int :wn \__prop_pair:wn
\int_gincr:N \g__kernel_prg_map_int
\cs_gset_protected:Npn \__prop_pair:wn #1 \s__prop #2 {#2} #1
\prg_break_point:Nn \prop_map_break: { }
\int_gdecr:N \g__kernel_prg_map_int
\cs_gset_eq:Nc \__prop_pair:wn \g__kernel_prg_map_int \s__prop
\cs_gset_eq:Nc \__prop_pair:wn \g__kernel_prg_map_int :wn
\end{verbatim}

902
The mapping is very similar to \prop_map_function:Nn. The \use_i:nn removes the leading \_\_prop. The odd construction \use:n (#1) allows #1 to contain any token without interfering with \prop_map_break:. The loop stops when the (key) between \_\_prop_pair:wn and \_\_prop is \fi: \prop_map_break: instead of being a string.

\cs_new:Npn \prop_map_tokens:Nn #1#2
\exp_last_unbraced:Nno \use_i:nn { \__prop_map_tokens:nw {#2} } #1
\__prop_pair:wn \fi: \prop_map_break: \_\_prop { }
\__prop_pair:wn \fi: \prop_map_break: \_\_prop { }
\__prop_pair:wn \fi: \prop_map_break: \_\_prop { }
\__prop_pair:wn \fi: \prop_map_break: \_\_prop { }
\prg_break_point:Nn \prop_map_break: { }
\cs_generate_variant:Nn \prop_map_tokens:Nn { c }

(End definition for \prop_map_tokens:Nn. This function is documented on page 204.)

The break statements are based on the general \prg_map_break:Nn.

\cs_new:Npn \prop_map_break: { \prg_map_break:Nn \prop_map_break: { } }
\cs_new:Npn \prop_map_break:n { \prg_map_break:Nn \prop_map_break: }

(End definition for \prop_map_break: and \prop_map_break:n. These functions are documented on page 205.)

### 61.7 Viewing property lists

Apply the general \_\_kernel_chk_tl_type:NnnT. Contrarily to sequences and comma lists, we use \msg_show_item:nn to format both the key and the value for each pair.

\cs_new_protected:Npn \prop_show:N { \_\_prop_show:NN \msg_show:nnxxxx }
\cs_new_protected:Npn \prop_log:N { \_\_prop_show:NN \msg_log:nnxxxx }
\cs_new_protected:Npn \prop_show:c { \_\_prop_show:NN \msg_show:nnnXXX }
\cs_new_protected:Npn \prop_log:c { \_\_prop_show:NN \msg_log:nnnXXX }
\cs_new_protected:Npn \prop_show:NN { \_\_prop_show:NN \msg_show:nnxxxx }
\cs_new_protected:Npn \prop_log:NN { \_\_prop_show:NN \msg_log:nnxxxx }
\cs_generate_variant:Nn \prop_show:N { c }
\cs_generate_variant:Nn \prop_log:N { c }

903
\cs_generate_variant:Nn \prop_log:N { c }
\cs_new_protected:Npn \__prop_show:NN #1#2
  {
\__kernel_chk_tl_type:NnnT #2 { prop }
  {
    \s__prop
\exp_after:wN \use_i:nn \exp_after:wN \__prop_show_validate:w #2
\__prop_pair:wn \q_recursion_tail \s__prop { } \q_recursion_stop
  }
  {
    #1 { prop } { show }
    \token_to_str:N #2 \
    \prop_map_function:NN #2 \msg_show_item:nn
  }
  {
  }
  {
}
\cs_new:Npn \__prop_show_validate:w #1 \__prop_pair:wn #2 \s__prop #3
  {
\quark_if_recursion_tail_stop:n {#2}
\exp_not:N \__prop_pair:wn \tl_to_str:n {#2} \s__prop \exp_not:n { {#3} }
\__prop_show_validate:w
  }

(End definition for \prop_show:N and others. These functions are documented on page 205.)

(/package)
Chapter 62

\textbf{l3skip implementation}

62.1 Length primitives renamed

Primitives renamed.

\begin{verbatim}
\if_dim:w \__dim_eval:w \__dim_eval_end:
\end{verbatim}

(End definition for \texttt{\if_dim:w}, \texttt{\__dim_eval:w}, and \texttt{\__dim_eval_end}: This function is documented on page 221.)

62.2 Internal auxiliaries

Internal scan marks.

\begin{verbatim}
\s__dim_mark \s__dim_stop
\end{verbatim}

(End definition for \texttt{\s__dim_mark} and \texttt{\s__dim_stop}.)

Functions to gobble up to a scan mark.

\begin{verbatim}
\__dim_use_none_delimit_by_s_stop:w #1 \s__dim_stop { }
\end{verbatim}

(End definition for \texttt{\__dim_use_none_delimit_by_s_stop:w}.)

62.3 Creating and initialising \texttt{dim} variables

Allocating \texttt{(dim)} registers ...

\begin{verbatim}
\dim_new:N \dim_new:c
\end{verbatim}
Contrarily to integer constants, we cannot avoid using a register, even for constants. We cannot use \texttt{\dim_gset:Nn} because debugging code would complain that the constant is not a global variable. Since \texttt{\dim_const:Nn} does not need to be fast, use \texttt{\dim_eval:n} to avoid needing a debugging patch that wraps the expression in checking code.

\begin{verbatim}
\cs_new_protected:Npn \dim_const:Nn #1#2
\{ \dim_new:N #1 \tex_global:D #1 = \dim_eval:n {#2} \scan_stop: \}
\cs_generate_variant:Nn \dim_const:Nn { c }
\end{verbatim}

Reset the register to zero. Using \texttt{\c_zero_skip} deals with the case where the variable passed is incorrectly a skip (for example a \LaTeX\ length). Besides, these functions are then simply copied for \texttt{\skip_zero:N} and related functions.

\begin{verbatim}
\cs_new_protected:Npn \dim_zero:N #1 { #1 = \c_zero_skip }
\cs_new_protected:Npn \dim_gzero:N #1 { \tex_global:D #1 = \c_zero_skip }
\cs_generate_variant:Nn \dim_zero:N { c }
\cs_generate_variant:Nn \dim_gzero:N { c }
\end{verbatim}

Create a register if needed, otherwise clear it.

\begin{verbatim}
\cs_new_protected:Npn \dim_zero_new:N #1 { \dim_if_exist:NTF #1 { \dim_zero:N #1 } { \dim_new:N #1 } }
\cs_new_protected:Npn \dim_gzero_new:N #1 { \dim_if_exist:NTF #1 { \dim_gzero:N #1 } { \dim_new:N #1 } }
\cs_generate_variant:Nn \dim_zero_new:N { c }
\cs_generate_variant:Nn \dim_gzero_new:N { c }
\end{verbatim}

Copies of the \texttt{cs} functions defined in \texttt{l3basics}.

\begin{verbatim}
\prg_new_eq_conditional:NNn \dim_if_exist:N \cs_if_exist:N { TF , T , F , p }
\prg_new_eq_conditional:NNn \dim_if_exist:c \cs_if_exist:c { TF , T , F , p }
\end{verbatim}

Setting dimensions is easy enough but when debugging we want both to check that the variable is correctly local/global and to wrap the expression in some code. The \texttt{\scan_stop:} deals with the case where the variable passed is a skip (for example a \LaTeX\ length).

\begin{verbatim}
\cs_new_protected:Npn \dim_set:Nn \dim_set:cn \dim_gset:Nn \dim_gset:cn
\{ \dim_new:N \dim_gset:Nn \dim_gset:cn
\{ \dim_new:N \dim_gset:cn
\{ \dim_new:N \dim_gset:cn
\{ \dim_new:N \dim_gset:cn
\{ \dim_new:N \dim_gset:cn
\{ \dim_new:N \dim_gset:cn
\end{verbatim}

\section{Setting dim variables}

Setting dimensions is easy enough but when debugging we want both to check that the variable is correctly local/global and to wrap the expression in some code. The \texttt{\scan_stop:} deals with the case where the variable passed is a skip (for example a \LaTeX\ length).
\begin{verbatim}
2012 \cs_new_protected:Npn \dim_gset:Nn #1#2
2013 \{ \tex_global:D #1 = \__dim_eval:w #2 \__dim_eval_end: \scan_stop: \}
2014 \cs_generate_variant:Nn \dim_set:Nn \{ c \}
2015 \cs_generate_variant:Nn \dim_gset:Nn \{ c \}

(End definition for \dim_set:Nn and \dim_gset:Nn. These functions are documented on page 208.)
\end{verbatim}

\dim_set_eq:NN All straightforward, with a \scan_stop: to deal with the case where #1 is (incorrectly)
a skip.
\dim_set_eq:cn \dim_set_eq:cc
\dim_gset_eq:NN \dim_gset_eq:cn \dim_gset_eq:cc

(End definition for \dim_set_eq:NN and \dim_gset_eq:NN. These functions are documented on page 208.)

\dim_add:Nn Using by here would slow things down just to detect nonsensical cases such as passing
\dim_add:nn \dim_gadd:Nn \dim_gadd:nn
\dim_sub:Nn \dim_gadd:Nn \dim_gadd:nn

Using \scan_stop: deals with skip variables. Since debugging checks that the variable is correctly local/global, the global versions cannot
be defined as \texttt{\tex_global:D} followed by the local versions.
\dim_sub:nn \dim_gsub:Nn \dim_gsub:nn

(End definition for \dim_add:Nn and others. These functions are documented on page 208.)

\dim_abs:n Functions for \texttt{min}, \texttt{max}, and absolute value with only one evaluation. The absolute value
\dim_abs:N \dim_max:nn \dim_min:nn \dim_maxmin:wwN

is evaluated by removing a leading \texttt{-} if present.
\dim_use:N \__dim_eval:w \__dim_eval_end:

(End definition for \dim_add:Nn and \dim_sub:nn. These functions are documented on page 208.)

62.5 Utilities for dimension calculations

\dim_abs:n
\__dim_abs:N
\dim_max:nn
\dim_min:nn
\__dim_maxmin:wwN
\end{verbatim}

907
\cs_new:Npn \__dim_abs:N #1
{ \if_meaning:w - #1 \else: \exp_after:wN #1 \fi: }
\cs_new:Npn \dim_max:nn #1#2
{ \dim_use:N \__dim_eval:w \exp_after:wN \__dim_maxmin:wwN \dim_use:N \__dim_eval:w #1 \exp_after:wN ; \dim_use:N \__dim_eval:w #2 ; > \__dim_eval_end: }
\cs_new:Npn \dim_min:nn #1#2
{ \dim_use:N \__dim_eval:w \exp_after:wN \__dim_maxmin:wwN \dim_use:N \__dim_eval:w #1 \exp_after:wN ; \dim_use:N \__dim_eval:w #2 ; < \__dim_eval_end: }
\cs_new:Npn \__dim_maxmin:wwN #1 ; #2 ; #3
{ \if_dim:w #1 #3 #2 ~ \dim_use:N #1 \else: \dim_use:N #2 \fi: }

(End definition for \dim_abs:n and others. These functions are documented on page 208.)

\dim_ratio:nn
\__dim_ratio:n

With dimension expressions, something like 10 pt * ( 5 pt / 10 pt ) does not work. Instead, the ratio part needs to be converted to an integer expression. Using \int_value:w forces everything into sp, avoiding any decimal parts.

\cs_new:Npn \dim_ratio:nn #1#2
{ \__dim_ratio:n {#1} / \__dim_ratio:n {#2} }
\cs_new:Npn \__dim_ratio:n #1
{ \int_value:w \__dim_eval:w (#1) \__dim_eval_end: }

(End definition for \dim_ratio:nn and \__dim_ratio:n. This function is documented on page 209.)

62.6 Dimension expression conditionals

Simple comparison.

\prg_new_conditional:Nppnn \dim_compare:nNn \dim_compare:n \dim_compare_p:n \dim_compare_p:nN \dim_compare_p:nT
\__dim_compare:w
\__dim_compare:wNN
\__dim_compare_=:w
\__dim_compare_!:w
\__dim_compare_<:w
\__dim_compare_>:w
\__dim_compare_error:

This code is adapted from the \int_compare:nTF function. First make sure that there is at least one relation operator, by evaluating a dimension expression with a trailing \__dim_compare_error:. Just like for integers, the looping auxiliary \__dim_compare:wNN closes a primitive conditional and opens a new one. It is actually easier to
grab a dimension operand than an integer one, because once evaluated, dimensions all end with pt (with category other). Thus we do not need specific auxiliaries for the three “simple” relations <, =, and >.

\prg_new_conditional:Nppnn \dim_compare:n #1 { p , T , F , TF }
{ \exp_after:wN \__dim_compare:w
\dim_use:N \__dim_eval:w #1 \__dim_compare_error:
}
\cs_new:Npn \__dim_compare:w #1 \__dim_compare_error:
{ \exp_after:wN \if_false: \exp:w \exp_end_continue_f:w
\__dim_compare:wNN #1 ? { = \__dim_compare_end:w \else: } \s__dim_stop
\}
\exp_args:Nno \use:nn
{ \cs_new:Npn \__dim_compare:wNN #1 } { \tl_to_str:n {pt} #2#3 }
{ \if_meaning:w = #3
\use:c { __dim_compare_#2:w }
\fi:

\prg_return_false:
\exp_after:wN \__dim_compare:wNN \dim_use:N \__dim_eval:w #3
{ \__dim_compare_ ! :w }
#1 \reverse_if:N #2 ! #3 = { #1 #2 = #3 }
\cs_new:Npn \__dim_compare_end:nw #1 \prg_return_false: #2 \s__dim_stop
{ #1 \prg_return_false: \else: \prg_return_true: \fi:
\cs_new_protected:Npn \__dim_compare_error:
{ \if_int_compare:w \c_zero_int \c_zero_int \fi:
= \__dim_compare_error:
\}

(End definition for \dim_compare:nTF and others. This function is documented on page 210.)

\dim_case:nn \dim_case:nnTF \__dim_case:nnTF \__dim_case:nnw \__dim_case_end:nnw
For dimension cases, the first task to fully expand the check condition. The over all idea is then much the same as for \str_case:nnTF as described in l3basics.
\[ \begin{align*} &\text{while do and do while functions for dimensions. Same as for the int type only the names have changed.} \\
&\text{End definition for \texttt{dim_case:nnTF} and others. This function is documented on page 211.)} \\
&\text{62.7 Dimension expression loops} \\
\end{align*} \]
62.8 Dimension step functions

Before all else, evaluate the initial value, step, and final value. Repeating a function by steps first needs a check on the direction of the steps. After that, do the function for the start value then step and loop around. It would be more symmetrical to test for a step size of zero before checking the sign, but we optimize for the most frequent case (positive step).

```latex
\cs_new:Npn \dim_step_function:nnnN #1#2#3
\exp_after:wN \__dim_step:wwwN \tex_the:D \__dim_eval:w #1 \exp_after:wN ;
```

(End definition for \texttt{\dim_while_do:nn} and others. These functions are documented on page 212.)
The approach here is to build a function, with a global integer required to make the nesting safe (as seen in other in line functions), and map that function using \dim_step_function:nnnN. We put a \prg_break_point:Nn so that map_break functions from other modules correctly decrement \g__kernel_prg_map_int before looking for their own break point. The first argument is \scan_stop:, so that no breaking function recognizes this break point as its own.
62.9 Using dim expressions and variables

**\dim_eval:n** Evaluating a dimension expression expandably.

```latex
\cs_new:Npn \dim_eval:n #1 \{ \dim_use:N \__dim_eval:w #1 \__dim_eval_end: \}
(End definition for \dim_eval:n. This function is documented on page 213.)
```

**\dim_sign:n \__dim_sign:Nw** See \dim_abs:n. Contrarily to \int_sign:n the case of a zero dimension cannot be distinguished from a positive dimension by looking only at the first character, since 0.2pt and 0pt start the same way. We need explicit comparisons. We start by distinguishing the most common case of a positive dimension.

```latex
\cs_new:Npn \dim_sign:n #1 \{ \int_value:w \exp_after:wN \__dim_sign:Nw \dim_use:N \__dim_eval:w #1 \__dim_eval_end: ; \exp_stop_f: \}
\cs_new:Npn \__dim_sign:Nw #1#2 ; \{ \if_dim:w #1#2 > \c_zero_dim 1 \else: \if_meaning:w - #1 -1 \else: 0 \fi: \fi: \fi: \}
(End definition for \dim_sign:n and \__dim_sign:Nw. This function is documented on page 213.)
```

**\dim_use:N \dim_use:c** Accessing a \texttt{dim}. We hand-code the \texttt{c} variant for some speed gain.

```latex
\cs_new_eq:NN \dim_use:N \tex_the:D
\cs_new:Npn \dim_use:c #1 { \tex_the:D \cs:w #1 \cs_end: \}
(End definition for \dim_use:N. This function is documented on page 213.)
```

**\dim_to_decimal:n \__dim_to_decimal:w** A function which comes up often enough to deserve a place in the kernel. Evaluate the dimension expression \#1 then remove the trailing pt. When debugging is enabled, the argument is put in parentheses as this prevents the dimension expression from terminating early and leaving extra tokens lying around. This is used a lot by low-level manipulations.
\cs_new:Npn \dim_to_decimal:n #1 \{ 
\exp_after:wN \__dim_to_decimal:w \__dim_eval:w #1 \__dim_eval_end:\}
\use:x \{ 
\cs_new:Npn \exp_not:N \__dim_to_decimal:w ##1 . ##2 \tl_to_str:n { pt } \}
\int_compare:nNnTF {#2} > \c_zero_int { #1 . #2 } { #1 }
\}

(End definition for \dim_to_decimal:n and \__dim_to_decimal:w. This function is documented on page 213.)

\dim_to_decimal_in_bp:n Conversion to big points is done using a scaling inside \__dim_eval:w as \TeX{} does that using 64-bit precision. Here, 800/803 is the integer fraction for 72/72.27. This is a common case so is hand-coded for accuracy (and speed).
\cs_new:Npn \dim_to_decimal_in_bp:n #1 \{ \dim_to_decimal:n { ( #1 ) * 800 / 803 } \}

(End definition for \dim_to_decimal_in_bp:n. This function is documented on page 214.)

\dim_to_decimal_in_sp:n Another hard-coded conversion: this one is necessary to avoid things going off-scale.
\cs_new:Npn \dim_to_decimal_in_sp:n #1 \{ \int_value:w \__dim_eval:w #1 \__dim_eval_end: \}

(End definition for \dim_to_decimal_in_sp:n. This function is documented on page 214.)

\dim_to_decimal_in_unit:nn An analogue of \dim_ratio:nn that produces a decimal number as its result, rather than a rational fraction for use within dimension expressions.
\cs_new:Npn \dim_to_decimal_in_unit:nn #1#2 \{ \dim_to_decimal:n \lpt * \dim_ratio:nn {#1} {#2} \}

(End definition for \dim_to_decimal_in_unit:nn. This function is documented on page 214.)

\dim_to_fp:n Defined in l3fp-convert, documented here.

(End definition for \dim_to_fp:n. This function is documented on page 214.)
62.10 Viewing dim variables

\dim_show:N \dim_show:c

\begin{verbatim}
(End definition for \skip_zero_new:N and \skip_gzero_new:N. These functions are documented on page 216.)
\end{verbatim}
\skip_if_exist_p:N \skip_if_exist_p:c \skip_if_exist:N \skip_if_exist:c
\prg_new_eq_conditional:NNn \skip_if_exist:N \cs_if_exist:N { TF , T , F , p }
\prg_new_eq_conditional:NNn \skip_if_exist:c \cs_if_exist:c { TF , T , F , p }
\begin{verbatim}
(End definition for \skip_if_exist:N. This function is documented on page 216.)
\end{verbatim}
62.14 Setting skip variables

\skip_set:Nn \skip_set:cn
\skip_gset:Nn \skip_gset:cn

Much the same as for dimensions.

\skip_set_eq:NN \skip_set_eq:cN \skip_set_eq:Nc \skip_set_eq:cc
\skip_gset_eq:NN \skip_gset_eq:cN \skip_gset_eq:Nc \skip_gset_eq:cc

All straightforward.

\skip_add:Nn \skip_add:cn \skip_gadd:Nn \skip_gadd:cn
\skip_sub:Nn \skip_sub:cn \skip_gsub:Nn \skip_gsub:cn

Using by here deals with the (incorrect) case \skip123.

(End definition for \skip_set:Nn and \skip_gset:Nn. These functions are documented on page 216.)

62.15 Skip expression conditionals

\skip_if_eq_p:nn \skip_if_eq:nn

Comparing skips means doing two expansions to make strings, and then testing them.

As a result, only equality is tested.

(End definition for \skip_set_eq:NN and \skip_gset_eq:NN. These functions are documented on page 216.)

(End definition for \skip_add:Nn and others. These functions are documented on page 216.)

\skip_if_eq_p:nn \skip_if_eq:nnTF

(End definition for \skip_if_eq:nnTF. This function is documented on page 217.)
With $\varepsilon$-TeX, we have an easy access to the order of infinities of the stretch and shrink components of a skip. However, to access both, we either need to evaluate the expression twice, or evaluate it, then call an auxiliary to extract both pieces of information from the result. Since we are going to need an auxiliary anyways, it is quicker to make it search for the string `fil` which characterizes infinite glue.

\begin{verbatim}
\cs_set_protected:Npn \__skip_tmp:w #1
{ \prg_new_conditional:Npn \skip_if_finite:n ##1 { p , T , F , TF } \\

Chapter 63

l3keys Implementation

63.1 Low-level interface

The low-level key parser’s implementation is based heavily on explkv. Compared to keyval it adds a number of additional “safety” requirements and allows to process the parsed list of key–value pairs in a variety of ways. The net result is that this code needs around one and a half the amount of time as keyval to parse the same list of keys. To optimise speed as far as reasonably practical, a number of lower-level approaches are taken rather than using the higher-level expl3 interfaces.

\l__kernel_keyval_allow_blank_keys_bool

The general behavior of the l3keys module is to throw an error on blank key names. However to support the usage of \keyval_parse:nnn in the l3prop module we allow this error to be switched off temporarily and just ignore blank names.

\s__keyval_nil
\s__keyval_mark
\s__keyval_stop
\s__keyval_tail

(End definition for \s__keyval_nil and others.)

\_l_kernel_keyval_allow_blank_keys_bool

The main function starts the first of two loops. The outer loop splits the key–value list at active commas, the inner loop will do so at other commas. The use of \s__keyval_mark here prevents loss of braces from the key argument.
\cs_if_exist:NTF \tex_expanded:D
  {
    \cs_new:Npn \keyval_parse:nnn ##1 ##2 ##3
      {
        \__kernel_exp_not:w \tex_expanded:D
          {
            \__keyval_loop_active:nnw {##1} {##2}
            \s__keyval_mark ##3 \s__keyval_tail #1
            \group_align_safe_end:
          }
      }
  }
\cs_new:Npn \keyval_parse:nnn ##1 ##2 ##3
  {
    \group_align_safe_begin:
    \__keyval_loop_active:nnw {##1} {##2}
    \s__keyval_mark ##3 \s__keyval_tail #1
    \group_align_safe_end:
  }
\cs_new_eq:NN \keyval_parse:NNn \keyval_parse:nnn

(End definition for \keyval_parse:nnn and \keyval_parse:NNn. These functions are documented on page \pageref{keyval-parse}.)

\__keyval_loop_active:nnw

First a fast test for the end of the loop is done, it'll gobble everything up to a \s__keyval_tail. The loop ending macro will gobble everything to the last comma in this definition. If the end isn't reached yet, start the second loop splitting at other commas, the next iteration of this first loop will be inserted by the end of \__keyval_loop_other:nnw.

\cs_new:Npn \__keyval_loop_active:nnw \__keyval_loop_active:nnn \__keyval_loop_active:nnn

(End definition for \__keyval_loop_active:nnw.)

\__keyval_split_other:w \__keyval_split_active:w

These two macros allow to split at the first equals sign of category 12 or 13. At the same time they also execute branching by inserting the first token following \s__keyval_mark that followed the equals sign. Hence they also test for the presence of such an equals sign simultaneously.

\cs_new:Npn \__keyval_split_other:w \s__keyval_mark \__keyval_split_active:w

(End definition for \__keyval_split_other:w and \__keyval_split_active:w.)

\__keyval_loop_other:nnw

The second loop uses the same test for its end as the first loop, next it splits at the first active equals sign using \__keyval_split_active:w. The \s__keyval_nil prevents
accidental brace stripping and acts as a delimiter in the next steps. First testing for an
active equals sign will reduce the number of necessary expansion steps for the expected
average use case of other equals signs and hence perform better on average.

\cs_new:Npn \_keyval_loop_other:nnw ##1 ##2 ##3 ,
\begin{verbatim}
  \__keyval_if_recursion_tail:w ##3
  \__keyval_end_loop_other:w \s__keyval_tail
  \s__keyval_mark \_keyval_split_active:w ##3 \s__keyval_nil
  \_keyval_mark \_keyval_split_active_auxi:w \_keyval_clean_up_active:w
  \_keyval_split_active_auxii:w ##2 \_keyval_mark
\end{verbatim}

(End definition for \_keyval_loop_other:nnw.)

\_keyval_split_active_auxi:w \_keyval_split_active_auxii:w \_keyval_split_active_auxiii:w \_keyval_split_active_auxiv:w \_keyval_split_active_auxv:w

After \_keyval_split_active:w the following will only be called if there was at least
one active equals sign in the current key–value pair. Therefore this is the execution
branch for a key–value pair with an active equals sign. First it tests for other equals signs in the key name, which will
eventually throw an error via \_keyval_misplaced_equal_after_active_error:w. If
none was found we forward the key to \_keyval_split_active_auxii:w.

\cs_new:Npn \_keyval_split_active_auxii:w ##1 \s__keyval_nil \s__keyval_mark \_keyval_misplaced_equal_after_active_error:w
\s__keyval_stop \s__keyval_mark
\_keyval_split_active_auxiii:w \_keyval_split_active_auxiv:w \_keyval_split_active_auxv:w

This runs the last test after sanitising the remainder of the previous one. This time test
for a misplaced equals sign of category 12 in the value. Finally the last auxiliary macro
will be called.

\cs_new:Npn \_keyval_split_active_auxv:w
\_keyval_clean_up_active:w \_keyval_split_active_auxvi:w
This last macro in this execution branch sanitises the last test, trims the value and passes it to \_keyval_pair:nnnn.

\cs_new:Npn \_keyval_clean_up_active:w ##1 \s__keyval_nil \s__keyval_mark \_keyval_split_active_auxi:w \s__keyval_stop \s__keyval_mark \{ \_keyval_trim:nN { ##1 } \_keyval_pair:nnnn \}

(End definition for \_keyval_split_activeAuxi:w and others.)

\_keyval_split_other_auxi:w

This is executed if the key–value pair doesn’t contain an active equals sign but at least one other. \#1 of \_keyval_split_other_auxi:w will contain the complete key name, which is trimmed and forwarded to the next auxiliary macro.

\cs_new:Npn \_keyval_split_other_auxi:w \#1 \s__keyval_stop \{ \_keyval_split_other:w \#1 \s__keyval_nil \s__keyval_mark \_keyval_split_other_auxii:w \s__keyval_stop \s__keyval_mark \{ \_keyval_trim:nN { \#1 } \_keyval_pair:nnnn \}

We know that the value doesn’t contain misplaced active equals signs but we have to test for others. Also we need to sanitise the previous test, which is done here and not earlier to avoid superfluous argument grabbing.

\cs_new:Npn \_keyval_split_other_auxii:w \#1 \#2 \s__keyval_nil \s__keyval_mark \_keyval_clean_up_other:w \s__keyval_stop \{ \_keyval_split_other:w \#2 \s__keyval_nil \s__keyval_mark \_keyval_misplaced_equal_in_split_error:w \s__keyval_stop \s__keyval_mark \{ \_keyval_trim:nN { \#1 } \_keyval_pair:nnnn \}

\_keyval_split_other_auxiii:w sanitis the test for other equals signs, trims the value and forwards it to \_keyval_pair:nnnn.

\cs_new:Npn \_keyval_split_other_auxiii:w \#1 \s__keyval_nil \s__keyval_mark \_keyval_misplaced_equal_in_split_error:w \s__keyval_stop \s__keyval_mark \{ \_keyval_trim:nN { \#1 } \_keyval_pair:nnnn \}

(End definition for \_keyval_split_other_auxi:w, \_keyval_split_other_auxii:w, and \_keyval_split_other_auxiii:w.)
\_\_keyval\_\_clean\_\_up\_\_other:w  \_\_keyval\_\_clean\_\_up\_\_other:w is the last branch that might exist. It is called if no equals sign was found, hence the only possibilities left are a blank list element, which is to be skipped, or a lonely key. If it’s no empty list element this will trim the key name and forward it to \_\_keyval\_\_key:nn.

\cs_new:Npn \_\_keyval\_\_clean\_\_up\_\_other:w
\begin{verbatim}
    \_\_keyval\_\_clean\_\_up\_\_other:w
    \_\_keyval\_\_split\_\_other\_auxi:w \_\_keyval\_\_stop
\end{verbatim}

(\textit{End definition for} \_\_keyval\_\_clean\_\_up\_\_other:w)

\keyval\_\_misplaced\_\_equal\_\_after\_\_active\_\_error:w
\keyval\_\_misplaced\_\_equal\_\_in\_\_split\_\_error:w
All these two macros do is gobble the remainder of the current other loop execution and throw an error. Afterwards they have to insert the next loop iteration.

\cs_new:Npn \_\_keyval\_\_misplaced\_\_equal\_\_after\_\_active\_\_error:w
\begin{verbatim}
    \_\_keyval\_\_misplaced\_\_equal\_\_after\_\_active\_\_error:w
    \_\_keyval\_\_mark \_\_keyval\_\_stop
\end{verbatim}

(\textit{End definition for} \_\_keyval\_\_misplaced\_\_equal\_\_after\_\_active\_\_error:w and \_\_keyval\_\_misplaced\_\_equal\_\_in\_\_split\_\_error:w)

\keyval\_\_end\_\_loop\_\_other:w
\keyval\_\_end\_\_loop\_\_active:w
All that’s left for the parsing loops are the macros which end the recursion. Both just gobble the remaining tokens of the respective loop including the next recursion call. \_\_keyval\_\_end\_\_loop\_\_other:w also has to insert the next iteration of the active loop.

\cs_new:Npn \_\_keyval\_\_end\_\_loop\_\_other:w
\begin{verbatim}
    \_\_keyval\_\_end\_\_loop\_\_other:w
    \_\_keyval\_\_tail
\end{verbatim}

\_\_keyval\_\_end\_\_loop\_\_active:w
\_\_keyval\_\_end\_\_loop\_\_active:w
\_\_keyval\_\_loop\_\_active:nw
The parsing loops are done, so here ends the definition of \_keyval_tmp:w, which will finally set up the macros.

\begin{verbatim}
\char_set_catcode_active:n { '\, }
\char_set_catcode_active:n { '\= }
\_keyval_tmp:w , =
\end{verbatim}

These macros will be called on the parsed keys and values of the key–value list. All arguments are completely trimmed. They test for blank key names and call the functions passed to \keyval_parse:nnn inside of \exp_not:n with the correct arguments. Afterwards they insert the next iteration of the other loop.

\begin{verbatim}
\cs_set_protected:Npn \_keyval_tmp:w #1#2
{ \cs_new:Npn \_keyval_pair:nnnn ##1 ##2 ##3 ##4
{ \__keyval_if_blank:w \s__keyval_mark ##2 \s__keyval_nil \s__keyval_stop \__keyval_blank_key_error:w
\s__keyval_mark \s__keyval_stop #1
\exp_not:n { ##4 {##2} {##1} }
#2
\__keyval_loop_other:nnw {##3} {##4}
}
\cs_new:Npn \_keyval_key:nn ##1 ##2
{ \__keyval_if_blank:w \s__keyval_mark ##1 \s__keyval_nil \s__keyval_stop \__keyval_blank_key_error:w
\s__keyval_mark \s__keyval_stop #1
\exp_not:n { ##2 {##1} }
#2
\__keyval_loop_other:nnw {##2}
}

\cs_if_exist:NTF \tex_expanded:D
{ \_keyval_tmp:w { } { } }
{ \_keyval_tmp:w \group_align_safe_end: \group_align_safe_begin: }
\end{verbatim}

All these tests work by gobbling tokens until a certain combination is met, which makes them pretty fast. The test for a blank argument should be called with an arbitrary token following the argument. Each of these utilize the fact that the argument will contain a leading \s__keyval_mark.

\begin{verbatim}
\cs_new:Npn \_keyval_if_empty:w \_keyval_if_blank:w \_keyval_if_recursion_tail:w
\_keyval_if_empty:w \_keyval_if_blank:w \_keyval_if_recursion_tail:w
\end{verbatim}

(End definition for \_keyval_pair:nnnn and \_keyval_key:nn.)
These macros will be called if the tests above didn’t gobble them, they execute the branching.

\begin{verbatim}
\cs_new:Npn \__keyval_blank_true:w \s_keyval_mark \s_keyval_stop \__keyval_trim:nN #1 \__keyval_loop_other:nnw \
\cs_new:Npn \__keyval_blank_key_error:w \s_keyval_mark \s_keyval_stop #1 \__keyval_loop_other:nnw \
{ \bool_if:NTF \l__kernel_keyval_allow_blank_keys_bool \
{ #1 } 
\msg_expandable_error:nn { keyval } { blank-key-name } 
\__keyval_loop_other:nnw 
\}
\end{verbatim}

(End definition for \__keyval_blank_true:w and \__keyval_blank_key_error:w.)

Two messages for the low level parsing system.

\begin{verbatim}
\msg_new:nnn { keyval } { misplaced-equals-sign } { Misplaced~’=’~in~key-value~input~\msg_line_context: }
\msg_new:nnn { keyval } { blank-key-name } { Blank~key~name~in~key-value~input~\msg_line_context: }
\prop_gput:Nnn \g_msg_module_name_prop { keyval } { LaTeX }
\prop_gput:Nnn \g_msg_module_type_prop { keyval } { }
\end{verbatim}

And an adapted version of \_tl_trim_spaces:nn which is a bit faster for our use case, as it can strip the braces at the end. This is pretty much the same concept, so I won’t comment on it here. The speed gain by using this instead of \tl_trim_spaces_apply:nn is about 10% of the total time for \keyval_parse:NNn with one key and one key–value pair, so I think it’s worth it.

\begin{verbatim}
\__keyval_trim:nN \__keyval_trim_auxi:w \__keyval_trim_auxii:w \__keyval_trim_auxiii:w \__keyval_trim_auxiv:w
\cs_set_protected:Npn \__keyval_tmp:w #1 \\

\str_const:Nn \c__keys_code_root_str { key~code~>~ }
\str_const:Nn \c__keys_check_root_str { key~check~>~ }
\str_const:Nn \c__keys_default_root_str { key~default~>~ }
\str_const:Nn \c__keys_groups_root_str { key~groups~>~ }
\str_const:Nn \c__keys_inherit_root_str { key~inherit~>~ }
\str_const:Nn \c__keys_type_root_str { key~type~>~ }
\str_const:Nn \c__keys_props_root_str { key~prop~>~ }
\end{verbatim}

(End definition for \c__keys_code_root_str and others.)

Publicly accessible data on which choice is being used when several are generated as a set.

\begin{verbatim}
\int_new:N \l_keys_choice_int \tl_new:N \l_keys_choice_tl
\end{verbatim}

(End definition for \l_keys_choice_int and \l_keys_choice_tl. These variables are documented on page 229.)

Used for storing and recovering the list of groups which apply to a key: set as a comma list but at one point we have to use this for a token list recovery.

\begin{verbatim}
\clist_new:N \l__keys_groups_clist
\end{verbatim}

(End definition for \l__keys_groups_clist.)

The name of a key itself: needed when setting keys. The \texttt{tl} version is deprecated but has to be handled manually.

\begin{verbatim}
\str_new:N \l_keys_key_str \tl_new:N \l_keys_key_tl
\end{verbatim}

930
\l__keys_module_str  The module for an entire set of keys.
\str_new:N \l__keys_module_str (End definition for \l__keys_module_str.)

\l__keys_no_value_bool  A marker is needed internally to show if only a key or a key plus a value was seen: this is recorded here.
\bool_new:N \l__keys_no_value_bool (End definition for \l__keys_no_value_bool.)

\l__keys_only_known_bool  Used to track if only “known” keys are being set.
\bool_new:N \l__keys_only_known_bool (End definition for \l__keys_only_known_bool.)

\l__keys_path_str  The “path” of the current key is stored here: this is available to the programmer and so is public. The older version is deprecated but has to be handled manually.
\str_new:N \l__keys_path_str
\tl_new:N \l__keys_path_tl (End definition for \l__keys_path_str and \l__keys_path_tl. These variables are documented on page 231.)

\l__keys_inherit_str  (End definition for \l__keys_inherit_str.)

\l__keys_relative_tl  The relative path for passing keys back to the user. As this can be explicitly no-value, it must be a token list.
\tl_new:N \l__keys_relative_tl
\tl_set:Nn \l__keys_relative_tl { \q__keys_no_value } (End definition for \l__keys_relative_tl.)

\l__keys_property_str  The “property” begin set for a key at definition time is stored here.
\str_new:N \l__keys_property_str (End definition for \l__keys_property_str.)

\l__keys_selective_bool \l__keys_filtered_bool  Two flags for using key groups: one to indicate that “selective” setting is active, a second to specify which type (“opt-in” or “opt-out”).
\bool_new:N \l__keys_selective_bool
\bool_new:N \l__keys_filtered_bool (End definition for \l__keys_selective_bool and \l__keys_filtered_bool.)

\l__keys_selective_seq  The list of key groups being filtered in or out during selective setting.
\seq_new:N \l__keys_selective_seq (End definition for \l__keys_selective_seq.)
\l__keys_unused_clist  Used when setting only some keys to store those left over.

\l_keys_value_tl  The value given for a key: may be empty if no value was given.

\l__keys_tmp_bool, \l__keys_tmpa_tl, \l__keys_tmpb_tl  Scratch space.

\l__keys_precompile_bool, \l__keys_precompile_tl  For digesting keys.

\l_keys_usage_load_prop, \l_keys_usage_preamble_prop  Global data for document-level information.

\s__keys_nil, \s__keys_mark, \s__keys_stop  Internal scan marks.

\q__keys_no_value  Internal quarks.

\__keys_quark_if_no_value:p:N  Branching quark conditional.

\__keys_precompile:n  An auxiliary to allow cleaner showing of code.

63.2.1 Internal auxiliaries
The key defining mechanism

The public function for definitions is just a wrapper for the lower level mechanism, more or less. The outer function is designed to keep a track of the current module, to allow safe nesting. The module is set removing any leading / (which is not needed here).

\keys_define:nn
\__keys_define:nnn
\__keys_define:onn

The outer functions here record whether a value was given and then converge on a common internal mechanism. There is first a search for a property in the current key name, then a check to make sure it is known before the code hands off to the next step.

\__keys_define:n
\__keys_define:nn
\__keys_define_aux:nn

Searching for a property means finding the last . in the input, and storing the text before and after it. Everything is turned into strings, so there is no problem using an x-type expansion. Since \__keys_trim_spaces:n will turn its argument into a string anyway, this function uses \cs_set_nopar:Npx instead of \tl_set:Nx to gain some speed.

\__keys_property_find:n
\__keys_property_find_auxi:w
\__keys_property_find_auxii:w
\__keys_property_find_auxiii:w
\__keys_property_find_auxiv:w

(End definition for \keys_define:nn and \__keys_define:nnn. This function is documented on page 223.)
Two possible cases. If there is a value for the key, then just use the function. If not, then check to make sure there is no need for a value with the property. If there should be one then complain, otherwise execute it. There is no need to check for a : as if it was missing the earlier tests would have failed.
63.4 Turning properties into actions

Boolean keys are really just choices, but all done by hand. The second argument here is the scope: either empty or \texttt{g} for global.

To make a choice from a key, two steps: set the code, and set the unknown key. As multichoices and choices are essentially the same bar one function, the code is given together.
Auto-generating choices means setting up the root key as a choice, then defining each choice in turn.

```
\cs_new_protected:Npn \__keys_choice_make:nn #1#2
{ \__keys_choice_make:Nnn \__keys_choice_make: }
\cs_new_protected:Npn \__keys_multichoices_make:nn
{ \__keys_choice_make:Nnn \__keys_multichoice_make: }
\cs_new_protected:Npn \__keys_choices_make:Nnn #1#2#3
{ #1 \int_zero:N \l_keys_choice_int 
  \clist_map_inline:nn {#2} 
  \__keys_cmd_set:nx { \l_keys_path_str / \__keys_trim_spaces:n {##1} } 
  \tl_set:Nn \exp_not:N \l_keys_choice_tl {##1} 
  \int_set:Nn \exp_not:N \l_keys_choice_int { \int_use:N \l_keys_choice_int } 
  \exp_not:n {#3} 
} 
```

(End definition for \__keys_choice_make: and others.)

Setting the code for a key first logs if appropriate that we are defining a new key, then saves the code.

```
\cs_new_protected:Npn \__keys_cmd_set:nn #1#2
{ \__keys_cmd_set_direct:nn {#1} { \__keys_precompile:n {#2} } }
\cs_new_protected:Npn \__keys_cmd_set:Vn #1#2
{ \__keys_cmd_set_direct:nn {#1} { \__keys_precompile:n {#2} } }
\cs_new_protected:Npn \__keys_cmd_set:Vo #1#2
{ \__keys_cmd_set_direct:nn {#1} { \__keys_precompile:n {#2} } }
```
Creating control sequences is a bit more tricky than other cases as we need to pick up the p argument. To make the internals look clearer, the trailing n argument here is just for appearance.

Assigning a key to one or more groups uses comma lists. As the list of groups only exists if there is anything to do, the setting is done using a scratch list. For the usual grouping reasons we use the low-level approach to undefining a list. We also use the low-level approach for the other case to avoid tripping up the check-declarations code.
\__keys_inherit:n Inheritance means ignoring anything already said about the key: zap the lot and set up.
\cs_new_protected:Npn \__keys_inherit:n #1 { \__keys_undefine: \cs_set_nopar:cpn { \c__keys_inherit_root_str \l_keys_path_str } {#1} }

\__keys_initialise:n A set up for initialisation: just run the code if it exists.
\cs_new_protected:Npn \__keys_initialise:n #1 { \cs_if_exist:cTF { \c__keys_inherit_root_str \__keys_parent:o \l_keys_path_str } { \__keys_execute_inherit: } { \str_clear:N \l__keys_inherit_str \cs_if_exist:cT { \c__keys_code_root_str \l_keys_path_str } { \__keys_execute:nn \l_keys_path_str {#1} } } }

\__keys_legacy_if_set:nn Much the same as expl3 booleans, except we assume that the switch exists.
\cs_new_protected:Npn \__keys_legacy_if_set:nn #1#2 { \__keys_legacy_if_set:nnnn {#1} {#2} { true } { false } }

\cs_new_protected:Npn \__keys_legacy_if_set_inverse:nn #1#2 { \__keys_legacy_if_set:nnnn {#1} {#2} { false } { true } }

\cs_new_protected:Npn \__keys_legacy_if_set:nnnn #1#2#3#4 { \__keys_choice_make: \__keys_cmd_set:nx { \l_keys_path_str / true } { \exp_not:c { legacy_if_#2 set_ #3 :n } { \exp_not:n {#1} } } \__keys_cmd_set:nx { \l_keys_path_str / false } { \exp_not:c { legacy_if_#2 set_ #4 :n } { \exp_not:n {#1} } } \__keys_cmd_set:nn { \l_keys_path_str / unknown } { \msg_error:nnx { keys } { boolean-values-only } \l_keys_key_str } \__keys_default_set:n { true } \cs_if_exist:cF { if#1 } { \cs:w newif \exp_after:wN \cs_end: \cs:w if#1 \cs_end: } }

938
To create a meta-key, simply set up to pass data through.

\begin{verbatim}
cs_new_protected:Npn \__keys_meta_make:n #1
c { \exp_args:NVo \__keys_cmd_set_direct:nn \l_keys_path_str
c { \exp_after:wN \keys_set:nn \exp_after:wN
  { \l__keys_module_str } {#1} }
}
cs_new_protected:Npn \__keys_meta_make:nn #1#2
c { \exp_args:NV \__keys_cmd_set_direct:nn
  \l_keys_path_str { \keys_set:nn {#1} {#2} } }
\end{verbatim}

Much the same as other variables, but needs a dedicated auxiliary.

\begin{verbatim}
cs_new_protected:Npn \__keys_prop_put:Nn #1#2
c { \prop_if_exist:NF #1 { \prop_new:N #1 }
c \exp_after:wN \__keys_find_key_module:wNN \l_keys_path_str \s__keys_stop
  \l__keys_tmpa_tl \l__keys_tmpb_tl
  \__keys_cmd_set:nx \l_keys_path_str
  { \exp_not:c { prop_ #2 put:Nnn }
    \exp_not:N #1
    { \l__keys_tmpb_tl }
    \exp_not:n { {##1} }
  }
}
cs_generate_variant:Nn \__keys_prop_put:Nn { c }
\end{verbatim}

Undefining a key has to be done without \cs_undefine:c as that function acts globally.

\begin{verbatim}
cs_new_protected:Npn \__keys_undefine:
c { \clist_map_inline:nn { code , default , groups , inherit , type , check }
c { \cs_set_eq:cN
    { \tl_use:c { c__keys_ ##1 _root_str } \l_keys_path_str }
    \tex_undefined:D }
}
\end{verbatim}
Validating key input is done using a second function which runs before the main key code. Setting that up means setting it equal to a generic stub which does the check. This approach makes the lookup very fast at the cost of one additional csname per key that needs it. The cleanup here has to know the structure of the following code.

```latex
\cs_new_protected:Npn \__keys_value_requirement:nn #1#2
\{ \str_case:nnF {#2} \{
\true \{
\cs_set_eq:cc
\{ \c__keys_check_root_str \l_keys_path_str \}
\{ \__keys_check_ #1 : \}
\false \{
\cs_if_eq:ccT
\{ \c__keys_check_root_str \l_keys_path_str \}
\tex_undefined:D\}
\}
\false \{
\msg_error:nnx { keys } { boolean-values-only } \l_keys_path_str \l_keys_value_tl \use_none:nnn
\}
\}
\cs_new_protected:Npn \__keys_check_forbidden:
\{ \bool_if:NF \l__keys_no_value_bool \{
\msg_error:nxx { keys } { value-forbidden } \l_keys_path_str \l_keys_value_tl \use_none:mm
\}
\}
\cs_new_protected:Npn \__keys_check_required:
\{ \bool_if:NT \l__keys_no_value_bool \{
\msg_error:nx { keys } { value-required } \l_keys_path_str \use_none:mm
\}
\}
```

(End definition for \__keys_value_requirement:nn, \__keys_check_forbidden:, and \__keys_check_required:.)
Save the relevant data.

\begin{lstlisting}[language=TeX, numbers=none]
\cs_new_protected:Npn \__keys_usage:n #1
\{
  \str_case:nnF {#1}
  \{
    \general

\}
\end{lstlisting}

63.5 Creating key properties

The key property functions are all wrappers for internal functions, meaning that things stay readable and can also be altered later on. Importantly, while key properties have “normal” argument specs, the underlying code always supplies one braced argument to these. As such, argument expansion is handled by hand rather than using the standard tools. This shows up particularly for the two-argument properties, where things would otherwise go badly wrong.

One function for this.

(End definition for \_keys_variable_set:NnnN and \_keys_variable_set_required:NnnN.)

One function for this.

(End definition for .bool_set:N and .bool_gset:N. These functions are documented on page 224.)
Making a choice is handled internally, as it is also needed by `.generate_choices:n`.

```
\cs_new_protected:cpn { \c__keys_props_root_str .choice: } \\
{ \__keys_choice_make: }
```

*(End definition for `.choice:`. This function is documented on page 224.)*

For auto-generation of a series of mutually-exclusive choices. Here, #1 consists of two separate arguments, hence the slightly odd-looking implementation.

```
\cs_new_protected:cpn { \c__keys_props_root_str .choices:nn } #1 \\
{ \__keys_choices_make:nn #1 }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .choices:Vn } #1 \\
{ \exp_args:NV \__keys_choices_make:nn #1 }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .choices:on } #1 \\
{ \exp_args:No \__keys_choices_make:nn #1 }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .choices:xn } #1 \\
{ \exp_args:Nx \__keys_choices_make:nn #1 }
```

*(End definition for `.choices:nn`. This function is documented on page 224.)*

Creating code is simply a case of passing through to the underlying set function.

```
\cs_new_protected:cpn { \c__keys_props_root_str .code:n } #1 \\
{ \__keys_cmd_set:nn \l_keys_path_str {#1} }
```

*(End definition for `.code:n`. This function is documented on page 225.)*

```
\cs_new_protected:cpn { \c__keys_props_root_str .clist_set:N } #1 \\
{ \__keys_variable_set:NnnN #1 { clist } { } n }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .clist_set:c } #1 \\
{ \__keys_variable_set:cnnN {#1} { clist } { } n }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .clist_gset:N } #1 \\
{ \__keys_variable_set:NnnN #1 { clist } { g } n }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .clist_gset:c } #1 \\
{ \__keys_variable_set:cnnN {#1} { clist } { g } n }
```

*(End definition for `.clist_set:N` and `.clist_gset:N`. These functions are documented on page 224.)*

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_set:Np } #1 \\
{ \__keys_cs_set:NNpn \cs_set:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_set:cp } #1 \\
{ \__keys_cs_set:Ncpn \cs_set:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_set_protected:Np } #1 \\
{ \__keys_cs_set:NNpn \cs_set_protected:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_set_protected:cp } #1 \\
{ \__keys_cs_set:Ncpn \cs_set_protected:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_gset:Np } #1 \\
{ \__keys_cs_set:NNpn \cs_gset:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_gset:cp } #1 \\
{ \__keys_cs_set:Ncpn \cs_gset:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_gset_protected:Np } #1 \\
{ \__keys_cs_set:NNpn \cs_gset_protected:Npn #1 { } }
```

```
\cs_new_protected:cpn { \c__keys_props_root_str .cs_gset_protected:cp } #1 \\
{ \__keys_cs_set:Ncpn \cs_gset_protected:Npn #1 { } }
```

943
Expansion is left to the internal functions.

Setting a variable is very easy: just pass the data along.

A single property to create groups of keys.

Nothing complex: only one variant at the moment!
The standard hand-off approach.

Setting a variable is very easy: just pass the data along.

Making a meta is handled internally.

Meta with path: potentially lots of variants, but for the moment no so many defined.

The same idea as .choice: and .choices:nn, but where more than one choice is allowed.
\begin{verbatim}
\cs_new_protected:cpn { \c__keys_props_root_str .multichoices:on } #1
{ \exp_args:No \__keys_multichoices_make:nn #1 }
\cs_new_protected:cpn { \c__keys_props_root_str .multichoices:nn } #1
{ \exp_args:Nx \__keys_multichoices_make:nn #1 }

(End definition for .multichoices and .multichoices:nn. These functions are documented on page 227.)

\muskip_set:N  Setting a variable is very easy: just pass the data along.
\muskip_set:c
\muskip_gset:N
\muskip_gset:c
\end{verbatim}

\begin{verbatim}
\cs_new_protected:cpn { \c__keys_props_root_str .muskip_set:N } #1
{ \__keys_variable_set_required:NnnN #1 { muskip } { } n }
\cs_new_protected:cpn { \c__keys_props_root_str .muskip_set:c } #1
{ \__keys_variable_set_required:cnnN {#1} { muskip } { } n }
\cs_new_protected:cpn { \c__keys_props_root_str .muskip_gset:N } #1
{ \__keys_variable_set_required:NnnN #1 { muskip } { g } n }
\cs_new_protected:cpn { \c__keys_props_root_str .muskip_gset:c } #1
{ \__keys_variable_set_required:cnnN {#1} { muskip } { g } n }

(End definition for .muskip_set:N and .muskip_gset:N. These functions are documented on page 227.)

Setting known keys simply means setting the appropriate flag, then running the standard
code. To allow for nested setting, any existing value of \l__keys_unused_clist is saved
on the stack and reset afterwards. Note that for speed/simplicity reasons we use a tl
operation to set the clist here!
The idea of setting keys in a selective manner again uses flags wrapped around the basic code. The comments on \keys_set_known:nnN also apply here. We have a bit more shuffling to do to keep everything nestable.

\keys_precompile:nnN A simple wrapper.
(End definition for \keys_set_filter:nnnn and others. These functions are documented on page 233.)
A shared system once again. First, set the current path and add a default if needed.
There are then checks to see if the value is required or forbidden. If everything passes, move on to execute the code.

The key path here can be fully defined, after which there is a search for the key and module names: the user may have passed them with part of what is actually the module (for our purposes) in the key name. As that happens on a per-key basis, we use the stack approach to restore the module name without a group.

This function uses \cs_set_nopar:Npx internally for performance reasons, the argument #1 is already a string in every usage, so turning it into a string again seems unnecessary.
If selective setting is active, there are a number of possible sub-cases to consider. The key name may not be known at all or if it is, it may not have any groups assigned. There is then the question of whether the selection is opt-in or opt-out.

In the case where selective setting requires a comparison of the list of groups which apply to a key with the list of those which have been set active. That requires two mappings, and again a different outcome depending on whether opt-in or opt-out is set. We cannot replace the clist mapping by \clist_if_in:NnTF because catcodes may not be the same; they cannot be normalized easily in the clist because of the remote possibility that some items need braces if they involve commas or leading/trailing spaces.
\_\_keys\_value\_or\_default:n

If a value is given, return it as \#1, otherwise send a default if available.
\__keys_value_or_default:n #1
\cs_new_protected:Npn \__keys_value_or_default:n #1
{ \bool_if:NTF \l\_keys\_no\_value\_bool
{ \cs_if_exist:cTF { \c\__keys\_default\_root\_str \l\_keys\_path\_str } } \tl_set_eq:Nc \l\_keys\_value\_tl \l\_keys\_value\_tl
{ \c\__keys\_default\_root\_str \l\_keys\_path\_str } \tl_clear:N \l\_keys\_value\_tl \cs_if_exist:cT { \c\__keys\_inherit\_root\_str \l\_keys\_parent\_o \l\_keys\_path\_str } { \_\_keys\_default\_inherit: } \tl_set:Nn \l\_keys\_value\_tl {#1} } \cs_new_protected:Npn \_\_keys\_default\_inherit:
{ \clist_map_inline:cn \c\__keys\_inherit\_root\_str \l\_keys\_parent\_o \l\_keys\_path\_str } \cs_if_exist:cT { \c\__keys\_default\_root\_str \l\_keys\_key\_str } { \tl_set_eq:Nc \l\_keys\_value\_tl \l\_keys\_value\_tl
{ \c\__keys\_default\_root\_str \l\_keys\_key\_str } }
Actually executing a key is done in two parts. First, look for the key itself, then look for the unknown key with the same path. If both of these fail, complain. What exactly happens if a key is unknown depends on whether unknown keys are being skipped or if an error should be raised.

To deal with the case where there is no hit, we leave `\__keys_execute_unknown:` in the input stream and clean it up using the break function: that avoids needing a boolean.
A key’s code is in the control sequence with csname \c__keys_code_root_str #1. We expand it once to get the replacement text (with argument #2) and call \use:n with this replacement as its argument. This ensures that any undefined control sequence error in the key’s code will lead to an error message of the form <argument>...⟨control sequence⟩ in which one can read the (undefined) ⟨control sequence⟩ in full, rather than an error message that starts with the potentially very long key name, which would make the (undefined) ⟨control sequence⟩ be truncated or sometimes completely hidden. See https://github.com/latex3/latex2e/issues/351.

\exp_args:NNo \exp_args:No \use:n
\cs:w \c__keys_code_root_str #1 \exp_after:wN \cs_end:
\exp_after:wN {#2}

When there is no relative path, things here are easy: just save the key name and value. When we are working with a relative path, first we need to turn it into a string: that can’t happen earlier as we need to store \q__keys_no_value. Then, use a standard delimited approach to fish out the partial path.

\cs_new_protected:Npn \__keys_store_unused:

\{ \__keys_store_unused_aux: \}
\__keys_choice_find:n
\__keys_choice_find:nn
\__keys_multichoice_find:n

Executing a choice has two parts. First, try the choice given, then if that fails call the unknown key. That always exists, as it is created when a choice is first made. So there is no need for any escape code. For multiple choices, the same code ends up used in a mapping.

\cs_new:Npn \__keys_choice_find:n #1
\cs_new:Npn \__keys_choice_find:nn #1#2
\cs_new:Npn \__keys_multichoice_find:n #1
63.7 Utilities

Used to strip off the ending part of the key path after the last `/.

Space stripping has to allow for the fact that the key here might have several parts, and spaces need to be stripped from each part. Since the key name is turned into a string groups can’t be stripped accidentally and the precautions of `\tl_trim_spaces:n` aren’t necessary, in this case it is much faster to just directly strip spaces around `/.
\keys_if_exist_p:nn
\keys_if_exist:nnTF

A utility for others to see if a key exists.

\prg_new_conditional:Nppnn \keys_if_exist:nn #1#2 { p , T , F , TF } { \keys_if_exist:nn #1#2 } { \keys_if_exist:nnTF }

\keys_if_choice_exist_p:nnn
\keys_if_choice_exist:nnnTF

Just an alternative view on \keys_if_exist:nnTF.

\prg_new_conditional:Npnn \keys_if_choice_exist:nnn #1#2#3 { p , T , F , TF } { \keys_if_choice_exist:nnn #1#2#3 } { \keys_if_choice_exist:nnnTF }

\keys_show:nn
\keys_log:nn
\__keys_show:Nnn
\__keys_show:n
\__keys_show:w

The key '#1' only accepts predefined values, and '#2' is not one of these.

The key '#1' is unknown and is being ignored.

The module '#2' does not have a key called '#1'. Check that you have spelled the key name correctly.

Attempt to define '#1' as a nested choice key.

The key '#1' cannot be defined as a choice as the parent key '#2' is itself a choice.

The key '#1' does not take a value.

The key '#1' should be given without a value.

The value '#2' was present: the key will be ignored.

The key '#1' requires a value.

No value was present: the key will be ignored.

The key '#1' is undefined.

has the properties: #2 .

is undefined.

has the properties: #2 .
Chapter 64

\l3intarray implementation

There are two implementations for this module: One \fontdimen based one for more traditional \TeX\ engines and a Lua based one for engines with Lua support.

Both versions do not allow negative array sizes.

\msg_new:nnn { kernel } { negative-array-size } { Size of array may not be negative: \#1 }

\l__intarray_loop_int A loop index.

\int_new:N \l__intarray_loop_int

\msg_new:nnn { kernel } { negative-array-size } { Size of array may not be negative: \#1 }

\l__intarray_loop_int

64.1 Lua implementation

First, let’s look at the Lua variant:

We select the Lua version if the Lua helpers were defined. This can be detected by the presence of \__intarray_gset_count:Nw.

\cs_if_exist:NTF \__intarray_gset_count:Nw

64.1.1 Allocating arrays

\g__intarray_table_int Used to differentiate intarrays in Lua and to record an invalid index.
\l__intarray_bad_index_int Used as marker for intarrays in Lua. Followed by an unbraced number identifying the array and a single space. This format is used to make it easy to scan from Lua.

\luacmd{\__intarray:w', function()}
\texttt{LaTeX} Error: Isolated \texttt{intarray} ignored
end, \texttt{protected}', \texttt{global}')
(End definition for \_\_\_intarray:w.)
\texttt{__intarray_new:Nn} Declare \texttt{#1} as a tokenlist with the scanmark and a unique number. Pass the array’s size to the Lua helper. Every \texttt{intarray} must be global; it’s enough to run this check in \texttt{\intarray_new:Nn}.
\texttt{\__intarray_new:N} #1
\texttt{\cs_new_protected:Npn \__intarray_new:N #1} { \__kernel_chk_if_free_cs:N #1 \int_gincr:N \g__intarray_table_int \cs_gset_nopar:Npx #1 { \_\_\_intarray:w \int_use:N \g__intarray_table_int \c_space_tl }
\cs_new_protected:Npn \intarray_new:Nn #1#2 { \__intarray_new:N #1 \__intarray_gset_count:Nw #1 \int_eval:n {#2} \scan_stop:
\int_compare:nNnT { \intarray_count:N #1 } < 0 {
\msg_error:nnx { kernel } { negative-array-size }
{ \intarray_count:N #1 }
}
\cs_generate_variant:Nn \intarray_new:Nn { c }
(End definition for \intarray_new:Nn and \_\_\_intarray_new:N. This function is documented on page 237.)
Before we get to the first command implemented in Lua, we first need some definitions. Since \texttt{token.create} only works correctly if \TeX{} has seen the tokens before, we first run a short \TeX{} sequence to ensure that all relevant control sequences are known.
\texttt{\__intarray_table} Internal helper to scan an intarray token, extract the associated Lua table and return an error if the input is invalid.
local \_\_\_intarray_table do
local tables = get_luadata and get_luadata'\_\_\_intarray' or {[0] = {}}
function \_\_\_intarray_table()
local t = scan_token()
if t ~= intarray_marker then
put_next(t)
res.error'LaTeX Error: intarray expected'
function scan_int()
    i = 0
    for i = 1, #tables do
        if current_table then return current_table end
        current_table = {}
        tables[i] = current_table
    end
    return current_table
end

since in l3luatex this is loaded in the format, we want to preserve any intarrays which are
created while format building for the actual run.

to do this, we use the register_luadata mechanism from l3luatex: directly before
the format get dumped, the following function gets invoked and serializes all existing
tables into a string. this string gets compiled and dumped into the format and is made
available at the beginning of regular runs as get_luadata'@@'.

if register_luadata then
    register_luadata('__intarray', function()
        local t = '{[0]={},'
        for i = 1, #tables do
            t = string.format("%s{%s},", t, table.concat(tables[i], ','))
        end
        return t .. "}"
    end)
end

(set and get the size of an array. "Setting the size" means in this context that we add
zeros until we reach the desired size.

\intarray_count:N
\intarray_count:c
\__intarray_gset_count:Nw

\cs_generate_variant:Nn \intarray_count:N { c }

(End definition for \intarray_count:N and \__intarray_gset_count:Nw. This function is documented
on page 237.)
64.1.2 Array items

\__intarray_gset:wF
\__intarray_gset:w

The setter provided by Lua. The argument order somewhat emulates the \fontdimen:
First the array index, followed by the intarray and then the new value. This has been
chosen over a more conventional order to provide a delimiter for the numbers.

\begin{verbatim}
local i = scan_int()
local t = __intarray_table()
if t[i] then
  t[i] = scan_int()
  put_next(use_none)
else
  tex.count.l__intarray_bad_index_int = i
  scan_int()
  put_next(use_i)
end
\end{verbatim}

\begin{verbatim}
local i = scan_int()
local t = __intarray_table()
t[i] = scan_int()
end
\end{verbatim}

\intarray_gset:Nnn
\intarray_gset:cnn
\__kernel_intarray_gset:Nnn

The \__kernel_intarray_gset:Nnn function does not use \int_eval:n, namely its
arguments must be suitable for \int_value:w. The user version checks the position and
value are within bounds.

\begin{verbatim}
\cs_new_protected:Npn \__kernel_intarray_gset:Nnn #1#2#3
  { \__intarray_gset:w #2 #1 #3 \scan_stop: }
\cs_new_protected:Npn \intarray_gset:Nnn #1#2#3
  {
    \__intarray_gset:wF \int_eval:n {#2} #1 \int_eval:n{#3}
    { \msg_error:nnnxx { kernel } { out-of-bounds } 
      \token_to_str:N #1 \int_use:N \l__intarray_bad_index_int } \intarray_
    }
\cs_generate_variant:Nn \intarray_gset:Nnn { c }
\end{verbatim}

\intarray_gzero:N
\intarray_gzero:c

Set the appropriate array entry to zero. No bound checking needed.

\begin{verbatim}
local t = __intarray_table()
for i=1, #t do
  t[i] = 0
\end{verbatim}

\end{verbatim}
Get the appropriate entry and perform bound checks. The \texttt{\_\_kernel_intarray\_item:Nn} function omits bound checks and omits \texttt{int\_eval:n}, namely its argument must be a \texttt{\TeX} integer suitable for \texttt{int\_value:w}.

\begin{verbatim}
\cs_new:Npn \__kernel_intarray_item:Nn \cs_new:Npn \intarray_item:Nn
\cs_new:Npn \__kernel_intarray_item:wF \cs_new:Npn \intarray_item:wF
\cs_new:Npn \__kernel_intarray_item:w \cs_new:Npn \intarray_item:w
\cs_generate_variant:Nn \intarray_gzero:N \cs_generate_variant:Nn \intarray_gzero:cn
\intarray_item:Nn \intarray_item:cn \__kernel_intarray_item:Nn \__intarray_item:wF \__intarray_item:w
\intarray_rand_item:N \intarray_rand_item:c
\end{verbatim}

(End definition for \texttt{\_\_kernel_intarray\_item:Nn} and others. This function is documented on page 238.)

Importantly, \texttt{\intarray_item:Nn} only evaluates its argument once.

\begin{verbatim}
\cs_new:Npn \intarray_rand_item:N \cs_new:Npn \intarray_rand_item:c
\end{verbatim}

(End definition for \texttt{\intarray_item:Nn} and others. This function is documented on page 238.)
64.1.3 Working with contents of integer arrays

We use the \_kernel_intarray_gset:Nnn which does not do bounds checking and instead automatically resizes the array. This is not implemented in Lua to ensure that the clist parsing is consistent with the clist module.

The \_intarray_to_clist:N auxiliary allows to choose the delimiter and is also used in \intarray_show:N. Here we just pass the information to Lua and let table.concat do the actual work. We discard the category codes of the passed delimiter but this is not an issue since the delimiter is always just a comma or a comma and a space. In both cases sprint(2, ...) provides the right catcodes.

Loop through part of the array.
local from = scan_int()
local to = scan_int()
sprint(-2, concat(t, ',', from, to))
end, 'global')

(End definition for \_\_kernel_intarray_range_to_clist:Nnn and \_\_intarray_range_to_clist:w)

Loop through part of the array. We allow additional commas at the end.

\cs_new_protected:Npn \__kernel_intarray_gset_range_from_clist:Nnn #1#2#3
{\__intarray_gset_range:w \int_eval:w #2 #1 #3 , , \scan_stop:}
\luacmd('__intarray_gset_range:w', function()
  local from = scan_int()
  local t = __intarray_table()
  while true do
    local tok = scan_token()
    if tok == comma then
      repeat
        tok = scan_token()
      until tok ~= comma
    break
    else
      put_next(tok)
    end
    t[from] = scan_int()
    scan_token()
    from = from + 1
  end
  end, 'global', 'protected')
\luaend

(End definition for \_\_kernel_intarray_gset_range_from_clist:Nnn and \_\_intarray_gset_range:nNw)

In order to allow some code sharing later we provide the \_\_intarray_gset_overflow_test:nw name here. It doesn’t actually test anything since the Lua implementation accepts all integers which could be tested with \tex_ifabsnum:D.
\cs_new_protected:Npn \__intarray_gset_overflow_test:nw #1
{ }
\luaend

(End definition for \_\_intarray_gset_overflow_test:nw)

64.2 Font dimension based implementation

Go to the false branch of the conditional above.
}
64.2.1 Allocating arrays

\__intarray_entry:w We use these primitives quite a lot in this module.
\__intarray_count:w
\cs_new_eq:NN \__intarray_entry:w \tex_fontdimen:D
\cs_new_eq:NN \__intarray_count:w \tex_hyphenchar:D

(End definition for \__intarray_entry:w and \__intarray_count:w.)

\c__intarray_sp_dim Used to convert integers to dimensions fast.
\dim_const:Nn \c__intarray_sp_dim { 1 sp }

(End definition for \c__intarray_sp_dim.)

\g__intarray_font_int Used to assign one font per array.
\int_new:N \g__intarray_font_int

(End definition for \g__intarray_font_int.)

\intarray_new:Nn \intarray_new:cn \__intarray_new:N

Declare #1 to be a font (arbitrarily cmr10 at a never-used size). Store the array’s size as the \hyphenchar of that font and make sure enough \fontdimen are allocated, by setting the last one. Then clear any \fontdimen that cmr10 starts with. It seems LuaTeX’s cmr10 has an extra \fontdimen parameter number 8 compared to other engines (for a math font we would replace 8 by 22 or some such). Every intarray must be global; it’s enough to run this check in \intarray_new:Nn.

\cs_new_protected:Npn \__intarray_new:N #1
\__kernel_chk_if_free_cs:N #1
\int_gincr:N \g__intarray_font_int
\tex_global:D \tex_font:D #1
= cmr10-at \g__intarray_font_int \c__intarray_sp_dim \scan_stop:
\int_step_inline:nn { 8 } { \__kernel_intarray_gset:Nnn #1 {##1} \c_zero_int }

\cs_new_protected:Npn \intarray_new:Nn #1#2
\__intarray_new:N #1\__intarray_count:w #1 = \int_eval:n {#2} \scan_stop:
\int_compare:nNnT { \intarray_count:N #1 } < 0
{ \msg_error:nnx { kernel } { negative-array-size } { \intarray_count:N #1 } }
{ \__intarray_count:N #1 = 0 }

\cs_generate_variant:Nn \intarray_new:Nn { c }

(End definition for \intarray_new:Nn and \__intarray_new:N. This function is documented on page 237.)

\intarray_count:N Size of an array.
\intarray_count:c
\cs_new:Npn \intarray_count:N #1 { \int_value:w \__intarray_count:w #1 }
\cs_generate_variant:Nn \intarray_count:N { c }

(End definition for \intarray_count:N. This function is documented on page 237.)
64.2.2 Array items

Used when an item to be stored is larger than `\c_max_dim` in absolute value; it is replaced by ±\(\pm \c_max_dim\).

```latex
\cs_new:Npn \__intarray_signed_max_dim:n #1
\int_value:w \int_compare:nNnT {#1} < 0 { - } \c_max_dim
```

(End definition for \__intarray_signed_max_dim:n.)

The functions `\intarray_gset:Nnn` and `\intarray_item:Nn` share bounds checking. The \T branch is used if \#3 is within bounds of the array \#2.

```latex
\cs_new:Npn \__intarray_bounds:NNnTF #1#2#3
\if_int_compare:w 1 > #3 \exp_stop_f:
\__intarray_bounds_error:NNnw #1 #2 {#3}
\else:
\if_int_compare:w #3 > \intarray_count:N #2 \exp_stop_f:
\__intarray_bounds_error:NNnw #1 #2 {#3}
\fi:
\fi:
\use_i:nn
\fi
\cs_new:Npn \__intarray_bounds_error:NNnw #1#2#3#4 \use_i:nn #5#6
\#4
\if_int_compare:w \intarray_count:N #2 \exp_stop_f:
\__intarray_gset_overflow:Nnn #1#2#3
\else:
\fi
\#6
\fi
```

(End definition for \__intarray_bounds:NNnTF and \__intarray_bounds_error:NNnw.)

Set the appropriate `\fontdimen`. The \__kernel_intarray_gset:Nnn function does not use `\int_eval:w`, namely its arguments must be suitable for `\int_value:w`. The user version checks the position and value are within bounds.

```latex
\cs_new_protected:Npn \__kernel_intarray_gset:Nnn #1#2#3
\__intarray_entry:w #2 #1 #3 \c__intarray_sp_dim
\cs_new_protected:Npn \intarray_gset:Nnn #1#2#3
\exp_after:wN \__intarray_gset:Nww
\exp_after:wN #1
\int_value:w \int_eval:n {#2} \exp_after:wN ;
\int_value:w \int_eval:n {#3} ;
\}
\cs_generate_variant:Nn \intarray_gset:Nnn { c }
\cs_new_protected:Npn \__intarray_gset_overflow:Nnn #1#2#3
\msg_error:nnxxx #1 { out-of-bounds }
\token_to_str:N \intarray_count:N \int_eval:n {#2} { \intarray_count:N \int_eval:n {#3} }
\use_i:nn
\}
```

(End definition for \__kernel_intarray_gset:Nnn and \__intarray_gset_overflow:Nnn.)
\cs_if_exist:NTF \tex_ifabsnum:D
{
\cs_new_protected:Npn \__intarray_gset_overflow_test:nw #1
{
\tex_ifabsnum:D #1 > \c_max_dim
\exp_after:wN \__intarray_gset_overflow:NNnn \fi:
}
}
\cs_new_protected:Npn \__intarray_gset_overflow_test:nw #1
{
\if_int_compare:w \int_abs:n {#1} > \c_max_dim
\exp_after:wN \__intarray_gset_overflow:NNnn \fi:
}
\cs_new_protected:Npn \__intarray_gset_overflow:NNnn #1#2#3#4
{
\msg_error:nnxxxx { kernel } { overflow }
\token_to_str:N #2 \int_eval:n {#3} \int_eval:n {#4} \__intarray_signed_max_dim:n {#4} \_1 #1 \_2 \_3 \_4
\_1 \_2 \_3 \_4
\__intarray_signed_max_dim:n {#4}
\_1 \_2 \_3 \_4
\_1 \_2 \_3 \_4
}

(End definition for \intarray_gset:Nnn and others. This function is documented on page 237.)

\intarray_gzero:N\intarray_gzero:c
Set the appropriate \fontdimen to zero. No bound checking needed. The \prg_replicate:nn possibly uses quite a lot of memory, but this is somewhat comparable to the size of the array, and it is much faster than an \int_step_inline:nn loop.

\cs_new_protected:Npn \intarray_gzero:N #1
{
\int_zero:N \l__intarray_loop_int

\cs_generate_variant:Nn \intarray_item:Nn { c }

970
64.2.3 Working with contents of integer arrays

Similar to \texttt{\intarray_new:Nn} (which we don’t use because when debugging is enabled that function checks the variable name starts with \texttt{g_.}) We make use of the fact that \TeX{} allows allocation of successive \texttt{\fontdimen} as long as no other font has been declared: no need to count the comma list items first. We need the code in \texttt{\intarray_gset:Nnn} that checks the item value is not too big, namely \texttt{\__intarray_gset_overflow_test:nw}, but not the code that checks bounds. At the end, set the size of the intarray.

\begin{verbatim}

64.3.1 Random arrays

We only perform the bounds checks once. This is done by two \_\_kernel_gset_range_\_overflow_test:nw, with an appropriate empty argument to avoid a spurious “at position #1” part in the error message. Then calculate the number of choices: this is at most $(2^{30} - 1) - (-(2^{30} - 1)) + 1 = 2^{31} - 1$, which just barely does not overflow. For small ranges use \_\_kernel_randint:n (making sure to subtract 1 before adding the random number to the $\langle\min\rangle$, to avoid overflow when $\langle\min\rangle$ or $\langle\max\rangle$ are $\pm \c_max_int$), otherwise \_\_kernel_randint:nn. Finally, if there are no random numbers do not define any of the auxiliaries.

Chapter 65

l3fp implementation

Nothing to see here: everything is in the subfiles!
Chapter 66

l3fp-aux implementation

66.1 Access to primitives

Largely for performance reasons, we need to directly access primitives rather than use \int_eval:n. This happens a lot, so we use private names. The same is true for \romannumeral, although it is used much less widely.

\cs_new_eq:NN \__fp_int_eval:w \tex_numexpr:D
\cs_new_eq:NN \__fp_int_eval_end: \scan_stop:
\cs_new_eq:NN \__fp_int_to_roman:w \tex_romannumeral:D

(End definition for \__fp_int_eval:w, \__fp_int_eval_end:, and \__fp_int_to_roman:w.)

66.2 Internal representation

Internally, a floating point number \( X \) is a token list containing

\s__fp \__fp_chk:w \langle case \rangle \langle sign \rangle \langle body \rangle ;

Let us explain each piece separately.

Internal floating point numbers are used in expressions, and in this context are subject to f-expansion. They must leave a recognizable mark after f-expansion, to prevent the floating point number from being re-parsed. Thus, \s__fp is simply another name for \relax.

When used directly without an accessor function, floating points should produce an error: this is the role of \__fp_chk:w. We could make floating point variables be protected to prevent them from expanding under x-expansion, but it seems more convenient to treat them as a subcase of token list variables.

The (decimal part of the) IEEE-754-2008 standard requires the format to be able to represent special floating point numbers besides the usual positive and negative cases. We distinguish the various possibilities by their \langle case \rangle, which is a single digit:

0 zeros: +0 and -0,
1 “normal” numbers (positive and negative),
### Table 3: Internal representation of floating point numbers.

<table>
<thead>
<tr>
<th>Representation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 0 _s_fp_... ;</td>
<td>Positive zero.</td>
</tr>
<tr>
<td>0 2 _s_fp_... ;</td>
<td>Negative zero.</td>
</tr>
<tr>
<td>1 0 {\langle exponent\rangle} {\langle X_1\rangle} {\langle X_2\rangle} {\langle X_3\rangle} {\langle X_4\rangle} ;</td>
<td>Positive floating point.</td>
</tr>
<tr>
<td>1 2 {\langle exponent\rangle} {\langle X_1\rangle} {\langle X_2\rangle} {\langle X_3\rangle} {\langle X_4\rangle} ;</td>
<td>Negative floating point.</td>
</tr>
<tr>
<td>2 0 _s_fp_... ;</td>
<td>Positive infinity.</td>
</tr>
<tr>
<td>2 2 _s_fp_... ;</td>
<td>Negative infinity.</td>
</tr>
<tr>
<td>3 1 _s_fp_... ;</td>
<td>Quiet nan.</td>
</tr>
<tr>
<td>3 1 _s_fp_... ;</td>
<td>Signalling nan.</td>
</tr>
</tbody>
</table>

2 infinities: +inf and -inf.

3 quiet and signalling nan.

The \langle sign\rangle is 0 (positive) or 2 (negative), except in the case of nan, which have \langle sign\rangle = 1. This ensures that changing the \langle sign\rangle digit to 2 − \langle sign\rangle is exactly equivalent to changing the sign of the number.

Special floating point numbers have the form

\_s\_fp \_fp_chk:w \langle case\rangle \langle sign\rangle \_s\_fp\_... ;

where \_s\_fp\_... is a scan mark carrying information about how the number was formed (useful for debugging).

Normal floating point numbers ((\langle case\rangle = 1) have the form

\_s\_fp \_fp_chk:w 1 \langle sign\rangle \{\langle exponent\rangle\} \{\langle X_1\rangle\} \{\langle X_2\rangle\} \{\langle X_3\rangle\} \{\langle X_4\rangle\} ;

Here, the \langle exponent\rangle is an integer, between −10000 and 10000. The body consists in four blocks of exactly 4 digits, 0000 ≤ \langle X_i\rangle ≤ 9999, and the floating point is

\((-1)^{\langle sign\rangle}2\langle X_1\rangle\langle X_2\rangle\langle X_3\rangle\langle X_4\rangle \cdot 10^{\langle exponent\rangle−16}

where we have concatenated the 16 digits. Currently, floating point numbers are normalized such that the \langle exponent\rangle is minimal, in other words, 1000 ≤ \langle X_1\rangle ≤ 9999.

Calculations are done in base 10000, i.e. one myriad.

#### 66.3 Using arguments and semicolons

\_fp_use_none_stop_f:n This function removes an argument (typically a digit) and replaces it by \exp_stop_f:, a marker which stops f-type expansion.

\_fp_use_s:n \_fp_use_s:nn Those functions place a semicolon after one or two arguments (typically digits).
Those functions select specific arguments among a set of arguments delimited by a semicolon.

\begin{verbatim}
\cs_new:Npn \__fp_use_none_until_s:w #1; { }
\cs_new:Npn \__fp_use_i_until_s:nw #1#2; {#1}
\cs_new:Npn \__fp_use_ii_until_s:nnw #1#2#3; {#2}
\end{verbatim}

(End definition for \__fp_use_none_until_s:w, \__fp_use_i_until_s:nw, and \__fp_use_ii_until_s:nnw.)

\__fp_reverse_args:Nww

Many internal functions take arguments delimited by semicolons, and it is occasionally useful to swap two such arguments.

\begin{verbatim}
\cs_new:Npn \__fp_reverse_args:Nww #1 #2; #3; { #1 #3; #2; }
\end{verbatim}

(End definition for \__fp_reverse_args:Nww.)

\__fp_rrot:www

Rotate three arguments delimited by semicolons. This is the inverse (or the square) of the Fortth primitive \texttt{ROT}, hence the name.

\begin{verbatim}
\cs_new:Npn \__fp_rrot:www #1; #2; #3; { #2; #3; #1; }
\end{verbatim}

(End definition for \__fp_rrot:www.)

\__fp_use_i:ww \__fp_use_i:www

Many internal functions take arguments delimited by semicolons, and it is occasionally useful to remove one or two such arguments.

\begin{verbatim}
\cs_new:Npn \__fp_use_i:ww #1; #2; #3; { #1; }
\cs_new:Npn \__fp_use_i:www #1; #2; #3; { #1; }
\end{verbatim}

(End definition for \__fp_use_i:ww and \__fp_use_i:www.)

\section{6.6.4 Constants, and structure of floating points}

\__fp_misused:n

This receives a floating point object (floating point number or tuple) and generates an error stating that it was misused. This is called when for instance an \texttt{fp} variable is left in the input stream and its contents reach \TeX’s stomach.

\begin{verbatim}
\cs_new_protected:Npn \__fp_misused:n #1
\{ \msg_error:nnx { fp } { misused } { \fp_to_tl:n {#1} } \}
\end{verbatim}

(End definition for \__fp_misused:n.)

\__fp_chk:w

Floating points numbers all start with \texttt{\_fp\\_fp\_chk:w}, where \texttt{\_fp} is equal to the \TeX primitive \texttt{relax}, and \texttt{\_fp\_chk:w} is protected. The rest of the floating point number is made of characters (or \texttt{relax}). This ensures that nothing expands under f-expansion, nor under x-expansion. However, when typeset, \texttt{\_fp} does nothing, and \texttt{\_fp\_chk:w} is expanded. We define \texttt{\_fp\_chk:w} to produce an error.

\begin{verbatim}
\scan_new:N \_fp
\cs_new_protected:Npn \__fp_misused:n #1
\{ \msg_error:nnx { fp } { misused } { \fp_to_tl:n {#1} } \}
\end{verbatim}

(End definition for \_fp and \_fp\_chk:w.)

\_fp_expr_mark \_fp_expr_stop

Aliases of \texttt{\_fp\_expr\_mark}, used to terminate expressions.

\begin{verbatim}
\scan_new:N \_fp\_expr\_mark
\scan_new:N \_fp\_expr\_stop
\end{verbatim}

(End definition for \_fp\_expr\_mark and \_fp\_expr\_stop.)
\__fp_mark
\__fp_stop

Generic scan marks used throughout the module.

\_fp_use_i_delimit_by_s_stop:nw

Functions to gobble up to a scan mark.

\__fp_invalid
\__fp_underflow
\__fp_overflow
\__fp_division
\__fp_exact

A couple of scan marks used to indicate where special floating point numbers come from.

\c_zero_fp
\c_minus_zero_fp
\c_inf_fp
\c_minus_inf_fp
\c_nan_fp

The special floating points. We define the floating points here as “exact”.

\c__fp_prec_int
\c__fp_half_prec_int
\c__fp_block_int

The number of digits of floating points.

\c__fp_myriad_int

Blocks have 4 digits so this integer is useful.

\c__fp_minus_min_exponent_int
\c__fp_max_exponent_int

Normal floating point numbers have an exponent between \texttt{minus_min_exponent} and \texttt{max_exponent} inclusive. Larger numbers are rounded to \texttt{±∞}. Smaller numbers are rounded to \texttt{±0}. It would be more natural to define a \texttt{min_exponent} with the opposite sign but that would waste one \TeX{} count.

\c__fp_max_exp_exponent_int

If a number’s exponent is larger than that, its exponential overflows/underflows.

(End definition for \c__fp_max_exp_exponent_int.)
A floating point number that is bigger than all normal floating point numbers. This replaces infinities when converting to formats that do not support infinities.

\begin{verbatim}
\tl_const:Nx \c__fp_overflowing_fp
\{ \s__fp \__fp_chk:w 1 0
\{ \int_eval:n { \c__fp_max_exponent_int + 1 } \}
1000 \{0000\} \{0000\} \{0000\} ;
\}
\end{verbatim}

(End definition for \c__fp_overflowing_fp.)

\__fp_zero_fp:N In case of overflow or underflow, we have to output a zero or infinity with a given sign.

\begin{verbatim}
\cs_new:Npn \__fp_zero_fp:N #1
\{ \s__fp \__fp_chk:w 0 #1 \s__fp_underflow ; \}
\end{verbatim}

(End definition for \__fp_zero_fp:N)

\__fp_inf_fp:N

\begin{verbatim}
\cs_new:Npn \__fp_inf_fp:N #1
\{ \s__fp \__fp_chk:w 2 #1 \s__fp_overflow ; \}
\end{verbatim}

(End definition for \__fp_zero_fp:N and \__fp_inf_fp:N.)

\__fp_exponent:w For normal numbers, the function expands to the exponent, otherwise to 0. This is used in l3str-format.

\begin{verbatim}
\cs_new:Npn \__fp_exponent:w \s__fp \__fp_chk:w #1
\if_meaning:w 1 #1
\exp_after:wN \__fp_use_ii_until_s:nnw
\else:
\exp_after:wN \__fp_use_i_until_s:nw
\exp_after:wN 0
\fi:
\end{verbatim}

(End definition for \__fp_exponent:w.)

\__fp_neg_sign:N When appearing in an integer expression or after \int_value:w, this expands to the sign opposite to #1, namely 0 (positive) is turned to 2 (negative), 1 (nan) to 1, and 2 to 0.

\begin{verbatim}
\cs_new:Npn \__fp_neg_sign:N #1
\{ \__fp_int_eval:w 2 - #1 \__fp_int_eval_end: \}
\end{verbatim}

(End definition for \__fp_neg_sign:N.)

\__fp_kind:w Expands to 0 for zeros, 1 for normal floating point numbers, 2 for infinities, 3 for nan, 4 for tuples.

\begin{verbatim}
\cs_new:Npn \__fp_kind:w #1
\{ \__fp_if_type_fp:NTwFw
#1 \__fp_use_i_until_s:nw
\s__fp { \__fp_use_i_until_s:nw 4 } \s__fp_stop
\}
\end{verbatim}

(End definition for \__fp_kind:w.)
### 66.5 Overflow, underflow, and exact zero

Expects the sign and the exponent in some order, then the significand (which we don’t touch). Outputs the corresponding floating point number, possibly underflowed to ±0 or overflowed to ±∞. The functions \_fp_underflow:w and \_fp_overflow:w are defined in l3fp-traps.

\begin{verbatim}
\cs_new:Npn \_fp_sanitize:Nw #1 #2; 
{ \if_case:w \if_int_compare:w #2 > \c__fp_max_exponent_int 1 \else: \if_int_compare:w #2 < - \c__fp_minus_min_exponent_int 2 \else: \if_meaning:w 1 #1 3 \fi: \fi: \fi: 0 \or: \exp_after:wN \_fp_overflow:w \or: \exp_after:wN \_fp_underflow:w \or: \exp_after:wN \_fp_sanitize_zero:w \fi: \s__fp \_fp_chk:w 1 #1 {#2} }
\cs_new:Npn \_fp_sanitize:wN #1; #2 { \__fp_sanitize:Nw #2 #1; }
\cs_new:Npn \_fp_sanitize_zero:w \s__fp \_fp_chk:w #1 #2 #3; { \c_zero_fp }
\end{verbatim}

(End definition for \_fp_sanitize:Nw, \_fp_sanitize:wN, and \_fp_sanitize_zero:w.)

### 66.6 Expanding after a floating point number

\begin{verbatim}
\_fp_exp_after_o:w (floating point) \_fp_exp_after_f:nw (tokens) (floating point) \cs_new:Npn \_fp_exp_after_o:w \_fp_exp_after_f:nw \{\text{tokens}\} \{\text{token list}\}
\end{verbatim}

Places \textit{tokens} (empty in the case of \_fp_exp_after_o:w) between the (\textit{floating point}) and the following tokens, then hits those tokens with \texttt{o} or \texttt{f}-expansion, and leaves the floating point number unchanged.

We first distinguish normal floating points, which have a significand, from the much simpler special floating points.

\begin{verbatim}
\cs_new:Npn \_fp_exp_after_o:w \_fp_exp_after_f:nw \{\text{tokens}\} \{\text{token list}\} 
{ \if_meaning:w 1 \texttt{#1} \exp_after:wN \_fp_exp_after_normal:nNW \else: \exp_after:wN \_fp_exp_after_special:nNW \fi: \{ \text{token list}\} \} 
\cs_new:Npn \_fp_exp_after_f:nw \{ \text{tokens}\} \{\text{token list}\} 
{ \if_meaning:w 1 \texttt{#1} \exp_after:wN \_fp_exp_after_normal:nNW \else: \exp_after:wN \_fp_exp_after_special:nNW \fi: \{ \text{token list}\} \} 
\end{verbatim}
Special floating point numbers are easy to jump over since they contain few tokens.

\cs_new:Npn \__fp_exp_after_special:nNNw #1 #2 #3 #4 ;
{ \exp_after:wN \s__fp \exp_after:wN \__fp_chk:w \exp_after:wN #2 \exp_after:wN #3 \exp_after:wN #4 \exp_after:wN ; #1 }

For normal floating point numbers, life is slightly harder, since we have many tokens to jump over. Here it would be slightly better if the digits were not braced but instead were delimited arguments (for instance delimited by ,). That may be changed some day.

\cs_new:Npn \__fp_exp_after_normal:nNNw #1 1 #2 #3 #4 #5 #6 #7 ;
{ \exp_after:wN \__fp_exp_after_normal:Nwwwww \exp_after:wN #2 \int_value:w #3 \exp_after:wN ; \int_value:w 1 #4 \exp_after:wN ; \int_value:w 1 #5 \exp_after:wN ; \int_value:w 1 #6 \exp_after:wN ; \int_value:w 1 #7 \exp_after:wN ; #1 }

Floating point tuples take the form \s__fp_tuple \__fp_tuple_chk:w { ⟨fp 1⟩ ⟨fp 2⟩ ... } ; where each ⟨fp⟩ is a floating point number or tuple, hence ends with ; itself. When a tuple is typeset, \__fp_tuple_chk:w produces an error, just like usual floating point numbers. Tuples may have zero or one element.
Count the number of items in a tuple of floating points by counting semicolons. The technique is very similar to \tl_count:n, but with the loop built-in. Checking for the end of the loop is done with the \use_none:n #1 construction.

\cs_new:Npn \_fp_tuple_count:w \s__fp_tuple \_fp_tuple_chk:w #1 ;
\prg_break_point: \__fp_int_eval_end:}
\cs_new:Npn \_fp_tuple_count_loop:Nw #1 { \use_none:n #1 + 1 \_fp_tuple_count_loop:Nw }

Used as \_fp_if_type_fp:NTwFw ⟨marker⟩ \{ ⟨true code⟩⟩ \s__fp \{ ⟨false code⟩⟩ \s__fp_stop, this test whether the ⟨marker⟩ is \s__fp or not and runs the appropriate ⟨code⟩. The very unusual syntax is for optimization purposes as that function is used for all floating point operations.

\cs_new:Npn \_fp_if_type_fp:NTwFw #1 \s__fp #2 #3 \s__fp_stop {#2}

True if all items are floating point numbers. Used for min.

\cs_new:Npn \_fp_array_if_all_fp:nTF \_fp_array_if_all_fp_loop:w
\cs_new:Npx \_fp_array_if_all_fp:nTF #1
\{ \_fp_array_if_all_fp_loop:w #1 \{ \s__fp \prg_break: \prg_break_point: \use_i:nn
\cs_new:Npn \_fp_array_if_all_fp_loop:w #1#2 ;
\prg_break_point: \use_i:nn
\cs_new:Npn \_fp_array_if_all_fp:nTF \_fp_array_if_all_fp_loop:w
\s__fp \prg_break:n \use_iii:nnn \s__fp_stop

Used as \_fp_type_from_scan:N ⟨token⟩. Grabs the pieces of the stringified ⟨token⟩ which lies after the first s__fp. If the ⟨token⟩ does not contain that string, the result is _?.

\cs_new:Npn \_fp_type_from_scan:N \_fp_type_from_scan_other:N \_fp_type_from_scan:w
\cs_new:Npx \_fp_type_from_scan:N #1
\{ \_fp_if_type_fp:NTwFw
\#1 \_fp_array_if_all_fp_loop:w
\s__fp \prg_break:n \use_iii:nnn \s__fp_stop
\cs_new:Npx \_fp_type_from_scan_other:N #1
\{ \exp_not:N \exp_after:wN \exp_not:N \_fp_type_from_scan:w

983
Arguments are \textit{(type marker)} \textit{(function)} \textit{(recovery)}. This gives the function obtained by placing the type after \texttt{@@}. If the function is not defined then \textit{(recovery)} \textit{(function)} is used instead; however that test is not run when the \textit{(type marker)} is \texttt{s__fp}.

The \texttt{Nnw} function simply dispatches to the appropriate \texttt{\_\_fp_exp_after...f:nw} with “…” (either empty or \texttt{\_\_type}) extracted from \texttt{#1}, which should start with \texttt{s__fp}. If it doesn’t start with \texttt{s__fp} the function \texttt{\_\_fp_exp_after...f:nw} defined in \texttt{l3fp-parse} gives an error; another special \texttt{(type)} is \texttt{stop}, useful for loops, see below. The \texttt{nw} function has an important optimization for floating points numbers; it also fetches its type marker \texttt{#2} from the floating point.
\begin{verbatim}
\_fp ( \_fp_after_any_f:Nnw \#2 ) \_fp_stop
{\#1} \#2 }
\cs_new_eq:NN \_fp_after_expr_stop_f:nw \use_none:nn
(End definition for \_fp_after_any_f:Nnw, \_fp_after_any_f:nw, and \_fp_after_expr_stop_f:nw.)
\_fp_after_tuple_o:w \_fp_after_tuple_f:nw \_fp_after_array_f:w
The loop works by using the n argument of \_fp_after_any_f:nw to place the
loop macro after the next item in the tuple and expand it.
\_fp_after_array_f:w \langle \_fp n \rangle ; \ldots \langle \_fp n \rangle ;
\_fp_expr_stop
\cs_new:Npn \_fp_after_tuple_o:w
{ \_fp_after_tuple_f:nw {\exp_after:wN \exp_stop_f: } }
\cs_new:Npn \_fp_after_tuple_f:nw
\_fp ;
{\exp:w \exp_end_continue_f:w \_fp_after_array_f:w \exp_after:wN \_fp_tuple \_fp_tuple_chk:w #2 ;
\exp:w \exp_end_continue_f:w \_fp_expr_stop \_fp ;
\_fp_after_array_f:w
{ \_fp_after_expr_stop_f:nw { \_fp_after_array_f:w } }
(End definition for \_fp_after_tuple_o:w, \_fp_after_tuple_f:nw, and \_fp_after_expr_stop_f:nw.)

66.8 Packing digits
When a positive integer \#1 is known to be less than \(10^8\), the following trick splits it into
two blocks of 4 digits, padding with zeros on the left.

\cs_new:Npn \pack:NNNNNw \#1 #2#3#4#5 #6; \{ \#2#3#4#5 \} \#6}
\exp_after:wN \pack:NNNNw
\_fp_int_value:w \_fp_int_eval:w 1 0000 0000 + \#1 ;

The idea is that adding \(10^8\) to the number ensures that it has exactly 9 digits, and can
then easily find which digits correspond to what position in the number. Of course, this
can be modified for any number of digits less or equal to 9 (we are limited by \TeX’s
integers). This method is very heavily relied upon in 13fp-basics.

More specifically, the auxiliary inserts + \#1#2#3#4#5 ; \{#6\}, which allows us to
calculate several blocks of 4 digits in a nested manner, performing carries on the fly. Say
we want to compute \(1 2345 \times 6677 8899\). With simplified names, we would do

985
\end{verbatim}
The \texttt{\exp_after:wN} \texttt{\post_processing:w}, which starts a first computation, whose initial value is \(-5 \,0000\) (the “leading shift”). In that computation appears an \texttt{\exp_after:wN}, which triggers the nested computation \texttt{\int_value:w \__fp_int_eval:w} with starting value \(4 \,9995 \,0000\) (the “middle shift”). That, in turn, expands \texttt{\exp_after:wN} which triggers the third computation. The third computation’s value is \(5 \,0000 \,0000 \,+ \,12345 \times 8899\), which has 9 digits. Adding \(5 \cdot 10^8\) to the product allowed us to know how many digits to expect as long as the numbers to multiply are not too big; it also works to some extent with negative results. The \texttt{pack} function puts the last 4 of those 9 digits into a brace group, moves the semi-colon delimiter, and inserts a +, which combines the carry with the previous computation. The shifts nicely combine into \(5 \,0000 \,0000 / 10^4 + 4 \,9995 \,0000 = 5 \,0000 \,0000\). As long as the operands are in some range, the result of this second computation has 9 digits. The corresponding pack function, expanded after the result is computed, braces the last 4 digits, and leaves \(+\langle5 \text{ digits}\rangle\) for the initial computation. The “leading shift” cancels the combination of the other shifts, and the \texttt{\post_processing:w} takes care of packing the last few digits.

Admittedly, this is quite intricate. It is probably the key in making \texttt{l3fp} as fast as other pure \TeX floating point units despite its increased precision. In fact, this is used so much that we provide different sets of packing functions and shifts, depending on ranges of input.

This set of shifts allows for computations involving results in the range \([-4 \cdot 10^8, 5 \cdot 10^8 - 1]\). Shifted values all have exactly 9 digits.

This set of shifts allows for computations involving results in the range \([-5 \cdot 10^8, 6 \cdot 10^8 - 1]\) (actually a bit more). Shifted values all have exactly 10 digits. Note that the upper bound is due to \TeX’s limit of \(2^{31} - 1\) on integers. The shifts are chosen to be roughly the mid-point of \(10^9\) and \(2^{31}\), the two bounds on 10-digit integers in \TeX.
This set of shifts allows for computations with results in the range $[-1 \cdot 10^9, 147483647]$; the end-point is $2^{31} - 2 \cdot 10^9 \approx 1.47 \cdot 10^8$. Shifted values all have exactly 10 digits. Shifts and packing functions are used in \l3fp-basics{} and \l3fp-extended. Addition and multiplication of significands are done in two steps: first compute a (more or less) exact result, then round and pack digits in the final (braced) form. These functions take care of the packing, with special attention given to the case where rounding has caused a carry. Since rounding can only shift the final digit by 1, a carry always produces an exact power of 10. Thus, \_\_fp_basics_pack_high_carry:bw is always followed by four times \{0000\}. This is used in \l3fp-basics{} and \l3fp-extended.
This is used in \texttt{l3fp-basics} for additions and divisions. Their syntax is confusing, hence the name.

\begin{verbatim}
\cs_new:Npn \__fp_basics_pack_weird_low:NNNNw #1 #2#3#4 #5; 
{ \if_meaning:w 2 #1 + 1 \fi: \__fp_int_eval_end: \#2#3#4; {#5} ; }
\cs_new:Npn \__fp_basics_pack_weird_high:NNNNNNNNw 1 #1#2#3#4 #5#6#7#8 #9; { {#1#2#3#4} {#5#6#7#8} {#9} }
\end{verbatim}

(End definition for \__fp_basics_pack_weird_low:NNNNw and \__fp_basics_pack_weird_high:NNNNNNNNw.)

66.9 Decimate (dividing by a power of 10)

\begin{verbatim}
\__fp_decimate:nNnnn {(#shift)} {(#1)}
{(#X_1)} {(#X_2)} {(#X_3)}

Each \langle X_i \rangle consists in 4 digits exactly, and 1000 \leq \langle X_1 \rangle < 9999. The first argument determines by how much we shift the digits. \langle f_1 \rangle is called as follows:

\langle f_1 \rangle \langle \text{rounding} \rangle \langle X'_{#1} \rangle \langle X'_{#2} \rangle \langle \text{extra-digits} \rangle ;

where 0 \leq \langle X'_{#1} \rangle < 10^8 - 1 are 8 digit integers, forming the truncation of our number. In other words,

\[
\left( \sum_{i=1}^{4} \langle X_i \rangle \cdot 10^{-4i} \cdot 10^{-\langle #\text{shift} \rangle} \right) - \left( \langle X'_{#1} \rangle \cdot 10^{-8} + \langle X'_{#2} \rangle \cdot 10^{-16} \right) = 0.\langle \text{extra-digits} \rangle \cdot 10^{-16} \in [0, 10^{-16}).
\]

To round properly later, we need to remember some information about the difference. The \langle \text{rounding} \rangle digit is 0 if and only if the difference is exactly 0, and 5 if and only if the difference is exactly 0.5 \cdot 10^{-16}. Otherwise, it is the (non-0, non-5) digit closest to 10^17 times the difference. In particular, if the shift is 17 or more, all the digits are dropped, \langle \text{rounding} \rangle is 1 (not 0), and \langle X'_{#1} \rangle and \langle X'_{#2} \rangle are both zero.

If the shift is 1, the \langle \text{rounding} \rangle digit is simply the only digit that was pushed out of the brace groups (this is important for subtraction). It would be more natural for the \langle \text{rounding} \rangle digit to be placed after the \langle X'_{#i} \rangle, but the choice we make involves less reshuffling.

Note that this function treats negative \langle #\text{shift} \rangle as 0.
\end{verbatim}

988
Each of the auxiliaries see the function \( f_1 \), followed by 4 blocks of 4 digits.

(End definition for \( \textתאריעי: \text{Nnnnn} \).

If the \langle shift \rangle is zero, or too big, life is very easy.

\[
\text{End definition for \( \text{__fp_decimate}: \text{Nnnnn} \) and \( \text{__fp_decimate_tiny}: \text{Nnnnn} \).}
\]

\[
\text{Shifting happens in two steps: compute the \langle rounding \rangle digit, and repack digits into two blocks of 8. The sixteen functions are very similar, and defined through \( \text{__fp_tmp:w} \). The arguments are as follows: \#1 indicates which function is being defined; after one step of expansion, \#2 yields the “extra digits” which are then converted by \( \text{__fp_round_digit:Nw} \) to the \langle rounding \rangle digit (note the + separating blocks of digits to avoid overflowing \TeX’s \text{integers}). This triggers the f-expansion of \( \text{__fp_decimate_pack:nnnnnnnnnnw} \) responsible for building two blocks of 8 digits, and removing the rest. For this to work, \#3 alternates between braced and unbraced blocks of 4 digits, in such a way that the 5 first and 5 next token groups yield the correct blocks of 8 digits.
\]

(End definition for \( \text{__fp_decimate_auxi:Nnnnn} \) and others.)
The computation of the \textit{(rounding)} digit leaves an unfinished \texttt{\textbackslash int\_value:w}, which expands the following functions. This allows us to repack nicely the digits we keep. Those digits come as an alternation of unbraced and braced blocks of 4 digits, such that the first 5 groups of token consist in 4 single digits, and one brace group (in some order), and the next 5 have the same structure. This is followed by some digits and a semicolon.

\begin{verbatim}
\cs_new:Npn \__fp_decimate_pack:nnnnnnnnnnw \#1\#2\#3\#4\#5
\{
    \__fp_decimate_pack:nnnnnnnnnnw \{ \#1\#2\#3\#4\#5 \}
\}
\cs_new:Npn \__fp_decimate_pack:nnnnnnnw \#1 \#2\#3\#4\#5\#6
\{
    \{ \#1\} \{ \#2\#3\#4\#5\#6 \}
\}
\end{verbatim}
(End definition for \texttt{\_\_fp\_decimate\_pack:nnnnnnnnnnw}.)

\section{Functions for use within primitive conditional branches}

The functions described in this section are not pretty and can easily be misused. When correctly used, each of them removes one \texttt{\textbackslash fi:} as part of its parameter text, and puts one back as part of its replacement text.

Many computation functions in \texttt{l3fp} must perform tests on the type of floating points that they receive. This is often done in an \texttt{\if\textbackslash case:w} statement or another conditional statement, and only a few cases lead to actual computations: most of the special cases are treated using a few standard functions which we define now. A typical use context for those functions would be

\begin{verbatim}
\if\textbackslash case:w \{integer\} \exp_stop_f:
\__fp_case_return_o:Nw \{ fp var \}
\or: \__fp_case_use:nw \{ \{some computation\} \}
\or: \__fp_case_return_same_o:w
\or: \__fp_case_return:nw \{ \{something\} \}
\fi:
\{junk\}
\{floating point\}
\end{verbatim}

In this example, the case 0 returns the floating point \texttt{\{fp var\}}, expanding once after that floating point. Case 1 does \texttt{\{some computation\}} using the \texttt{(floating point)} (presumably compute the operation requested by the user in that non-trivial case). Case 2 returns the \texttt{(floating point)} without modifying it, removing the \texttt{(junk)} and expanding once after. Case 3 closes the conditional, removes the \texttt{(junk)} and the \texttt{(floating point)}, and expands \texttt{(something)} next. In other cases, the \texttt{\{junk\}} is expanded, performing some other operation on the \texttt{(floating point)}. We provide similar functions with two trailing \texttt{(floating points)}.

\begin{verbatim}
\__fp_case_use:nw
\end{verbatim}
This function ends a \TeX\ conditional, removes junk until the next floating point, and places its first argument before that floating point, to perform some operation on the floating point.

\begin{verbatim}
\cs_new:Npn \__fp_case_use:nw \#1\#2 \fi: \#3 \a__fp \{ \fi: \#1 \a__fp \}
\end{verbatim}
(End definition for \texttt{\_\_fp\_case\_use:nw}.)

990
\__fp_case_return:nw This function ends a T\'eX conditional, removes junk and a floating point, and places its first argument in the input stream. A quirk is that we don’t define this function requiring a floating point to follow, simply anything ending in a semicolon. This, in turn, means that the \langle junk \rangle may not contain semicolons.

\cs_new:Npn \__fp_case_return:nw #1#2 \fi: #3 ; { \fi: #1 }

(End definition for \__fp_case_return:nw.)

\__fp_case_return_o:Nw This function ends a T\'eX conditional, removes junk and a floating point, and returns its first argument (an \langle fp var \rangle) then expands once after it.

\cs_new:Npn \__fp_case_return_o:Nw #1#2 \fi: #3 \s__fp #4 ; { \fi: \exp_after:wN #1 #3 #4 ; }

(End definition for \__fp_case_return_o:Nw.)

\__fp_case_return_same_o:w This function ends a T\'eX conditional, removes junk, and returns the following floating point, expanding once after it.

\cs_new:Npn \__fp_case_return_same_o:w #1 \fi: #2 \s__fp #3 ; { \fi: \__fp_exp_after_o:w \s__fp #2 #3 #4 #5 ; }

(End definition for \__fp_case_return_same_o:w.)

\__fp_case_return_o:Nww Same as \__fp_case_return_o:Nw but with two trailing floating points.

\cs_new:Npn \__fp_case_return_o:Nww #1#2 \fi: #3 #4 ; { \fi: \exp_after:wN #1 #3 #4 ; }

(End definition for \__fp_case_return_o:Nww.)

\__fp_case_return_i_o:ww \__fp_case_return_ii_o:ww Similar to \__fp_case_return_same_o:w, but this returns the first or second of two trailing floating point numbers, expanding once after the result.

\cs_new:Npn \__fp_case_return_i_o:ww #1 \fi: #2 \s__fp #3 ; \s__fp #4 ; { \fi: \__fp_exp_after_o:w \s__fp #2 #3 ; }
\cs_new:Npn \__fp_case_return_ii_o:ww #1 \fi: #2 \s__fp ; { \fi: \__fp_exp_after_o:w }

(End definition for \__fp_case_return_i_o:ww and \__fp_case_return_ii_o:ww.)

66.11 Integer floating points

\__fp_int_p:w \__fp_int:w TF Tests if the floating point argument is an integer. For normal floating point numbers, this holds if the rounding digit resulting from \__fp_decimate:nNnnnn is 0.

\prg_new_conditional:Npnn \__fp_int:w \s__fp \__fp_chk:w #1 #2 #3 #4; { TF , T , F , p } { \if_case:w #1 \exp_stop_f: { \prg_return_true: { \or: { \if_charcode:w 0 \__fp_decimate:nNnnnn { \c__fp_prec_int - #3 } \__fp_use_i_until_s:nw #4 \prg_return_true: { \else: \prg_return_false:; \end if_case:w #1 \exp_stop_f: } } } } }
66.12 Small integer floating points

Tests if the floating point argument is an integer or ±∞. If so, it is clipped to an integer in the range \([-10^8, 10^8]\] and fed as a braced argument to the \textit{(true code)}. Otherwise, the \textit{(false code)} is performed.

First filter special cases: zeros and infinities are integers, \texttt{nan} is not. For normal numbers, decimate. If the rounding digit is not 0 run the \textit{(false code)}. If it is, then the integer is \#2 \#3; use \#3 if \#2 vanishes and otherwise \(10^8\).

\begin{verbatim}
\cs_new:Npn \__fp_small_int:wTF \s__fp \__fp_chk:w #1#2
  { \if_case:w #1 \exp_stop_f: \__fp_case_return:nw { \__fp_small_int_true:wTF 0 ; } \or: \exp_after:wN \__fp_small_int_normal:NnwTF \or: \__fp_case_return:nw
    \exp_after:wN \__fp_case_return:nw
    \__fp_decimate:nNnnnn { \c__fp_prec_int - #2 } \__fp_small_int_test:NnnwNw #3 #1
  } \else: \__fp_case_return:nw \use_ii:nn \fi: #2 }
\cs_new:Npn \__fp_small_int_true:wTF #1; #2#3 { #2 {#1} }
\cs_new:Npn \__fp_small_int_normal:NnwTF #1#2#3;

Chapter 67

l3fp-traps Implementation

Exceptions should be accessed by an n-type argument, among
• invalid_operation
• division_by_zero
• overflow
• underflow
• inexact (actually never used).

67.1 Flags

Flags to denote exceptions.

\flag_new:n { fp_invalid_operation }
\flag_new:n { fp_division_by_zero }
\flag_new:n { fp_overflow }
\flag_new:n { fp_underflow }

(End definition for flag fp_invalid_operation and others. These variables are documented on page 249.)

67.2 Traps

Exceptions can be trapped to obtain custom behaviour. When an invalid operation or a division by zero is trapped, the trap receives as arguments the result as an n-type floating point number, the function name (multiple letters for prefix operations, or a single symbol for infix operations), and the operand(s). When an overflow or underflow is trapped, the trap receives the resulting overly large or small floating point number if it is not too big, otherwise it receives $+\infty$. Currently, the inexact exception is entirely ignored.

The behaviour when an exception occurs is controlled by the definitions of the functions

• \_\_fp_invalid_operation::nmw,
• \__fp_invalid_operation_o:Nww,
• \__fp_invalid_operation_tl_o:ff,
• \__fp_division_by_zero_o:Nnw,
• \__fp_division_by_zero_o:NNww,
• \__fp_overflow:w,
• \__fp_underflow:w.

Rather than changing them directly, we provide a user interface as \fp_trap:nn
{\langle exception\rangle} {\langle way of trapping\rangle}, where the \langle way of trapping\rangle is one of error, flag, or none.

We also provide \__fp_invalid_operation_o:nw, defined in terms of \__fp_invalid_operation:nw.

\fp_trap:nn

\cs_new_protected:Npm \fp_trap:nn #1#2
\begin{verbatim}
{ \cs_if_exist_use:cF { __fp_trap_#1_set_#2: }
  { \clist_if_in:nnTF { invalid_operation , division_by_zero , overflow , underflow } {#1}
    { \msg_error:nnxx { fp } { unknown-fpu-trap-type } {#1} {#2} }
    { \msg_error:nnx { fp } { unknown-fpu-exception } {#1} }
  }
}
\end{verbatim}
(End definition for \fp_trap:nn. This function is documented on page 249.)

\__fp_trap_invalid_operation_set:nnn

We provide three types of trapping for invalid operations: either produce an error and raise the relevant flag; or only raise the flag; or don’t even raise the flag. In most cases, the function produces as a result its first argument, possibly with post-expansion.

\cs_new_protected:Npm \__fp_trap_invalid_operation_set:nnn
\begin{verbatim}
\exp_args:Nno \use:n
{ \cs_set:Npn \__fp_invalid_operation:nnn ##1##2##3; }
\end{verbatim}
We provide three types of trapping for invalid operations and division by zero: either produce an error and raise the relevant flag; or only raise the flag; or don’t even raise the flag. In all cases, the function must produce a result, namely its first argument, \( \pm \infty \) or \( \text{nan} \).

\( \text{\_\_fp\_trap\_division\_by\_zero\_set\_error} \): and others.

\( \text{\_\_fp\_trap\_division\_by\_zero\_set\_flag} \):

\( \text{\_\_fp\_trap\_division\_by\_zero\_set\_none} \):

\( \text{\_\_fp\_trap\_division\_by\_zero\_set:N} \):
Just as for invalid operations and division by zero, the three different behaviours are obtained by feeding `\prg_do_nothing:` or `\use_none:nnnnn` or `\use_none:nnnnnnn` to an auxiliary, with a further auxiliary common to overflow and underflow functions. In most cases, the argument of the `\__fp_overflow:w` and `\__fp_underflow:w` functions will be an (almost) normal number (with an exponent outside the allowed range), and the error message thus displays that number together with the result to which it overflowed or underflowed. For extreme cases such as `10 ** 1e9999`, the exponent would be too large for \TeX{}, and \__fp_overflow:w receives $\pm \infty$ (\__fp_underflow:w would receive $\pm 0$); then we cannot do better than simply say an overflow or underflow occurred.

```latex
\cs_new_protected:Npn \__fp_trap_overflow_set_error: { \__fp_trap_overflow_set:N \prg_do_nothing: }
\cs_new_protected:Npn \__fp_trap_overflow_set_flag: { \__fp_trap_overflow_set:N \use_none:nnnnn }
\cs_new_protected:Npn \__fp_trap_overflow_set_none: { \__fp_trap_overflow_set:N \use_none:nnnnnnn }
\cs_new_protected:Npn \__fp_trap_overflow_set:N #1 { \__fp_trap_overflow_set:NnNn #1 { overflow } \__fp_inf_fp:N { inf } }
\cs_new_protected:Npn \__fp_trap_underflow_set_error: { \__fp_trap_underflow_set:N \prg_do_nothing: }
\cs_new_protected:Npn \__fp_trap_underflow_set_flag: { \__fp_trap_underflow_set:N \use_none:nnnnn }
\cs_new_protected:Npn \__fp_trap_underflow_set_none: { \__fp_trap_underflow_set:N \use_none:nnnnnnn }
\cs_new_protected:Npn \__fp_trap_underflow_set:N #1 { \__fp_trap_overflow_set:NnNn #1 { underflow } \__fp_zero_fp:N { 0 } }
\cs_new_protected:Npn \__fp_trap_overflow_set:NnNn #1#2#3#4 { \exp_args:Nno \use:n { \cs_set:cpn { __fp_ #2 :w } \s__fp \__fp_chk:w ##1##2##3; } #1 \__fp_error:nffn { flow \if_meaning:w 1 ##1 -to \fi: } { \fp_to_tl:n { \s__fp \__fp_chk:w ##1##2##3; } } { \token_if_eq_meaning:NNF 0 ##2 { - } #4 } {#2} \flag_raise_if_clear:n { fp_#2 } #3 ##2 }
```

(End definition for `\__fp_trap_division_by_zero_set_error: and others.`)

```
\cs_new:Npn \__fp_invalid_operation:nnw #1#2#3; { }
\cs_new:Npn \__fp_invalid_operation_o:Nww #1#2; #3; { }
\cs_new:Npn \__fp_invalid_operation_tl_o:ff #1 #2 { }
\cs_new:Npn \__fp_division_by_zero_o:Nww #1#2; #3; { }
```

Initialize the control sequences (to log properly their existence). Then set invalid operations to trigger an error, and division by zero, overflow, and underflow to act silently on their flag.

```latex
\cs_new:Npn \__fp_invalid_operation:nnw #1#2#3; { }
\cs_new:Npn \__fp_invalid_operation_o:Nww #1#2; #3; { }
\cs_new:Npn \__fp_invalid_operation_tl_o:ff #1 #2 { }
```

(End definition for `\__fp_trap_division_by_zero_set_error: and others.`)
Convenient short-hands for returning \c_nan_fp for a unary or binary operation, and expanding after.

68.1 Rounding tools

\c__fp_five_int This is used as the half-point for which numbers are rounded up/down.

23150 \int_const:Nn \c__fp_five_int { 5 }

(End definition for \c__fp_five_int.)

Floating point operations often yield a result that cannot be exactly represented in a significand with 16 digits. In that case, we need to round the exact result to a representable number. The IEEE standard defines four rounding modes:
• Round to nearest: round to the representable floating point number whose absolute difference with the exact result is the smallest. If the exact result lies exactly at the mid-point between two consecutive representable floating point numbers, round to the floating point number whose last digit is even.

• Round towards negative infinity: round to the greatest floating point number not larger than the exact result.

• Round towards zero: round to a floating point number with the same sign as the exact result, with the largest absolute value not larger than the absolute value of the exact result.

• Round towards positive infinity: round to the least floating point number not smaller than the exact result.

This is not fully implemented in l3fp yet, and transcendental functions fall back on the “round to nearest” mode. All rounding for basic algebra is done through the functions defined in this module, which can be redefined to change their rounding behaviour (but there is not interface for that yet).

The rounding tools available in this module are many variations on a base function \__fp_round:NNN, which expands to \0\exp_stop_f: or \1\exp_stop_f: depending on whether the final result should be rounded up or down.

• \__fp_round:NNN \langle sign \rangle \langle digit_1 \rangle \langle digit_2 \rangle can expand to \0\exp_stop_f: or \1\exp_stop_f:.

• \__fp_round_s:NNNw \langle sign \rangle \langle digit_1 \rangle \langle digit_2 \rangle \langle more digits \rangle; can expand to \0\exp_stop_f:; or \1\exp_stop_f;.

• \__fp_round_neg:NNN \langle sign \rangle \langle digit_1 \rangle \langle digit_2 \rangle can expand to \0\exp_stop_f: or \1\exp_stop_f:.

See implementation comments for details on the syntax.

\\_fp_round:NNN \langle digit_1 \rangle \langle digit_2 \rangle

If rounding the number \langle digit_1 \rangle \langle digit_2 \rangle to an integer rounds it towards zero (truncates it), this function expands to \0\exp_stop_f:, and otherwise to \1\exp_stop_f:. Typically used within the scope of an \__fp_int_eval:w, to add 1 if needed, and thereby round correctly. The result depends on the rounding mode.

It is very important that \langle final sign \rangle be the final sign of the result. Otherwise, the result would be incorrect in the case of rounding towards \(-\infty\) or towards \(+\infty\). Also recall that \langle final sign \rangle is 0 for positive, and 2 for negative.

By default, the functions below return \0\exp_stop_f:, but this is superseded by \__fp_round_return_one:, which instead returns \1\exp_stop_f:, expanding everything and removing \0\exp_stop_f: in the process. In the case of rounding towards \(\pm\infty\) or towards 0, this is not really useful, but it prepares us for the “round to nearest, ties to even” mode.

The “round to nearest” mode is the default. If the \langle digit_2 \rangle is larger than 5, then round up. If it is less than 5, round down. If it is exactly 5, then round such that \langle digit_1 \rangle plus the result is even. In other words, round up if \langle digit_1 \rangle is odd.

The “round to nearest” mode has three variants, which differ in how ties are rounded: down towards \(\infty\), truncated towards 0, or up towards \(-\infty\).

\End definition for \__fp_round_s:NNNw.
\__fp_round_digit:Nw \__fp_round_digit:Nw \langle digit \rangle \langle intexpr \rangle;
This function should always be called within an \int_value:w or \__fp_int_eval:w expansion; it may add an extra \__fp_int_eval:w, which means that the integer or integer expression should not be ended with a synonym of \relax, but with a semi-colon for instance.
\cs_new:Npn \__fp_round_digit:Nw #1 #2;
{ \if_int_odd:w \if_meaning:w 0 #1 1 \else: \if_meaning:w 5 #1 1 \else: \__fp_stop_f: \fi: \fi: \__fp_int_eval:w #2 > \c_zero_int \__fp_int_eval:w 1 + \fi: \fi: \fi: \fi: \}
This expands to \exp_stop_f: or \exp_stop_f: after doing the following test. Starting from a number of the form \((\text{final sign})0.(15 \text{ digits})(\text{digit_1})\), subtract from it \((\text{final sign})0.0...0(\text{digit_2})\), where there are 16 zeros. If in the current rounding mode the result should be rounded down, then this function returns \exp_stop_f:. Otherwise, \textit{i.e.}, if the result is rounded back to the first operand, then this function returns 0\exp_stop_f:.

It turns out that this negative “round to nearest” is identical to the positive one. And this is the default mode.

And this is the default mode.

### 68.2 The round function

First check that all arguments are floating point numbers. The \texttt{trunc}, \texttt{ceil} and \texttt{floor} functions expect one or two arguments (the second is 0 by default), and the \texttt{round} function also accepts a third argument (\texttt{nan} by default), which changes \#1 from \texttt{\__fp_round_to_nearest:NNN} to one of its analogues.

Chapter 69

l3fp-parse implementation

69.1 Work plan

The task at hand is non-trivial, and some previous failed attempts show that the code leads to unreadable logs, so we had better get it (almost) right the first time. Let us first describe our goal, then discuss the design precisely before writing any code.

In this file at least, a floating point object is a floating point number or tuple. This can be extended to anything that starts with \s__fp or \s__fp_{type} and ends with ; with some internal structure that depends on the (type).

\__fp_parse:n\q{\sfpexpr}

Evaluates the floating point expression and leaves the result in the input stream as a floating point object. This function forms the basis of almost all public l3fp functions. During evaluation, each token is fully f-expanded.

\__fp_parse_o:n does the same but expands once after its result.

\TeXhackers note: Registers (integers, toks, etc.) are automatically unpacked, without requiring a function such as \int_use:N. Invalid tokens remaining after f-expansion lead to unrecoverable low-level \TeX errors.

Floating point expressions are composed of numbers, given in various forms, infix operators, such as +, **, or , (which joins two numbers into a list), and prefix operators, such as the unary -, functions, or opening parentheses. Here is a list of precedences which control the order of evaluation (some distinctions are irrelevant for the order of evaluation, but serve as signals), from the tightest binding to the loosest binding.

16 Function calls.

13/14 Binary ** and ~ (right to left).

12 Unary +, -, ! (right to left).

11 Juxtaposition (implicit *) with no parenthesis.
10 Binary * and /.
9 Binary + and −.
7 Comparisons.
6 Logical and, denoted by &&.
5 Logical or, denoted by ||.
4 Ternary operator ?:, piece ?.
3 Ternary operator ?:, piece :.
2 Commas.
1 Place where a comma is allowed and generates a tuple.

0 Start and end of the expression.

\( \text{End definition for } \c__fp_prec_func_int \text{ and others.} \)

### 69.1.1 Storing results

The main question in parsing expressions expandably is to decide where to put the intermediate results computed for various subexpressions.

One option is to store the values at the start of the expression, and carry them together as the first argument of each macro. However, we want to f-expand tokens one by one in the expression (as \texttt{\int_eval:n} does), and with this approach, expanding the next unread token forces us to jump with \texttt{\exp_after:wN} over every value computed earlier in the expression. With this approach, the run-time grows at least quadratically in the length of the expression, if not as its cube (inserting the \texttt{\exp_after:wN} is tricky and slow).

A second option is to place those values at the end of the expression. Then expanding the next unread token is straightforward, but this still hits a performance issue: for long expressions we would be reaching all the way to the end of the expression at every step of the calculation. The run-time is again quadratic.

A variation of the above attempts to place the intermediate results which appear when computing a parenthesized expression near the closing parenthesis. This still lets
us expand tokens as we go, and avoids performance problems as long as there are enough parentheses. However, it would be better to avoid requiring the closing parenthesis to be present as soon as the corresponding opening parenthesis is read: the closing parenthesis may still be hidden in a macro yet to be expanded.

Hence, we need to go for some fine expansion control: the result is stored before the start!

Let us illustrate this idea in a simple model: adding positive integers which may be resulting from the expansion of macros, or may be values of registers. Assume that one number, say, 12345, has already been found, and that we want to parse the next number. The current status of the code may look as follows.

\exp_after:wN \add:ww \int_value:w 12345 \exp_after:wN ;
\exp:w \operand:w ⟨stuff⟩

One step of expansion expands \exp_after:wN, which triggers the primitive \int_value:w, which reads the five digits we have already found, 12345. This integer is unfinished, causing the second \exp_after:wN to expand, and to trigger the construction \exp:w, which expands \operand:w, defined to read what follows and make a number out of it, then leave \exp_end:, the number, and a semicolon in the input stream. Once \operand:w is done expanding, we obtain essentially

\exp_after:wN \add:ww \int_value:w 12345 ;
\exp:w \exp_end: 333444 ;

where in fact \exp_after:wN has already been expanded, \int_value:w has already seen 12345, and \exp:w is still looking for a number. It finds \exp_end:, hence expands to nothing. Now, \int_value:w sees the ;, which cannot be part of a number. The expansion stops, and we are left with

\add:ww 12345 ; 333444 ;

which can safely perform the addition by grabbing two arguments delimited by ;.

If we were to continue parsing the expression, then the following number should also be cleaned up before the next use of a binary operation such as \add:ww. Just like \int_value:w 12345 \exp_after:wN ; expanded what follows once, we need \add:ww to do the calculation, and in the process to expand the following once. This is also true in our real application: all the functions of the form \_\_fp\_\_o:ww expand what follows once. This comes at the cost of leaving tokens in the input stack, and we need to be careful not to waste this memory. All of our discussion above is nice but simplistic, as operations should not simply be performed in the order they appear.

69.1.2 Precedence and infix operators

The various operators we will encounter have different precedences, which influence the order of calculations: 1 + 2 × 3 = 1 + (2 × 3) because × has a higher precedence than +. The true analog of our macro \operand:w must thus take care of that. When looking for an operand, it needs to perform calculations until reaching an operator which has lower precedence than the one which called \operand:w. This means that \operand:w must know what the previous binary operator is, or rather, its precedence: we thus rename it \operand:Nw. Let us describe as an example how we plan to do the calculation 41-2^3+4+5. More precisely we describe how to perform the first operation in this expression. Here, we abuse notations: the first argument of \operand:Nw should be an integer.
constant \(_\text{c\_fp\_prec\_plus\_int}, \ldots\) equal to the precedence of the given operator, not directly the operator itself.

- Clean up 41 and find \(-\). We call \texttt{\_\_fp\_parse\_operand:} to find the second operand.
- Clean up 2 and find \(^\). 
- Compare the precedences of \(-\) and \(^\). Since the latter is higher, we need to compute the exponentiation. For this, find the second operand with a nested call to \texttt{\_\_fp\_parse\_operand:}.
- Clean up 3 and find \(*\).
- Compare the precedences of \(^\) and \(*\). Since the former is higher, \texttt{\_\_fp\_parse\_operand:} has found the second operand of the exponentiation, which is computed: \(2^3 = 8\).
- We now have 41-8+4+5, and \texttt{\_\_fp\_parse\_operand:} is still looking for a second operand for the subtraction. Is it 8?
- Compare the precedences of \(-\) and \(*\). Since the latter is higher, we are not done with 8. Call \texttt{\_\_fp\_parse\_operand:} to find the second operand of the multiplication.
- Clean up 4, and find \(+\).
- Compare the precedences of \(*\) and \(+\). Since the former is higher, \texttt{\_\_fp\_parse\_operand:} has found the second operand of the multiplication, which is computed: \(8 * 4 = 32\).
- We now have 41-32+5, and \texttt{\_\_fp\_parse\_operand:} is still looking for a second operand for the subtraction. Is it 32?
- Compare the precedences of \(-\) and \(+\). Since they are equal, \texttt{\_\_fp\_parse\_operand:} has found the second operand for the subtraction, which is computed: \(41 - 32 = 9\).
- We now have 9+5.

The procedure above stops short of performing all computations, but adding a surrounding call to \texttt{\_\_fp\_parse\_operand:} with a very low precedence ensures that all computations are performed before \texttt{\_\_fp\_parse\_operand:} is done. Adding a trailing marker with the same very low precedence prevents the surrounding \texttt{\_\_fp\_parse\_operand:} from going beyond the marker.

The pattern above to find an operand for a given operator, is to find one number and the next operator, then compare precedences to know if the next computation should be done. If it should, then perform it after finding its second operand, and look at the next operator, then compare precedences to know if the next computation should be done. This continues until we find that the next computation should not be done. Then, we stop.

We are now ready to get a bit more technical and describe which of the l3fp-parse functions correspond to each step above.

First, \texttt{\_\_fp\_parse\_operand:} is the \texttt{\_\_fp\_parse\_operand:} function above, with small modifications due to expansion issues discussed later. We denote by \texttt{\langle\text{precedence}\rangle} the argument of \texttt{\_\_fp\_parse\_operand:}, that is, the precedence of the binary operator whose operand we are trying to find. The basic action is to read numbers from the input stream. This is done by \texttt{\_\_fp\_parse\_one:}. A first approximation of this function is that it reads one \texttt{\langle\text{number}\rangle}, performing no computation, and finds the following binary \texttt{\langle\text{operator}\rangle}. Then it expands to

1012
expanding the *infix* auxiliary before leaving the above in the input stream.

We now explain the *infix* auxiliaries. We need some flexibility in how we treat the case of equal precedences: most often, the first operation encountered should be performed, such as 1-2-3 being computed as (1-2)-3, but 2^3^4 should be evaluated as 2^(3^4) instead. For this reason, and to support the equivalence between ** and ^ more easily, each binary operator is converted to a control sequence \_fp\textunderscore parse\_infix\_ \langle \textit{operator} \rangle: N when it is encountered for the first time. Instead of passing both precedences to a test function to do the comparison steps above, we pass the \langle \textit{precedence} \rangle (of the earlier operator) to the *infix* auxiliary for the following \langle \textit{operator} \rangle, to know whether to perform the computation of the \langle \textit{operator} \rangle. If it should not be performed, the *infix* auxiliary expands to

\[ \@ \use\_none:n \_fp\textunderscore parse\_infix\_ \langle \textit{operator} \rangle: N \]

and otherwise it calls \_fp\textunderscore parse\_operand: Nw with the precedence of the \langle \textit{operator} \rangle to find its second operand \langle \textit{number} \rangle and the next \langle \textit{operator} \rangle, and expands to

\[ \@ \use\_none:n \_fp\textunderscore parse\_infix\_ \langle \textit{operator} \rangle: N \]

The *infix* function is responsible for comparing precedences, but cannot directly call the computation functions, because the first operand \langle \textit{number} \rangle is before the *infix* function in the input stream. This is why we stop the expansion here and give control to another function to close the loop.

A definition of \_fp\textunderscore parse\_operand: Nw \langle \textit{precedence} \rangle with some of the expansion control removed is

\[ \exp\_after:w N \_fp\textunderscore parse\_continue:Nw N \exp\_after:w N \langle \textit{precedence} \rangle \exp:w \exp\_end\_continue_f:w \_fp\textunderscore parse\_one:Nw \langle \textit{precedence} \rangle \]

This expands \_fp\textunderscore parse\_one:Nw \langle \textit{precedence} \rangle completely, which finds a number, wraps the next \langle \textit{operator} \rangle into an *infix* function, feeds this function the \langle \textit{precedence} \rangle, and expands it, yielding either

\[ \_fp\textunderscore parse\_continue:Nw N \langle \textit{precedence} \rangle \langle \textit{number} \rangle \@ \]  
\[ \use\_none:n \_fp\textunderscore parse\_infix\_ \langle \textit{operator} \rangle: N \]

or

\[ \_fp\textunderscore parse\_continue:Nw N \langle \textit{precedence} \rangle \langle \textit{number} \rangle \@ \_fp\textunderscore parse\_apply\_binary:Nw Nw N \langle \textit{operator} \rangle \langle \textit{number} \rangle \_fp\textunderscore parse\_infix\_ \langle \textit{operator} \rangle: N \]

The definition of \_fp\textunderscore parse\_continue:Nw N is then very simple:

\[ \cs\_new:Npn \_fp\textunderscore parse\_continue:Nw N \#1\#2\#3 \{ \#3 \#1 \#2 \@ \} \]

1013
In the first case, #3 is `\use_none:n`, yielding
```
\use_none:n \langle \text{precedence} \rangle \langle \text{number} \rangle @
```
then `\langle \text{number} \rangle @ \__fp\_parse\_infix\_\langle \text{operator} \rangle:N`. In the second case, #3 is `\__fp\_parse\_apply\_binary:NwNwN`, whose role is to compute `\langle \text{number} \rangle \langle \text{operator} \rangle \langle \text{number} \rangle 2` and to prepare for the next comparison of precedences: first we get

```
\__fp\_parse\_apply\_binary:NwNwN
\langle \text{precedence} \rangle \langle \text{number} \rangle @
\langle \text{operator} \rangle \langle \text{number} \rangle 2@ \__fp\_parse\_infix\_\langle \text{operator} \rangle:2:N
```
then

```
\exp\_after:wN \__fp\_parse\_continue:NwN
\exp\_after:wN \langle \text{precedence} \rangle
\exp:w \exp\_end\_continue\_f:w
\__fp\_\langle \text{operator} \rangle:oww \langle \text{number} \rangle \langle \text{number} \rangle 2
\exp:w \exp\_end\_continue\_f:w
\__fp\_parse\_infix\_\langle \text{operator} \rangle:2:N \langle \text{precedence} \rangle
```

where `\__fp\_\langle \text{operator} \rangle:oww` computes `\langle \text{number} \rangle \langle \text{operator} \rangle \langle \text{number} \rangle 2` and expands after the result, thus triggers the comparison of the precedence of the `\langle \text{operator} \rangle 2` and the `\langle \text{precedence} \rangle`, continuing the loop.

We have introduced the most important functions here, and the next few paragraphs we describe various subtleties.

### 69.1.3 Prefix operators, parentheses, and functions

Prefix operators (unary `-`, `+`, `!`) and parentheses are taken care of by the same mechanism, and functions (`\sin`, `\exp`, etc.) as well. Finding the argument of the unary `-`, for instance, is very similar to grabbing the second operand of a binary infix operator, with a subtle precedence explained below. Once that operand is found, the operator can be applied to it (for the unary `-`, this simply flips the sign). A left parenthesis is just a prefix operator with a very low precedence equal to that of the closing parenthesis (which is treated as an infix operator, since it normally appears just after numbers), so that all computations are performed until the closing parenthesis. The prefix operator associated to the left parenthesis does not alter its argument, but it removes the closing parenthesis (with some checks).

Prefix operators are the reason why we only summarily described the function `\__fp\_parse\_one:Nw` earlier. This function is responsible for reading in the input stream the first possible `\langle \text{number} \rangle` and the next infix `\langle \text{operator} \rangle`. If what follows `\__fp\_parse\_one:Nw` is a prefix operator, then we must find the operand of this prefix operator through a nested call to `\__fp\_parse\_operand:Nw` with the appropriate precedence, then apply the operator to the operand found to yield the result of `\__fp\_parse\_one:Nw`. So far, all is simple.

The unary operators `+`, `-`, `!` complicate things a little bit: `-3**2` should be `−(3^2) = −9`, and not `−3^2 = 9`. This would easily be done by giving `-` a lower precedence, equal to that of the infix `+` and `-`. Unfortunately, this fails in cases such as `3**-2*4`, yielding `3^{−2}×4` instead of the correct `3^{−2}×4`. A second attempt would be to call `\__fp\_parse\_operand:Nw` with the `\langle \text{precedence} \rangle` of the previous operator, but `0>-2+3` is then
parsed as 0->(2+3): the addition is performed because it binds more tightly than the comparison which precedes -. The correct approach is for a unary - to perform operations whose precedence is greater than both that of the previous operation, and that of the unary - itself. The unary - is given a precedence higher than multiplication and division. This does not lead to any surprising result, since -(x/y) = (-x)/y and similarly for multiplication, and it reduces the number of nested calls to \_fp_parse_operand:Nw.

Functions are implemented as prefix operators with very high precedence, so that their argument is the first number that can possibly be built.

Note that contrarily to the infix functions discussed earlier, the prefix functions do perform tests on the previous ⟨precedence⟩ to decide whether to find an argument or not, since we know that we need a number, and must never stop there.

69.1.4 Numbers and reading tokens one by one

So far, we have glossed over one important point: what is a “number”? A number is typically given in the form ⟨significand⟩e⟨exponent⟩, where the ⟨significand⟩ is any non-empty string composed of decimal digits and at most one decimal separator (a period), the exponent “e⟨exponent⟩” is optional and is composed of an exponent mark e followed by a possibly empty string of signs + or - and a non-empty string of decimal digits. The ⟨significand⟩ can also be an integer, dimension, skip, or muskip variable, in which case dimensions are converted from points (or mu units) to floating points, and the ⟨exponent⟩ can also be an integer variable. Numbers can also be given as floating point variables, or as named constants such as nan, inf or pi. We may add more types in the future.

When \_fp_parse_one:Nw is looking for a “number”, here is what happens.

- If the next token is a control sequence with the meaning of \scan_stop:, it can be: \s__fp, in which case our job is done, as what follows is an internal floating point number, or \s__fp_expr_mark, in which case the expression has come to an early end, as we are still looking for a number here, or something else, in which case we consider the control sequence to be a bad variable resulting from c-expansion.

- If the next token is a control sequence with a different meaning, we assume that it is a register, unpack it with \tex_the:D, and use its value (in pt for dimensions and skips, mu for muskips) as the ⟨significand⟩ of a number: we look for an exponent.

- If the next token is a digit, we remove any leading zeros, then read a significand larger than 1 if the next character is a digit, read a significand smaller than 1 if the next character is a period, or we have found a significand equal to 0 otherwise, and look for an exponent.

- If the next token is a letter, we collect more letters until the first non-letter: the resulting word may denote a function such as asin, a constant such as pi or be unknown. In the first case, we call \_fp_parse_operand:Nw to find the argument of the function, then apply the function, before declaring that we are done. Otherwise, we are done, either with the value of the constant, or with the value nan for unknown words.

- If the next token is anything else, we check whether it is a known prefix operator, in which case \_fp_parse_operand:Nw finds its operand. If it is not known, then either a number is missing (if the token is a known infix operator) or the token is simply invalid in floating point expressions.
Once a number is found, \_\_fp_parse_one:Nw also finds an infix operator. This goes as follows.

- If the next token is a control sequence, it could be the special marker \s__-fp_expr_mark, and otherwise it is a case of juxtaposing numbers, such as 2\c_zero_int, with an implied multiplication.
- If the next token is a letter, it is also a case of juxtaposition, as letters cannot be proper infix operators.
- Otherwise (including in the case of digits), if the token is a known infix operator, the appropriate \_\_fp_infix_(operator):N function is built, and if it does not exist, we complain. In particular, the juxtaposition \c_zero_int 2 is disallowed.

In the above, we need to test whether a character token \#1 is a digit:

\if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
  is a digit
\else:
  not a digit
\fi:

To exclude 0, replace 9 by 10. The use of \token_to_str:N ensures that a digit with any catcode is detected. To test if a character token is a letter, we need to work with its character code, testing if ‘\#1 lies in [65,90] (uppercase letters) or [97,112] (lowercase letters)

\if_int_compare:w \__fp_int_eval:w
  ( ‘\#1 \if_int_compare:w ‘\#1 > ‘Z - 32 \fi: ) / 26 = 3 \exp_stop_f:
  is a letter
\else:
  not a letter
\fi:

At all steps, we try to accept all category codes: when \#1 is kept to be used later, it is almost always converted to category code other through \token_to_str:N. More precisely, catcodes {3,6,7,8,11,12} should work without trouble, but not \{1,2,4,10,13\}, and of course \{0,5,9\} cannot become tokens.

Floating point expressions should behave as much as possible like ε-TpX-based integer expressions and dimension expressions. In particular, f-expansion should be performed as the expression is read, token by token, forcing the expansion of protected macros, and ignoring spaces. One advantage of expanding at every step is that restricted expandable functions can then be used in floating point expressions just as they can be in other kinds of expressions. Problematically, spaces stop f-expansion: for instance, the macro \X below would not be expanded if we simply performed f-expansion.

\DeclareDocumentCommand \{test\} {m} { \fp_eval:n \{\#1\} }
\ExplSyntaxOff
\test { 1 + \X }

Of course, spaces typically do not appear in a code setting, but may very easily come in document-level input, from which some expressions may come. To avoid this problem, at every step, we do essentially what \use:f would do: take an argument, put it back
in the input stream, then f-expand it. This is not a complete solution, since a macro's expansion could contain leading spaces which would stop the f-expansion before further macro calls are performed. However, in practice it should be enough: in particular, floating point numbers are correctly expanded to the underlying \s__fp ... structure. The f-expansion is performed by \__fp_parse_expand:w.

## 69.2 Main auxiliary functions

\__fp_parse_operand:Nw

\exp:w \__fp_parse_operand:Nw (precedence) \__fp_parse_expand:w

Reads the “...”, performing every computation with a precedence higher than \langle precedence \rangle, then expands to

\langle result \rangle \@ \__fp_parse_infix_(operation):N ...

where the \langle operation \rangle is the first operation with a lower precedence, possibly end, and the “...” start just after the \langle operation \rangle.

(End definition for \__fp_parse_operand:Nw.)

\__fp_parse_infix_+:N

\__fp_parse_infix_+:N (precedence) ...

If + has a precedence higher than the \langle precedence \rangle, cleans up a second \langle operand \rangle and finds the \langle operation2 \rangle which follows, and expands to

\@ \__fp_parse_apply_binary:NwNwN \langle operand1 \rangle \@ \__fp_parse_infix_(operation2):N ...

Otherwise expands to

\@ \use_none:n \__fp_parse_infix_+:N ...

A similar function exists for each infix operator.

(End definition for \__fp_parse_infix_+:N.)

\__fp_parse_one:Nw

\__fp_parse_one:Nw (precedence) ...

Cleans up one or two operands depending on how the precedence of the next operation compares to the \langle precedence \rangle. If the following \langle operation \rangle has a precedence higher than \langle precedence \rangle, expands to

\langle operand1 \rangle \@ \__fp_parse_apply_binary:NwNwN \langle operation \rangle \langle operand2 \rangle \@ \__fp_parse_infix_(operation2):N ...

and otherwise expands to

\langle operand \rangle \@ \use_none:n \__fp_parse_infix_(operation):N ...

(End definition for \__fp_parse_one:Nw.)
69.3 Helpers

\_\_fp\_parse\_expand:w  \exp:w \_\_fp\_parse\_expand:w \langle tokens \rangle

This function must always come within a \exp:w expansion. The \langle tokens \rangle should be the part of the expression that we have not yet read. This requires in particular closing all conditionals properly before expanding.

\cs_new:Npn \_\_fp\_parse\_expand:w \#1 \{ \exp\_end\_continue\_f:w \#1 \}

(End definition for \_\_fp\_parse\_expand:w.)

\_fp\_parse\_return\_semicolon:w

This very odd function swaps its position with the following \fi: and removes \_\_fp\_parse\_expand:w normally responsible for expansion. That turns out to be useful.

\cs_new:Npn \_\_fp\_parse\_return\_semicolon:w \#1 \fi: \_\_fp\_parse\_expand:w \{ \fi: ; \#1 \}

(End definition for \_\_fp\_parse\_return\_semicolon:w.)

\_\_fp\_parse\_digits\_vii:N  \_\_fp\_parse\_digits\_vi:N  \_\_fp\_parse\_digits\_v:N  \_\_fp\_parse\_digits\_iv:N  \_\_fp\_parse\_digits\_iii:N  \_\_fp\_parse\_digits\_ii:N  \_\_fp\_parse\_digits\_i:N  \_\_fp\_parse\_digits_:N

These functions must be called within an \int\_value:w or \_\_fp\_int\_eval:w construction. The first token which follows must be f-expanded prior to calling those functions. The functions read tokens one by one, and output digits into the input stream, until meeting a non-digit, or up to a number of digits equal to their index. The full expansion is

\langle digits \rangle ; \langle filling 0 \rangle ; \langle length \rangle

where \langle filling 0 \rangle is a string of zeros such that \langle digits \rangle \langle filling 0 \rangle has the length given by the index of the function, and \langle length \rangle is the number of zeros in the \langle filling 0 \rangle string. Each function puts a digit into the input stream and calls the next function, until we find a non-digit. We are careful to pass the tested tokens through \token\_to\_str:N to normalize their category code.

\_\_fp\_parse\_expand:w
\}

(End definition for \_\_fp\_parse\_digits\_vii:N and others.)
69.4 Parsing one number

This function finds one number, and packs the symbol which follows in an `\_fp_parse_infix...` csname. #1 is the previous *(precedence)*, and #2 the first token of the operand. We distinguish four cases: #2 is equal to `\scan_stop:` in meaning, #2 is a different control sequence, #2 is a digit, and #2 is something else (this last case is split further later). Despite the earlier f-expansion, #2 may still be expandable if it was protected by `\exp_not:N`, as may happen with the \LaTeX\ 2e command \protect. Using a well placed `\reverse_if:N`, this case is sent to `\_fp_parse_one_fp:NN` which deals with it robustly.

```latex
\cs_new:Npn \_fp_parse_one:Nw #1 #2
\begin{verbatim}
  \if_catcode:w \scan_stop: \exp_not:N #2
  \exp_after:wN \if_meaning:w \exp_not:N #2 #2 \else:
    \exp_after:wN \reverse_if:N 
  \fi:
  \if_meaning:w \scan_stop: #2
    \exp_after:wN \exp_after:wN
    \exp_after:wN \_fp_parse_one_fp:NN
  \else:
    \exp_after:wN \exp_after:wN
    \exp_after:wN \_fp_parse_one_register:NN
  \fi:
  \else:
    \if_int_compare:w 9 < 1 \token_to_str:N #2 \exp_stop_f:
      \exp_after:wN \exp_after:wN
      \exp_after:wN \_fp_parse_one_digit:NN
    \else:
      \exp_after:wN \exp_after:wN
      \exp_after:wN \_fp_parse_one_other:NN
    \fi:
  \fi:
  #1 #2
\end{verbatim}
\end{verbatim}
```

\(\text{(End definition for }\_fp_parse_one:Nw.)\)

This function receives a *(precedence)* and a control sequence equal to `\scan_stop:` in meaning. There are three cases.

- \_fp starts a floating point number, and we call \_fp\_exp\_after\_f:nn, which f-expands after the floating point.
- \_fp\_expr\_mark is a premature end, we call \_fp\_exp\_after\_expr\_mark\_f:nn, which triggers an \fp\_early\_end error.
- For a control sequence not containing \_fp, we call \_fp\_exp\_after\_\?\_f:nn, causing a \bad\_variable error.

This scheme is extensible: additional types can be added by starting the variables with a scan mark of the form \_fp\_⟨type⟩ and defining \_fp\_exp\_after\_⟨type⟩\_f:nn. In all cases, we make sure that the second argument of \_fp\_parse\_infix:nn is correctly expanded. A special case only enabled in \LaTeX\ 2e is that if \protect is encountered then
the error message mentions the control sequence which follows it rather than \texttt{protect} itself. The test for \LaTeX{} 2e uses \texttt{@unexpandable@protect} rather than \texttt{protect} because \texttt{protect} is often \texttt{scan_stop}: hence “does not exist”.

```
This is called whenever \#2 is a control sequence other than \scan_stop: in meaning. We special-case \wd, \ht, \dp (see later) and otherwise assume that it is a register, but carefully unpack it with \tex\-the:D within braces. First, we find the exponent following \#2. Then we unpack \#2 with \tex\-the:D, and the auxii auxiliary distinguishes integer registers from dimensions/skips from muskips, according to the presence of a period and/or of pt. For integers, simply convert ⟨value⟩e⟨exponent⟩ to a floating point number with \__fp\-parse:n (this is somewhat wasteful). For other registers, the decimal rounding provided by Te\TeX{} does not accurately represent the binary value that it manipulates, so we extract this binary value as a number of scaled points with \int\_value:w \dim\_to\_decimal\_in\_sp:n {⟨decimal value⟩ pt}, and use an auxiliary of \dim\_to\_fp:n, which performs the multiplication by 2^{-16}, correctly rounded.

The \texttt{\textbackslash wd}, \texttt{\textbackslash dp}, \texttt{\textbackslash ht} primitives expect an integer argument. We abuse the exponent parser to find the integer argument: simply include the exponent marker \texttt{e}. Once that “exponent” is found, use \texttt{\textbackslash tex_the:D} to find the box dimension and then copy what we did for dimensions.

A digit marks the beginning of an explicit floating point number. Once the number is found, we catch the case of overflow and underflow with \texttt{\_\_fp\_sanitize:NN},
then \__fp_parse_infix_after_operand:NwN expands \__fp_parse_infix:NN after the number we find, to wrap the following infix operator as required. Finding the number itself begins by removing leading zeros: further steps are described later.

\cs_new:Npn \__fp_parse_one_digit:NN #1

(End definition for \__fp_parse_one_other:NN.)

\__fp_parse_word:Nw
\__fp_parse_letters:N
Finding letters is a simple recursion. Once \__fp_parse_letters:N has done its job, we try to build a control sequence from the word \#2. If it is a known word, then the corresponding action is taken, and otherwise, we complain about an unknown word, yield \c_nan_fp, and look for the following infix operator. Note that the unknown word could be a mistyped function as well as a mistyped constant, so there is no way to tell whether to look for arguments; we do not. The standard requires \texttt{\texttt{inf}} and \texttt{\texttt{infinity}} and \texttt{\texttt{nan}} to be recognized regardless of case, but we probably don’t want to allow every $l3fp$ word to have an arbitrary mixture of lower and upper case, so we test and use a differently-named control sequence.

\_fp_parse_prefix:NNN \_fp_parse_prefix_unknown:NNN

For this function, \#1 is the previous \langle precedence \rangle, \#2 is the operator just seen, and \#3 is a control sequence which implements the operator if it is a known operator. If this control sequence is \scan_stop:, then the operator is in fact unknown. Either the expression is missing a number there (if the operator is valid as an infix operator), and we put nan, wrapping the infix operator in a csname as appropriate, or the character is simply invalid in floating point expressions, and we continue looking for a number, starting again from \_fp_parse_one:Nw.
69.4.1 Numbers: trimming leading zeros

Numbers are parsed as follows: first we trim leading zeros, then if the next character is a digit, start reading a significand ≥ 1 with the set of functions \_\_fp_parse_large...; if it is a period, the significand is < 1; and otherwise it is zero. In the second case, trim additional zeros after the period, counting them for an exponent shift (exp₁) < 0, then read the significand with the set of functions \_\_fp_parse_small... Once the significand is read, read the exponent if e is present.

\_\_fp_parse_trim_zeros:N
\_\_fp_parse_trim_end:w

This function expects an already expanded token. It removes any leading zero, then distinguishes three cases: if the first non-zero token is a digit, then call \_\_fp_parse_large:N (the significand is ≥ 1); if it is ., then continue trimming zeros with \_\_fp_parse_strim_zeros:N; otherwise, our number is exactly zero, and we call \_\_fp_parse_zero: to take care of that case.
If we have removed all digits until a period (or if the body started with a period), then enter the “small trim” loop which outputs \(-1\) for each removed 0. Those \(-1\) are added to an integer expression waiting for the exponent. If the first non-zero token is a digit, call \_fp_parse_small:N (our significand is smaller than 1), and otherwise, the number is an exact zero. The name strim stands for “small trim”.

\begin{verbatim}
\cs_new:Npn \__fp_parse_strim_zeros:N #1
\begin{cases}
  \if:w 0 \exp_not:N #1 - 1 \exp_after:wN \__fp_parse_strim_zeros:N \exp:w
  \else:
  \__fp_parse_strim_end:w #1 \fi:
\end{cases}
\__fp_parse_expand:w
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \__fp_parse_strim_end:w #1 \fi: \__fp_parse_expand:w
\begin{cases}
  \if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
  \exp_after:wN \__fp_parse_small:N
  \else:
  \exp_after:wN \__fp_parse_zero:
  \fi:
\end{cases}
\__fp_parse_expand:w
\end{verbatim}

After reading a significand of 0, find any exponent, then put a sign of 1 for \_fp\_sanitize:wN, which removes everything and leaves an exact zero.

\begin{verbatim}
\cs_new:Npn \__fp_parse_zero:
\begin{cases}
  \exp_after:wN ; \exp_after:wN 1 \int_value:w \__fp_parse_exponent:N
\end{cases}
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \__fp_parse_small:N \__fp_parse_exponent:N
\end{verbatim}

This function is called after we have passed the decimal separator and removed all leading zeros from the significand. It is followed by a non-zero digit (with any catcode). The goal is to read up to 16 digits. But we can’t do that all at once, because \int_value:w (which allows us to collect digits and continue expanding) can only go up to 9 digits. Hence we grab digits in two steps of 8 digits. Since \#1 is a digit, read seven more digits using \_fp_parse_digits_vii:N. The small leading auxiliary leaves those digits in the \int_value:w, and grabs some more, or stops if there are no more digits. Then the
pack_leading auxiliary puts the various parts in the appropriate order for the processing further up.

\cs_new:Npn \_fp_parse_small:N #1
\{\exp_after:wN \_fp_parse_pack_leading:NNNNww
\int_value:w \_fp_int_eval:w 1 \token_to_str:N #1

\exp_after:wN \_fp_parse_digits_vii:N
\exp:w \_fp_parse_expand:w
\}

(End definition for \_fp_parse_small:N.)

\_fp_parse_small_leading:wwNN \_fp_parse_small_leading:wwNN 1 \langle digits \rangle ; \langle zeros \rangle ; \langle number of zeros \rangle

We leave \langle digits \rangle \langle zeros \rangle in the input stream: the functions used to grab digits are such that this constitutes digits 1 through 8 of the significand. Then prepare to pack 8 more digits, with an exponent shift of zero (this shift is used in the case of a large significand). If \#4 is a digit, leave it behind for the packing function, and read 6 more digits to reach a total of 15 digits: further digits are involved in the rounding. Otherwise put 8 zeros in to complete the significand, then look for an exponent.

\cs_new:Npn \_fp_parse_small_leading:wwNN 1 \#1 ; \#2; \#3 \#4
\{ \#1 \#2

\_fp_parse_expand:w
\}

(End definition for \_fp_parse_small_leading:wwNN.)

\_fp_parse_small_trailing:wwNN \_fp_parse_small_trailing:wwNN 1 \langle digits \rangle ; \langle zeros \rangle ; \langle number of zeros \rangle \langle next token \rangle

Leave digits 10 to 15 (arguments \#1 and \#2) in the input stream. If the \langle next token \rangle is a digit, it is the 16th digit, we keep it, then the small_round auxiliary considers this digit and all further digits to perform the rounding: the function expands to nothing, to +0 or to +1. Otherwise, there is no 16-th digit, so we put a 0, and look for an exponent.

\cs_new:Npn \_fp_parse_small_trailing:wwNN 1 \#1 ; \#2; \#3 \#4
\{ \#1 \#2
\if_int_compare:w 9 < 1 \token_to_str:N #4 \exp_stop_f:
\token_to_str:N #4
\exp_after:wN \_fp_parse_small_round:NN
\}

1027
Those functions are expanded after all the digits are found, we took care of the rounding, as well as the exponent. The last argument is the exponent. The previous five arguments are 8 digits which we pack in groups of 4, and the argument before that is 1, except in the rare case where rounding lead to a carry, in which case the argument is 2. The trailing function has an exponent shift as its first argument, which we add to the exponent found in the e... syntax. If the trailing digits cause a carry, the integer expression for the leading digits is incremented (+1 in the code below). If the leading digits propagate this carry all the way up, the function \__fp_parse_pack_carry:w increments the exponent, and changes the significand from 0000... to 1000...: this is simple because such a carry can only occur to give rise to a power of 10.

\cs_new:Npn \__fp_parse_pack_trailing:NNNNNNww \#1 \#2 \#3\#4\#5\#6 \#7; \#8 ;
\{ \if_meaning:w 2 \#2 + 1 \fi: ; \#8 + \#1 ; \{\#3\#4\#5\#6\} \{\#7\}; \}

(End definition for \__fp_parse_small_trailing:wwNN, \__fp_parse_pack_leading:wwNN, and \__fp_parse_pack_carry:w.)

69.4.3 Number: large significand

Parsing a significand larger than 1 is a little bit more difficult than parsing small significands. We need to count the number of digits before the decimal separator, and add that to the final exponent. We also need to test for the presence of a dot each time we run out of digits, and branch to the appropriate parse_small function in those cases.

\cs_new:Npn \__fp_parse_large:N \#1
\{ \exp_after:wN \__fp_parse_large_leading:wwNN \int_value:w 1 \token_to_str:N \#1 \exp_after:wN \__fp_parse_digits_vii:N \exp:w \__fp_parse_expand:w \}

This function is followed by the first non-zero digit of a “large” significand (≥ 1). It is called within an integer expression for the exponent. Grab up to 7 more digits, for a total of 8 digits.
\__fp_parse_large_leading:wwNN

We shift the exponent by the number of digits in \#1, namely the target number, 8, minus the \langle number of zeros \rangle (number of digits missing). Then prepare to pack the 8 first digits. If the \langle next token \rangle is a digit, read up to 6 more digits (digits 10 to 15). If it is a period, try to grab the end of our 8 first digits, branching to the small functions since the number of digit does not affect the exponent anymore. Finally, if this is the end of the significand, insert the \langle zeros \rangle to complete the 8 first digits, insert 8 more, and look for an exponent.

\__fp_parse_large_trailing:wwNN

We have just read 15 digits. If the \langle next token \rangle is a digit, then the exponent shift caused by this block of 8 digits is 8, first argument to the \texttt{pack_trailing} function. We keep the \langle digits \rangle and this 16-th digit, and find how this should be rounded using \__fp_parse_large_round:NN. Otherwise, the exponent shift is the number of \langle digits \rangle, 7 minus the \langle number of zeros \rangle, and we test for a decimal point. This case happens in 123451234512345.67 with exactly 15 digits before the decimal separator. Then branch to the appropriate small auxiliary, grabbing a few more digits to complement the digits.
we already grabbed. Finally, if this is truly the end of the significand, look for an exponent after using the \texttt{⟨zeros⟩} and providing a 16-th digit of 0.

\begin{verbatim}
c_new:Npn \_\_fp_parse_large_trailing:wwNN 1 #1 ; #2; #3 #4 23812 { 23813 \if_int_compare:w 9 < 1 \token_to_str:N #4 \exp_stop_f: 23814 \exp_after:wN \_\_fp_parse_pack_trailing:NNNNWWw 23815 \exp_after:wN \c__fp_half_prec_int 23816 \int_value:w \_\_fp_int_eval:w 1 \#1 \token_to_str:N #4 23817 \exp_after:wN \_\_fp_parse_large_round:NN 23818 \exp_after:wN #4 23819 \exp:w 23820 } 23821 \else: 23822 \exp_after:wN \_\_fp_parse_pack_trailing:NNNNWWw 23823 \int_value:w \_\_fp_int_eval:w 7 - \#3 \exp_stop_f: 23824 \int_value:w \_\_fp_int_eval:w 1 \#1 23825 \if:w . \exp_not:N #4 23826 \exp_after:wN \_\_fp_parse_small_trailing:wwNN 23827 \int_value:w 1 23828 \cs:w 23829 \_\_fp_parse_digits_ 23830 \_\_fp_int_to_roman:w \#3 23831 \:N \exp_after:wN 23832 \cs:w 23833 \_\_fp_parse_expand:w 23834 \exp:w 23835 } 23836 \else: 23837 \#2 0 \_\_fp_parse_exponent:Nw #4 23838 \fi: 23839 \_\_fp_parse_expand:w 23840 }
\end{verbatim}

(End definition for \_\_fp_parse_large_trailing:wwNN.)

\subsection*{69.4.4 Number: beyond 16 digits, rounding}

This loop is called when rounding a number (whether the mantissa is small or large). It should appear in an integer expression. This function reads digits one by one, until reaching a non-digit, and adds 1 to the integer expression for each digit. If all digits found are 0, the function ends the expression by ;0, otherwise by ;1. This is done by switching the loop to \texttt{round up} at the first non-zero digit, thus we avoid to test whether digits are 0 or not once we see a first non-zero digit.

\begin{verbatim}
c_new:Npn \_\_fp_parse_round_loop:N 23841 \_\_fp_parse_round_loop:N #1 23842 { 23843 \if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f: 23844 + 1 23845 \if:w 0 \token_to_str:N #1 23846 \exp_after:wN \_\_fp_parse_round_loop:N 23847 \exp:w 23848 \else: 23849 \exp_after:wN \_\_fp_parse_round_up:N 23850 \exp:w 23851 \fi: 23852 \else: 23853 \fi:
\end{verbatim}
\_\_fp\_parse\_round\_up:N #1
\fi:
\_\_fp\_parse\_expand:w
}
\cs\_new:Npn \_\_fp\_parse\_round\_up:N #1
{
\if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
  + 1
\exp_after:wN \_\_fp\_parse\_round\_up:N
\exp:w
\else:
 \_\_fp\_parse\_return\_semicolon:w 1 #1
\fi:
\_\_fp\_parse\_expand:w
}
(End definition for \_\_fp\_parse\_round\_loop:N and \_\_fp\_parse\_round\_up:N.)

\_\_fp\_parse\_round\_after:wN

After the loop \_\_fp\_parse\_round\_loop:N, this function fetches an exponent with \_\_fp\_parse\_exponent:N, and combines it with the number of digits counted by \_\_fp\_parse\_round\_loop:N. At the same time, the result 0 or 1 is added to the surrounding integer expression.

\cs\_new:Npn \_\_fp\_parse\_round\_after:wN #1; #2
{
+ #2 \exp_after:wN ;
\int_value:w \_\_fp\_int\_eval:w #1 + \_\_fp\_parse\_exponent:N
}
(End definition for \_\_fp\_parse\_round\_after:wN.)

\_\_fp\_parse\_small\_round:NNN
\_\_fp\_parse\_round\_after:wN

Here, #1 is the digit that we are currently rounding (we only care whether it is even or odd). If #2 is not a digit, then fetch an exponent and expand to \texttt{(exponent)} only. Otherwise, we expand to \texttt{+0} or \texttt{+1}, then \texttt{(exponent)}. To decide which, call \_\_fp\_round\_s:NNNw to know whether to round up, giving it as arguments a sign 0 (all explicit numbers are positive), the digit #1 to round, the first following digit #2, and either \texttt{+0} or \texttt{+1} depending on whether the following digits are all zero or not. This last argument is obtained by \_\_fp\_parse\_round\_loop:N, whose number of digits we discard by multiplying it by 0. The exponent which follows the number is also fetched by \_\_fp\_parse\_round\_after:wN.

\cs\_new:Npn \_\_fp\_parse\_small\_round:NNN #1#2
{
\if_int_compare:w 9 < 1 \token_to_str:N #2 \exp_stop_f:
  +
\exp_after:wN \_\_fp\_round\_s:NNNw
\exp_after:wN 0
\exp_after:wN #1
\exp_after:wN #2
\int_value:w \_\_fp\_int\_eval:w
\exp_after:wN \_\_fp\_parse\_round\_after:wN
\int_value:w \_\_fp\_int\_eval:w 0 \exp_after:wN \_\_fp\_int\_eval:w 0
\exp_after:wN \_\_fp\_parse\_round\_loop:N
\exp:w
\else:
 \_\_fp\_parse\_exponent:Nw #2
\exp:w
}\endinput
Large numbers are harder to round, as there may be a period in the way. Again, #1 is the digit that we are currently rounding (we only care whether it is even or odd). If there are no more digits (#2 is not a digit), then we must test for a period: if there is one, then switch to the rounding function for small significands, otherwise fetch an exponent. If there are more digits (#2 is a digit), then round, checking with \_\_fp_parse_round_-\_loop:N if all further digits vanish, or some are non-zero. This loop is not enough, as it is stopped by a period. After the loop, the aux function tests for a period: if it is present, then we must continue looking for digits, this time discarding the number of digits we find.
Expansion is a little bit tricky here, in part because we accept input where multiplication is implicit.

\__fp_parse:n { 3.2 erf(0.1) }
\__fp_parse:n { 3.2 e\l_my_int }
\__fp_parse:n { 3.2 \c_pi_fp }

The first case indicates that just looking one character ahead for an “e” is not enough, since we would mistake the function erf for an exponent of “rf”. An alternative would be to look two tokens ahead and check if what follows is a sign or a digit, considering in that case that we must be finding an exponent. But taking care of the second case requires that we unpack registers after e. However, blindly expanding the two tokens ahead completely would break the third example (unpacking is even worse). Indeed, in the course of reading 3.2, \c_pi_fp is expanded to \s__fp \__fp_chk:w 1 0 {-1} {3141} ··· and \s__fp stops the expansion. Expanding two tokens ahead would then force the expansion of \__fp_chk:w (despite it being protected), and that function tries to produce an error.

What can we do? Really, the reason why this last case breaks is that just as \TeX does, we should read ahead as little as possible. Here, the only case where there may be an exponent is if the first token ahead is e. Then we expand (and possibly unpack) the second token.

\__fp_parse_exponent:Nw

This auxiliary is convenient to smuggle some material through \fi: ending conditional processing. We place those \fi: (argument #2) at a very odd place because this allows us to insert \__fp_int_eval:w ... there if needed.

\cs_new:Npn \__fp_parse_exponent:Nw #1 #2 \__fp_parse_expand:w
\exp_after:wN ;
\int_value:w #2 \__fp_parse_exponent:N #1
\__fp_parse_expand:w

\__fp_parse_exponent:N
\__fp_parse_exponent_aux:NN

This function should be called within an \int_value:w expansion (or within an integer expression). It leaves digits of the exponent behind it in the input stream, and terminates the expansion with a semicolon. If there is no e (or E), leave an exponent of 0. If there is an e or E, expand the next token to run some tests on it. The first rough test is that if the character code of #1 is greater than that of 9 (largest code valid for an exponent, less than any code valid for an identifier), there was in fact no exponent; otherwise, we search for the sign of the exponent.
\begin{verbatim}
\if:w e \if:w E \exp_not:N #1 e \else: \exp_not:N #1 \fi:
\exp_after:wN \__fp_parse_exponent_aux:NN

\__fp_parse_expand:w}(End definition for \__fp_parse_exponent_body:N.)
\end{verbatim}

1034
\_fp\_parse\_exponent\_digits:N

Read digits one by one, and leave them behind in the input stream. When finding a non-digit, stop, and insert a semicolon. Note that we do not check for overflow of the exponent, hence there can be a \TeX error. It is mostly harmless, except when parsing 0e9876543210, which should be a valid representation of 0, but is not.

\begin{verbatim}
\cs_new:Npn \_fp\_parse\_exponent\_digits:N #1
{\if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:\exp:w
\else:\_fp\_parse\_return\_semicolon:w #1 \fi:\_fp\_parse\_expand:w}
\end{verbatim}

\_fp\_parse\_exponent\_keep:NFT

This is the last building block for parsing exponents. The argument \#1 is already fully expanded, and neither + nor - nor a digit. It can be:

- \s__fp, marking the start of an internal floating point, invalid here;
- another control sequence equal to \relax, probably a bad variable;
- a register: in this case we make sure that it is an integer register, not a dimension;
- a character other than +, - or digits, again, an error.

\begin{verbatim}
\prg_new_conditional:Npnn \_fp\_parse\_exponent\_keep:N #1 { TF }
{\if_catcode:w \scan_stop: \exp_not:N #1 \if_meaning:w \scan_stop: #1 \if:w 0 \__fp\_str\_if\_eq:nn { \s__fp } { \exp_not:N #1 } 0 \msg\_expandable\_error:nnn { fp } { after-e } { floating-point- } \prg\_return\_true:\else:\_fp\_parse\_return\_false:\fi:\else:\if:w 0 \__fp\_str\_if\_eq:nn { \int\_value:w #1 } { \tex\_the:D #1 } \_fp\_parse\_return\_false:

\else:
\if:w 0 \__fp\_str\_if\_eq:nn { \int\_value:w #1 } \_fp\_parse\_return\_false:
\else:
0 \msg\_expandable\_error:nnn { kernel } { bad-variable } {#1} \prg\_return\_false:
\fi:
\fi:
\end{verbatim}
69.5 Constants, functions and prefix operators

69.5.1 Prefix operators

\_\_fp\_parse\_prefix\_+:Nw

A unary + does nothing: we should continue looking for a number.

\cs_new_eq:cN { __fp_parse_prefix_+:Nw } \__fp_parse_one:Nw

(End definition for \__fp_parse_prefix_+:Nw.)

\_fp\_parse\_apply\_function:NNNw

Here, \#1 is a precedence, \#2 is some extra data used by some functions, \#3 is e.g., \_\_fp\_sin\_o:w, and expands once after the calculation, \#4 is the operand, and \#5 is a \_\_fp\_parse\_infix\_\_\_\_\_\_\_:N function. We feed the data \#2, and the argument \#4, to the function \#3, which expands \exp:w thus the infix function \#5.

\cs_new:Npn \__fp_parse_apply_function:NNNwN #1#2#3#4@#5
{ #3 #2 #4 @ \exp:w \exp_end_continue_f:w #5 #1 }

(End definition for \__fp_parse_apply_function:NNNw.)

\_fp\_parse\_apply\_unary:NNNw

\_fp\_parse\_apply\_unary\_chk:NwNw

\_fp\_parse\_apply\_unary\_chk:nNNNw

\_fp\_parse\_apply\_unary\_type:NNN

\_fp\_parse\_apply\_unary\_error:Nw

In contrast to \_\_fp\_parse\_apply\_function:NNNwN, this checks that the operand \#4 is a single argument (namely there is a single ;). We use the fact that any floating point starts with a "safe" token like \_\_fp. If there is no argument produce the fp-no-arg error; if there are at least two produce fp-multi-arg. For the error message extract the mathematical function name (such as sin) from the expl3 function that computes it, such as \_\_fp\_sin\_o:w.

In addition, since there is a single argument we can dispatch on type and check that the resulting function exists. This catches things like sin((1,2)) where it does not make sense to take the sine of a tuple.

\cs_new:Npn \__fp_parse_apply_unary:NNNwN #1#2#3#4@#5
{ \__fp_parse_apply_unary_chk:NwNw #4 @ ; . \s__fp_stop \__fp_parse_apply_unary_type:NNN #3 #2 #4 @ \exp:w \exp_end_continue_f:w #5 #1 }

(End definition for \__fp_parse_apply_unary:NNNw.)
The unary - and boolean not are harder: we parse the operand using a precedence equal to the maximum of the previous precedence `#1` and the precedence `\c__fp_prec_not_int` of the unary operator, then call the appropriate `\__fp⟨operation⟩_o:w` function, where the ⟨operation⟩ is `set_sign` or `not`.

```
\cs_set_protected:Npn \__fp_parse_prefix_-:Nw \__fp_parse_prefix_!:Nw
\__fp_parse_prefix_.:Nw
\__fp_parse_prefix_-:Nw
\__fp_parse_prefix_!:Nw
\__fp_parse_prefix_.:Nw
```

Numbers which start with a decimal separator (a period) end up here. Of course, we do not look for an operand, but for the rest of the number. This function is very similar to `\__fp_parse_one_digit:NN` but calls `\__fp_parse_strim_zeros:N` to trim zeros after the decimal point, rather than the `trim_zeros` function for zeros before the decimal point.

```
\cs_new:cpn { __fp_parse_prefix_ .:Nw } #1
\exp_after:wN \__fp_parse_infix_after_operand:NwN \exp_after:wN #1 1037
```

(End definition for \__fp_parse_apply_unary:NNNw and others.)
The left parenthesis is treated as a unary prefix operator because it appears in exactly the same settings. If the previous precedence is \c__fp_prec_func_int we are parsing arguments of a function and commas should not build tuples; otherwise commas should build tuples. We distinguish these cases by precedence: \c__fp_prec_comma_int for the case of arguments, \c__fp_prec_tuple_int for the case of tuples. Once the operand is found, the \texttt{lparen\_after} auxiliary makes sure that there was a closing parenthesis (otherwise it complains), and leaves in the input stream an operand, fetching the following infix operator.

\begin{verbatim}
\cs_new:cpn { __fp_parse_prefix_(:Nw } #1
  { \exp_after:wN \__fp_parse_lparen_after:NwN \exp_after:wN #1 \exp:w
    \if_int_compare:w #1 = \c__fp_prec_func_int \__fp_parse_operand:Nw \c__fp_prec_comma_int
      \else: \__fp_parse_operand:Nw \c__fp_prec_tuple_int \fi:
    \__fp_parse_expand:w
  }
\cs_new:Npx \__fp_parse_lparen_after:NwN #1#2 @ #3
  { \exp_not:N \token_if_eq_meaning:NNTF #3 \exp_not:c { __fp_parse_infix_):N }
    { \exp_not:N \__fp_exp_after_array_f:w #2 \exp_not:N \__fp_expr_stop
      \exp_not:N \exp_after:wN \exp_not:N \__fp_parse_infix_after_paren:NN
      \exp_not:N \exp_after:wN #1 \exp_not:N \exp:w
      \exp_not:N \__fp_parse_expand:w
    }
    { \exp_not:N \msg_expandable_error:nnn { fp } { missing } { ) }
      \exp_not:N \tl_if_empty:nT {#2} \exp_not:N \c__fp_empty_tuple_fp
      #2 @ \exp_not:N \use_none:n #3
    }
\end{verbatim}

The right parenthesis can appear as a prefix in two similar cases: in an empty tuple or tuple ending with a comma, or in an empty argument list or argument list ending with a comma, such as in \texttt{max(1,2,)} or in \texttt{rand(\}).
\__fp_parse_infix_after_paren:NN #1 )
\end{definition}

### 69.5.2 Constants

\__fp_parse_word_inf:N \__fp_parse_word_nan:N \__fp_parse_word_pi:N \__fp_parse_word_deg:N \__fp_parse_word_true:N \__fp_parse_word_false:N

Some words correspond to constant floating points. The floating point constant is left as a result of \__fp_parse_one:Nw after expanding \__fp_parse_infix:Nw.

\cs_set_protected:Npn \__fp_tmp:w #1 #2
\cs_new:cpn \__fp_parse_word_#1:N { \exp_after:wN #2 \exp:w \exp_end_continue_f:w \__fp_parse_infix:NN }

\__fp_tmp:w { inf } \c_inf_fp \__fp_tmp:w { nan } \c_nan_fp \__fp_tmp:w { pi } \c_pi_fp \__fp_tmp:w { deg } \c_one_degree_fp \__fp_tmp:w { true } \c_one_fp \__fp_tmp:w { false } \c_zero_fp

(End definition for \__fp_parse_word_inf:N and others.)

\__fp_parse_caseless_inf:N \__fp_parse_caseless_infinity:N \__fp_parse_caseless_nan:N

Copies of \__fp_parse_word_...:N commands, to allow arbitrary case as mandated by the standard.

\cs_new_eq:NN \__fp_parse_caseless_inf:N \__fp_parse_word_inf:N \cs_new_eq:NN \__fp_parse_caseless_infinity:N \__fp_parse_word_inf:N \cs_new_eq:NN \__fp_parse_caseless_nan:N \__fp_parse_word_nan:N

(End definition for \__fp_parse_caseless_inf:N, \__fp_parse_caseless_infinity:N, and \__fp_parse_caseless_nan:N.)

\__fp_parse_word_pt:N \__fp_parse_word_in:N \__fp_parse_word_cm:N \__fp_parse_word_mm:N \__fp_parse_word_dd:N \__fp_parse_word_cc:N \__fp_parse_word_nd:N \__fp_parse_word_nc:N \__fp_parse_word_bp:N \__fp_parse_word_sp:N

Dimension units are also floating point constants but their value is not stored as a floating point constant. We give the values explicitly here.

\cs_set_protected:Npn \__fp_tmp:w #1 #2
\cs_new:cpn \__fp_parse_word_#1:N { \exp_after:wN #2 \exp:w \exp_end_continue_f:w \__fp_parse_infix:NN }

\__fp_tmp:w { pt } \c_inf_fp \__fp_tmp:w { in } \c_nan_fp \__fp_tmp:w { cm } \c_pi_fp \__fp_tmp:w { mm } \c_one_degree_fp \__fp_tmp:w { dd } \c_one_fp \__fp_tmp:w { cc } \c_zero_fp

(End definition for \__fp_parse_word_pt:N, \__fp_parse_word_in:N, \__fp_parse_word_cm:N, \__fp_parse_word_mm:N, \__fp_parse_word_dd:N, \__fp_parse_word_cc:N, \__fp_parse_word_nd:N, \__fp_parse_word_nc:N, \__fp_parse_word_bp:N, \__fp_parse_word_sp:N)
The font-dependent units \textit{em} and \textit{ex} must be evaluated on the fly. We reuse an auxiliary of \dim_to_fp:n.

\begin{verbatim}
\tl_map_inline:nn { {em} {ex} }
  \cs_new:cpn { __fp_parse_word_#1:N } { \exp_after:wN \__fp_from_dim_test:ww \exp_after:wN 0 \exp_after:wN , \int_value:w \dim_to_decimal_in_sp:n { 1 #1 } \exp_after:wN ; \exp:w \exp_end_continue_f:w \__fp_parse_infix:NN }
\end{verbatim}

(End definition for \__fp_parse_word_em:N and \__fp_parse_word_ex:N.)

(End definition for \__fp_parse_unary_function:NNN and \__fp_parse_function:NNN.)
69.6 Main functions

Start an \texttt{\exp:w} expansion so that \texttt{\_fp_parse:n} expands in two steps. The \texttt{\_fp_parse_operand:Nw} function performs computations until reaching an operation with precedence \texttt{\c__fp_prec_end_int} or less, namely, the end of the expression. The marker \texttt{\s__fp_expr_mark} indicates that the next token is an already parsed version of an infix operator, and \texttt{\_fp_parse_infix_end:N} has infinitely negative precedence. Finally, clean up a (well-defined) set of extra tokens and stop the initial expansion with \texttt{\exp_end:].

\exp_after:wN \_fp_parse_continue:NwN
\exp_after:wN #1
\exp:w \exp_end_continue_f:w
\exp_after:wN \_fp_parse_one:Nw
\exp_after:wN #1
\exp:w
\end{verbatim}
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \_fp_parse_continue:NwN #1 #2 @ #3 { #3 #1 #2 @ }
\end{verbatim}

\begin{verbatim}
\_fp_parse_operand:Nw
\_fp_parse_continue:NwN
\end{verbatim}

This is just a shorthand which sets up both \texttt{\_fp_parse_continue:NwN} and \texttt{\_fp_parse_one:Nw} with the same precedence. Note the trailing \texttt{\exp:w}.

\begin{verbatim}
\cs_new:Npn \_fp_parse_operand:Nw #1
\begin{verbatim}
\exp_end_continue_f:w
\exp_after:wN \_fp_parse_continue:NwN
\exp_after:wN #1
\exp:w \exp_end_continue_f:w
\exp_after:wN \_fp_parse_one:Nw
\exp_after:wN #1
\exp:w
\end{verbatim}
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \_fp_parse_continue:NwN #1 #2 @ #3 { #3 #1 #2 @ }
\end{verbatim}

\begin{verbatim}
\_fp_parse_operand:Nw
\_fp_parse_continue:NwN
\end{verbatim}

(End definition for \texttt{\_fp_parse:n}, \texttt{\_fp_parse_o:n}, and \texttt{\_fp_parse_after:ww}.)

(End definition for \texttt{\_fp_parse_operand:Nw} and \texttt{\_fp_parse_continue:NwN}.)

1041
Receives \( \langle \text{precedence} \rangle \) \( \langle \text{operand1} \rangle \) \@ \( \langle \text{operation} \rangle \) \( \langle \text{operand2} \rangle \) \@ \( \langle \text{infix command} \rangle \). Builds the appropriate call to the \( \langle \text{operation} \rangle \) #3, dispatching on both types. If the resulting control sequence does not exist, the operation is not allowed.

This is redefined in 13fp-extras.

1043
69.7.1 Closing parentheses and commas

As an infix operator, \s__fp_expr_mark means that the next token (#3) has already gone through \__fp_parse_infix:NN and should be provided the precedence #1. The scan mark #2 is discarded.
This one is a little bit odd: force every previous operator to end, regardless of the precedence.

```latex
\cs_new:Npn \__fp_parse_infix_end:N #1
\{ @ \use_none:n \__fp_parse_infix_end:N \}
```

This is very similar to \texttt{\__fp_parse_infix_end:N}, complaining about an extra closing parenthesis if the previous operator was the beginning of the expression, with precedence \texttt{\c__fp_prec_end_int}.

```latex
\cs_set_protected:Npn \__fp_tmp:w #1
\{ \cs_new:Npn #1 ##1
\if_int_compare:w ##1 > \c__fp_prec_end_int
\exp_after:wN @
\exp_after:wN \use_none:n
\exp_after:wN #1
\else:
\msg_expandable_error:nnn { fp } { extra } { ) }
\exp_after:wN \__fp_parse_infix:NN
\exp_after:wN ##1
\exp:w \exp_after:wN \__fp_parse_expand:w
\fi:
\}
\exp_args:Nc \__fp_tmp:w { \__fp_parse_infix_):N }
```

As for other infix operations, if the previous operation has higher precedence the comma waits. Otherwise we call \texttt{\__fp_parse_operand:Nw} to read more comma-delimited arguments that \texttt{\__fp_parse_infix_comma:w} simply concatenates into a @-delimited array. The first comma in a tuple that is not a function argument is distinguished: in that case call \texttt{\__fp_parse_apply_comma:NwWwW} whose job is to convert the first item of the tuple and an array of the remaining items into a tuple. In contrast to \texttt{\__fp_parse_apply_-binary:NwWwW} this function’s operands are not single-object arrays.

```latex
\cs_set_protected:Npn \__fp_tmp:w #1
\{ \cs_new:Npn #1 ##1
\if_int_compare:w ##1 > \c__fp_prec_comma_int
\exp_after:wN @
\exp_after:wN \use_none:n
\exp_after:wN #1
\else:
\if_int_compare:w ##1 < \c__fp_prec_comma_int
\exp_after:wN @
\exp_after:wN \__fp_parse_apply_comma:NwWwW
\exp_after:wN ,
\exp:w
\else:
```

1045
As described in the “work plan”, each infix operator has an associated \(..._infix_...\) function, a computing function, and precedence, given as arguments to \__fp_tmp:w. Using the general mechanism for arithmetic operations. The power operation must be associative in the opposite order from all others. For this, we use two distinct precedences.
69.7.3 Juxtaposition

\__fp_parse_infix_(:N

When an opening parenthesis appears where we expect an infix operator, we compute the product of the previous operand and the contents of the parentheses using \__fp_parse_infix_mul:N.

\cs_new:cpn { __fp_parse_infix_(:N } #1

69.8 Tools for functions

\_\_fp\_parse\_function\_all\_fp\_o:fnw

Followed by {⟨function name⟩} {⟨code⟩} {⟨float array⟩} @ this checks all floats are floating point numbers (no tuples).
This is followed by \( \langle \text{function name} \rangle \) \( \langle \text{code} \rangle \) \( \langle \text{float array} \rangle \) @. It checks that the \( \langle \text{float array} \rangle \) consists of one or two floating point numbers (not tuples), then leaves the \( \langle \text{code} \rangle \) (if there is one float) or its tail (if there are two floats) followed by the \( \langle \text{float array} \rangle \). The \( \langle \text{code} \rangle \) should start with a single token such as \__fp_atan_default:w\) that deals with the single-float case.

The first \_\_fp_if_type_fp:NTwFw test catches the case of no argument and the case of a tuple argument. The next one distinguishes the case of a single argument (no error, just add \c_one_fp) from a tuple second argument. Finally check there is no further argument.
Apply \texttt{#1} to all items in the following tuple and expand once afterwards. The code \texttt{#1} should itself expand once after its result.

\begin{verbatim}
\cs_new:Npn \__fp_tuple_map_o:nw #1 \s__fp_tuple \__fp_tuple_chk:w #2 ;
  {\exp:w \exp_end_continue_f:w \__fp_tuple_map_loop_o:nw {#1} #2 \prg_break: ; \s__fp \prg_break_point: \exp_after:wN } \exp_after:wN ;
\end{verbatim}

Apply \texttt{#1} to pairs of items in the two following tuples and expand once afterwards.

\begin{verbatim}
\cs_new:Npn \__fp_tuple_mapthread_o:nww #1 \s__fp_tuple \__fp_tuple_chk:w #2 ; #3 ;
  {\exp:w \exp_end_continue_f:w \__fp_tuple_mapthread_loop_o:nw {#1} #2 \s__fp \prg_break_point: \exp_after:wN \s__fp_tuple \__fp_tuple_chk:w #3 ; \s__fp \prg_break_point: \exp_after:wN } \exp_after:wN ;
\end{verbatim}

Chapter 70

\textbf{l3fp-assign implementation}

\subsection{Assigning values}

\texttt{\textbackslash fp\_new:N} Floating point variables are initialized to be +0.
\begin{verbatim}
\cs_new_protected:Npn \fp\_new:N #1 { \cs_new_eq:NN #1 \c_zero_fp }
\cs_generate_variant:Nn \fp\_new:N {c}
\end{verbatim}

\texttt{\textbackslash fp\_set:Nn}, \texttt{\textbackslash fp\_gset:Nn}, and \texttt{\textbackslash fp\_const:Nn} Simply use \texttt{\_\_fp\_parse:n} within various f-expanding assignments.
\begin{verbatim}
\cs_new_protected:Npn \fp\_set:Nn #1#2 { \__kernel_tl_set:Nx #1 { \exp_not:f { \__fp_parse:n {#2} } } }
\cs_new_protected:Npn \fp\_gset:Nn #1#2 { \__kernel_tl_gset:Nx #1 { \exp_not:f { \__fp_parse:n {#2} } } }
\cs_new_protected:Npn \fp\_const:Nn #1#2 { \tl_const:Nx #1 { \exp_not:f { \__fp_parse:n {#2} } } }
\cs_generate_variant:Nn \fp\_set:Nn {c}
\cs_generate_variant:Nn \fp\_gset:Nn {c}
\cs_generate_variant:Nn \fp\_const:Nn {c}
\end{verbatim}

\texttt{\textbackslash fp\_set\_eq:NN}, \texttt{\textbackslash fp\_gset\_eq:NN}, and \texttt{\textbackslash fp\_const\_eq:NN} Copying a floating point is the same as copying the underlying token list.
\begin{verbatim}
\cs_new_eq:NN \fp\_set\_eq:NN \tl\_set\_eq:NN
\cs_new_eq:NN \fp\_set\_eq:cN \tl\_set\_eq:NN
\cs_new_eq:NN \fp\_gset\_eq:NN \tl\_gset\_eq:NN
\cs_new_eq:NN \fp\_gset\_eq:cN \tl\_gset\_eq:NN
\cs_new_eq:NN \fp\_const\_eq:NN \tl\_const\_eq:NN
\cs_new_eq:NN \fp\_const\_eq:cN \tl\_const\_eq:NN
\cs_generate_variant:Nn \fp\_set\_eq:NN {c , Nc , cc}
\cs_generate_variant:Nn \fp\_gset\_eq:NN {c , Nc , cc}
\cs_generate_variant:Nn \fp\_const\_eq:NN {c , Nc , cc}
\end{verbatim}

\texttt{\textbackslash fp\_zero:NN}, \texttt{\textbackslash fp\_gzero:NN} Setting a floating point to zero: copy \texttt{\c_zero_fp}.
\begin{verbatim}
\cs_new_protected:Npn \fp\_zero:NN #1 { \fp\_set\_eq:NN #1 \c_zero_fp }
\cs_new_protected:Npn \fp\_gzero:NN #1 { \fp\_gset\_eq:NN #1 \c_zero_fp }
\cs_generate_variant:Nn \fp\_zero:NN {c}
\cs_generate_variant:Nn \fp\_gzero:NN {c}
\end{verbatim}
Set the floating point to zero, or define it if needed.

\cs_new_protected:Npn \fp_zero_new:N #1 { \fp_if_exist:NTF #1 { \fp_zero:N #1 } { \fp_new:N #1 } }
\cs_new_protected:Npn \fp_gzero_new:N #1 { \fp_if_exist:NTF #1 { \fp_gzero:N #1 } { \fp_new:N #1 } }
\cs_generate_variant:Nn \fp_zero_new:N { c }
\cs_generate_variant:Nn \fp_gzero_new:N { c }

For the sake of error recovery we should not simply set \#1 to \#1±(\#2): for instance, if \#2 is 0+2, the parsing error would be raised at the last closing parenthesis rather than at the closing parenthesis in the user argument. Thus we evaluate \#2 instead of just putting parentheses. As an optimization we use \_\_\_fp_parse:n rather than \fp_eval:n, which would convert the result away from the internal representation and back.

\cs_new_protected:Npn \fp_add:Nn { \__fp_add:NNNn \fp_set:Nn + }
\cs_new_protected:Npn \fp_gadd:Nn { \__fp_add:NNNn \fp_gset:Nn + }
\cs_new_protected:Npn \fp_sub:Nn { \__fp_add:NNNn \fp_set:Nn - }
\cs_new_protected:Npn \fp_gsub:Nn { \__fp_add:NNNn \fp_gset:Nn - }
\cs_new_protected:Npn \__fp_add:NNNn #1#2#3#4 { #1 #3 { #3 #2 \__fp_parse:n {#4} } }
\cs_generate_variant:Nn \fp_add:Nn { c }
\cs_generate_variant:Nn \fp_gadd:Nn { c }
\cs_generate_variant:Nn \fp_sub:Nn { c }
\cs_generate_variant:Nn \fp_gsub:Nn { c }

This shows the result of computing its argument by passing the right data to \tl_show:n or \tl_log:n.

\cs_new_protected:Npn \fp_show:N { \__fp_show:NN \tl_show:n }
\cs_new_protected:Npn \fp_log:N { \__fp_show:NN \tl_log:n }
\cs_new_protected:Npn \__fp_show:NN #1#2 { \__kernel_chk_tl_type:NnnT #2 { fp } 
\{ 
\str_if_eq:eeTF { \tl_head:N #2 } { \s__fp_tuple } { \exp_not:o #2 } 
\{ 
\exp_after:wN \__fp_show_validate:w #2 \#2 
\s__fp \__fp_chk:w ??? ; \s__fp_stop 
\} 
}

This shows the result of computing its argument by passing the right data to \tl_show:n or \tl_log:n.

\cs_new_protected:Npn \fp_show:N { \__fp_show:NN \tl_show:n }
\cs_new_protected:Npn \fp_log:N { \__fp_show:NN \tl_log:n }

}
Some useful constants and scratch variables

Some constants.
\c_one fp
\c_e_fp
\c_pi_fp
\c_one_degree_fp

We simply round $\pi$ to and $\pi/180$ to 16 significant digits.

Scratch variables are simply initialized there.
\l_tmpa_fp
\l_tmpb_fp
\g_tmpa_fp
\g_tmpb_fp

(End definition for \l_tmpa_fp and \l_tmpb_fp. These variables are documented on page 248.)
Chapter 71

\textbf{l3fp-logic} Implementation

Those functions may receive a variable number of arguments.

\begin{verbatim}
\__fp_parse_word_max:N \__fp_parse_word_min:N
\end{verbatim}

\section{Syntax of internal functions}

\begin{itemize}
\item \texttt{\_\_fp\_compare\_npos:nwnw \{(expo1)\} \{body1\} ; \{(expo2)\} \{body2\} ;}
\item \texttt{\_\_fp\_minmax\_o:Nw (sign) (floating point array)}
\item \texttt{\_\_fp\_not\_o:w ? (floating point array) (with one floating point number only)}
\item \texttt{\_\_fp\_\&\_o:ww (floating point) (floating point)}
\item \texttt{\_\_fp\_|\_o:ww (floating point) (floating point)}
\item \texttt{\_\_fp\_ternary:NwwN, \_\_fp\_ternary\_auxi:NwwN, \_\_fp\_ternary\_auxii:NwwN}
\end{itemize}

have to be understood.

\section{Tests}

\begin{verbatim}
\_fp\_if\_exist:p:N \_fp\_if\_exist:p:c
\_fp\_if\_exist:NTF \_fp\_if\_exist:cTF
\end{verbatim}

Copies of the \texttt{cs} functions defined in \texttt{l3basics}.

\begin{verbatim}
\prg\_new\_eq\_conditional:Nnn \_fp\_if\_exist:N \cs\_if\_exist:N \{ TF , T , F , p \}
\prg\_new\_eq\_conditional:Nnn \_fp\_if\_exist:c \cs\_if\_exist:c \{ TF , T , F , p \}
\end{verbatim}

(End definition for \_\_fp\_if\_exist:NTF. This function is documented on page 243.)
\fp_if_nan_p:n
\fp_if_nan:nTF

Evaluate and check if the result is a floating point of the same kind as \texttt{nan}.

\begin{verbatim}
\prg_new_conditional:Nnn \fp_if_nan:n \fp_if_nan:n #1 { TF , T , F , p }
\{ 
  \exp:w \exp_last_unbraced:Nf \__fp_kind:w \__fp_parse:n {#1} \}
\prg_return_true:
\else:
\prg_return_false:
\fi:
\}
\end{verbatim}

(End definition for \texttt{\fp_if_nan:nTF}. This function is documented on page 305.)

71.3 Comparison

Within floating point expressions, comparison operators are treated as operations, so we evaluate \#1, then compare with \pm 0. Tuples are \texttt{true}.

\begin{verbatim}
\prg_new_conditional:Nnn \fp_compare:n \fp_compare:n #1 { p , T , F , TF }
\{ 
  \exp:w \exp_end_continue_f:w \__fp_parse:n {#1} \}
\cs_new:Npn \__fp_compare_return:w #1#2#3; 
\{ 
  \if_charcode:w 0 \__fp_if_type_fp:NTwFw #1 \__fp_use_i_delimit_by_s_stop:nw #3 \s__fp_stop \s__fp 1 \s__fp_stop \}
\prg_return_false:
\else:
\prg_return_true:
\fi:
\}
\end{verbatim}

(End definition for \texttt{\fp_compare:nTF} and \__fp_compare_return:w. This function is documented on page 245.)

\begin{verbatim}
\prg_new_conditional:Nnn \fp_compare_p:n \fp_compare:nTF \__fp_compare_aux:wn #1#2#3 { p , T , F , TF }
\{ 
  \if_int_compare:w \__fp_int_compare:w \__fp_int_eval:w '#2 - '#2 \__fp_int_eval_end:
\prg_return_true:
\else:
\prg_return_false:
\fi:
\}
\end{verbatim}

Evaluate \#1 and \#3, using an auxiliary to expand both, and feed the two floating point numbers swapped to \__fp_compare_back_any:ww, defined below. Compare the result with \texttt{#2-#2}, which is \texttt{-1} for \textless, \texttt{0} for \texttt{=} for, \texttt{1} for \textgreater and \texttt{2} for \texttt{?}.

\begin{verbatim}
\prg_new_conditional:Nnn \fp_compare_p:n \fp_compare:nTF \__fp_compare_aux:wn #1#2#3 { #1#2#3 \}
\{ 
  \if_int_compare:w \__fp_int_compare:w \__fp_int_eval:w '#2 - '#2 \__fp_int_eval_end:
\prg_return_true:
\else:
\prg_return_false:
\fi:
\}
\end{verbatim}
(End definition for \fp_compare:nTF and \__fp_compare_aux:wn. This function is documented on page 244.)

\__fp_compare_back_any:ww (y) ; (x);
Expands (in the same way as \int_eval:n) to −1 if x < y, 0 if x = y, 1 if x > y, and 2 otherwise (denoted as x?y). If either operand is nan, stop the comparison with \__fp_compare_nan:w returning 2. If x is negative, swap the outputs 1 and −1 (i.e., > and <); we can henceforth assume that x ≥ 0. If y ≥ 0, and they have the same type, either they are normal and we compare them with \__fp_compare_npos:nwnw, or they are equal. If y ≥ 0, but of a different type, the highest type is a larger number. Finally, if y ≤ 0, then x > y, unless both are zero.

\cs_new:Npn \__fp_compare_back_any:ww #1#2 ; #3
{
\__fp_if_type_fp:NTwFw #1 { \__fp_if_type_fp:NTwFw #3 \use_i:nn \s__fp \use_ii:nn \s__fp_stop }
\__fp_compare_back:ww {
\cs:w __fp __fp_type_from_scan:N #1 \__fp_type_from_scan:N #3 :ww \cs_end:
}
\cs_new:Npn \__fp_compare_back:ww
{\s__fp __fp_chk:w #1 #2 #3; \s__fp __fp_chk:w #4 #5 #6; \int_value:w \if_meaning:w 3 #1 \exp_after:wN \__fp_compare_nan:w \fi:
\if_meaning:w 3 #4 \exp_after:wN \__fp_compare_nan:w \fi:
\if_meaning:w 2 #5 - \fi:

\else: \if_int_compare:w #1#4 = \c_zero_int 0 \fi:
\else: 1
}
Tuple and floating point numbers are not comparable so return 2 in mixed cases or when tuples have a different number of items. Otherwise compare pairs of items with \texttt{\_\_fp\_compare\_back\_tuple:ww} and if any don’t match return 2 (as \texttt{\int\_value:w 02 \exp\_stop\_f:}).

\texttt{\_\_fp\_tuple\_compare\_back:ww} and others.

\texttt{\_\_fp\_tuple\_compare\_back\_tuple:ww}

Within an \texttt{\int\_value:w ... \exp\_stop\_f:} construction, this expands to 0 if the two numbers are equal, –1 if the first is smaller, and 1 if the first is bigger. First compare the exponents: the larger one denotes the larger number. If they are equal, we must compare significands. If both the first 8 digits and the next 8 digits coincide, the numbers are equal. If only the first 8 digits coincide, the next 8 decide. Otherwise, the first 8 digits are compared.
\_\_fp\_compare\_significand:nnnnnnn #2 \#4
\else:
  \if_int_compare:w \#1 < \#3 \- \fi: 1

\{ \fp_compare:nNnT {#1} #2 {#3}
\{ #4
\fp_while_do:nNnn {#1} #2 {#3} {#4} \}
\}

(End definition for \fp_do_until:nNnn and others. These functions are documented on page 245.)

\fp_step_function:nnnN
\fp_step_function:nnnc
\__fp_step:wwwwN
\__fp_step_fp:wwwwN
\__fp_step:NnnnnN
\__fp_step:NfnnnN

The approach here is somewhat similar to \int_step_function:nnnN. There are two
subtleties: we use the internal parser \__fp_parse:n to avoid converting back and forth
from the internal representation; and (due to rounding) even a non-zero step does not
guarantee that the loop counter increases.
\cs_new:Npn \fp_step_function:nnnN #1#2#3
\{ \exp_after:wN \__fp_step:wwwwN

{\tl_set:Nn \exp_not:N #4 {##1}
\exp_not:n {#5}}
\}
\cs_new_protected:Npn \__fp_step:NNnnnn #1#2#3#4#5#6
\#1 \#2 ##1 \{#6\}
\fp_step_function:nnnN {#3} {#4} {#5} #2
\prg_break_point:Nn \scan_stop: \{ \int_gdecr:N \g__kernel_prg_map_int \}
\end{verbatim}

(End definition for \fp_step_inline:nnnn, \fp_step_variable:nnnNn, and \__fp_step:NNnnnn. These functions are documented on page 247.)

\begin{verbatim}
\msg_new:nnn { fp } { step-tuple }{ Tuple-argument-in-fp_step_...-{#1}{#2}{#3}. }
\msg_new:nnn { fp } { bad-step }{ Invalid-step-size-#2-for-function-#3. }
\msg_new:nnn { fp } { tiny-step }{ Tiny-step-size-(#1+#2=#1)-for-function-#3. }
\end{verbatim}

## 71.5 Extrema

First check all operands are floating point numbers. The argument #1 is 2 to find the maximum of an array #2 of floating point numbers, and 0 to find the minimum. We read numbers sequentially, keeping track of the largest (smallest) number found so far. If numbers are equal (for instance \pm 0), the first is kept. We append \(-\infty (\infty)\), for the case of an empty array. Since no number is smaller (larger) than that, this additional item only affects the maximum (minimum) in the case of \texttt{max()} and \texttt{min()} with no argument. The weird \texttt{fp}-like trailing marker breaks the loop correctly: see the precise definition of \__fp_minmax_loop:Nww.

\begin{verbatim}
\cs_new:Npn \__fp_minmax_o:Nw #1
\__fp_parse_function_all_fp_o:fnw
\{ \token_if_eq_meaning:NNTF 0 #1 \{ min \} \{ max \} \}
\cs_new:Npn \__fp_minmax_aux_o:Nw #1 #1
\__fp_minmax_loop:Nww
\end{verbatim}
The first argument is − or + to denote the case where the currently largest (smallest)
number found (first floating point argument) should be replaced by the new number
(second floating point argument). If the new number is nan, keep that as the extremum,
unless that extremum is already a nan. Otherwise, compare the two numbers. If the new
number is larger (in the case of max) or smaller (in the case of min), the test yields true,
and we keep the second number as a new maximum; otherwise we keep the first number.
Then loop.

\Cs_new:Npn \__fp_minmax_loop:Nww \#1 \s__fp \__fp_chk:w \#2 \s__fp \__fp_chk:w \#3; \s__fp \__fp_chk:w \#4 \s__fp \__fp_chk:w \#5;
\{\if_int_compare:w \__fp_compare_back:ww \s__fp \__fp_chk:w \#4 \s__fp \__fp_chk:w \#5; \else:\if_meaning:w \__fp_minmax_break_o:w \__fp_minmax_loop:Nww \#1 \s__fp \__fp_chk:w \#2 \s__fp \__fp_chk:w \#3; \fi:\else:\fi:\\else:\\if_int_compare:w \__fp_minmax_break_o:w \__fp_minmax_loop:Nww \#1 \s__fp \__fp_chk:w \#2 \s__fp \__fp_chk:w \#3; \fi:\else:\fi:\}
\_fp\_minmax\_break\_o:w

This function is called from within an \texttt{if\_meaning:w} test. Skip to the end of the tests, close the current test with \texttt{fi:}, clean up, and return the appropriate number with one post-expansion.

\texttt{\cs\new:Npn \_fp\_minmax\_break\_o:w \#1 \texttt{fi:} \texttt{fi:} \#2 \texttt{s\_fp \#3; \#4;}}

(End definition for \_fp\_minmax\_auxi:ww and \_fp\_minmax\_auxii:ww)

\_fp\_not\_o:w
\_fp\_tuple\_not\_o:w

Return \texttt{true} or \texttt{false}, with two expansions, one to exit the conditional, and one to please l3fp-parse. The first argument is provided by l3fp-parse and is ignored.

\texttt{\cs\new:Npn \_fp\_not\_o:w \#1 \s\_fp \_fp\_chk:w \#2\#3; \#4;}
\texttt{\exp\_after:wN \exp\_after:wN \exp\_after:wN \c\_one_fp}
\texttt{\else:}
\texttt{\exp\_after:wN \exp\_after:wN \exp\_after:wN \c\_zero_fp}
\texttt{\texttt{fi:}}

(End definition for \_fp\_not\_o:w and \_fp\_tuple\_not\_o:w)

\_fp\_\&\_o:ww
\_fp\_\&\_tuple\_o:ww
\_fp\_\_\&\_tuple\_o:ww
\_fp\_\|\_o:ww
\_fp\_\|\_tuple\_o:ww
\_fp\_\_\|\_tuple\_o:ww
\_fp\_and\_return:wNw

For \texttt{and}, if the first number is zero, return it (with the same sign). Otherwise, return the second one. For \texttt{or}, the logic is reversed: if the first number is non-zero, return it, otherwise return the second number: we achieve that by hi-jacking \_fp\_\&\_o:ww, inserting an extra argument, \texttt{\else:}, before \texttt{s\_fp}. In all cases, expand after the floating point number.

(End definition for \_fp\_\&\_o:ww and \_fp\_\&\_tuple\_o:ww)
The first function receives the test and the true branch of the `?` ternary operator. It calls \_fp_ternary_auxii:NwwN if the test branch is a floating point number \pm 0, and otherwise calls \_fp_ternary_auxi:NwwN. These functions select one of their two arguments.

71.7 Ternary operator

«...\cs_new:Npn \_fp_ternary:NwwN \_fp_ternary_auxi:NwwN \_fp_ternary_auxii:NwwN
\_fp_tuple_|_tuple_o:ww #1; \_fp_and_return:ww #1; \fi: #2; { /fi: \_fp_exp_after_o:ww #1; }
\group_end:
\cs_new:Npn \_fp_tuple_|_tuple_o:ww #1; #2; \{ \_fp_exp_after_tuple_o:w #1; \}
\cs_new:Npn \_fp_and_return:ww #1; \fi: #2; { \fi: \_fp_exp_after_o:w #1; }
(End definition for \_fp_&_o:ww and others.)"
(End definition for \_fp_ternary:NwwN, \_fp_ternary_auxi:NwwN, and \_fp_ternary_auxii:NwwN.)
Chapter 72

l3fp-basics Implementation

The l3fp-basics module implements addition, subtraction, multiplication, and division of two floating points, and the absolute value and sign-changing operations on one floating point. All operations implemented in this module yield the outcome of rounding the infinitely precise result of the operation to the nearest floating point.

Some algorithms used below end up being quite similar to some described in “What Every Computer Scientist Should Know About Floating Point Arithmetic”, by David Goldberg, which can be found at http://cr.yp.to/2005-590/goldberg.pdf.

Unary functions.

\__fp_parse_word_abs:N
\__fp_parse_word_logb:N
\__fp_parse_word_sign:N
\__fp_parse_word_sqrt:N

(End definition for \__fp_parse_word_abs:N and others.)

72.1 Addition and subtraction

We define here two functions, \__fp_-_o:ww and \__fp_+_o:ww, which perform the subtraction and addition of their two floating point operands, and expand the tokens following the result once.

A more obscure function, \__fp_add_big_i_o:wNww, is used in l3fp-expo.

The logic goes as follows:

- \__fp_-_o:ww calls \__fp_+_o:ww to do the work, with the sign of the second operand flipped;
- \__fp_+_o:ww dispatches depending on the type of floating point, calling specialized auxiliaries;
• in all cases except summing two normal floating point numbers, we return one or the other operands depending on the signs, or detect an invalid operation in the case of $\infty - \infty$;

• for normal floating point numbers, compare the signs;

• to add two floating point numbers of the same sign or of opposite signs, shift the significand of the smaller one to match the bigger one, perform the addition or subtraction of significands, check for a carry, round, and pack using the \_\_fp\_basics\_pack\_\_ functions.

The trickiest part is to round correctly when adding or subtracting normal floating point numbers.

### 72.1.1 Sign, exponent, and special numbers

\_\_fp\_\_o:ww

The \_\_fp\_\_o:ww auxiliary has a hook: it takes one argument between the first \s\_\_fp and \_\_fp\_chk:w, which is applied to the sign of the second operand. Positioning the hook there means that \_\_fp\_\_o:ww can still perform the sanity check that it was followed by \s\_\_fp.

\begin{verbatim}
\cs_new:cpx { __fp_-_o:ww } \s\_\_fp
\exp_not:c { __fp_+_o:ww }
\exp_not:n { \s\_\_fp \__fp_neg_sign:N }
\end{verbatim}

(End definition for \_\_fp\_\_o:ww.)

\_\_fp\_\_o:ww

This function is either called directly with an empty #1 to compute an addition, or it is called by \_\_fp\_\_o:ww with \_\_fp\_neg_sign:N as #1 to compute a subtraction, in which case the second operand’s sign should be changed. If the \langle types \rangle #2 and #4 are the same, dispatch to case #2 (0, 1, 2, or 3), where we call specialized functions: thanks to \int_value:w, those receive the tweaked \langle sign \rangle (expansion of #1#5) as an argument. If the \langle types \rangle are distinct, the result is simply the floating point number with the highest \langle type \rangle. Since case 3 (used for two nan) also picks the first operand, we can also use it when \langle type1 \rangle is greater than \langle type2 \rangle. Also note that we don’t need to worry about \langle sign \rangle in that case since the second operand is discarded.

\begin{verbatim}
\cs_new:cpn { __fp_+_o:ww }
\s\_\_fp \int_value:w \or: \exp_after:wN \__fp_add_zeros_o:Nww
\end{verbatim}

1070
\or: \exp_after:wN \_fp_add_inf_o:Nww \int_value:w
\or: \_fp_case_return_i_o:ww

(End definition for \_fp_add_zeros_o:)
We now have two normal numbers to add, and we have to check signs and exponents more carefully before performing the addition.

In this subsection, we perform the addition of two positive normal numbers. Since we are doing an addition, the final sign is \langle sign1 \rangle. Start an \__fp_int_eval:w, responsible for computing the exponent: the result, and the \langle final sign \rangle are then given to \__fp_sanitize:Nw which checks for overflow. The exponent is computed as the largest exponent \#2 or \#5, incremented if there is a carry. To add the significands, we decimate the smaller number by the difference between the exponents. This is done by \__fp_minus

\__fp_int_eval:w \_if_int_compare:w #2 > #5 \exp_stop_f: #2
\else:
\fi:
\__fp_int_eval:w #5 - #2 ; #1 #3;

(End definition for \__fp_add_npos_o:Nnw.)

### 72.1.2 Absolute addition

In this subsection, we perform the addition of two positive normal numbers.
To round properly, we must know at which digit the rounding should occur. This requires to know whether the addition produces an overall carry or not. Thus, we do the computation now and check for a carry, then go back and do the rounding. The rounding may cause a carry in very rare cases such as \(0.99\cdots95\rightarrow1.00\cdots0\), but this situation always give an exact power of 10, for which it is easy to correct the result at the end. If there's no carry, grab all the digits again and round. The packing function \(\_\_fp_add_significand_no_carry_o:wwNN\) takes care of the case where rounding brings a carry.
25376 \{ \\

25383 \}

(End definition for \_\_fp_add_significand_no_carry_o:wwwNN.)

\_\_fp_add_significand_carry_o:wwwNN
\_\_fp_add_significand_carry_o:wwwNN
⟨8d⟩; ⟨6d⟩; ⟨2d⟩; ⟨rounding digit⟩ ⟨sign⟩

The case where there is a carry is very similar. Rounding can even raise the first digit from 1 to 2, but we don't care.

72.1.3 Absolute subtraction

\_\_fp_sub_npos_o:NwwNN
\_\_fp_sub_eq_o:Nwwnnw
\_\_fp_sub_npos_ii_o:Nwwnnw
\_\_fp_sub_npos_o:NwwNN
⟨sign1⟩ ⟨exp1⟩ ⟨body1⟩; \s\_\_fp \_\_fp_chk:w 1
⟨initial sign2⟩ ⟨exp2⟩ ⟨body2⟩;

Rounding properly in some modes requires to know what the sign of the result will be. Thus, we start by comparing the exponents and significands. If the numbers coincide, return zero. If the second number is larger, swap the numbers and call \_\_fp_sub_npos_-_i_o:Nwwnnw with the opposite of ⟨sign1⟩.

72.1.3 Absolute subtraction

\_\_fp_sub_npos_o:NwwNN
\_\_fp_sub_eq_o:Nwwnnw
\_\_fp_sub_npos_ii_o:Nwwnnw
\_\_fp_sub_npos_o:NwwNN ⟨sign1⟩ ⟨exp1⟩ ⟨body1⟩; \s\_\_fp \_\_fp_chk:w 1
⟨initial sign2⟩ ⟨exp2⟩ ⟨body2⟩;

Rounding properly in some modes requires to know what the sign of the result will be. Thus, we start by comparing the exponents and significands. If the numbers coincide, return zero. If the second number is larger, swap the numbers and call \_\_fp_sub_npos_-_i_o:Nwwnnw with the opposite of ⟨sign1⟩.
After the computation is done, \texttt{\_\_fp\_sanitize:Nw} checks for overflow/underflow. It expects the (\textit{final sign}) and the (\textit{exponent}) (delimited by ;). Start an integer expression for the exponent, which starts with the exponent of the largest number, and may be decreased if the two numbers are very close. If the two numbers have the same exponent, call the \textit{near} auxiliary. Otherwise, decimate \( y \), then call the \textit{far} auxiliary to evaluate the difference between the two significands. Note that we decimate by 1 less than one could expect.

\begin{verbatim}

\_fp_sub_back_shift:wnnnn
\_fp_sub_back_shift_ii:ww
\_fp_sub_back_shift_iii:NNNNNNNw
\_fp_sub_back_shift_iv:nnnnw

This function is called with \langle Z_1 \rangle \leq 999. Act with \texttt{number} to trim leading zeros from \langle Z_1 \rangle \langle Z_2 \rangle (we don’t do all four blocks at once, since non-zero blocks would then overflow \TeX’s integers). If the first two blocks are zero, the auxiliary receives an empty \texttt{#1} and trims \texttt{#2#3} from leading zeros, yielding a total shift between 7 and 16 to the exponent. Otherwise we get the shift from \texttt{#1} alone, yielding a result between 1 and 6. Once the exponent is taken care of, trim leading zeros from \texttt{#1#2#3} (when \texttt{#1} is empty, the space before \texttt{#2#3} is ignored), get four blocks of 4 digits and finally clean up. Trailing zeros are added so that digits can be grabbed safely.

\_fp_sub_back_far_o:NNnnnnN \texttt{\langle rounding \rangle} \{(Y’_1)\} \{(Y’_2)\}
\langle extra-digits \rangle \{(X_1)\} \{(X_2)\} \{(X_3)\} \{(X_4)\} \langle final sign \rangle

If the difference is greater than 10^{(\texttt{expo})}, call the \texttt{very_far} auxiliary. If the result is less than 10^{(\texttt{expo})}, call the \texttt{not_far} auxiliary. If it is too close a call to know yet, namely if 1\langle Y’_1 \rangle \langle Y’_2 \rangle = \langle X_1 \rangle \langle X_2 \rangle \langle X_3 \rangle \langle X_4 \rangle 0, then call the \texttt{quite_far} auxiliary. We use the odd combination of space and semi-colon delimiters to allow the \texttt{not_far} auxiliary to grab each piece individually, the \texttt{very_far} auxiliary to use \_fp_pack_eight:wNNNNNNNN, and the \texttt{quite_far} to ignore the significands easily (using the ; delimiter).

\cs_new:Npn \_fp_sub_back_far_o:NNnnnnN #1 #2#3 #4; #5#6#7#8
\}
The easiest case is when \( x - y \) is extremely close to a power of 10, namely the first digit of \( x \) is 1, and all others vanish when subtracting \( y \). Then the \langle \text{rounding} \rangle #3 and the \langle \text{final sign} \rangle #4 control whether we get 1 or 0.9999999999999999. In the usual round-to-nearest mode, we get 1 whenever the \langle \text{rounding} \rangle digit is less than or equal to 5 (remember that the \langle \text{rounding} \rangle digit is only equal to 5 if there was no further non-zero digit).

In the present case, \( x \) and \( y \) have different exponents, but \( y \) is large enough that \( x - y \) has a smaller exponent than \( x \). Decrement the exponent (with -1). Then proceed in a way similar to the \text{near} auxiliaries seen earlier, but multiplying \( x \) by 10 (\#30 and \#40 below), and with the added quirk that the \langle \text{rounding} \rangle digit has to be taken into account. Namely, we may have to decrease the result by one unit if \text{\texttt{\_\_fp_round_neg:NNN}} returns 1. This function expects the \langle \text{final sign} \rangle #6, the last digit of 1100000000+\#40-\#2, and the \langle \text{rounding} \rangle digit. Instead of redoing the computation for the second argument, we note that \text{\texttt{\_\_fp_round_neg:NNN}} only cares about its parity, which is identical to that of the last digit of \#2.

The case where \textit{x} \textit{−} \textit{y} and \textit{x} have the same exponent is a bit more tricky, mostly because it cannot reuse the same auxiliaries. Shift the \textit{y} significand by adding a leading 0. Then the logic is similar to the \textit{not_far} functions above. Rounding is a bit more complicated: we have two \langle rounding \rangle digits #3 and #6 (from the decimation, and from the new shift) to take into account, and getting the parity of the main result requires a computation. The first \texttt{\int_value:w} triggers the second one because the number is unfinished; we can thus not use 0 in place of 2 there.

72.2.2 Absolute multiplication

In this subsection, we perform the multiplication of two positive normal numbers.
\[ \text{\texttt{\_fp_mul_cases}} \]
\[ \text{\texttt{\_fp_mul_npos}} \]
\[ \text{\texttt{\_fp_mul_significand}} \]

Note the three semicolons at the end of the definition. One is for the last \texttt{\_fp\_mul\_significand\_drop}; one is for \texttt{\_fp\_round\_digit} later on; and one, preceded by \texttt{\exp_after:wN}, which is correctly expanded (within an \texttt{\_fp\_int\_eval}), is used by \texttt{\_fp\_basics\_pack\_low}.

The product of two 16 digit integers has 31 or 32 digits, but it is impossible to know which one before computing. The place where we round depends on that number of digits, and may depend on all digits until the last in some rare cases. The approach is thus to compute the 5 first blocks of 4 digits (the first one is between 100 and 9999 inclusive), and a compact version of the remaining 3 blocks. Afterwards, the number of digits is known, and we can do the rounding within yet another set of \texttt{\_fp\_int\_eval}.

\[ \text{\texttt{\cs_new:Npn \_fp\_mul\_significand\_o:nnnnnnnn}} \]
\[ \text{\texttt{\_fp\_mul\_significand\_drop}} \]

\__fp_mul_significand_large_f:NwwNNNN
In this branch, \{digit 1\} is non-zero. The result is thus \{digits 1–16\}, plus some rounding which depends on the digits 16, 17, and whether all subsequent digits are zero or not. Here, \__fp_round_digit:Nw takes digits 17 and further (as an integer expression), and replaces it by a \{rounding digit\}, suitable for \__fp_round:NNN.
\cs_new:Npn \__fp_mul_significand_large_f:NwwNNNN #1 #2; #3; #4#5#6#7; +
{ \exp_after:wN \__fp_basics_pack_high:NNNNNw \int_value:w \__fp_int_eval:w 1#2 \exp_after:wN \__fp_basics_pack_low:NNNNNw \int_value:w \__fp_int_eval:w 1#3#4#5#6#7 + \exp_after:wN \__fp_round:NNN \exp_after:wN \__fp_round:NNN #1 }
In this branch, \((\text{digit } 1)\) is zero. Our result is thus \((\text{digits } 2-17)\), plus some rounding which depends on the digits 17, 18, and whether all subsequent digits are zero or not. The 8 digits \(1\#3\) are followed, after expansion of the small\_pack auxiliary, by the next digit, to form a 9 digit number.

72.3 Division

72.3.1 Signs, and special numbers

Time is now ripe to tackle the hardest of the four elementary operations: division.

Filtering special floating point is very similar to what we did for multiplications, with a few variations. Invalid operation exceptions display \(/\) rather than \(*\). In the formula for dispatch, we replace \(-2+-\) by \(-\). The case of normal numbers is treated using \/__fp\_/\_div\_npos\_o:Nww rather than \/__fp\_mul\_npos\_o:Nww. There are two additional cases: if the first operand is normal and the second is a zero, then the division by zero exception is raised; cases 10 and 11 of the \texttt{if\_case:w} construction in \/__fp\_mul\_cases\_o:Nnww are provided as the fourth argument here.
We want to compute $A/Z$. As for multiplication, \_fp\_sanitize:Nw checks for overflow or underflow; we provide it with the ⟨final sign⟩, and an integer expression in which we compute the exponent. We set up the arguments of \_fp\_div\_significand_i_o:wnnw, namely an integer ⟨y⟩ obtained by adding 1 to the first 5 digits of $Z$ (explanation given soon below), then the four ⟨$A_i$⟩, then the four ⟨$Z_i$⟩, a semi-colon, and the ⟨final sign⟩, used for rounding at the end.

\cs_new:Npn \_fp\_div\_npos_o:Nww
\begin{verbatim}
\#1 \_fp\_chk:w 1 \_fp\_div\_npos_o:Nww \_fp\_sanitize:Nw \_fp\_chk:w 1 \_fp\_div\_npos_o:Nww \_fp\_chk:w 1 ; \_fp\_chk:w 1 \_fp\_chk:w 1 ; \_fp\_chk:w 1 \_fp\_chk:w 1 ;
\end{verbatim}

(End definition for \_fp\_div\_npos_o:Nww.)

### 72.3.2 Work plan

In this subsection, we explain how to avoid overflowing \TeX's integers when performing the division of two positive normal numbers.

We are given two numbers, $A = 0.A_1A_2A_3A_4$ and $Z = 0.Z_1Z_2Z_3Z_4$, in blocks of 4 digits, and we know that the first digits of $A_1$ and of $Z_1$ are non-zero. To compute $A/Z$, we proceed as follows.

- Find an integer $Q_A \simeq 10^4 A/Z$.
- Replace $A$ by $B = 10^4 A - Q_A Z$.
- Find an integer $Q_B \simeq 10^4 B/Z$.
- Replace $B$ by $C = 10^4 B - Q_B Z$.
- Find an integer $Q_C \simeq 10^4 C/Z$.
- Replace $C$ by $D = 10^4 C - Q_C Z$.
- Find an integer $Q_D \simeq 10^4 D/Z$.
- Consider $E = 10^4 D - Q_D Z$, and ensure correct rounding.
The result is then $Q = 10^{-4} Q_A + 10^{-8} Q_B + 10^{-12} Q_C + 10^{-16} Q_D + \text{rounding}$. Since the $Q_i$ are integers, $B$, $C$, $D$, and $E$ are all exact multiples of $10^{-16}$, in other words, computing with 16 digits after the decimal separator yields exact results. The problem is the risk of overflow: in general $B$, $C$, $D$, and $E$ may be greater than 1.

Unfortunately, things are not as easy as they seem. In particular, we want all intermediate steps to be positive, since negative results would require extra calculations at the end. This requires that $Q_A \leq 10^4 A/Z$ etc. A reasonable attempt would be to define $Q_A$ as

$$Q_A = \inteval{n} \left\{ \frac{A_1 A_2}{Z_1+1} - 1 \right\} \leq \frac{10^4 A}{Z}$$

Subtracting 1 at the end takes care of the fact that \texttt{\_fp_int_eval:w} rounds divisions instead of truncating (really, 1/2 would be sufficient, but we work with integers). We add 1 to $Z_1$ because $Z_1 \leq 10^4 Z < Z_1 + 1$ and we need $Q_A$ to be an underestimate. However, we are now underestimating $Q_A$ too much: it can be wrong by up to 100, for instance when $Z = 0.1$ and $A \approx 1$. Then $B$ could take values up to 10 (maybe more), and a few steps down the line, we would run into arithmetic overflow, since \TeX{} can only handle integers less than roughly $2 \cdot 10^9$.

A better formula is to take

$$Q_A = \inteval{n} \left\{ \frac{10 \cdot A_1 A_2}{[10^{-3} \cdot Z_1 Z_2] + 1} - 1 \right\}.$$ 

This is always less than $10^9 A/(10^5 Z)$, as we wanted. In words, we take the 5 first digits of $Z$ into account, and the 8 first digits of $A$, using 0 as a 9-th digit rather than the true digit for efficiency reasons. We shall prove that using this formula to define all the $Q_i$ avoids any overflow. For convenience, let us denote

$$y = [10^{-3} \cdot Z_1 Z_2] + 1,$$

so that, taking into account the fact that \texttt{\_fp_int_eval:w} rounds ties away from zero,

$$Q_A = \inteval{n} \left\{ \left( \frac{A_1 A_2 y - 1}{2} \right) - \frac{3}{2} \frac{y - 1}{2} \right\}.$$

Note that $10^4 < y \leq 10^5$, and $999 \leq Q_A \leq 99989$. Also note that this formula does not cause an overflow as long as $A < (2^{31} - 1)/10^9 \approx 2.147 \cdots$, since the numerator involves an integer slightly smaller than $10^5 A$.

Let us bound $B$:

$$10^5 B = A_1 A_2 0 + 10 \cdot 0 \cdot A_3 A_4 - 10 \cdot Z_1 Z_2 Z_3 Z_4 \cdot Q_A$$

$$< A_1 A_2 0 \cdot \left( 1 - 10 \cdot \frac{Z_1 Z_2 Z_3 Z_4}{y} \right) + \frac{3}{2} \cdot 10 \cdot Z_1 Z_2 Z_3 Z_4 + 10$$

$$\leq A_1 A_2 0 \cdot \left( y - 10 \cdot Z_1 Z_2 Z_3 Z_4 \right) + \frac{3}{2} y + 10$$

$$\leq \frac{A_1 A_2 0 \cdot 1}{y} + \frac{3}{2} y + 10 \leq \frac{10^9 A}{y} + 1.6 \cdot y.$$
At the last step, we hide $10$ into the second term for later convenience. The same reasoning yields

$$10^5B < 10^9A/y + 1.6y,$$

$$10^5C < 10^9B/y + 1.6y,$$

$$10^5D < 10^9C/y + 1.6y,$$

$$10^5E < 10^9D/y + 1.6y.$$ 

The goal is now to prove that none of $B$, $C$, $D$, and $E$ can go beyond $(2^{31} - 1)/10^9 = 2.147\ldots$.

Combining the various inequalities together with $A < 1$, we get

$$10^5B < 10^9/y + 1.6y,$$

$$10^5C < 10^{13}/y^2 + 1.6(y + 10^4),$$

$$10^5D < 10^{17}/y^3 + 1.6(y + 10^4 + 10^8/y),$$

$$10^5E < 10^{21}/y^4 + 1.6(y + 10^4 + 10^8/y + 10^{12}/y^2).$$

All of those bounds are convex functions of $y$ (since every power of $y$ involved is convex, and the coefficients are positive), and thus maximal at one of the end-points of the allowed range $10^4 < y \leq 10^5$. Thus,

$$10^5B < \max(1.16 \cdot 10^5, 1.7 \cdot 10^5),$$

$$10^5C < \max(1.32 \cdot 10^5, 1.77 \cdot 10^5),$$

$$10^5D < \max(1.48 \cdot 10^5, 1.777 \cdot 10^5),$$

$$10^5E < \max(1.64 \cdot 10^5, 1.7777 \cdot 10^5).$$

All of those bounds are less than $2.147 \cdot 10^5$, and we are thus within $\text{TeX}$’s bounds in all cases!

We later need to have a bound on the $Q_i$. Their definitions imply that $Q_A < 10^9A/y - 1/2 < 10^5A$ and similarly for the other $Q_i$. Thus, all of them are less than $177770$.

The last step is to ensure correct rounding. We have

$$A/Z = \sum_{i=1}^{4} (10^{-4i}Q_i) + 10^{-16}E/Z$$

exactly. Furthermore, we know that the result is in $[0.1, 10)$, hence will be rounded to a multiple of $10^{-16}$ or of $10^{-15}$, so we only need to know the integer part of $E/Z$, and a “rounding” digit encoding the rest. Equivalently, we need to find the integer part of $2E/Z$, and determine whether it was an exact integer or not (this serves to detect ties). Since

$$\frac{2E}{Z} = 2 \frac{10^5E}{10^8Z} \leq 2 \frac{10^5E}{10^9} < 36,$$
this integer part is between 0 and 35 inclusive. We let $\varepsilon$-TEX round

$$P = \texttt{\texttt{int\_eval:n}} \left\{ \frac{2 \cdot E_1 E_2}{Z_1 Z_2} \right\},$$

which differs from $2E/Z$ by at most

$$\frac{1}{2} + 2 \left| \frac{E}{Z} - \frac{E}{10^{-8} Z_1 Z_2} \right| + 2 \left| \frac{10^8 E - E_1 E_2}{Z_1 Z_2} \right| < 1,$$

(1/2 comes from $\varepsilon$-TEX’s rounding) because each absolute value is less than $10^{-7}$. Thus $P$ is either the correct integer part, or is off by 1; furthermore, if $2E/Z$ is an integer, $P = 2E/Z$. We will check the sign of $2E - PZ$. If it is negative, then $E/Z \in ((P-1)/2, P/2)$. If it is zero, then $E/Z = P/2$. If it is positive, then $E/Z \in (P/2, (P+1)/2)$. In each case, we know how to round to an integer, depending on the parity of $P$, and the rounding mode.

72.3.3 Implementing the significand division

```latex
\texttt{\texttt{\_\_fp\_div\_significand\_i\_o:wnnw}} (y) ; \{\langle A_1 \rangle \} \{\langle A_2 \rangle \} \{\langle A_3 \rangle \} \{\langle A_4 \rangle \}
\{\langle Z_1 \rangle \} \{\langle Z_2 \rangle \} \{\langle Z_3 \rangle \} \{\langle Z_4 \rangle \} ; \langle \text{sign} \rangle
```

Compute $10^6 + Q_A$ (a 7 digit number thanks to the shift), unbrace $\langle A_1 \rangle$ and $\langle A_2 \rangle$, and prepare the $\langle \text{continuation} \rangle$ arguments for 4 consecutive calls to \texttt{\_\_fp\_div\_significand\_calc:wnnnnnnnn}. Each of these calls needs (y) (#1), and it turns out that we need post-expansion there, hence the \texttt{\texttt{int\_value:w}}. Here, #4 is six brace groups, which give the six first n-type arguments of the calc function.

1086
use the usual trick of adding a large power of $10$ to ensure that the number of digits is fixed.

The bound on $Q_A$, implies that $10^6 + Q_A$ starts with the digit $1$, followed by $0$ or $1$. We test, and call different auxiliaries for the two cases. An earlier implementation did the tests within the computation, but since we added a \langle continuation \rangle, this is not possible because the macro has $9$ parameters.

The result we want is then (the overall power of $10$ is arbitrary):

$$
10^{-4}(\#2 - \#1 \cdot \#5 - 10 \cdot \langle i \rangle \cdot \#5\#6) + 10^{-8}(\#3 - \#1 \cdot \#6 - 10 \cdot \langle i \rangle \cdot \#7)
$$

$$
+ 10^{-12}(\#4 - \#1 \cdot \#7 - 10 \cdot \langle i \rangle \cdot \#8) + 10^{-16}(-\#1 \cdot \#8),
$$

where $\langle i \rangle$ stands for the $10^5$ digit of $Q_A$, which is $0$ or $1$, and $\#1, \#2, \text{etc.}$ are the parameters of either auxiliary. The factors of $10$ come from the fact that $Q_A = 10 \cdot 10^4 \cdot \langle i \rangle + \#1$. As usual, to combine all the terms, we need to choose some shifts which must ensure that the number of digits of the second, third, and fourth terms are each fixed. Here, the positive contributions are at most $10^8$ and the negative contributions can go up to $10^9$. Indeed, for the auxiliary with $\langle i \rangle = 1$, $\#1$ is at most $80000$, leading to contributions of at worse $-8 \cdot 10^8$, while the other negative term is very small $< 10^6$ (except in the first expression, where we don’t care about the number of digits); for the auxiliary with $\langle i \rangle = 0$, $\#1$ can go up to $99999$, but there is no other negative term. Hence, a good choice is $2 \cdot 10^9$, which produces totals in the range $[10^9, 2 \cdot 10^9]$. We are flirting with \TeX’s limits once more.
\__fp_div_significand_ii:wwn \__fp_div_significand_ii:wwn
\langle y \rangle; \langle E_1 \rangle; \\{ \langle E_2 \rangle \} \\{ \langle E_3 \rangle \} \\{ \langle E_4 \rangle \} \\{ \langle Z_1 \rangle \} \\{ \langle Z_2 \rangle \} \\{ \langle Z_3 \rangle \} \\{ \langle Z_4 \rangle \} \langle \text{sign} \rangle

Compute $Q_B$ by evaluating $(B_1)(B_2)/y - 1$. The result is output to the left, in an \__fp_int_eval:w which we start now. Once that is evaluated (and the other $Q_i$ also, since later expansions are triggered by this one), a packing auxiliary takes care of placing the digits of $Q_B$ in an appropriate way for the final addition to obtain $Q$. This auxiliary is also used to compute $Q_C$ and $Q_D$ with the inputs $C$ and $D$ instead of $B$.

\__fp_div_significand_iii:wwnnnnn \__fp_div_significand_iii:wwnnnnn
\langle P \rangle; \langle E_1 \rangle; \\{ \langle E_2 \rangle \} \\{ \langle E_3 \rangle \} \\{ \langle E_4 \rangle \} \\{ \langle Z_1 \rangle \} \\{ \langle Z_2 \rangle \} \\{ \langle Z_3 \rangle \} \\{ \langle Z_4 \rangle \} \langle \text{sign} \rangle

We compute $P \approx 2E/Z$ by rounding $2E_1E_2/Z_1Z_2$. Note the first 0, which multiplies $Q_D$ by 10: we later add (roughly) $5 \cdot P$, which amounts to adding $P/2 \approx E/Z$ to $Q_D$, the appropriate correction from a hypothetical $Q_E$.

\__fp_div_significand_iv:wwnnnnnnn
\langle P \rangle; \langle E_1 \rangle; \\{ \langle E_2 \rangle \} \\{ \langle E_3 \rangle \} \\{ \langle E_4 \rangle \} \\{ \langle Z_1 \rangle \} \\{ \langle Z_2 \rangle \} \\{ \langle Z_3 \rangle \} \\{ \langle Z_4 \rangle \} \langle \text{sign} \rangle
This adds to the current expression \((10^7 + 10 \cdot Q_D)\) a contribution of \(5 \cdot P + \text{sign}(T)\) with \(T = 2E - PZ\). This amounts to adding \(P/2\) to \(Q_D\), with an extra \(\langle\text{rounding}\rangle\) digit. This \(\langle\text{rounding}\rangle\) digit is 0 or 5 if \(T\) does not contribute, \textit{i.e.}, if \(0 = T = 2E - PZ\), in other words if \(10^{16} A/Z\) is an integer or half-integer. Otherwise it is in the appropriate range, \([1, 4]\) or \([6, 9]\). This is precise enough for rounding purposes (in any mode).

It seems an overkill to compute \(T\) exactly as I do here, but I see no faster way right now.

Once more, we need to be careful and show that the calculation \(#1 \cdot \#6 \#7\) below does not cause an overflow: naively, \(P\) can be up to 35, and \#6 \#7 up to \(10^9\), but both cannot happen simultaneously. To show that things are fine, we split in two (non-disjoint) cases.

- For \(P < 10\), the product obeys \(P \cdot \#6 \#7 < 10^8 \cdot P < 10^9\).
- For large \(P \geq 3\), the rounding error on \(P\), which is at most 1, is less than a factor of 2, hence \(P \leq 4E/Z\). Also, \#6 \#7 \(\leq 10^8 \cdot Z\), hence \(P \cdot \#6 \#7 \leq 4E \cdot 10^8 < 10^9\).

Both inequalities could be made tighter if needed.

Note however that \(P \cdot \#8 \#9\) may overflow, since the two factors are now independent, and the result may reach \(3.5 \cdot 10^9\). Thus we compute the two lower levels separately. The rest is standard, except that we use + as a separator (ending integer expressions explicitly). \(T\) is negative if the first character is -, it is positive if the first character is neither 0 nor -. It is also positive if the first character is 0 and second argument of \(\_\_fp\_div\_significand\_vi:Nw\), a sum of several terms, is also zero. Otherwise, there was an exact agreement: \(T = 0\).

\begin{verbatim}
\cs_new:Npn \__fp_div_significand_iv:wwnnnnnnn #1; #2;#3#4#5 #6#7#8#9 
{ + 5 * #1 
\exp_after:wN \__fp_div_significand_vi:Nw 
\int_value:w \_fp_int_eval:w -20 + 2*#2#3 - #1*#6#7 + 
\exp_after:wN \__fp_div_significand_v:NN 
\int_value:w \_fp_int_eval:w 199980 + 2*#4 - #1*#8 + 
\exp_after:wN \__fp_div_significand_v:NN

\else:
\_if_meaning:w - #1 - \else: + \fi: 1
\fi:
\_fp_div_significand_pack:NNN
}
\end{verbatim}

(End definition for \(\_\_fp\_div\_significand\_iv:wwnnnnnnn, \_\_fp\_div\_significand\_v:NNw, and \_\_fp\_div\_significand\_vi:Nw\).)

At this stage, we are in the following situation: \(\TeX\) is in the process of expanding several integer expressions, thus functions at the bottom expand before those above.
Here, $\epsilon = \text{sign}(T)$ is 0 in case $2E = PZ$, 1 in case $2E > PZ$, which means that $P$ was the correct value, but not with an exact quotient, and $-1$ if $2E < PZ$, i.e., $P$ was an overestimate. The packing function we define now does nothing special: it removes the $10^6$ and carries two digits (for the $10^5$'s and the $10^4$'s).

\[
\text{\_fp_div_significand_test_o:w 1 0 (5d); (4d); (4d); (5d); (sign)}
\]

The reason we know that the first two digits are $1$ and $0$ is that the final result is known to be between $0.1$ (inclusive) and $10$, hence $Q_A$ (the tilde denoting the contribution from the other $Q_i$) is at most $999999$, and $10^6 + Q_A = 10 \cdots$.

It is now time to round. This depends on how many digits the final result will have.

\[
\text{\_fp_div_significand_test_o:w 10 #1}
\]

Standard use of the functions \_fp_basics_pack_low:NNNNNw and \_fp_basics_pack_high:NNNNNw. We finally get to use the (final sign) which has been sitting there for a while.

\[
\text{\_fp_div_significand_small_o:wwwNNNNw} 0 (4d); (4d); (4d); (5d); (sign)
\]

We know that the final result cannot reach 10, hence 1#1#2, together with contributions from the level below, cannot reach $2 \cdot 10^9$. For rounding, we build the (rounding digit) from the last two of our 18 digits.
72.4 Square root

\textbf{Zeros are unchanged:} $\sqrt{-0} = -0$ and $\sqrt{+0} = +0$. Negative numbers (other than $-0$) have no real square root. Positive infinity, and \texttt{nan}, are unchanged. Finally, for normal positive numbers, there is some work to do.

\begin{verbatim}
\cs_new:Npn \__fp_sqrt_o:w #1 \s__fp \__fp_chk:w #2#3#4; @
{ \if_meaning:w 0 #2 \__fp_case_return_same_o:w \fi:
  \if_meaning:w 2 #3
  \__fp_case_use:nw { \__fp_invalid_operation_o:nw { sqrt } }
  \fi:
  \if_meaning:w 1 #2 \else: \__fp_case_return_same_o:w \fi:
  \__fp_sqrt_npos_o:w
  \s__fp \__fp_chk:w #2 #3 #4;
}
\end{verbatim}

\textit{(End definition for \__fp_sqrt_o:w.)}

Prepare \__fp_sanitize:Nw to receive the final sign 0 (the result is always positive) and the exponent, equal to half of the exponent \#1 of the argument. If the exponent \#1 is even, find a first approximation of the square root of the significand $10^{\frac{\#1}{2}}a_1 + a_2 = 10^{\frac{\#1}{2}} + 4\#5$ through Newton's method, starting at $x = 57234133 \approx 10^{7.75}$. Otherwise, first shift the significand of the argument by one digit, getting $a'_1 \in [10^6, 10^7)$ instead of $[10^7, 10^8)$, then use Newton's method starting at $17782794 \approx 10^{7.25}$.

\begin{verbatim}
\cs_new:Npn \__fp_sqrt_npos_o:w \s__fp \__fp_chk:w 1 0 \#1\#2\#3\#4\#5;
{ \exp_after:wN \__fp_sanitize:Nw \\
  \exp_after:wN 0 \\
  \int_value:w \__fp_int_eval:w
  \if_int_odd:w #1 \exp_stop_f:
  \__fp_sqrt_npos_o:w
  \s__fp \__fp_chk:w #2 #3 #4 #5;
}
\end{verbatim}

\textit{(End definition for \__fp_sqrt_npos_o:w.)}
Newton’s method maps $x \mapsto \left[ (x + [10^8a_1/x]) / 2 \right]$ in each iteration, where $[b/c]$ denotes ε-Ti\TeX’s division. This division rounds the real number $b/c$ to the closest integer, rounding ties away from zero, hence when $c$ is even, $b/c - 1/2 + 1/c \leq [b/c] \leq b/c + 1/2$ and when $c$ is odd, $b/c - 1/2 + 1/(2c) \leq [b/c] \leq b/c + 1/2 - 1/(2c)$. For all $c$, $b/c - 1/2 + 1/(2c) \leq [b/c] \leq b/c + 1/2$.

Let us prove that the method converges when implemented with ε-Ti\TeX division, for any $10^6 \leq a_1 < 10^8$ and starting value $10^6 \leq x < 10^8$. Using the inequalities above and the arithmetic–geometric inequality, for any $t = 10^6a_1/x$, we find

$$x' = \left[ \frac{x + [10^8a_1/x]}{2} \right] = \frac{x + 10^8a_1/x - 1/2 + 1/(2x)}{2} \geq \sqrt{10^8a_1} - \frac{1}{4} + \frac{1}{4x}.$$ 

After any step of iteration, we thus have $\delta = x - \sqrt{10^8a_1} \geq -0.25 + 0.25 \cdot 10^{-8}$. The new difference $\delta' = x' - \sqrt{10^8a_1}$ after one step is bounded above as

$$x' - \sqrt{10^8a_1} \leq \frac{x + 10^8a_1/x + 1/2}{2} + \frac{1}{2} - \sqrt{10^8a_1} \leq \frac{\delta}{2} + \frac{3}{4}.$$ 

For $\delta > 3/2$, this last expression is $\leq \delta/2 + 3/4$, so $\delta$ decreases at each step: since all $x$ are integers, $\delta$ must reach a value $-1/4 < \delta \leq 3/2$. In this range of values, we get $\delta' \leq \frac{3}{2} \frac{3}{2} + \frac{3}{4} \leq 0.75 + 1.125 \cdot 10^{-7}$. We deduce that the difference $\delta = x - \sqrt{10^8a_1}$ eventually reaches a value in the interval $[-0.25 + 0.25 \cdot 10^{-8}, 0.75 + 11.25 \cdot 10^{-8}]$, whose width is $1 + 11 \cdot 10^{-8}$. The corresponding interval for $x$ may contain two integers, hence $x$ might oscillate between these two values.

However, the fact that $x \mapsto x - 1$ and $x - 1 \mapsto x$ puts stronger constraints, which are not compatible: the first implies

$$x + [10^8a_1/x] \leq 2x - 2$$

hence $10^8a_1/x \leq x - 3/2$, while the second implies

$$x - 1 + [10^8a_1/(x - 1)] \geq 2x - 1$$

hence $10^8a_1/(x - 1) \geq x - 1/2$. Combining the two inequalities yields $x^2 - 3x/2 \geq 10^8a_1 \geq x - 3x/2 + 1/2$, which cannot hold. Therefore, the iteration always converges to a single integer $x$. To stop the iteration when two consecutive results are equal, the function \verb|\_fp_sqrt_Nowno:wwn| receives the newly computed result as #1, the previous result as #2, and $a_1$ as #3. Note that ε-Ti\TeX combines the computation of a multiplication and a following division, thus avoiding overflow in $#3 * 100000000 / #1$. In any case, the result is within $[10^7, 10^8]$. 

1092
This receives a continuation function #1, then five blocks of 4 digits for $y$, then two 8-digit blocks and a single digit for $a$. A common estimate of $\sqrt{a}-y = (a-y^2)/(\sqrt{a}+y)$ is $(a-y^2)/(2y)$, which leads to alternating overestimates and underestimates. We tweak this, to only work with underestimates (no need then to worry about signs in the computation). Each step finds the largest integer $j \leq 6$ such that $10^{13}(a-y^2) < 2 \cdot 10^8$, then computes the integer (with $\varepsilon$-TeX's rounding division)

$$10^{13}z = \left[\left\lfloor 10^{13}(a-y^2) \right\rfloor - 257 \right] \cdot (0.5 \cdot 10^8) \left/ \left( 10^8y + 1 \right) \right].$$

The choice of $j$ ensures that $10^{13}z < 2 \cdot 10^8 \cdot 0.5 \cdot 10^8/10^7 = 10^9$, thus $10^9 + 10^{13}z$ has exactly 10 digits, does not overflow $\varepsilon$-TeX's integer range, and starts with 1. Incidentally, since all $a-y^2 \leq 3.2 \cdot 10^{-8}$, we know that $j \geq 3$.

Let us show that $z$ is an underestimate of $\sqrt{a}-y$. On the one hand, $\sqrt{a}-y \leq 16 \cdot 10^{-8}$ because this holds for the initial $y$ and values of $y$ can only increase. On the other hand, the choice of $j$ implies that $\sqrt{a}-y \leq 5(\sqrt{a}+y)(\sqrt{a}-y) = 5(a-y^2) < 10^{9-j}$. For $j = 3$,
the first bound is better, while for larger $j$, the second bound is better. For all $j \in [3, 6]$, we find $\sqrt{a} - y < 16 \cdot 10^{-2j}$. From this, we deduce that

$$10^{4j}(\sqrt{a} - y) = \frac{10^{4j}(a - y^2 - (\sqrt{a} - y)^2)}{2y} \geq \frac{|10^{4j}(a - y^2)| - 257}{2 \cdot 10^{-8}[10^{8}y + 1]} + \frac{1}{2}$$

where we have replaced the bound $10^{4j}(16 \cdot 10^{-2j}) = 256$ by $257$ and extracted the corresponding term $1/(2 \cdot 10^{-8}[10^{8}y + 1]) \geq 1/2$. Given that $\epsilon$-FPX's integer division obeys $[b/c] \leq b/c + 1/2$, we deduce that $10^{4j}z \leq 10^{4j}(\sqrt{a} - y)$, hence $y + z \leq \sqrt{a}$ is an underestimate of $\sqrt{a}$, as claimed. One implementation detail: because the computation involves $-\#4*\#4 - 2*\#3*\#5 - 2*\#2*\#6$ which may be as low as $-5 \cdot 10^8$, we need to use the pack_big functions, and the big shifts.

We receive here the difference $a - y^2 = d = \sum d_i \cdot 10^{-4i}$, as $\langle d_2 \rangle \cdots \langle d_{10} \rangle$, where each block has 4 digits, except $\langle d_2 \rangle$. This function finds the largest $j \leq 6$ such that $10^{4j}(a - y^2) < 2 \cdot 10^8$, then leaves an open parenthesis and the integer $[10^{4j}(a - y^2)]$
in an integer expression. The closing parenthesis is provided by the caller \__fp_sqrt_-auxii_o:NnnnnnnN, which completes the expression
\[
10^{4j} z = \left(\left\lfloor \frac{(a - y^2)}{257} \right\rfloor \cdot 0.5 \cdot 10^8 \right) \left\lfloor \frac{10^8 y + 1}{10^8} \right\rfloor
\]
for an estimate of \(10^{4j}(\sqrt{a} - y)\). If \(d_2 \geq 2, j = 3\) and the auxiv auxiliary receives \(10^{12} z\). If \(d_2 \leq 1\) but \(10^{4}d_2 + 10^8d_3 + 10^4d_4 + d_5 \geq 1\). In this last case, we detect when \(10^{12} z < 10^8\), which essentially means \(\sqrt{a} - y \lesssim 10^{-17}\); once this threshold is reached, there is enough information to find the correctly rounded \(\sqrt{a}\) with only one more call to \(\__fp_sqrt_auxii_o:NnnnnnnN\). Note that the iteration cannot be stuck before reaching \(j = 6\), because for \(j < 6\), one has \(2 \cdot 10^8 \leq 10^{2(j+1)}(a - y^2)\), hence
\[
10^{4j} z \geq \frac{(20000 - 257)(0.5 \cdot 10^8)}{10^8 y + 1} \geq (20000 - 257) \cdot 0.5 > 0.
\]
Simply add the two 8-digit blocks of \( z \), aligned to the last four of the five 4-digit blocks of \( y \), then call the auxii auxiliary to evaluate \( y^2 = (y + z)^2 \).

```latex
\begin{verbatim}
\texttt{\_fp_sqrt_auxviii_o:nnnnnnn} \hspace{1em} \texttt{\_fp_sqrt_auxix_o:wnwnw}
\texttt{\_fp_sqrt_auxx_o:Nnnnnnnn} \hspace{1em} \texttt{\_fp_sqrt_auxxi_o:wwnnN}
\end{verbatim}
```

At this stage, \( j = 6 \) and \( 10^{24}z < 10^7 \), hence

\[
10^7 + 1/2 > 10^{24}z + 1/2 \geq (10^{24}(a - y^2) - 258) \cdot (0.5 \cdot 10^8) \bigg/ (10^8 y + 1),
\]

then \( 10^{24}(a - y^2) - 258 < 2(10^7 + 1/2)(y + 10^{-8}) \), and

\[
10^{24}(a - y^2) < (10^7 + 1290.5)(1 + 10^{-8}/y)(2y) < (10^7 + 1290.5)(1 + 10^{-7})(y + \sqrt{a}),
\]

which finally implies \( 0 \leq \sqrt{a} - y < 0.2 \cdot 10^{-16} \). In particular, \( y \) is an underestimate of \( \sqrt{a} \) and \( y + 0.5 \cdot 10^{-16} \) is a (strict) overestimate. There is at exactly one multiple \( m \) of \( 0.5 \cdot 10^{-16} \) in the interval \([y, y + 0.5 \cdot 10^{-16}]\); rather, only the last 4 digits \#8 of \( y \) are considered, and we do not perform any carry yet. The auxx auxiliary sets up auxii with a continuation function auxxii instead of auxxiii as before. To prevent auxx from giving a negative results \( a - m^2 \), we compute \( a + 10^{-16} - m^2 \) instead, always positive since \( m < \sqrt{a} + 0.5 \cdot 10^{-16} \) and \( a \leq 1 - 10^{-16} \).
The difference \(0 \leq a + 10^{-16} - m^2 \leq 10^{-16} + (\sqrt{a} - m)(\sqrt{a} + m) \leq 2 \cdot 10^{-16}\) was just computed: its first 8 digits vanish, as do the next four, \#1, and most of the following four, \#2. The guess \(m\) is an overestimate if \(a + 10^{-16} - m^2 < 10^{-16}\), that is, \#1\#2 vanishes. Otherwise it is an underestimate, unless \(a + 10^{-16} - m^2 = 10^{-16}\) exactly. For an underestimate, call the auxxiv function with argument 9998. For an exact result call it with 9999, and for an overestimate call it with 10000.

This receives 9998, 9999 or 10000 as \#1 when \(m\) is an underestimate, exact, or an overestimate, respectively. Then comes \(m\) as five blocks of 4 digits, but where the last block \#6 may be 0, 5000, or 10000. In the latter case, we need to add a carry, unless \(m\) is an overestimate (\#1 is then 10000). Then comes \(a\) as three arguments. Rounding is done by \_fp_round:NNN, whose first argument is the final sign (square roots are positive). We fake its second argument. It should be the last digit kept, but this is only used when ties are “rounded to even”, and only when the result is exactly half-way between two representable numbers rational square roots of numbers with 16 significant digits have: this situation never arises for the square root, as any exact square root of a 16 digit number has at most 8 significant digits. Finally, the last argument is the next digit, possibly shifted by 1 when there are further nonzero digits. This is achieved by \_fp_round_digit:Nw, which receives (after removal of the 10000’s digit) one of 0000, 0001, 4999, 5000, 5001, or 9999, which it converts to 0, 1, 4, 5, 6, and 9, respectively.
72.5 About the sign and exponent

The exponent of a normal number is its \textit{exponent} minus one.

\begin{verbatim}
\cs_new:Npn \__fp_logb_o:w ? \s__fp \__fp_chk:w #1#2; @ 
{ \if_case:w #1 \exp_stop_f: \__fp_case_use:nw 
  \{ \__fp_division_by_zero_o:Nnw \c_minus_inf_fp \{ \logb \} \}
  \or: \exp_after:wN \__fp_logb_aux_o:w 
  \or: \__fp_case_return_o:Nw \c_inf_fp 
  \else: \__fp_case_return_same_o:w 
  \fi: 
  \s__fp \__fp_chk:w #1 #2; }
\cs_new:Npn \__fp_logb_aux_o:w \s__fp \__fp_chk:w #1 #2 #3 #4 ; 
{ \exp_after:wN \__fp_parse:n \exp_after:wN \int_value:w \int_eval:w #3 - 1 \exp_after:wN }
\end{verbatim}

(End definition for \__fp_logb_o:w and \__fp_logb_aux_o:w.)

\begin{verbatim}
\cs_new:Npn \__fp_sign_o:w ? \s__fp \__fp_chk:w #1#2; @ 
{ \if_case:w #1 \exp_stop_f: \__fp_case_return_same_o:w 
  \or: \exp_after:wN \__fp_sign_aux_o:w 
  \or: \exp_after:wN \__fp_sign_aux_o:w 
  \else: \__fp_case_return_same_o:w 
  \fi: 
  \s__fp \__fp_chk:w #1 #2; }
\cs_new:Npn \__fp_sign_aux_o:w \s__fp \__fp_chk:w #1 #2 #3 #4 ; 
{ \exp_after:wN \__fp_set_sign_o:w \exp_after:wN #2 \c_one_fp @ }
\end{verbatim}

(End definition for \__fp_sign_o:w and \__fp_sign_aux_o:w.)
This function is used for the unary minus and for `abs`. It leaves the sign of `nan` invariant, turns negative numbers (sign 2) to positive numbers (sign 0) and positive numbers (sign 0) to positive or negative numbers depending on #1. It also expands after itself in the input stream, just like `\__fp_set_sign_o:w`.

\begin{verbatim}
\cs_new:Npn \__fp_set_sign_o:w #1 \s__fp \__fp_chk:w #2#3#4; @
\exp_after:wN \__fp_exp_after_o:w
\exp_after:wN \s__fp
\exp_after:wN \__fp_chk:w
\exp_after:wN #2
\int_value:w
\if_case:w #3 \exp_stop_f: #1 \or: 1 \or: 0 \fi: \exp_stop_f:
#4;
}\end{verbatim}

(End definition for `\__fp_set_sign_o:w`.)

72.6 Operations on tuples

Two cases: `abs((tuple))` for which #1 is 0 (invalid for tuples) and `-(tuple)` for which #1 is 2. In that case, map over all items in the tuple an auxiliary that dispatches to the type-appropriate sign-flipping function.

\begin{verbatim}
\cs_new:Npn \__fp_tuple_set_sign_o:w #1
\if_meaning:w 2 #1 \exp_after:wN \__fp_tuple_set_sign_aux_o:Nnw \fi:
\__fp_invalid_operation_o:nw { abs }
\end{verbatim}

(End definition for `\__fp_tuple_set_sign_o:w`, `\__fp_tuple_set_sign_aux_o:Nnw`, and `\__fp_tuple_set_sign_aux_o:w`.)

For `(number)*(tuple)` and `(tuple)*(number)` and `(tuple)/(number)`, loop through the `(tuple)` some code that multiplies or divides by the appropriate `(number)`. Importantly we need to dispatch according to the type, and we make sure to apply the operator in the correct order.

\begin{verbatim}
\cs_new:cpn { \__fp_*_tuple_o:ww } #1 ;
\cs_new:cpn { \__fp_tuple_* o:ww } #1 ; #2;
\cs_new:cpn { \__fp_tuple_/_o:ww } #1 ; #2;
\end{verbatim}

(End definition for `\__fp_*_tuple_o:ww`, `\__fp_tuple_* o:ww`, and `\__fp_tuple_/_o:ww`. )
Check the two tuples have the same number of items and map through these a helper that dispatches appropriately depending on the types. This means \((1,2)+((1,1),2)\) gives \((\text{nan},4)\).

\[
\begin{array}{ll}
\__fp_tuple_+_tuple_o:ww & \text{Explicitly defined inside \texttt{package}} \\
\__fp_tuple_-_tuple_o:ww & \text{Explicitly defined inside \texttt{package}}
\end{array}
\]

\begin{verbatim}
\cs_set_protected:Npn \__fp_tmp:w #1
\begin{Verbatim}
\cs_new:cpn { \__fp_tuple_#1_tuple_o:ww }
\s__fp_tuple \__fp_tuple_chk:w ##1 ;
\s__fp_tuple \__fp_tuple_chk:w ##2 ;
{ \int_compare:nNnTF{ \__fp_array_count:n {##1} } = { \__fp_array_count:n {##2} }{ \__fp_tuple_mapthread_o:nww { \__fp_binary_type_o:Nww #1 } { \__fp_invalid_operation_o:nww #1 } \s__fp_tuple \__fp_tuple_chk:w {##1} ; \s__fp_tuple \__fp_tuple_chk:w {##2} ;} }
\end{Verbatim}
\__fp_tmp:w +
\__fp_tmp:w -
\end{verbatim}

(End definition for \texttt{\__fp_tuple_+_tuple_o:ww and \__fp_tuple_-_tuple_o:ww}.)
Chapter 73

l3fp-extended implementation

73.1 Description of fixed point numbers

This module provides a few functions to manipulate positive floating point numbers with extended precision (24 digits), but mostly provides functions for fixed-point numbers with this precision (24 digits). Those are used in the computation of Taylor series for the logarithm, exponential, and trigonometric functions. Since we eventually only care about the 16 first digits of the final result, some of the calculations are not performed with the full 24-digit precision. In other words, the last two blocks of each fixed point number may be wrong as long as the error is small enough to be rounded away when converting back to a floating point number. The fixed point numbers are expressed as

\[(a_1) \{a_2\} \{a_3\} \{a_4\} \{a_5\} \{a_6\};\]

where each \(a_i\) is exactly 4 digits (ranging from 0000 to 9999), except \(a_1\), which may be any “not-too-large” non-negative integer, with or without leading zeros. Here, “not-too-large” depends on the specific function (see the corresponding comments for details).

Checking for overflow is the responsibility of the code calling those functions. The fixed point number \(a\) corresponding to the representation above is \(a = \sum_{i=1}^{6} a_i \cdot 10^{-4i}\).

Most functions we define here have the form

\[
\_\_fp_fixed_\langle\text{calculation}\rangle: \text{w} \text{n} \langle\text{operand}_1\rangle; \langle\text{operand}_2\rangle; \langle\text{continuation}\rangle
\]

They perform the \(\langle\text{calculation}\rangle\) on the two \(\langle\text{operands}\rangle\), then feed the result (6 brace groups followed by a semicolon) to the \(\langle\text{continuation}\rangle\), responsible for the next step of the calculation. Some functions only accept an \(\text{N}\)-type \(\langle\text{continuation}\rangle\). This allows constructions such as

\[
\_\_fp_fixed_add: \text{w} \text{n} \langle X_1 \rangle; \langle X_2 \rangle; \\
\_\_fp_fixed_mul: \text{w} \text{n} \langle X_3 \rangle; \\
\_\_fp_fixed_add: \text{w} \text{n} \langle X_4 \rangle;
\]
to compute \((X_1 + X_2) \cdot X_3 + X_4\). This turns out to be very appropriate for computing continued fractions and Taylor series.

At the end of the calculation, the result is turned back to a floating point number using `\__fp_fixed_to_float:wN`. This function has to change the exponent of the floating point number: it must be used after starting an integer expression for the overall exponent of the result.

### 73.2 Helpers for numbers with extended precision

\c__fp_one_fixed_tl

The fixed-point number \(1\), used in \l3fp-expo.

\cs_new:Npn \__fp_fixed_continue:wn #1; #2 { #2 #1; }

\__fp_fixed_div_myriad:wn

Divide a fixed point number by 10000. This is a little bit more subtle than just removing the last group and adding a leading group of zeros: the first group \#1 may have any number of digits, and we must split \#1 into the new first group and a second group of exactly 4 digits. The choice of shifts allows \#1 to be in the range \([0, 5 \cdot 10^8 - 1]\).

\cs_new:Npn \__fp_fixed_mul_after:wwn #1; #2; #3 { #3 {#1} #2; }

\__fp_fixed_mul:wn

The fixed point operations which involve multiplication end by calling this auxiliary. It braces the last block of digits, and places the \langle continuation \rangle \#3 in front.
### 73.3 Multiplying a fixed point number by a short one

\[
\text{\_fp_fixed_mul_short:wwn}
\]

\[
\{ (a_1) \} \{ (a_2) \} \{ (a_3) \} \{ (a_4) \} \{ (a_5) \} \{ (a_6) \};
\]

\[
\{ (b_0) \} \{ (b_1) \} \{ (b_2) \}; \{ \text{continuation} \}
\]

Computes the product \( c = ab \) of \( a = \sum_i (a_i)10^{-4i} \) and \( b = \sum_i (b_i)10^{-4i} \), rounds it to the closest multiple of \( 10^{-24} \), and leaves \{continuation\} \{ (c_1) \} \ldots \{ (c_6) \}; in the input stream, where each of the \{ (c_i) \} are blocks of 4 digits, except \{ (c_1) \}, which is any \TeX integer. Note that indices for \{ (b) \} start at 0: for instance a second operand of \{0001\}{0000}{0000} leaves the first operand unchanged (rather than dividing it by \(10^3\), as \_fp_fixed_mul:wwn would).

\[
\text{\texttt{\textbackslash cs:\textunderscore new:n}} \text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore mul\textunderscore short:wwn}} \text{\texttt{ #1\#2\#3\#4\#5\#6; #7\#8\#9;}}
\]

\[
\{ \text{\texttt{\textbackslash exp\textunderscore after:wN}} \text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore mul\textunderscore after:wnN}} \text{\texttt{\textunderscore int\textunderscore value:w}} \text{\texttt{\textunderscore fp\textunderscore int\textunderscore eval:w}} \text{\texttt{\textunderscore c\textunderscore fp\textunderscore leading\textunderscore shift\textunderscore int}}
\]

\[
+ \text{\texttt{\textunderscore int\textunderscore value:w}} \text{\texttt{\textunderscore fp\textunderscore int\textunderscore eval:w}} \text{\texttt{\textunderscore c\textunderscore fp\textunderscore middle\textunderscore shift\textunderscore int}}
\]

\[
+ \text{\texttt{\textunderscore int\textunderscore value:w}} \text{\texttt{\textunderscore fp\textunderscore int\textunderscore eval:w}} \text{\texttt{\textunderscore c\textunderscore fp\textunderscore middle\textunderscore shift\textunderscore int}}
\]

\[
+ \text{\texttt{\textunderscore int\textunderscore value:w}} \text{\texttt{\textunderscore fp\textunderscore int\textunderscore eval:w}} \text{\texttt{\textunderscore c\textunderscore fp\textunderscore trailing\textunderscore shift\textunderscore int}}
\]

\[
+ \text{\texttt{\textunderscore int\textunderscore value:w}} \text{\texttt{\textunderscore fp\textunderscore int\textunderscore eval:w}} \text{\texttt{\textunderscore c\textunderscore fp\textunderscore myriad\textunderscore int}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore pack:NNNNw}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore div\textunderscore int:wwN}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore div\textunderscore int:wwN}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore div\textunderscore int\textunderscore auxi:wwn}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore div\textunderscore int\textunderscore auxi:wwn}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore div\textunderscore int\textunderscore pack:Nw}}
\]

\[
\text{\texttt{\textunderscore fp\textunderscore fixed\textunderscore div\textunderscore int\textunderscore after:Nw}}
\]

(End definition for \_fp_fixed_mul_short:wwn.)

### 73.4 Dividing a fixed point number by a small integer

\[
\text{\_fp_fixed_div_int:wwN (a) ; (n) ; (continuation)}
\]

Divides the fixed point number \( a \) by the (small) integer \( 0 < (n) < 10^4 \) and feeds the result to the \{continuation\}. There is no bound on \( a_1 \).

The arguments of the \( i \) auxiliary are 1: one of the \( a_i \), 2: \( n \), 3: the \( ii \) or the \( iii \) auxiliary. It computes a (somewhat tight) lower bound \( Q_i \) for the ratio \( a_i/n \).

The \( ii \) auxiliary receives \( Q_i \), \( n \), and \( a_i \) as arguments. It adds \( Q_i \) to a surrounding integer expression, and starts a new one with the initial value 9999, which ensures that the result of this expression has 5 digits. The auxiliary also computes \( a_i - n \cdot Q_i \), placing the result in front of the 4 digits of \( a_{i+1} \). The resulting \( a_{i+1} = 10^4(a_i - n \cdot Q_i) + a_{i+1} \) serves as the first argument for a new call to the \( i \) auxiliary.

When the \( iii \) auxiliary is called, the situation looks like this:

\[
1103
\]
\__fp_fixed_div_int_after:Nw \textit{(continuation)}
\-1 + Q_1
\__fp_fixed_div_int_pack:Nw 9999 + Q_2
\__fp_fixed_div_int_pack:Nw 9999 + Q_3
\__fp_fixed_div_int_pack:Nw 9999 + Q_4
\__fp_fixed_div_int_pack:Nw 9999 + Q_5
\__fp_fixed_div_int_pack:Nw 9999 + Q_6
\__fp_fixed_div_int_auxii:wnn \{n\} \{\langle a_6 \rangle\}

where expansion is happening from the last line up. The \text{\texttt{iii}} auxiliary adds $Q_6 + 2 \approx a_6/n + 1$ to the last 9999, giving the integer closest to 10000 + $a_6/n$.

Each \text{\texttt{pack}} auxiliary receives 5 digits followed by a semicolon. The first digit is added as a carry to the integer expression above, and the 4 other digits are braced. Each call to the \text{\texttt{pack}} auxiliary thus produces one brace group. The last brace group is produced by the \text{\texttt{after}} auxiliary, which places the \textit{(continuation)} as appropriate.

73.5 Adding and subtracting fixed points
\__fp_fixed_add:wwn \langle a \rangle; \langle b \rangle; \textit{(continuation)}
\__fp_fixed_sub:wwn
\__fp_fixed_add:Nnnnnwnn
\__fp_fixed_add:nnNnnnn
\__fp_fixed_add_pack:NNNNNwn
\__fp_fixed_add_after:NNNNNwn

(End definition for \text{\texttt{\_fp_fixed_div_int:wwN}} and others.)
Computes $a + b$ (resp. $a - b$) and feeds the result to the (continuation). This function requires $0 \leq a_1, b_1 \leq 114748$, its result must be positive (this happens automatically for addition) and its first group must have at most 5 digits: $(a \pm b)_1 < 100000$. The two functions only differ by a sign, hence use a common auxiliary. It would be nice to grab the 12 brace groups in one go; only 9 parameters are allowed. Start by grabbing the sign, $a_1, \ldots, a_4$, the rest of $a$, and $b_1$ and $b_2$. The second auxiliary receives the rest of $a$, the sign multiplying $b$, the rest of $b$, and the (continuation) as arguments. After going down through the various level, we go back up, packing digits and bringing the (continuation) (#8, then #7) from the end of the argument list to its start.

\begin{verbatim}
\cs_new:Npn \__fp_fixed_add:wwn { \__fp_fixed_add:Nnnnnwnn + }

\__fp_fixed_add:nnNnnnwn #6 #1
\cs_new:Npn \__fp_fixed_add_after:NNNNNwn #1 { #2#3#4#5 { #6 } }
\end{verbatim}

(End definition for \__fp_fixed_add:wwn and others.)

\begin{verbatim}
\__fp_fixed_mul:wwn \__fp_fixed_mul:nnnnnnnw
\__fp_fixed_mul:nnnnnnnw \__fp_fixed_mul:wwn\__fp_fixed_mul:nnnnnnnw (a) ; (b) ; {(continuation)}
\end{verbatim}

Computes $a \times b$ and feeds the result to (continuation). This function requires $0 \leq a_1, b_1 < 10000$. Once more, we need to play around the limit of 9 arguments for \TeX macros. Note that we don’t need to obtain an exact rounding, contrarily to the * operator, so things could be harder. We wish to perform carries in

\[
\begin{align*}
  a \times b &= a_1 \times b_1 \times 10^{-8} \\
  &\quad + (a_1 \times b_2 + a_2 \times b_1) \times 10^{-12} \\
  &\quad + (a_1 \times b_3 + a_2 \times b_2 + a_3 \times b_1) \times 10^{-16} \\
  &\quad + (a_1 \times b_4 + a_2 \times b_3 + a_3 \times b_2 + a_4 \times b_1) \times 10^{-20} \\
  &\quad + \left( a_2 \times b_4 + a_3 \times b_3 + a_4 \times b_2 \\
  &\quad \quad + a_3 \times b_4 + a_4 \times b_3 + a_1 \times b_6 + a_2 \times b_5 + a_5 \times b_2 + a_6 \times b_1 \right) \times 10^4 \\
  &\quad + a_1 \times b_5 + a_5 \times b_1 \right) \times 10^{-24} + O(10^{-24}),
\end{align*}
\]
where the $O(10^{-24})$ stands for terms which are at most $5 \cdot 10^{-24}$; ignoring those leads to an error of at most 5 ulp. Note how the first 15 terms only depend on $a_1, \ldots, a_4$ and $b_1, \ldots, b_4$, while the last 6 terms only depend on $a_1, a_2, a_5, a_6$, and the corresponding parts of $b$. Hence, the first function grabs $a_1, \ldots, a_4$, the rest of $a$, and $b_1, \ldots, b_4$, and writes the 15 first terms of the expression, including a left parenthesis for the fraction. The $i$ auxiliary receives $a_5, a_6, b_1, b_2, a_1, a_2, b_5, b_6$ and finally the (continuation) as arguments. It writes the end of the expression, including the right parenthesis and the denominator of the fraction. The (continuation) is finally placed in front of the 6 brace groups by \_\_fp_fixed_mul_after:wwn.

### 73.7 Combining product and sum of fixed points

\begin{verbatim}
\_\_fp_fixed_mul_add:wwn \_\_fp_fixed_mul_mul_sub_back:wwn \_\_fp_fixed_one_minus_mul:wwn
\end{verbatim}

Sometimes called FMA (fused multiply-add), these functions compute $a \times b + c$, $c - a \times b$, and $1 - a \times b$ and feed the result to the (continuation). Those functions require $0 \leq a_1, b_1, c_1 \leq 10000$. Since those functions are at the heart of the computation of Taylor expansions, we over-optimize them a bit, and in particular we do not factor out the common parts of the three functions.
For definiteness, consider the task of computing $a \times b + c$. We perform carries in

$$a \times b + c = (a_1 \cdot b_1 + c_{1c_2}) \cdot 10^{-8}$$

$$+ (a_1 \cdot b_2 + a_2 \cdot b_1) \cdot 10^{-12}$$

$$+ (a_1 \cdot b_3 + a_2 \cdot b_2 + a_3 \cdot b_1 + c_{3c4}) \cdot 10^{-16}$$

$$+ (a_1 \cdot b_4 + a_2 \cdot b_3 + a_3 \cdot b_2 + a_4 \cdot b_1) \cdot 10^{-20}$$

$$+ \left(\frac{a_2 \cdot b_4 + a_3 \cdot b_3 + a_4 \cdot b_2 + a_2 \cdot b_4 + a_3 \cdot b_3 + a_4 \cdot b_2}{10^4}ight) \cdot 10^{-24} + O(10^{-24}),$$

where $c_{1c2}$, $c_{3c4}$, $c_{5c6}$ denote the 8-digit number obtained by juxtaposing the two blocks of digits of $c$, and $\cdot$ denotes multiplication. The task is obviously tough because we have 18 brace groups in front of us.

Each of the three function starts the first two levels (the first, corresponding to $10^{-4}$, is empty), with $c_{1c2}$ in the first level, calls the $i$ auxiliary with arguments described later, and adds a trailing $+ c_{5c6}$; \{(continuation)\}. The $+ c_{5c6}$ piece, which is omitted for $\__fp_fixed_one_minus_mul:wwn$, is taken in the integer expression for the $10^{-24}$ level.
Expressions all parts of \( \text{mul_one_minus_mul} \) was inserted by the \( \cdot \) and \( + \). Obviously, those expressions make no mathematical sense: we complete them with \( a_5 \cdot b \) and \( a_6 \cdot b \), and with \( a_6 \cdot b_1 + a_5 \cdot b_5 \) and \( b_6 + a_1 \cdot b_0 \), and of course with the trailing \( + c_6 c_6 \). To do all this, we keep \( a_5 \), \( a_6 \), and the corresponding pieces of \( b \).

\[ b_1 + a_4 \cdot b_2 + a_3 \cdot b_3 + a_2 \cdot b_4 + a_1 \]
\[ b_2 + a_4 \cdot b_3 + a_3 \cdot b_4 + a_2. \]

\( \texttt{%6#7#8} \texttt{\theta} \)

\[ \text{End definition for } \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \texttt{\theta}_\texttt{\theta} \]
In this section, we manipulate floating point numbers with roughly 24 significant figures ("extended-precision" numbers, in short, "ep"), which take the form of an integer exponent, followed by a comma, then six groups of digits, ending with a semicolon. The first group of digits may be any non-negative integer, while other groups of digits have 4 digits. In other words, an extended-precision number is an exponent ending in a comma, then a fixed point number. The corresponding value is \( 0.digits \cdot 10^{exponent} \). This convention differs from floating points.

73.8 Extended-precision floating point numbers

Converts an extended-precision number with an exponent at most 4 and a first block less than \( 10^8 \) to a fixed point number whose first block has 12 digits, hopefully starting with many zeros.

\begin{verbatim}
cs_new:Npn \_fp_fixed_mul_add:nnnnwnnnwN #1#2 #3#4#5; #6#7#8; #9
{ #9 (#4* #1 *#7) #9 (#5*#6+#4* #2 *#7+#3*#8) / \c__fp_myriad_int }
\end{verbatim}

(End definition for \_fp_fixed_mul_add:nnnnwnnn.)

\begin{verbatim}
\_fp_fixed_mul_add:nnnnwnnnwN \{\{partial1\}\} \{\{partial2\}\}
\{\{a_1\}\} \{\{a_2\}\} \{\{b_1\}\} \{\{b_2\}\}; \langle partial1\rangle \langle partial2\rangle \{\{a\}\} \{\{b\}\} ; \langle op \rangle + \langle c_5\rangle \langle c_6\rangle ;
\end{verbatim}

Complete the \( \langle partial1\rangle \) and \( \langle partial2\rangle \) expressions as explained for the \( ii \) auxiliary. The second one is divided by 10000: this is the carry from level \( 10^{-28} \). The trailing + \( c_5c_6 \) is taken into the expression for level \( 10^{-24} \). Note that the total of level \( 10^{-24} \) is in the interval \( [-5 \cdot 10^8, 6 \cdot 10^8 \) (give or take a couple of 10000), hence adding it to the shift gives a 10-digit number, as expected by the packing auxiliaries. See l3fp-aux for the definition of the shifts and packing auxiliaries.

\begin{verbatim}
cs_new:Npn \_fp_ep_to_fixed:wwn #1,#2
{ \exp_after:wN \_fp_ep_to_fixed_auxi:www \int_value:w \__fp_int_eval:w 1 0000 0000 + #2 \exp_after:wN ; \exp:w \exp_end_continue_f:w \prg_replicate:nn { 4 - \int_max:nn {#1} { -32 } } { 0 } ;
\}
\end{verbatim}

(End definition for \_fp_fixed_mul_add:nnnnwnnnwN.)
Normalize an extended-precision number. More precisely, leading zeros are removed from
the mantissa of the argument, decreasing its exponent as appropriate. Then the digits
are packed into 6 groups of 4 (discarding any remaining digit, not rounding). Finally,
the continuation \#8 is placed before the resulting exponent-mantissa pair. The input
exponent may in fact be given as an integer expression. The loop auxiliary grabs a
digit: if it is 0, decrement the exponent and continue looping, and otherwise call the end
auxiliary, which places all digits in the right order (the digit that was not 0, and any
remaining digits), followed by some 0, then packs them up neatly in \(3 \times 2 = 6\) blocks of
four. At the end of the day, remove with \__fp_use_i:ww any digit that did not make it
in the final mantissa (typically only zeros, unless the original first block has more than 4
digits).

\end{verbatim}

(End definition for \__fp_ep_to_ep:wwN and others.)

In \texttt{l3fp-trig} we need to compare two extended-precision numbers. This is based on the
same function for positive floating point numbers, with an extra test if comparing only
16 decimals is not enough to distinguish the numbers. Note that this function only works
if the numbers are normalized so that their first block is in \([1000, 9999]\).

\begin{verbatim}
\cs_new:Npn \__fp_ep_compare:wwww \__fp_ep_compare_aux:wwww
\{
\}
\end{verbatim}
Multiply two extended-precision numbers: first normalize them to avoid losing too much precision, then multiply the mantissas \#2 and \#4 as fixed point numbers, and sum the exponents \#1 and \#3. The result’s first block is in [100, 0999].

73.9 Dividing extended-precision numbers

Divisions of extended-precision numbers are difficult to perform with exact rounding: the technique used in \texttt{l3fp-basics} for 16-digit floating point numbers does not generalize easily to 24-digit numbers. Thankfully, there is no need for exact rounding.

Let us call \langle n \rangle the numerator and \langle d \rangle the denominator. After a simple normalization step, we can assume that \langle n \rangle \in [0.1, 1) and \langle d \rangle \in [0.1, 1), and compute \langle n \rangle/(10\langle d \rangle) \in (0.01, 1). In terms of the 6 blocks of digits \langle n_1 \rangle\cdots\langle n_6 \rangle and the 6 blocks \langle d_1 \rangle\cdots\langle d_6 \rangle, the condition translates to \langle n_1 \rangle,\langle d_1 \rangle \in [1000, 9999].
We first find an integer estimate \( a \approx 10^8/\langle d \rangle \) by computing

\[
\begin{align*}
\alpha &= \left\lceil \frac{10^9}{\langle d_1 \rangle + 1} \right\rceil \\
\beta &= \left\lfloor \frac{10^9}{\langle d_1 \rangle} \right\rfloor \\
a &= 10^3 \alpha + (\beta - \alpha) \cdot \left( 10^3 - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \right) - 1250,
\end{align*}
\]

where \( \lceil \cdot \rceil \) denotes \( \varepsilon \)-TEX’s rounding division, which rounds ties away from zero. The idea is to interpolate between \( 10^3 \alpha \) and \( 10^3 \beta \) with a parameter \( \langle d_2 \rangle/10^4 \), so that when \( \langle d_2 \rangle = 0 \) one gets \( a = 10^3 \beta - 1250 \approx 10^{12}/\langle d_1 \rangle \approx 10^8/\langle d \rangle \), while when \( \langle d_2 \rangle = 9999 \) one gets \( a = 10^3 \alpha - 1250 \approx 10^{12}/(\langle d_1 \rangle + 1) \approx 10^8/\langle d \rangle \). The shift by 1250 helps to ensure that \( a \) is an underestimate of the correct value. We shall prove that

\[
1 - 1.755 \cdot 10^{-5} < \frac{\langle d \rangle a}{10^8} < 1.
\]

We can then compute the inverse of \( \langle d \rangle a/10^8 = 1 - \epsilon \) using the relation \( 1/(1 - \epsilon) \approx (1 + \epsilon)(1 + \epsilon^2) + \epsilon^4 \), which is correct up to a relative error of \( \epsilon^8 < 1.6 \cdot 10^{-24} \). This allows us to find the desired ratio as

\[
\frac{\langle n \rangle}{\langle d \rangle} = \frac{\langle n \rangle a}{10^8} ((1 + \epsilon)(1 + \epsilon^2) + \epsilon^4).
\]

Let us prove the upper bound first (multiplied by \( 10^{15} \)). Note that \( 10^7 \langle d \rangle < 10^3 \langle d_1 \rangle + 10^{-1} (\langle d_2 \rangle + 1) \), and that \( \varepsilon \)-TEX’s division \( \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \) underestimates \( 10^{-1} (\langle d_2 \rangle + 1) \) by 0.5 at most, as can be checked for each possible last digit of \( \langle d_2 \rangle \). Then,

\[
\begin{align*}
10^7 \langle d \rangle a &< \left( 10^3 \langle d_1 \rangle + \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil + \frac{1}{2} \right) \left( 10^3 - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \right) \beta + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \alpha - 1250 ) \tag{1} \\
&< \left( 10^3 \langle d_1 \rangle + \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil + \frac{1}{2} \right) \left( 10^9 \langle d_1 \rangle + 1 \right) + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \left( \frac{10^9}{\langle d_1 \rangle + 1} + \frac{1}{2} \right) - 1250 \tag{2} \\
&< \left( 10^3 \langle d_1 \rangle + \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil + \frac{1}{2} \right) \left( 10^{12} \langle d_1 \rangle + \frac{\langle d_2 \rangle}{10} \right) - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \left( \frac{10^9}{\langle d_1 \rangle + 1} + 1 \right) - 750 \tag{3} \\
&< \left( 10^3 \langle d_1 \rangle + \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil + \frac{1}{2} \right) \left( 10^9 \langle d_1 \rangle + 1 \right) - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \left( \frac{10^9}{\langle d_1 \rangle + 1} + 1 \right) - 750 \tag{4}
\end{align*}
\]

We recognize a quadratic polynomial in \( \left\lfloor (\langle d_2 \rangle)/10 \right\rfloor \) with a negative leading coefficient: this polynomial is bounded above, according to \( (\langle d_2 \rangle/10) (b - c(\langle d_2 \rangle/10)) \leq (b + ca)^2/(4c) \). Hence,

\[
10^7 \langle d \rangle a < \frac{10^{15}}{\langle d_1 \rangle (\langle d_1 \rangle + 1)} \left( \langle d_1 \rangle + \frac{1}{2} + \frac{1}{4} \cdot 10^{-3} - \frac{3}{8} \cdot 10^{-9} \langle d_1 \rangle (\langle d_1 \rangle + 1) \right)^2
\]

Since \( \langle d_1 \rangle \) takes integer values within \([1000, 9999]\), it is a simple programming exercise to check that the squared expression is always less than \( \langle d_1 \rangle (\langle d_1 \rangle + 1) \), hence \( 10^7 \langle d \rangle a < 10^{15} \). The upper bound is proven. We also find that \( \frac{3}{8} \) can be replaced by slightly smaller numbers, but nothing less than \( 0.374563 \ldots \), and going back through the derivation of
the upper bound, we find that 1250 is as small a shift as we can obtain without breaking the bound.

Now, the lower bound. The same computation as for the upper bound implies

\[
10^7 \langle d \rangle a > \left( 10^3 \langle d_1 \rangle + \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil - \frac{1}{2} \right) \left( \frac{10^{12}}{\langle d_1 \rangle} - \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil \right) - 1750
\]

This time, we want to find the minimum of this quadratic polynomial. Since the leading coefficient is still negative, the minimum is reached for one of the extreme values \[ y/10 \] = 0 or \[ y/10 \] = 100, and we easily check the bound for those values.

We have proven that the algorithm gives us a precise enough answer. Incidentally, the upper bound that we derived tells us that \[ a < \frac{10^8}{\langle d \rangle} \leq \frac{10^9}{\langle d \rangle} \], hence we can compute \[ a \] safely as a \TeX{} integer, and even add \[ 10^9 \] to it to ease grabbing of all the digits. The lower bound implies \[ 10^8 - 1755 < a \], which we do not care about.

\_\_fp\_ep\_div:wwww
Compute the ratio of two extended-precision numbers. The result is an extended-precision number whose first block lies in the range \[ [100,9999] \], and is placed after the \langle continuation \rangle once we are done. First normalize the inputs so that both first block lie in \[ [1000,9999] \], then call \_\_fp\_ep\_div\_esti:wwww (denominator) \langle numerator \rangle, responsible for estimating the inverse of the denominator.

\_\_fp\_ep\_div\_esti:wwww
The esti function evaluates \[ \alpha = \frac{10^9}{\langle d_1 \rangle + 1} \], which is used twice in the expression for \[ a \], and combines the exponents \#1 and \#4 (with a shift by 1 because we later compute \langle n \rangle / (10 \langle d \rangle)). Then the estii function evaluates \[ 10^9 + a \], and puts the exponent \#2 after the continuation \#7: from there on we can forget exponents and focus on the mantissa. The estiii function multiplies the denominator \#7 by \[ 10^{-8} a \] (obtained as \[ a \] split into the single digit \#1 and two blocks of 4 digits, \#2\#3\#4\#5 and \#6). The result \[ 10^{-8} a (d) = (1 - \epsilon) \], and a partially packed \[ 10^{-9} a \] (as a block of four digits, and five individual digits, not packed by lack of available macro parameters here) are passed to \_\_fp\_ep\_div\_epsi:wnNNNNn, which computes \[ \frac{10^{-9} a}{1 - \epsilon} \], that is, \[ 1/(10 \langle d \rangle) \] and we finally multiply this by the numerator \#8.

\_\_fp\_ep\_div\_estii:wwnnwn
\_\_fp\_ep\_div\_estiii:NNNNNwwwn
\_\_fp\_ep\_div\_epsi:wnNNNNn
(End definition for \_\_fp\_ep\_div:wwww.)
The bounds shown above imply that the \texttt{epsi} function’s first operand is $(1 - \epsilon)$ with \(\epsilon \in [0, 1.755 \cdot 10^{-5}]\). The \texttt{epsi} function computes \(\epsilon\) as $1 - (1 - \epsilon)$. Since \(\epsilon < 10^{-4}\), its first block vanishes and there is no need to explicitly use \texttt{#1} (which is 9999). Then \texttt{epsii} evaluates $10^{-9}a/(1 - \epsilon)$ as $(1 + \epsilon^2)(1 + \epsilon)(10^{-9}a\epsilon) + 10^{-9}a$. Importantly, we compute $10^{-9}a\epsilon$ before multiplying it with the rest, rather than multiplying by \(\epsilon\) and then $10^{-9}a$, as this second option loses more precision. Also, the combination of \texttt{short_mul} and \texttt{div_myriad} is both faster and more precise than a simple \texttt{mul}. 

\begin{verbatim}
\def\__fp_ep_div_epsi:wnNNNNNn #1#2#3#4#5#6; { \__fp_fixed_mul_short:wnn #7; {#1}{#2#3#4#5}{#6}; \__fp_fixed_div_myriad:wn {#3}{#4#5#6}{#8000}; \__fp_fixed_mul:wn {#3}{#4#5#6}{#8000}; \__fp_fixed_add:wn {#3}{#4#5#6}{#8000}{0000}{0000}; \__fp_fixed_div:wn \__fp_fixed_add:wn \__fp_fixed_mul:wn \__fp_fixed_add:wn \__fp_fixed_mul:wn

\_\_fp_ep_div_estiii:NNNNNwwn.)
73.10 Inverse square root of extended precision numbers

The idea here is similar to division. Normalize the input, multiplying by powers of 100 until we have $x \in [0.01, 1)$. Then find an integer approximation $r \in [101, 1003]$ of $10^2/\sqrt{x}$, as the fixed point of iterations of the Newton method: essentially $r \to r + (r^2/(x r))/2$, starting from a guess that optimizes the number of steps before convergence. In fact, just as there is a slight shift when computing divisions to ensure that some inequalities hold, we replace $10^2$ by a slightly larger number which ensures that $r^2 x \geq 10^4$. This also causes $r \in [101, 1003]$. Another correction to the above is that the input is actually normalized to $[0.01, 1)$, and we use either $10^8$ or $10^9$ in the Newton method, depending on the parity of the exponent. Skipping those technical hurdles, once we have the approximation $r$, we set $y = 10^{-4} r^2 x$ (or rather, the correct power of 10 to get $y \approx 1$) and compute $y^{-1/2}$ through another application of Newton’s method. This time, the starting value is $z = 1$, each step maps $z \to z(1.5 - 0.5yz^2)$, and we perform a fixed number of steps. Our final result combines $r$ with $y^{-1/2}$ as $x^{-1/2} = 10^{-2} ry^{-1/2}$.

First normalize the input, then check the parity of the exponent $#1$. If it is even, the result’s exponent will be $-#1/2$, otherwise it will be $(#1 - 1)/2$ (except in the case where the input was an exact power of 100). The auxii function receives as $#1$ the result’s exponent just computed, as $#2$ the starting value for the iteration giving $r$ (the values 168 and 535 lead to the least number of iterations before convergence, on average), as $#3$ and $#4$ one empty argument and one 0, depending on the parity of the original exponent, as $#5$ and $#6$ the normalized mantissa ($#5 \in [1000, 9999]$), and as $#7$ the continuation. It sets up the iteration giving $r$: the esti function thus receives the initial two guesses $#2$ and 0, an approximation $#5$ of $10^4 x$ (its first block of digits), and the empty/zero arguments $#3$ and $#4$, followed by the mantissa and an altered continuation where we have stored the result’s exponent.

If the last two approximations gave the same result, we are done: call the estii function to clean up. Otherwise, evaluate $(\langle \text{prev} \rangle + 1.005 \cdot 10^3 x^5/(\langle \text{prev} \rangle \cdot x))/2$, as the next approximation: omitting the 1.005 factor, this would be Newton’s method. We can
check by brute force that if #4 is empty (the original exponent was even), the process computes an integer slightly larger than $100/\sqrt{x}$, while if #4 is 0 (the original exponent was odd), the result is an integer slightly larger than $100/\sqrt{x}/10$. Once we are done, we evaluate $100r^2/2$ or $10r^2/2$ (when the exponent is even or odd, respectively) and feed that to estiii. This third auxiliary finds $y_{\text{even}}/2 = 10^{-4}r^2x/2$ or $y_{\text{odd}}/2 = 10^{-5}r^2x/2$ (again, depending on earlier parity). A simple program shows that $y \in [1, 1.0201]$. The number $y/2$ is fed to \__fp_ep_isqrt_esti:wN, which computes $1/\sqrt{y}$, and we finally multiply the result by $r$.

(End definition for \__fp_ep_isqrt_epsii:wN and \__fp_ep_isqrt_epsii:wN.)
73.11 Converting from fixed point to floating point

After computing Taylor series, we wish to convert the result from extended precision (with or without an exponent) to the public floating point format. The functions here should be called within an integer expression for the overall exponent of the floating point.

An extended-precision number is simply a comma-delimited exponent followed by a fixed point number. Leave the exponent in the current integer expression then convert the fixed point number.

\begin{verbatim}
\cs_new:Npn \__fp_ep_to_float_o:wwN #1, \cs_new:Npn \__fp_ep_inv_to_float_o:wwN #1,#2;
\__fp_ep_to_float_o:wwN \__fp_fixed_to_float_o:wN \__fp_ep_inv_to_float_o:wwN \__fp_fixed_inv_to_float_o:wN \__fp_fixed_to_float_rad_o:wN
\end{verbatim}

Another function which reduces to converting an extended precision number to a float.

\begin{verbatim}
\cs_new:Npn \__fp_fixed_to_float_rad_o:wN #1; \cs_new:Npn \__fp_fixed_to_float_o:wN \__fp_fixed_to_float_o:Nw
\end{verbatim}

Converts the fixed point number #1 from degrees to radians then to a floating point number. This could perhaps remain in l3fp-trig.

And the to_fixed version gives six brace groups instead of 4, ensuring that 1000 ≤ \langle a'_1 \rangle ≤ 9999. At this stage, we know that \langle a_1 \rangle is positive (otherwise, it is sign of an error before), and we assume that it is less than 10^8.  

\begin{verbatim}
\cs_new:Npn \__fp_fixed_to_float_o:wN \__fp_fixed_to_float_o:Nw \__fp_int_eval:w \__fp_fixed_to_float_o:Nw #1\#2; \cs_new:Npn \__fp_fixed_to_float_o:Nw #1\#2\#3\#4\#5\#6; \cs_new:Npn \__fp_fixed_to_loop:N \__fp_int_eval:w \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN
\end{verbatim}

74.1 Logarithm

74.1.1 Work plan

As for many other functions, we filter out special cases in \__fp_ln_o:w. Then \__fp_ln_npos_o:w receives a positive normal number, which we write in the form \(a \cdot 10^b\) with \(a \in (0, 1)\).

The rest of this section is actually not in sync with the code. Or is the code not in sync with the section? In the current code, \(c \in [1, 10]\) is such that \(0.7 \leq ac < 1.4\).

We are given a positive normal number, of the form \(a \cdot 10^b\) with \(a \in [0.1, 1]\). To compute its logarithm, we find a small integer \(5 \leq c < 50\) such that \(0.91 \leq ac/5 < 1.1\), and use the relation

\[
\ln(a \cdot 10^b) = b \cdot \ln(10) - \ln(c/5) + \ln(ac/5).
\]

The logarithms \(\ln(10)\) and \(\ln(c/5)\) are looked up in a table. The last term is computed using the following Taylor series of \(\ln\) near 1:

\[
\ln\left(\frac{ac}{5}\right) = \ln\left(\frac{1 + t}{1 - t}\right) = 2t \left(1 + t^2 \left(\frac{1}{3} + t^2 \left(\frac{1}{5} + t^2 \left(\frac{1}{7} + \cdots\right)\right)\right)\right)
\]

where \(t = 1 - 10/(ac + 5)\). We can now see one reason for the choice of \(ac \sim 5\): then \(ac + 5 = 10(1 - \epsilon)\) with \(-0.05 < \epsilon \leq 0.045\), hence

\[
t = \frac{\epsilon}{1 - \epsilon} = \epsilon(1 + \epsilon)(1 + \epsilon^2)(1 + \epsilon^4)\ldots.
\]
is not too difficult to compute.

### 74.1.2 Some constants

A few values of the logarithm as extended fixed point numbers. Those are needed in the implementation. It turns out that we don’t need the value of \( \ln(5) \).

### 74.1.3 Sign, exponent, and special numbers

The logarithm of negative numbers (including \(-\infty\) and \(-0\)) raises the “invalid” exception. The logarithm of \(+0\) is \(-\infty\), raising a division by zero exception. The logarithm of \(+\infty\) or a \(\text{nan}\) is itself. Positive normal numbers call \c__fp_ln_npos_o:w.

### 74.1.4 Absolute ln

We catch the case of a significand very close to 0.1 or to 1. In all other cases, the final result is at least \(10^{-4}\), and then an error of \(0.5 \cdot 10^{-20}\) is acceptable.

(End definition for \c__fp_ln_o:w.)
This function expands to

\begin{align*}
\langle X_1 \rangle \{ \langle X_2 \rangle \} \{ \langle X_3 \rangle \} \{ \langle X_4 \rangle \} \{ \langle X_5 \rangle \} \{ \langle X_6 \rangle \};
\end{align*}

where \( Y = -\ln(X) \) as an extended fixed point.

\begin{align*}
\cs_new:Npn \__fp_ln_significand:NNNNNNN { #1#2#3#4 } { #1#2#3#4#5#6#7 } ;
\end{align*}

\begin{align*}
\__fp_ln_x_iii:NNNNNNw #1#2; { #3#4#5#6 } { #7 } ;
\end{align*}

\begin{align*}
\__fp_ln_x_iii_var:NNNNNw #1 #2#3 #4#5 #6;
\end{align*}

We have thus found \( c \in [1, 10] \) such that \( 0.7 \leq ac < 1.4 \) in all cases. Compute \( 1 + x = 1 + ac \in [1.7, 2.4) \).
The Taylor series to be used is expressed in terms of \( t = (x - 1)/(x + 1) = 1 - 2/(x + 1) \). We now compute the quotient with extended precision, reusing some code from \texttt{\_fp\_o:ww}. Note that \( 1 + x \) is known exactly.

To reuse notations from \texttt{l3fp-basics}, we want to compute \( A/Z \) with \( A = 2 \) and \( Z = x + 1 \). In \texttt{l3fp-basics}, we considered the case where both \( A \) and \( Z \) are arbitrary, in the range \([0.1, 1]\), and we had to monitor the growth of the sequence of remainders \( A, B, C, \) etc. to ensure that no overflow occurred during the computation of the next quotient. The main source of risk was our choice to define the quotient as roughly \( 10^9 \cdot A/10^5 \cdot Z \): then \( A \) was bound to be below \( 2 \cdot 10^{147} \cdots \), and this limit was never far.

In our case, we can simply work with \( 10^8 \cdot A \) and \( 10^4 \cdot Z \), because our reason to work with higher powers has gone: we needed the integer \( y \approx 10^5 \cdot Z \) to be at least \( 10^4 \), and now, the definition \( y \approx 10^4 \cdot Z \) suffices. Let us thus define \( y = \floor{10^4 \cdot Z} + 1 \in (1.7 \cdot 10^4, 2.4 \cdot 10^4] \), and

\[
Q_1 = \floor{\frac{10^8 \cdot A}{y} - \frac{1}{2}}.
\]

(The 1/2 comes from how \texttt{\_fp\_o:ww} rounds.) As for division, it is easy to see that \( Q_1 \leq 10^4 A/Z \), i.e., \( Q_1 \) is an underestimate.

Exactly as we did for division, we set \( B = 10^4 A - Q_1 Z \). Then

\[
10^4 B \leq A_1 A_2 A_3 A_4 - \left( \frac{A_1 A_2}{y} - \frac{3}{2} \right) 10^4 Z
\]

\[
\leq A_1 A_2 \left( 1 - \frac{10^4 Z}{y} \right) + 1 + \frac{3}{2} y
\]

\[
\leq 10^8 \frac{A}{y} + 1 + \frac{3}{2} y
\]

In the same way, and using \( 1.7 \cdot 10^4 \leq y \leq 2.4 \cdot 10^4 \), and convexity, we get

\[
10^4 A = 2 \cdot 10^4
\]

\[
10^4 B \leq 10^8 \frac{A}{y} + 1.6 y \leq 4.7 \cdot 10^4
\]

\[
10^4 C \leq 10^8 \frac{B}{y} + 1.6 y \leq 5.8 \cdot 10^4
\]

\[
10^4 D \leq 10^8 \frac{C}{y} + 1.6 y \leq 6.3 \cdot 10^4
\]

\[
10^4 E \leq 10^8 \frac{D}{y} + 1.6 y \leq 6.5 \cdot 10^4
\]

\[
10^4 F \leq 10^8 \frac{E}{y} + 1.6 y \leq 6.6 \cdot 10^4
\]

Note that we compute more steps than for division: since \( t \) is not the end result, we need to know it with more accuracy (on the other hand, the ending is much simpler, as we don’t need an exact rounding for transcendental functions, but just a faithful rounding).
The number is $x$. Compute $y$ by adding 1 to the five first digits.

We now have essentially

\[\text{\langle exponent\rangle; \langle\text{continuation}\rangle}\]

where $\langle\text{fixed tl}\rangle$ holds the logarithm of a number in $[1, 10]$, and $\langle\text{exponent}\rangle$ is the exponent. Also, the expansion is done backwards. Then $\langle\text{fp\_div_significand\_pack:NNN}\rangle$ puts things in the correct order to add the $Q_i$ together and put semicolons between each piece.
Just as with division, we know that the first two digits are 1 and 0 because of bounds on the final result of the division $2/(x+1)$, which is between roughly 0.8 and 1.2. We then compute $1 - 2/(x+1)$, after testing whether $2/(x+1)$ is greater than or smaller than 1.

```latex
\cs_new:Npn \__fp_ln_div_after:Nw #1 #2; #1 \exp_after:wN \__fp_ln_t_small:Nw #2
\exp_after:wN \__fp_ln_t_large:NNw - #1
\cs_new:Npn \__fp_ln_t_small:Nw #1 #2; #3; #4; #5; #6; #7;
\exp_after:wN \__fp_ln_t_large:NNw \langle \text{sign} \rangle \langle \text{fixed tl} \rangle \langle t_1 \rangle \langle t_2 \rangle \langle t_3 \rangle \langle t_4 \rangle \langle t_5 \rangle \langle t_6 \rangle \langle exponent \rangle \langle continuation \rangle
```

Compute the square $t^2$, and keep $t$ at the end with its sign. We know that $t < 0.1765$, so every piece has at most 4 digits. However, since we were not careful in $\__fp_ln_-t_small:w$, they can have less than 4 digits.

```latex
\cs_new:Npn \__fp_ln_t_square:NNw \langle sign \rangle \langle fixed tl \rangle \langle t_1 \rangle \langle t_2 \rangle \langle t_3 \rangle \langle t_4 \rangle \langle t_5 \rangle \langle t_6 \rangle \langle exponent \rangle \langle continuation \rangle
```

1124
Denoting \( T = t^2 \), we get
\[
\ln \left( \frac{1+t}{1-t} \right) = 2t \left( 1 + T \left( \frac{1}{3} + T \left( \frac{1}{5} + T \left( \frac{1}{7} + T \left( \frac{1}{9} + \cdots \right) \right) \right) \right) \]

The process looks as follows
\[
\text{loop 5; A; } \quad \text{div int 5; 1.0; add A; mul T; } \quad \text{loop \eval 5-2;} \quad \text{add 0.2; A; mul T; } \quad \text{loop \eval 5-2;} \quad \text{mul B; T; } \quad \text{loop 3; } \quad \text{loop 3; C; }
\]

This uses the routine for dividing a number by a small integer (\(< 10^4\)).
\__fp_ln_c:NwNw \__fp_ln_c:NwNw ⟨sign⟩
⟨r₁⟩ ⟨r₂⟩ ⟨r₃⟩ ⟨r₄⟩ ⟨r₅⟩ ⟨r₆⟩;
⟨fixed tl⟩ ⟨exponent⟩; ⟨continuation⟩

We are now reduced to finding \(\ln(c)\) and \(⟨\text{exponent}⟩\ln(10)\) in a table, and adding it to the mixture. The first step is to get \(\ln(c) - \ln(x) = -\ln(a)\), then we get \(b\ln(10)\) and add or subtract.

For now, \(\ln(x)\) is given as \(-10^0\). Unless both the exponent is 1 and \(c = 1\), we shift to working in units of \(-10^4\), since the final result is at least \(10(10/7) \approx 0.35\).

\__fp_ln_exponent:wn \__fp_ln_exponent:wn
⟨s₁⟩ ⟨s₂⟩ ⟨s₃⟩ ⟨s₄⟩ ⟨s₅⟩ ⟨s₆⟩;
⟨(exponent)⟩
Compute \(⟨\text{exponent}⟩\times\ln(10)\). Apart from the cases where \(⟨\text{exponent}⟩\) is 0 or 1, the result is necessarily at least \(\ln(10) \approx 2.3\) in magnitude. We can thus drop the least significant 4 digits. In the case of a very large (positive or negative) exponent, we can (and we need to) drop 4 additional digits, since the result is of order \(10^4\). Naively, one would think that in both cases we can drop 4 more digits than we do, but that would be slightly too tight for rounding to happen correctly. Besides, we already have addition and subtraction for 24 digits fixed point numbers.
Now we painfully write all the cases. No overflow nor underflow can happen, except when computing \( \ln(1) \).

For small exponents, we just drop one block of digits, and set the exponent of the log to 4 (minus any shift coming from leading zeros in the conversion from fixed point to floating point). Note that here the exponent has been made positive.

(End definition for \( _\text{fp}_\ln_\text{exponent}:\text{wn} \).)

1128
This function is called for numbers in the range \([10^{-9}, 10^{-1})\). We compute 10 terms of the Taylor series. The first argument is irrelevant (rounding digit used by some other functions). The next three arguments, at least 16 digits, delimited by a semicolon, form a fixed point number, so we pack it in blocks of 4 digits.

\begin{verbatim}
\cs_new:Npn \__fp_exp_Taylor:Nnnwn #1#2#3 #4; #5 #6
\{
    \__fp_pack_twice_four:wNNNNNNNN \__fp_pack_twice_four:wNNNNNNNN \__fp_pack_twice_four:wNNNNNNNN \__fp_exp_Taylor_ii:ww
    ; #2#3#4 0000 0000 ;
\}
\cs_new:Npn \__fp_exp_Taylor_ii:ww #1; #2; \s__fp_stop
\{
    \__fp_fixed_div_int:wwN #3 ; #1 ;
    \__fp_fixed_add_one:wN \__fp_fixed_mul:wwn #2 ;
\}
\cs_new:Npn \__fp_exp_Taylor_break:Nww #1 #2; \s__fp_stop
\{
    \__fp_fixed_add_one:wN #2 ;
\}
\end{verbatim}

Storing this data in an integer array makes it slightly harder to access (slower, too), but uses 16 bytes of memory per exponential stored, while storing as tokens used around 40 tokens; tokens have an especially large footprint in Unicode-aware engines.

\begin{verbatim}
\intarray_const_from_clist:Nn \c__fp_exp_intarray \{
    1 , 1 1105 1709 , 1 1807 5647 , 1 6248 1171 ,
    1 , 1 1221 4027 , 1 5816 0169 , 1 8339 2107 ,
    1 , 1 1349 8588 , 1 0757 6003 , 1 1039 8374 ,
    1 , 1 1491 8246 , 1 9764 1270 , 1 3178 2485 ,
\}
\end{verbatim}
\__fp_exp_intarray:ww
\__fp_exp_intarray_aux:ww

The first two arguments are irrelevant (a rounding digit, and a brace group with 8 zeros).
The third argument is the integer part of our number, then we have the decimal part delimited by a semicolon, and finally the exponent, in the range \([0,5]\). Remove leading zeros from the integer part: putting \#4 in there too ensures that an integer part of 0 is also removed. Then read digits one by one, looking up \(\exp((digit)\cdot10^{(exponent)})\) in a table, and multiplying that to the current total. The loop is done by \__fp_exp_large:NwN\, whose \#1 is the \(\langle\text{exponent}\rangle\), \#2 is the current mantissa, and \#3 is the \(\langle\text{digit}\rangle\). At the end, \__fp_exp_large_after:wwn moves on to the Taylor series, eventually multiplied with the mantissa that we have just computed.

</table>

We distinguished in this table the cases of finite (positive or negative) integer exponents, as $(-1)^b$ is defined in that case. One peculiarity of this operation is that $\text{nan}^0 = 1^\text{nan} = 1$, because this relation is obeyed for any number, even $\pm\infty$.

\texttt{\_\_fp\_\_o:ww} We cram most of the tests into a single function to save csnames. First treat the case $b = 0$: $a^0 = 1$ for any $a$, even $\text{nan}$. Then test the sign of $a$.

- If it is positive, and $a$ is a normal number, call \_\_fp\_\_pow\_\_normal\_o:ww followed by the two fp $a$ and $b$. For $a = +0$ or $+\infty$, call \_\_fp\_\_pow\_\_zero\_\_or\_\_inf:ww instead, to return either $+0$ or $+\infty$ as appropriate.

- If $a$ is a $\text{nan}$, then skip to the next semicolon (which happens to be conveniently the end of $b$) and return $\text{nan}$.

- Finally, if $a$ is negative, compute $a^b$ (\_\_fp\_\_pow\_\_normal\_o:ww which ignores the sign of its first operand), and keep an extra copy of $a$ and $b$ (the second brace group, containing $\{ b a \}$, is inserted between $a$ and $b$). Then do some tests to find the final sign of the result if it exists.
\_fp\_pow\_zero\_or\_inf:ww

Raising $-0$ or $-\infty$ to \texttt{nan} yields \texttt{nan}. For other powers, the result is $+0$ if $0$ is raised to a positive power or $\infty$ to a negative power, and $+\infty$ otherwise. Thus, if the type of $a$ and the sign of $b$ coincide, the result is $0$, since those conveniently take the same possible values, $0$ and $2$. Otherwise, either $a = \pm \infty$ and $b > 0$ and the result is $+\infty$, or $a = \pm 0$ with $b < 0$ and we have a division by zero unless $b = -\infty$.

\_fp\_pow\_normal\_o:ww

We have in front of us $a$, and $b \neq 0$, we know that $a$ is a normal number, and we wish to compute $|a|^b$. If $|a| = 1$, we return $1$, unless $a = -1$ and $b$ is \texttt{nan}. Indeed, returning $1$ at this point would wrongly raise “invalid” when the sign is considered. If $|a| \neq 1$, test the type of $b$:

0 Impossible, we already filtered $b = \pm 0$. 

1133
1 Call \__fp_pow_npos_o:Nww.

2 Return $+\infty$ or $+0$ depending on the sign of $b$ and whether the exponent of $a$ is positive or not.

3 Return $b$.

\begin{verbatim}
\cs_new:Npn \__fp_pow_normal_o:ww 1 \#1#2#3; \s__fp \__fp_chk:w #4#5
\{
  \if:w 0 \__fp_str_if_eq:nn { #2 #3 } { 1 {1000} {0000} {0000} {0000} }

\}
(End definition for \__fp_pow_normal_o:ww.)
\end{verbatim}

\__fp_pow_npos_o:Nww

We now know that $a \neq \pm 1$ is a normal number, and $b$ is a normal number too. We want to compute $|a|^b = (|x| \cdot 10^n)^y \cdot 10^p = \exp((\ln |x| + n \ln(10)) \cdot y \cdot 10^p) = \exp(z)$. To compute the exponential accurately, we need to know the digits of $z$ up to the 16-th position. Since the exponential of $10^5$ is infinite, we only need at most 21 digits, hence the fixed point result of \__fp_ln_o:w is precise enough for our needs. Start an integer expression for the decimal exponent of $e^{|z|}$. If $z$ is negative, negate that decimal exponent, and prepare to take the inverse when converting from the fixed point to the floating point result.

\begin{verbatim}
\cs_new:Npn \__fp_pow_npos_o:Nww 1 \#1#2#3 \s__fp \__fp_chk:w 1#2#3
\{
  \exp_after:wN \__fp_sanitize:Nw

  \if:w #1 \if_int_compare:w #3 > \c_zero_int 0 \else: 2 \fi:
    \exp_after:wN \__fp_pow_npos_aux:NNw
  \exp_after:wN \c_inf_fp
  \else:
    \exp_after:wN \__fp_fixed_to_float_o:wN
\end{verbatim}
The first argument is the conversion function from fixed point to float. Then comes an exponent and the 4 brace groups of \( x \), followed by \( b \). Compute \(-\ln(x)\).

\[
\begin{align*}
\text{\texttt{\_fp_pow_npos\_aux:NNnw}} & \text{\texttt{(End definition for \_fp\_pow\_npos\_o:Nw.)}} \\
& \text{The first argument is the conversion function from fixed point to float. Then comes an exponent and the 4 brace groups of } x, \text{ followed by } b. \text{ Compute } -\ln(x).
\end{align*}
\]
This function is followed by three floating point numbers: \( a^b, a \in [-\infty, -0], \) and \( b. \) If \( b \) is an even integer (case \(-1\)), \( a^b = a^2. \) If \( b \) is an odd integer (case \(0\)), \( a^b = -a^2. \) Otherwise, the sign is undefined. This is invalid, unless \( a^b \) turns out to be \(+0\) or \( \text{nan}, \) in which case we return that as \( a^b. \) In particular, since the
underflow detection occurs before \_\_fp\_pow\_neg::www is called, \((-0.1)**(12345.67)\) gives +0 rather than complaining that the sign is not defined.

\end{align*}
\]

This function expects a floating point number, and determines its “parity”. It should be used after \text{if}\_\text{case:}w or in an integer expression. It gives -1 if the number is an even integer, 0 if the number is an odd integer, and 1 otherwise. Zeros and ±∞ are even (because very large finite floating points are even), while \text{nan} is a non-integer. The sign of normal numbers is irrelevant to parity. After \_\_fp\_decimate:nNNnnn the argument \#1 of \_\_fp\_pow\_neg\_case\_aux:Nnnn is a rounding digit, 0 if and only if the number was an integer, and \#3 is the 8 least significant digits of that integer.

\end{align*}
\]

(End definition for \_\_fp\_pow\_neg\_case::w and \_\_fp\_pow\_neg\_case\_aux::Nnnn.)
The maximum integer whose factorial fits in the exponent range is 3248, as $3249! \sim 10^{10000.8}$.

First detect ±0 and $+\infty$ and $\text{nan}$. Then note that factorial of anything with a negative sign (except $-0$) is undefined. Then call \_\_fp_small_int:wTF to get an integer as the argument, and start a loop. This is not the most efficient way of computing the factorial, but it works all right. Of course we work with 24 digits instead of 16. It is easy to check that computing factorials with this precision is enough.
Then check the input is an integer, and call \_\_fp_fact_pos_o:w with that int as an argument. If it's too big the factorial overflows. Otherwise call \_\_fp_sanitize:Nw with a positive sign marker 0 and an integer expression that will mop up any exponent in the calculation.

The loop receives an integer \#1 whose factorial we want to compute, which we progressively decrement, and the result so far as an extended-precision number \#2 in the form ⟨exponent⟩,⟨mantissa⟩. The loop goes in steps of two because we compute \#1*\#1-1 as an integer expression (it must fit since \#1 is at most 3248), then multiply with the result so far. We don’t need to fill in most of the mantissa with zeros because \_\_fp_-ep_mul:wwwwn first normalizes the extended precision number to avoid loss of precision. When reaching a small enough number simply use a table of factorials less than 10^8. This limit is chosen because the normalization step cannot deal with larger integers.

75.1 Direct trigonometric functions

The approach for all trigonometric functions (sine, cosine, tangent, cotangent, cosecant, and secant), with arguments given in radians or in degrees, is the same.

- Filter out special cases ($\pm 0$, $\pm \infty$ and \texttt{nan}).
- Keep the sign for later, and work with the absolute value $|x|$ of the argument.
- Small numbers ($|x| < 1$ in radians, $|x| < 10$ in degrees) are converted to fixed point numbers (and to radians if $|x|$ is in degrees).
- For larger numbers, we need argument reduction. Subtract a multiple of $\pi/2$ (in degrees, 90) to bring the number to the range to $[0, \pi/2)$ (in degrees, $[0, 90)$).
- Reduce further to $[0, \pi/4)$ (in degrees, $[0, 45)$) using $\sin x = \cos(\pi/2 - x)$, and when working in degrees, convert to radians.
- Use the appropriate power series depending on the octant $\lfloor x \pi/4 \rfloor \mod 8$ (in degrees, the same formula with $\pi/4 \rightarrow 45$), the sign, and the function to compute.

75.1.1 Filtering special cases

\verb|\fp_sin_o:w|

This function, and its analogs for $\cos$, $\csc$, $\sec$, $\tan$, and $\cot$ instead of $\sin$, are followed either by \verb|\use_i:nn| and a float in radians or by \verb|\use_i:nn| and a float in degrees. The sine of $\pm 0$ or \texttt{nan} is the same float. The sine of $\pm \infty$ raises an invalid operation exception with the appropriate function name. Otherwise, call the \texttt{trig} function to perform argument reduction and if necessary convert the reduced argument to radians. Then, \verb|\fp_sin_series_o:NNwww| is called to compute the Taylor series: this function receives a sign \#3, an initial octant of 0, and the function \verb|\fp_ep_to_float_o:wwN| which converts the result of the series to a floating point directly rather than taking its inverse, since $\sin(x) = \#3 \sin|x|$.

75.1.2 Distinguishing small and large arguments

The first argument is \use_i:nn if the operand is in radians and \use_ii:nn if it is in degrees. Arguments #2 to #5 control what trigonometric function we compute, and #6 to #8 are pieces of a normal floating point number. Call the _series function #2, with arguments #3, either a conversion function (\__fp_to_float_o:wN or \__fp_inv_to_float_o:wN) or a sign 0 or 2 when computing tangent or cotangent; #4, a sign 0 or 2; the octant, computed in an integer expression starting with #5 and stopped by a period; and a fixed point number obtained from the floating point number by argument reduction (if necessary) and conversion to radians (if necessary). Any argument reduction adjusts the octant accordingly by leaving a (positive) shift into its integer expression. Let us explain the integer comparison. Two of the four \exp_after:wN are expanded, the expansion hits the test, which is true if the float is at least 1 when working in radians, and at least 10 when working in degrees. Then one of the remaining \exp_after:wN hits #1, which picks the trig or trigd function in whichever branch of the conditional was taken. The final \exp_after:wN closes the conditional. At the end of the day, a number is large if it is ≥ 1 in radians or ≥ 10 in degrees, and small otherwise. All four trig/trigd auxiliaries receive the operand as an extended-precision number.

(End definition for \__fp_trig:NNNNwwn.)
### 75.1.3 Small arguments

\_\_fp\_trig\_small:ww

This receives a small extended-precision number in radians and converts it to a fixed point number. Some trailing digits may be lost in the conversion, so we keep the original floating point number around: when computing sine or tangent (or their inverses), the last step is to multiply by the floating point number (as an extended-precision number) rather than the fixed point number. The period serves to end the integer expression for the octant.

\cs_new:Npn \__fp_trig_small:ww #1,#2;
\{ \__fp_ep_to_fixed:wwn #1,#2; . #1,#2; \}

(End definition for \_\_fp\_trig\_small:ww.)

\_\_fp\_trigd\_small:ww

Convert the extended-precision number to radians, then call \_\_fp\_trig\_small:ww to massage it in the form appropriate for the \_series auxiliary.

\cs_new:Npn \__fp_trigd_small:ww #1,#2;
\{\exp_after:wN \__fp_ep_mul_raw:wwwwN -1,{1745}{3292}{5199}{4329}{5769}{2369}; #1,#2; \__fp_trig_small:ww \}

(End definition for \_\_fp\_trigd\_small:ww.)

### 75.1.4 Argument reduction in degrees

\_\_fp\_trigd\_large:ww \_\_fp\_trigd\_large_auxi:nnnnwNNNN \_\_fp\_trigd\_large_auxii:wNw \_\_fp\_trigd\_large_auxiii:www

Note that $25 \times 360 = 9000$, so $10^{k+1} \equiv 10^k \pmod{360}$ for $k \geq 3$. When the exponent #1 is very large, we can thus safely replace it by 22 (or even 19). We turn the floating point number into a fixed point number with two blocks of 8 digits followed by five blocks of 4 digits. The original float is $10^k \times \langle block_1 \rangle \cdots \langle block_3 \rangle \langle block_4 \rangle \cdots \langle block_7 \rangle$, or is equal to it modulo 360 if the exponent #1 is very large. The first auxiliary finds $\langle block_1 \rangle + \langle block_2 \rangle \pmod{9}$, a single digit, and prepends it to the 4 digits of $\langle block_3 \rangle$. It also.unpacks $\langle block_4 \rangle$ and grabs the 4 digits of $\langle block_7 \rangle$. The second auxiliary grabs the $\langle block_3 \rangle$ plus any contribution from the first two blocks as #1, the first digit of $\langle block_4 \rangle$ (just after the decimal point in hundreds of degrees) as #2, and the three other digits as #3. It finds the quotient and remainder of #1#2 modulo 9, adds twice the quotient to the integer expression for the octant, and places the remainder (between 0 and 8) before #3 to form a new $\langle block_4 \rangle$. The resulting fixed point number is $x \in [0,0.9]$. If $x \geq 0.45$, we add 1 to the octant and feed $0.9 - x$ with an exponent of 2 (to compensate the fact that we are working in units of hundreds of degrees rather than degrees) to \_\_fp\_trig\_small:ww. Otherwise, we feed it $x$ with an exponent of 2. The third auxiliary also discards digits which were not packed into the various $\langle blocks \rangle$. Since the original exponent #1 is at least 2, those are all 0 and no precision is lost (#6 and #7 are four 0 each).

\cs_new:Npn \__fp_trigd_large:ww #1, #2#3#4#5#6#7;
\{ \exp_after:wN \__fp_pack_eight:wNNNNNNNN \exp_after:wN \__fp_pack_eight:wNNNNNNN \exp_after:wN \__fp_pack_twice_four:wNNNNNNNN \exp_after:wN \__fp_pack_twice_four:wNNNNNNNN \exp_after:wN \__fp_trigd_large_auxi:mmmmNNNN \exp_after:wN \__fp_trigd_large_auxii:ww \}

(End definition for \_\_fp\_trigd\_large:ww.)
75.1.5 Argument reduction in radians

Arguments greater or equal to 1 need to be reduced to a range where we only need a few terms of the Taylor series. We reduce to the range \([0, 2\pi]\) by subtracting multiples of \(2\pi\), then to the smaller range \([0, \pi/2]\) by subtracting multiples of \(\pi/2\) (keeping track of how many times \(\pi/2\) is subtracted), then to \([0, \pi/4]\) by mapping \(x \rightarrow \pi/2 - x\) if appropriate. When the argument is very large, say, \(10^{100}\), an equally large multiple of \(2\pi\) must be subtracted, hence we must work with a very good approximation of \(2\pi\) in order to get a sensible remainder modulo \(2\pi\).

Specifically, we multiply the argument by an approximation of \(1/(2\pi)\) with 10048 digits, then discard the integer part of the result, keeping 52 digits of the fractional part. From the fractional part of \(x/(2\pi)\) we deduce the octant (quotient of the first three digits by 125). We then multiply by 8 or \(-8\) (the latter when the octant is odd), ignore any integer part (related to the octant), and convert the fractional part to an extended precision number, before multiplying by \(\pi/4\) to convert back to a value in radians in \([0, \pi/4]\).

It is possible to prove that given the precision of floating points and their range of exponents, the 52 digits may start at most with 24 zeros. The 5 last digits are affected by carries from computations which are not done, hence we are left with at least 52 - 24 - 5 = 23 significant digits, enough to round correctly up to 0.6 · ulp in all cases.
This integer array stores blocks of 8 decimals of $10^{-16}/(2\pi)$. Each entry is $10^8$ plus an 8 digit number storing 8 decimals. In total we store 10112 decimals of $10^{-16}/(2\pi)$. The number of decimals we really need is the maximum exponent plus the number of digits we later need, 52, plus 12 (4 – 1 groups of 4 digits). The memory footprint (1/2 byte per digit) is the same as an earlier method of storing the data as a control sequence name, but the major advantage is that we can unpack specific subsets of the digits without unpacking the 10112 decimals.
The exponent #1 is between 1 and 10000. We wish to look up decimals \(10^{#1-16}/(2\pi)\) starting from the digit \#1 + 1. Since they are stored in batches of 8, compute \([#1/8]\) and fetch blocks of 8 digits starting there. The numbering of items in \texttt{\_fp_trig_intarray} starts at 1, so the block \([#1/8] + 1\) contains the digit we want, at one of the eight positions. Each call to \texttt{\_kernel_intarray_item:Nn} expands the next, until being stopped by \texttt{\_fp_trig_large_auxiii:w} using \texttt{\exp_stop_f:}. Once all these blocks are unpacked, the \texttt{\exp_stop_f:} and 0 to 7 digits are removed by \texttt{\use_none:n...n}. Finally, \texttt{\_fp_trig_large_auxii:w} packs 64 digits (there are between 65 and 72 at this point) into groups of 4 and the auxv auxiliary is called.
First come the first 64 digits of the fractional part of $10^{#1-16}/(2\pi)$, arranged in 16 blocks of 4, and ending with a semicolon. Then a few more digits of the same fractional part, ending with a semicolon, then 4 blocks of 4 digits holding the significand of the original argument. Multiply the 16-digit significand with the 64-digit fractional part: the \_fp trivial auxiliary receives the significand as \#2\#3\#4\#5 and 16 digits of the fractional part as \#6\#7\#8\#9, and computes one step of the usual ladder of pack functions we use for multiplication (see e.g., \_fp fixed \_mul::w\n), then discards one block of the fractional part to set things up for the next step of the ladder. We perform 13 such steps, replacing the last middle shift by the appropriate trailing shift, then discard the significand and remaining 3 blocks from the fractional part, as there are not enough digits to compute any more step in the ladder. The last semicolon closes the ladder, and we return control to the \_fp trivial auxiliary.
\__fp_trig_large_auxvii:w\  
\__fp_trig_large_auxviii:w\  
\__fp_trig_large_auxix:Nw\  
\__fp_trig_large_auxvi:w\  
\__fp_trig_large_auxvii:w\  
\__fp_trig_large_auxviii:w\  
\__fp_trig_large_auxvi:w

The auxvii auxiliary is followed by 52 digits and a semicolon. We find the octant as the integer part of 8 times what follows, or equivalently as the integer part of \#1#2#3/125, and add it to the surrounding integer expression for the octant. We then compute 8 times the 52-digit number, with a minus sign if the octant is odd. Again, the last middle shift is converted to a trailing shift. Any integer part (including negative values which come up when the octant is odd) is discarded by \__fp_use_i_until_s:nw. The resulting fractional part should then be converted to radians by multiplying by 2\pi/8, but first, build an extended precision number by abusing \__fp_ep_to_ep_loop:N with the appropriate trailing markers. Finally, \__fp_trig_small:ww sets up the argument for the functions which compute the Taylor series.
75.1.6 Computing the power series

Here we receive a conversion function \__fp_ep_to_float_o:wwN or \__fp_ep_inv_to_float_o:wwN, a \langle sign \rangle (0 or 2), a (non-negative) \langle octant \rangle delimited by a dot, a (fixed point) number delimited by a semicolon, and an extended-precision number. The auxiliary receives:

- the conversion function \#1;
- the final sign, which depends on the octant \#3 and the sign \#2;
- the octant \#3, which controls the series we use;
- the square \#4 * \#4 of the argument as a fixed point number, computed with \__fp_fixed_mul:wwn;
- the number itself as an extended-precision number.

If the octant is in \{1, 2, 5, 6, \ldots\}, we are near an extremum of the function and we use the series

$$\cos(x) = 1 - x^2 \left( \frac{1}{2!} - x^2 \left( \frac{1}{4!} - x^2 \cdots \right) \right).$$

Otherwise, the series

$$\sin(x) = x \left( 1 - x^2 \left( \frac{1}{3!} - x^2 \left( \frac{1}{5!} - x^2 \cdots \right) \right) \right)$$

is used. Finally, the extended-precision number is converted to a floating point number with the given sign, and \__fp_sanitize:Nw checks for overflow and underflow.
Contrarily to \_\_fp_sin_series_o:NNwwww which received a conversion auxiliary as #1, here, #1 is 0 for tangent and 2 for cotangent. Consider first the case of the tangent. The octant #3 starts at 1, which means that it is 1 or 2 for $|x| \in [0, \pi/2]$, it is 3 or 4 for $|x| \in [\pi/2, \pi]$, and so on: the intervals on which $\tan|x| \geq 0$ coincide with those for which $\lfloor (#3 + 1)/2 \rfloor$ is odd. We also have to take into account the original sign of $x$ to get the sign of the final result; it is straightforward to check that the first \_\_fp_int_eval:w expansion produces 0 for a positive final result, and 2 otherwise. A similar story holds for cot($x$).

The auxiliary receives the sign, the octant, the square of the (reduced) input, and the (reduced) input (an extended-precision number) as arguments. It then computes the numerator and denominator of

$$\tan(x) \approx \frac{x(1 - x^2(a_1 - x^2(a_2 - x^2(a_3 - x^2(a_4 - x^2a_5))))}{1 - x^2(b_1 - x^2(b_2 - x^2(b_3 - x^2(b_4 - x^2b_5))))}. $$

The ratio is computed by \_\_fp_ep_div:wwww, then converted to a floating point number. For octants #3 (really, quadrants) next to a pole of the functions, the fixed point
numerator and denominator are exchanged before computing the ratio. Note that this \if_int_odd:w test relies on the fact that the octant is at least 1.

(End definition for \__fp_tan_series_o:NNwwww and \__fp_tan_series_aux_o:Nnnww.)

### 75.2 Inverse trigonometric functions

All inverse trigonometric functions (arcsine, arccosine, arctangent, arccotangent, arccosecant, and arcsecant) are based on a function often denoted \texttt{atan2}. This func-
The parsing step manipulates atan and acot like min and max, reading in an array of operands, but also leaves \use_i:nn or \use_ii:nn depending on whether the result behaves in boundary cases. Other inverse trigonometric functions are expressed in terms of atan as

\[
\begin{align*}
\cos x &= \tan \left(\frac{\sqrt{1 - x^2}}{x}\right) \\
\sin x &= \tan \left(\frac{\sqrt{1 - x^2}}{x}\right) \\
\sec x &= \tan \left(\frac{\sqrt{x^2 - 1}}{x}\right) \\
\csc x &= \tan \left(\frac{\sqrt{x^2 - 1}}{x}\right) \\
\tan x &= \tan \left(\frac{\sqrt{x^2 - 1}}{x}\right) \\
\cot x &= \tan \left(\frac{\sqrt{x^2 - 1}}{x}\right).
\end{align*}
\]

Rather than introducing a new function, atan2, the arctangent function atan is overloaded: it can take one or two arguments. In the comments below, following many texts, we call the first argument \( y \) and the second \( x \), because atan(\( y/x \)) is the arctangent of the point \( (x, y) \).

As for direct trigonometric functions, the first step in computing \( \tan(\theta) \) is argument reduction. The sign of \( \tan(\theta) \) is accessed directly by feeding two arguments to arccotangent, and is defined by \( \arctan(y, x) = \arctan(y/x) \) for generic \( y \) and \( x \). Its advantages over the conventional arccotangent is that it takes values in \([-\pi, \pi]\) rather than \([-\pi/2, \pi/2]\), and that it is better behaved in boundary cases. Other inverse trigonometric functions are expressed in terms of \( \arctan \) as

\[
\begin{align*}
\arccos x &= \arctan \left(\frac{\sqrt{1 - x^2}}{x}\right) \\
\arcsin x &= \arctan \left(\frac{\sqrt{1 - x^2}}{x}\right) \\
\arcsec x &= \arctan \left(\frac{\sqrt{x^2 - 1}}{x}\right) \\
\arccosec x &= \arctan \left(\frac{\sqrt{x^2 - 1}}{x}\right) \\
\arctan x &= \arctan \left(\frac{\sqrt{x^2 - 1}}{x}\right) \\
\arccot x &= \arctan \left(\frac{\sqrt{x^2 - 1}}{x}\right).
\end{align*}
\]

In the following, we denote by \( z \) the ratio among \( \frac{\pi}{3} \), \( \frac{\pi}{2} \), \( \frac{\pi}{6} \), \( \frac{\pi}{4} \) which appears in the right-hand side above.

### 75.2.1 Arc tangent and arccotangent

The parsing step manipulates atan and acot like min and max, reading in an array of operands, but also leaves \use_i:nn or \use_ii:nn depending on whether the result
should be given in radians or in degrees. The helper \_fp_parse_function_one-two:nnw checks that the operand is one or two floating point numbers (not tuples) and leaves its second argument or its tail accordingly (its first argument is used for error messages). More precisely if we are given a single floating point number \_fp_atan_default:w places \_c_one_fp (expanded) after it; otherwise \_fp_atan_default:w is omitted by \_fp_parse_function_one_two:nnw.

(End definition for \_fp_atan_o:Nw, \_fp_acot_o:Nw, and \_fp_atan_default:w.)

(End definition for \_fp_atanii_o:Nww and \_fp_acotii_o:Nww.)
This auxiliary is called whenever one number is \( \pm 0 \) or \( \pm \infty \) (and neither is \texttt{nan}). Then the result only depends on the signs, and its value is a multiple of \( \pi/4 \). We use the same auxiliary as for normal numbers, \texttt{\_fp_atan_combine:NNwwN}, with arguments the final sign \#2; the octant \#3; \( \tan z/z = 1 \) as a fixed point number; \( z = 0 \) as a fixed point number; and \( z = 0 \) as an extended-precision number. Given the values we provide, \( \tan z \) is computed to be 0, and the result is \( \lceil 3/2 \rceil \cdot \pi/4 \) if the sign \#5 of \( x \) is positive, and \((7 - 3)/2 \cdot \pi/4 \) for negative \( x \), where the divisions are rounded up.

```latex
\cs_new:Npn \__fp_atan_inf_o:NNNw #1#2#3 \s__fp \__fp_chk:w \#4\#5\#6; \{
\exp_after:wN \__fp_atan_combine_o:NwwwwwN
\exp_after:wN \#2
\int_value:w \__fp_int_eval:w
\if_meaning:w 2 \#5 7 - \fi: \#3 \exp_after:wN ;
\c__fp_one_fixed_tl
\{0000\{0000\{0000\{0000\{0000\{0000\}; \#1
\}
\}
(End definition for \__fp_atan_inf_o:NNNw.)
```

\texttt{\_fp_atan_normal_o:NNnwNnw} Here we simply reorder the floating point data into a pair of signed extended-precision numbers, that is, a sign, an exponent ending with a comma, and a six-block mantissa ending with a semi-colon. This extended precision is required by other inverse trigonometric functions, to compute things like \( \tan(x, \sqrt{1-x^2}) \) without intermediate rounding errors.

```latex
\cs_new_protected:Npn \__fp_atan_normal_o:NNnwNnw \#1 \s__fp \__fp_chk:w 1\#2\#3\#4; \s__fp \__fp_chk:w 1\#5\#6\#7; \{
\__fp_atan_test_o:NwwNwwN \#2 \#3, \#4\{0000\{0000\{0000\{0000\{0000\{0000\}; \#1
\}
(End definition for \_fp_atan_normal_o:NNnwNnw.)
```

\texttt{\_fp_atan_test_o:NwwNwwN} This receives: the sign \#1 of \( y \), its exponent \#2, its 24 digits \#3 in groups of 4, and similarly for \( x \). We prepare to call \__fp_atan_combine_o:NNwwN which expects the sign \#1, the octant, the ratio \( \tan z \)/\( z = 1 - \cdots \), and the value of \( z \), both as a fixed point number and as an extended-precision floating point number with a mantissa in \([0.01,1)\). For now, we place \#1 as a first argument, and start an integer expression for the octant. The sign of \( x \) does not affect \( z \), so we simply leave a contribution to the octant: \( \langle \text{octant} \rangle \rightarrow 7 - \langle \text{octant} \rangle \) for negative \( x \). Then we order \(|y| > |x|\) in a non-decreasing order: if \(|y| > |x|\), insert 3- in the expression for the octant, and swap the two numbers. The finer test with 0.41421 is done by \__fp_atan_div:wnwwnw after the operands have been ordered.

```latex
\cs_new:Npn \__fp_atan_test_o:NwwNwwN \#1 \s__fp \__fp_chk:w 1\#2\#3\#4; \s__fp \__fp_chk:w 1\#5\#6\#7; \{
\exp_after:wN \__fp_atan_combine_o:NwwwwwN
\exp_after:wN \#1
\int_value:w \__fp_int_eval:w
\if_meaning:w 2 \#4 7 - \fi: \#1
\}
(End definition for \_fp_atan_test_o:NwwNwwN.)
```

1160
This receives two positive numbers \(a\) and \(b\) (equal to \(|x|\) and \(|y|\) in some order), each as an exponent and 6 blocks of 4 digits, such that \(0 < a < b\). If \(0.41421b < a\), the two numbers are “near”, hence the point \((y, x)\) that we started with is closer to the diagonals \(\{|y| = |x|\}\) than to the axes \(\{xy = 0\}\). In that case, the octant is 1 (possibly combined with the \(-7\) and \(-3\) inserted earlier) and we wish to compute \(\frac{\text{atan} b - \text{atan} a}{a + b}\). Otherwise, the octant is 0 (again, combined with earlier terms) and we wish to compute \(\text{atan} \frac{b}{a}\). In any case, call \(\__fp_atan_div:w\) followed by \(z\), as a comma-delimited exponent and a fixed point number.

\[
\__fp_atan_div:wnwwnw \__fp_atan_near:wwwn \__fp_atan_near_aux:wwn
\]

\(\__fp_atan_div:wnwwnw\) Convert \(z\) from a representation as an exponent and a fixed point number in \([0, 0.1)\) to a fixed point number only, then set up the call to \(\__fp_atan_Taylor_loop:www\), followed by the fixed point representation of \(z\) and the old representation.
We compute the series of $(\tan z)/z$. A typical intermediate stage has $#1 = 2k - 1$, $#2 = \frac{1}{2k+1} - z^2(\frac{1}{2k+3} - z^2(\cdots - z^2(\frac{1}{2k+1}))$, and $#3 = z^2$. To go to the next step $k \to k - 1$, we compute $\frac{1}{2k+1}$, then subtract from it $z^2$ times $#2$. The loop stops when $k = 0$: then $#2$ is $(\tan z)/z$, and there is a need to clean up all the unnecessary data, end the integer expression computing the octant with a semicolon, and leave the result $#2$ afterwards.

\begin{verbatim}
\cs_new:Npn \__fp_atan_Taylor_loop:www #1; #2; #3;
{\if_int_compare:w #1 = - \c_one_int \__fp_atan_Taylor_break:w \fi:
 \exp_after:wN \__fp_fixed_div_int:wwN \c__fp_one_fixed_tl #1;
 \__fp_rrot:www \__fp_fixed_mul_sub_back:wwwn #2; #3;
 {\exp_after:wN \__fp_atan_Taylor_loop:www
 \int_value:w \__fp_int_eval:w #1 - 2 ; #3;}
}
\cs_new:Npn \__fp_atan_Taylor_break:w
{ \fi: \__fp_fixed_mul_sub_back:wwwn #2; #3 !
 { \fi: ; #2 ;}
}
\end{verbatim}

This receives a ⟨sign⟩, an ⟨octant⟩, a fixed point value of $(\tan z)/z$, a fixed point number $z$, and another representation of $z$, as an ⟨exponent⟩ and the fixed point number $10^{-\langle exponent ⟩}z$, followed by either \use_i:nn (when working in radians) or \use_ii:nn (when working in degrees). The function computes the floating point result

\begin{equation}
(sign) \left( \left\lceil \frac{\langle octant \rangle}{2} \right\rceil \frac{\pi}{4} + (-1)^{\langle octant \rangle} \frac{\tan z}{z} \cdot z \right),
\end{equation}

multiplied by $180/\pi$ if working in degrees, and using in any case the most appropriate representation of $z$. The floating point result is passed to \__fp_sanitize:Nw, which checks for overflow or underflow. If the octant is 0, leave the exponent $#5$ for \__fp_sanitize:Nw, and multiply $#3 = \frac{\tan z}{z}$ with $#6$, the adjusted $z$. Otherwise, multiply $#3 = \frac{\tan z}{z}$ with $#4 = z$, then compute the appropriate multiple of $\frac{\pi}{4}$ and add or subtract the product $#3 \cdot #4$. In both cases, convert to a floating point with \__fp_fixed_to_float_o:wN.

\begin{verbatim}
\cs_new:Npn \__fp_atan_Taylor_loop:www \__fp_atan_Taylor_break:w
\cs_new:Npn \__fp_atan_combine_o:NwwwwN \__fp_atan_combine_aux:ww
\end{verbatim}

(End definition for \__fp_atan_Taylor_loop:www and \__fp_atan_Taylor_break:w.)
75.2.2 Arcsine and arccosine

\__fp_asin_o:w Again, the first argument provided by \l3fp-parse \use_i:nn if we are to work in radians and \use_i:nn for degrees. Then comes a floating point number. The arcsine of ±0 or nan is the same floating point number. The arcsine of ±∞ raises an invalid operation exception. Otherwise, call an auxiliary common with \__fp_acos_o:w, feeding it information about what function is being performed (for “invalid operation” exceptions).

(End definition for \__fp_atan_combine_o:NwwwwwN and \__fp_atan_combine_aux:ww.)
The arccosine of ±0 is π/2 (in degrees, 90). The arccosine of ±∞ raises an invalid operation exception. The arccosine of nan is itself. Otherwise, call an auxiliary common with \_fp_sin_o:w, informing it that it was called by acos or acosd, and preparing to swap some arguments down the line.

\_fp_acos_o:w

If the exponent #5 is at most 0, the operand lies within (−1, 1) and the operation is permitted: call \_fp_asin_auxi_o:NnNww with the appropriate arguments. If the number is exactly ±1 (the test works because we know that #5 ≥ 1, #6#7 ≥ 10000000, #8#9 ≥ 0, with equality only for ±1), we also call \_fp_asin_auxi_o:NnNww. Otherwise, \_fp_use_i:ww gets rid of the asin auxiliary, and raises instead an invalid operation, because the operand is outside the domain of arcsine or arccosine.

\_fp_asin_normal_o:NfwNnnnnw

We compute \( \frac{x}{\sqrt{1-x^2}} \). This function is used by asin and acos, but also by acsc and asec after inverting the operand, thus it must manipulate extended-precision numbers. First evaluate \( 1-x^2 \) as \((1+x)(1-x)\): this behaves better near \( x = 1 \). We do the
addition/subtraction with fixed point numbers (they are not implemented for extended-
precision floats), but go back to extended-precision floats to multiply and compute the
inverse square root $1/\sqrt{1-x^2}$. Finally, multiply by the (positive) extended-precision float
$|x|$, and feed the (signed) result, and the number $+1$, as arguments to the arctangent
function. When computing the arccosine, the arguments $x/\sqrt{1-x^2}$ and $+1$ are swapped
by \_\_fp_reverse_args:Nww in that case before \_\_fp_atan_test_o:NwwNww is
evaluated. Note that the arctangent function requires normalized arguments, hence the
need for ep_to_ep and continue after ep_mul.

75.2.3 Arccosecant and arcsecant

\_\_fp_acsc_o:w

Cases are mostly labelled by #2, except when #2 is 2: then we use #3#2, which is 02 = 2
when the number is $+\infty$ and 22 when the number is $-\infty$. The arccosecant of $\pm0$ raises
an invalid operation exception. The arccosecant of $\pm\infty$ is $\pm0$ with the same sign. The
arcosecant of nan is itself. Otherwise, \_\_fp_acsc_normal_o:NfwNnw does some more
tests, keeping the function name (acsc or acscd) as an argument for invalid operation
exceptions.
The arcsecant of ±0 raises an invalid operation exception. The arcsecant of ±∞ is π/2 (in degrees, 90). The arcsecant of nan is itself. Otherwise, do some more tests, keeping the function name asec (or asecd) as an argument for invalid operation exceptions, and a \_\_fp_reverse_args:Nww following precisely that appearing in \_\_fp_acos_o:w.

\begin{verbatim}
\cs_new:Npn \_\_fp_asec_o:w #1 \s__fp \_\_fp_chk:w #2#3; @
  \{\if_case:w #2 \exp_stop_f:

\end{verbatim}

\begin{verbatim}
(//package)
\end{verbatim}

1166
Chapter 76

13fp-convert implementation

76.1 Dealing with tuples

The first argument is for instance \_fp_to_tl_dispatch:w, which converts any floating point object to the appropriate representation. We loop through all items, putting ,~ between all of them and making sure to remove the leading ,~.

\cs_new:Npn \_fp_tuple_convert:Nw #1 \s__fp_tuple \_fp_tuple_chk:w #2 ;
\int_case:nnF \{ \_fp_array_count:n {#2} \}
\{ 0 \} \{ ( ) \}
\{ 1 \} \{ \_fp_tuple_convert_end:w \@ { #1 #2 , } \}
\}
\{ \_fp_tuple_convert_loop:nNw { } #1 #2 { ? \_fp_tuple_convert_end:w } ;
\@ \{ \use_none:nn \}
\}
\cs_new:Npn \_fp_tuple_convert_loop:nNw #1 #2 #3 #4 ; #5 \@ #6
\use_none:n #3
\exp_args:Nf \_fp_tuple_convert_loop:nNw { #2 #3 #4 ; } #2 #5
\@ \{ #6 , , #1 \}
\}
\cs_new:Npn \_fp_tuple_convert_end:w #1 \@ #2
\{ \exp_after:wN \exp:w \exp_end_continue_f:w #2 \}

(End definition for \_fp_tuple_convert:Nw, \_fp_tuple_convert_loop:nNw, and \_fp_tuple_convert_end:w.)

76.2 Trimming trailing zeros

If #1 ends with a 0, the loop auxiliary takes that zero as an end-delimiter for its first argument, and the second argument is the same loop auxiliary. Once the last trailing
zero is reached, the second argument is the dot auxiliary, which removes a trailing dot if any. We then clean-up with the end auxiliary, keeping only the number.

```
cs_new:Npn __fp_trim_zeros:w #1 ;
  { __fp_trim_zeros_loop:w #1
    ; __fp_trim_zeros_loop:w 0; __fp_trim_zeros_dot:w .; __fp_stop
  }

cs_new:Npn __fp_trim_zeros_loop:w #1 0; #2 { #2 #1 ; #2 }
cs_new:Npn __fp_trim_zeros_dot:w #1 .; { __fp_trim_zeros_end:w #1 ; }
cs_new:Npn __fp_trim_zeros_end:w #1 ; #2 __fp_stop { #1 }
```

(End definition for \_\_fp\_trim\_zeros:w and others.)

### 76.3 Scientific notation

The three public functions evaluate their argument, then pass it to \_\_fp\_to\_scientific\_dispatch:w.

```
cs_new:Npn \_fp\_to\_scientific:N #1
  { \exp_after:wN \_fp\_to\_scientific\_dispatch:w #1 }
cs_generate_variant:Nn \_fp\_to\_scientific:N { c }
cs_new:Npn \_fp\_to\_scientific:n
  { \exp_after:wN \_fp\_to\_scientific\_dispatch:w \exp:w \exp_end_continue_f:w \_fp\_parse:n }
```

(End definition for \_fp\_to\_scientific:N and \_fp\_to\_scientific:n. These functions are documented on page 243.)

We allow tuples.

```
cs_new:Npn \_\_fp\_to\_scientific\_dispatch:w #1
  { \_fp\_change\_func\_type:NNN #1 \_\_fp\_to\_scientific:w \_\_fp\_to\_scientific\_recover:w #1 }

\_fp\_to\_scientific\_recover:w #1 #2 ;
  { \_fp\_error:nffn { unknown\_type } { \tl\_to\_str:n { #2 ; } } } { } { }
nan
\_\_fp\_tuple\_to\_scientific:w
  { \_\_fp\_tuple\_convert:Nw \_\_fp\_to\_scientific\_dispatch:w }
```

(End definition for \_\_fp\_to\_scientific\_dispatch:w, \_\_fp\_to\_scientific\_recover:w, and \_\_fp\_tuple\_to\_scientific:w.)

Expressing an internal floating point number in scientific notation is quite easy: no rounding, and the format is very well defined. First cater for the sign: negative numbers (\#2 = -2) start with -; we then only need to care about positive numbers and \texttt{nan}. Then filter the special cases: ±0 are represented as 0; infinities are converted to a number slightly larger than the largest after an “invalid\_operation” exception; \texttt{nan} is represented as 0 after an “invalid\_operation” exception. In the normal case, decrement the exponent
and unbrace the 4 brace groups, then in a second step grab the first digit (previously hidden in braces) to order the various parts correctly.

\begin{verbatim}
\cs_new:Npn \__fp_to_scientific:w \s__fp \__fp_chk:w #1#2
  \{ \hspace{0.2em}
  \if_meaning:w 2 #2 \exp_after:wN \exp:w \exp_end_continue_f:w \fi:
  \if_case:w #1 \exp_stop_f:
    \__fp_case_return:nw { 0.000000000000000e0 }
  \or: \exp_after:wN \__fp_to_scientific_normal:wnnnn
  \or:
    \__fp_case_use:nw
      \__fp_invalid_operation:nnw
        \fp_to_scientific:N \c__fp_overflowing_fp 
        \fp_to_scientific 
    \__fp_case_use:nw
      \__fp_invalid_operation:nnw
        \fp_to_scientific:N \c_zero_fp 
        \fp_to_scientific
  \fi:
  \s__fp \__fp_chk:w #1 #2
\}
\cs_new:Npn \__fp_to_scientific_normal:wnnnn
  \s__fp \__fp_chk:w 1 #1 #2 #3#4#5#6 ;
  \exp_after:wN \__fp_to_scientific_normal:wNw
  \exp_after:wN e
  \int_value:w \__fp_int_eval:w #2 - 1
  ; #3 #4 #5 #6 ;
\cs_new:Npn \__fp_to_scientific_normal:wNw #1 ; #2#3;
  { #2.#3 #1 }
(End definition for \__fp_to_scientific:w, \__fp_to_scientific_normal:wnnnn, and \__fp_to_scientific_normal:wNw.)
\end{verbatim}

76.4 Decimal representation

\texttt{\textbackslash fp\_to\_decimal:N}  \texttt{\textbackslash fp\_to\_decimal:c}  \texttt{\textbackslash fp\_to\_decimal:n}

All three public variants are based on the same \texttt{\__fp_to_decimal_dispatch:w} after evaluating their argument to an internal floating point.

\begin{verbatim}
\cs_new:Npn \fp_to_decimal:N #1
  \{ \exp_after:wN \__fp_to_decimal_dispatch:w #1 \}
\cs_generate_variant:Nn \fp_to_decimal:N { c }
\cs_new:Npn \fp_to_decimal:n
  \{ \exp_after:wN \__fp_to_decimal_dispatch:w
    \exp:w \exp_end_continue_f:w \__fp_parse:n 
  \}
(End definition for \texttt{\textbackslash fp\_to\_decimal:N} and \texttt{\textbackslash fp\_to\_decimal:n}. These functions are documented on page 242.)
\end{verbatim}
We allow tuples.

\begin{verbatim}
\cs_new:Npn \__fp_to_decimal_dispatch:w #1
\__fp_change_func_type:NNN
\__fp_to_decimal:w \__fp_to_decimal_recover:w #1
\}
\cs_new:Npn \__fp_to_decimal_recover:w #1 #2 ;
\__fp_error:nffn { unknown-type } { \tl_to_str:n { #2 ; } } { } { }
nan
\cs_new:Npn \__fp_tuple_to_decimal:w
\__fp_tuple_convert:Nw \__fp_to_decimal_dispatch:w
\end{verbatim}

(End definition for \__fp_to_decimal_dispatch:w, \__fp_to_decimal_recover:w, and \__fp_tuple_to_decimal:w.)

The structure is similar to \__fp_to_scientific:w. Insert – for negative numbers. Zero gives 0, ±∞ and nan yield an “invalid operation” exception; note that ±∞ produces a very large output, which we don’t expand now since it most likely won’t be needed. Normal numbers with an exponent in the range [1, 15] have that number of digits before the decimal separator: “decimate” them, and remove leading zeros with \int_value:w, then trim trailing zeros and dot. Normal numbers with an exponent 16 or larger have no decimal separator, we only need to add trailing zeros. When the exponent is non-positive, the result should be \langle zeros\rangle\langle digits\rangle, trimmed.

\begin{verbatim}
\cs_new:Npn \__fp_to_decimal:w \s__fp \__fp_chk:w #1#2
\if_meaning:w 2 #2 \exp_after:wN - \exp:w \exp_end_continue_f:w \fi:
\if_case:w #1 \exp_stop_f:
\__fp_case_return:nw { 0 }
\or: \exp_after:wN \__fp_to_decimal_normal:wnnnnn
\or:
\__fp_case_use:nw
{ \__fp_invalid_operation:nnw { \fp_to_decimal:N \c__fp_overflowing_fp } { fp_to_decimal } }
\or:
\__fp_case_use:nw
{ \__fp_invalid_operation:nnw { 0 } { fp_to_decimal } }
\fi:
\s__fp \__fp_chk:w #1 #2}
\cs_new:Npn \__fp_to_decimal_normal:wnnnnn
\s__fp \__fp_chk:w 1 #1 #2 #3#4#5#6 ;
\int_compare:nNnTF {#2} > 0
\end{verbatim}

1170
76.5 Token list representation

These three public functions evaluate their argument, then pass it to \_\_fp_to_tl_-
\_\_fp_to_tl_dispatch:w.

We allow tuples.

(End definition for \_\_fp_to_tl:w and \_\_fp_to_tl:n. These functions are documented on page 243.)
28311  \_fp_to_tl:w
28312  \_fp_to_tl:normal:nnnn
28313  \_fp_to_tl:scientific:wnW
28314  \_fp_to_tl:scientific:wN
(End definition for \_fp_to_tl:w, \_fp_to_tl_recover:w, and \_fp_to_tuple_to_tl:w.)

A structure similar to \_fp_to_scientific_dispatch:w and \_fp_to_decimal_dispatch:w, but without the “invalid operation” exception. First filter special cases. We express normal numbers in decimal notation if the exponent is in the range \([-2, 16]\), and otherwise use scientific notation.

76.6 Formatting

This is not implemented yet, as it is not yet clear what a correct interface would be, for this kind of structured conversion from a floating point (or other types of variables) to a string. Ideas welcome.

76.7 Convert to dimension or integer

All three public variants are based on the same \_fp_to_dim_dispatch:w after evaluating their argument to an internal floating point. We only allow floating point numbers,
not tuples.

\begin{verbatim}
\cs_new:Npn \fp_to_dim:N #1  
\{ \exp_after:wN \__fp_to_dim_dispatch:w #1 \}
\cs_generate_variant:Nn \fp_to_dim:N { c }
\cs_new:Npn \fp_to_dim:n 
\{ \exp_after:wN \__fp_to_dim_dispatch:w \exp:w \exp_end_continue_f:w \__fp_parse:n \}
\cs_new:Npn \__fp_to_dim_dispatch:w #1#2 ;
\{ \__fp_change_func_type:NNN #1 \__fp_to_dim:w \__fp_to_dim_recover:w #1 #2 ; \}
\cs_new:Npn \__fp_to_dim_recover:w #1
\{ \__fp_invalid_operation:nnw { 0pt } { fp_to_dim } \}
\cs_new:Npn \__fp_to_dim:w #1; 
\{ \exp_after:wN \__fp_to_decimal:w \exp:w \exp_end_continue_f:w \__fp_round:Nwn \__fp_round_to_nearest:NNN #1; { 0 } \}
\end{verbatim}

(End definition for \fp_to_dim:N and others. These functions are documented on page 242.)

\begin{verbatim}
\fp_to_int:N \fp_to_int:c
\fp_to_int:n \__fp_to_int_dispatch:w \__fp_to_int_recover:w
\end{verbatim}

\begin{verbatim}
\cs_new:Npn \fp_to_int:N #1  
\{ \exp_after:wN \__fp_to_int_dispatch:w #1 \}
\cs_generate_variant:Nn \fp_to_int:N { c }
\cs_new:Npn \fp_to_int:n 
\{ \exp_after:wN \__fp_to_int_dispatch:w \exp:w \exp_end_continue_f:w \__fp_parse:n \}
\cs_new:Npn \__fp_to_int_dispatch:w #1#2 ;
\{ \__fp_change_func_type:NNN #1 \__fp_to_int:w \__fp_to_int_recover:w #1 #2 ; \}
\cs_new:Npn \__fp_to_int_recover:w #1
\{ \__fp_invalid_operation:nnw { 0 } { fp_to_int } \}
\cs_new:Npn \__fp_to_int:w #1;
\{ \exp_after:wN \__fp_to_decimal:w \exp:w \exp_end_continue_f:w \__fp_round:Nwn \__fp_round_to_nearest:NNN #1; { 0 } \}
\end{verbatim}

(End definition for \fp_to_int:N and others. These functions are documented on page 242.)

\section*{76.8 Convert from a dimension}

The dimension expression (which can in fact be a glue expression) is evaluated, converted to a number (i.e., expressed in scaled points), then multiplied by $2^{-16} = 0.0000152587890625$ to give a value expressed in points. The auxiliary \_\_fp_MUL_-npos_o:Nww expects the desired (final sign) and two floating point operands (of the form

$\dim_to_fp:n$

$\_\_fp_from_dim_test:ww$

$\_\_fp_from_dim:wW$

$\_\_fp_from_dim:wWnmmn$

$\_\_fp_from_dim:wWnmnnWw$
\s_{\_fp{...;}}\) as arguments. This set of functions is also used to convert dimension registers to floating points while parsing expressions: in this context there is an additional exponent, which is the first argument of \texttt{\_fp_from_dim_test:ww}, and is combined with the exponent \(-4\) of \(2^{-16}\). There is also a need to expand afterwards: this is performed by \texttt{\_fp_mul_npos_o:Nww}, and cancelled by \texttt{prg_do_nothing}: here.

\begin{verbatim}
\cs_new:Npn \dim_to_fp:n #1
\begin{verbatim}
\exp_after:wN \__fp_from_dim_test:ww
\exp_after:wN 0
\exp_after:wN ,
\int_value:w \tex_glueexpr:D #1 ;
\end{verbatim}
\end{verbatim}

(End definition for \texttt{\dim_to_fp:n} and others. This function is documented on page 214.)

### 76.9 Use and eval

\texttt{\fp_use:N} \texttt{\fp_use:c} \texttt{\fp_eval:n} Those public functions are simple copies of the decimal conversions.

\texttt{\cs_new_eq:NN \fp_use:N \fp_to_decimal:N}
\texttt{\cs_generate_variant:Nn \fp_use:N { c }}
\texttt{\cs_new_eq:NN \fp_eval:n \fp_to_decimal:n}

(End definition for \texttt{\fp_use:N} and \texttt{\fp_eval:n}. These functions are documented on page 243.)

1174
\texttt{\textbackslash fp\_sign:n} Trivial but useful. See the implementation of \texttt{\textbackslash fp\_add:Nn} for an explanation of why to use \texttt{\_\_fp\_parse:n}, namely, for better error reporting.

\begin{verbatim}
\cs_new:Npn \fp_sign:n #1
\{ \fp_to_decimal:n { sign \_\_fp\_parse:n (#1) } \}
\end{verbatim}

(End definition for \texttt{\fp\_sign:n}. This function is documented on page 242.)

\texttt{\textbackslash fp\_abs:n} Trivial but useful. See the implementation of \texttt{\textbackslash fp\_add:Nn} for an explanation of why to use \texttt{\_\_fp\_parse:n}, namely, for better error reporting.

\begin{verbatim}
\cs_new:Npn \fp_abs:n #1
\{ \fp_to_decimal:n { abs \_\_fp\_parse:n (#1) } \}
\end{verbatim}

(End definition for \texttt{\fp\_abs:n}. This function is documented on page 258.)

\texttt{\textbackslash fp\_max:nn} \texttt{\textbackslash fp\_min:nn} Similar to \texttt{\fp\_abs:n}, for consistency with \texttt{\int\_max:nn}, etc.

\begin{verbatim}
\cs_new:Npn \fp_max:nn #1 #2
\{ \fp_to_decimal:n { max ( \_\_fp\_parse:n (#1) , \_\_fp\_parse:n (#2) ) } \}
\cs_new:Npn \fp_min:nn #1 #2
\{ \fp_to_decimal:n { min ( \_\_fp\_parse:n (#1) , \_\_fp\_parse:n (#2) ) } \}
\end{verbatim}

(End definition for \texttt{\fp\_max:nn} and \texttt{\fp\_min:nn}. These functions are documented on page 258.)

76.10 Convert an array of floating points to a comma list

\texttt{\_\_fp\_array\_to\_clist:n} \texttt{\_\_fp\_array\_to\_clist\_loop:Nw}

Converts an array of floating point numbers to a comma-list. If speed here ends up irrelevant, we can simplify the code for the auxiliary to become

\begin{verbatim}
\cs_new:Npn \_\_fp\_array\_to\_clist\_loop:Nw #1#2
{ \tl_if_empty:nF {#1}
{ , ~ } \fp_to_tl:n { #1 #2 ; }
\_\_fp\_array\_to\_clist\_loop:Nw
}
\end{verbatim}

The \texttt{\_\_fp\_array\_to\_clist\_loop:Nw} function is expanded after \texttt{\_\_fp\_expand:n} is done, and it removes ,~ from the start of the representation.
\exp_not:f \{ \__fp_to_tl_dispatch:w #1 #2 ; \}
\__fp_array_to_clist_loop:Nw
\}

(End definition for \__fp_array_to_clist:n and \__fp_array_to_clist_loop:Nw.)

\package
Chapter 77

l3fp-random Implementation

Those functions may receive a variable number of arguments. We won’t use the argument \( ? \).

(End definition for \( \_\_fp\_parse\_word\_rand:N \) and \( \_\_fp\_parse\_word\_randint:N \).)

77.1 Engine support

Most engines provide random numbers, but not all. We write the test twice simply in order to write the false branch first.

(sys_if_rand_exist:F)

(End definition for \( \_\_fp\_parse\_word\_rand:N \) and \( \_\_fp\_parse\_word\_randint:N \).)
Quite problematic, it is uncomfortably close to being so, and it becomes worse as takes at the very least 16 seconds on a 2 giga-hertz processor). While this bias is not for the seed). The recommended way to get a number from bits of the seed (and of course the number of times the RNG was called since setting discard some of the lowest bits. 

\[ x \equiv N \pmod{2^k} \] 

increased. In our code, we shall thus combine several results from the RNG.

Second, suppose that we call the RNG with the same argument \( N \) to get a set of \( K \) integers in \([0, N - 1]\) (throwing away repeats), and suppose that \( N > K^3 \) and \( K > 55 \). The recursion used to construct more 28-bit numbers from previous ones is linear: \( x_n = x_{n-55} - x_{n-24} \) or \( x_n = x_{n-55} - x_{n-24} + 2^{28} \). After rescaling and rounding we find that the result \( N_n \in [0, N-1] \) is among \( N_{n-55} - N_{n-24} + \{-1, 0, 1\} \) modulo \( N \) (a more detailed analysis shows that 0 appears with frequency close to 3/4). The resulting set thus has more triplets \((a, b, c)\) than expected obeying \( a = b + c \) modulo \( N \). Namely it will have of order \((K - 55) \times 3/4\) such triplets, when one would expect \( K^3/(6N) \). This starts to be detectable around \( N = 2^{18} > 55^3 \) (earlier if one keeps track of positions too, but this is more subtle than it looks because the array of 28-bit integers is read backwards by the engine). Hopefully the correlation is subtle enough to not affect realistic documents so we do not specifically mitigate against this. Since we typically use two calls to the RNG per \texttt{int_rand:nn} we would need to investigate linear relations between the \( x_{2n} \) on the one hand and between the \( x_{2n+1} \) on the other hand. Such relations will have more complicated coefficients than \( \pm 1 \), which alleviates the issue.

Third, consider successive batches of 165 calls to the RNG (with argument \( 2^{28} \) or with argument 2 for instance), then most batches have more odd than even numbers. Note
that this does not mean that there are more odd than even numbers overall. Similar
issues are discussed in Knuth’s TAOCP volume 2 near exercise 3.3.2-31. We do not have
any mitigation strategy for this.
Ideally, our algorithm should be:

- Uniform. The result should be as uniform as possible assuming that the RNG’s
  underlying 28-bit integers are uniform.

- Uncorrelated. The result should not have detectable correlations between different
  seeds, similar to the lowest-bit ones mentioned earlier.

- Quick. The algorithm should be fast in \textsc{TeX}, so no “bit twiddling”, but “digit
twiddling” is ok.

- Simple. The behaviour must be documentable precisely.

- Predictable. The number of calls to the RNG should be the same for any \texttt{\int_-}
  \texttt{rand:nn}, because then the algorithm can be modified later without changing the
  result of other uses of the RNG.

- Robust. It should work even for \texttt{\int_rand:nn \{ - \c_max_int \} \{ \c_max_int \}}
  where the range is not representable as an integer. In fact, we also provide later a
  floating-point \texttt{randint} whose range can go all the way up to \(2 \times 10^{16} - 1\) possible
  values.

Some of these requirements conflict. For instance, uniformity cannot be achieved with a
fixed number of calls to the RNG.

Denote by \texttt{random}(N) one call to \texttt{\tex_uniformdeviate:D} with argument \(N\), and
by \texttt{ediv}(p, q) the \\textsc{TeX} rounding division giving \([p/q + 1/2]\). Denote by \langle \texttt{\\min} \rangle, \langle \texttt{\\max} \rangle
and \(R = \langle \texttt{\max} \rangle - \langle \texttt{\min} \rangle + 1\) the arguments of \texttt{\int_min:nn} and the number of possible
outcomes. Note that \(R \in [1, 2^{32} - 1]\) cannot necessarily be represented as an integer
(however, \(R - 2^{31}\) can). Our strategy is to get two 28-bit integers \(X\) and \(Y\) from the
RNG, split each into 14-bit integers, as \(X = X_1 \times 2^{14} + X_0\) and \(Y = Y_1 \times 2^{14} + Y_0\) then
return essentially \(\langle \texttt{\min} \rangle + \lfloor R(X_1 \times 2^{-14} + Y_1 \times 2^{-28} + Y_0 \times 2^{-42} + X_0 \times 2^{-56}) \rfloor\). For
small \(R\) the \(X_0\) term has a tiny effect so we ignore it and we can compute \(R \times Y/2^{28}\)
much more directly by \texttt{random(R)}.

- If \(R \leq 2^{17} - 1\) then return \texttt{ediv(R \texttt{random}(2^{14}) + \texttt{random}(R) + 2^{13}, 2^{14}) - 1 + \langle \texttt{\\min} \rangle.\}
  The shifts by \(2^{13}\) and \(-1\) convert \\textsc{TeX} division to truncated division. The bound
  on \(R\) ensures that the number obtained after the shift is less than \(\c_max_int\). The
  non-uniformity is at most of order \(2^{17}/2^{22} = 2^{-5}\).

- Split \(R = R_2 \times 2^{28} + R_1 \times 2^{14} + R_0\), where \(R_2 \in [0, 15]\). Compute \langle \texttt{\\min} \rangle + R_2 X_1 2^{14} + \langle R_2 Y_1 + R_1 X_1 \rangle + \text{ediv}(R_2 Y_0 + R_1 Y_1 + R_0 X_1 + \text{ediv}(R_2 X_0 + R_0 Y_1 + \text{ediv}(2^{14} R_1 + R_0)(2^{14} Y_0 + X_0), 2^{28}), 2^{14}), 2^{14})\) then map a result of \langle \texttt{\\max} \rangle + 1 to \langle \texttt{\\min} \rangle. Writing
each \texttt{ediv} in terms of truncated division with a shift, and using \([p + [r/s]]/[q] = \lfloor (ps + r)/sq \rfloor\), what we compute is equal to \([\langle \texttt{\\exact} \rangle + 2^{-29} + 2^{-15} + 2^{-1}]\) with
\langle \texttt{\\exact} \rangle = \langle \texttt{\\min} \rangle + R \times 0.X_1 Y_1 Y_0 X_0. Given we map \langle \texttt{\\max} \rangle + 1 to \langle \texttt{\\min} \rangle, the shift
has no effect on uniformity. The non-uniformity is bounded by \(R/2^{56} < 2^{-24}\). It
can be possible to speed up the code by dropping tiny terms such as \(R_0 X_0\), but
the analysis of non-uniformity proves too difficult.

To avoid the overflow when the computation yields \langle \texttt{\\max} \rangle + 1 with \langle \texttt{\\max} \rangle = 2^{31} - 1
(note that \(R\) is then arbitrary), we compute the result in two pieces. Compute
\c__kernel_randint_max_int

Constant equal to $2^{17} - 1$, the maximal size of a range that \int_range:nn can do with its "simple" algorithm.

\begin{verbatim}
\int_const:Nn \c__kernel_randint_max_int { 131071 }
\end{verbatim}

(End definition for \c__kernel_randint_max_int.)

\__kernel_randint:n

Used in an integer expression, \__kernel_randint:n \{R\} gives a random number \(1 + [\lfloor R \text{ random}(2^{14}) + \text{ random}(R)/2^{14} \rfloor]\) that is in \([1, R]\). Previous code was computing \([p/2^{14}]\) as ediv\((p - 2^{13}; 2^{14})\) but that wrongly gives \(-1\) for \(p = 0\).

\begin{verbatim}
\cs_new:Npn \__kernel_randint:n #1
  { (\#1 * \tex_uniformdeviate:D 16384
      + \tex_uniformdeviate:D \#1 + 8192 ) / 16384 }
\end{verbatim}

(End definition for \__kernel_randint:n.)

\__fp_rand_myriads:n
\__fp_rand_myriads_loop:w
\__fp_rand_myriads_get:w

Used as \__fp_rand_myriads:n \{XXX\} with one letter \(X\) (specifically) per block of four digits we want; it expands to \(X\); followed by the requested number of brace groups, each containing four (pseudo-random) digits. Digits are produced as a random number in \([10000, 19999]\) for the usual reason of preserving leading zeros.

\begin{verbatim}
\cs_new:Npn \__fp_rand_myriads:n \#1
  { \__fp_rand_myriads_loop:w \#1 \prg_break: X \prg_break_point: ; } \cs_new:Npn \__fp_rand_myriads_loop:w \#1 X
  { \#1 \exp_after:wN \__fp_rand_myriads_get:w \int_value:w \__fp_int_eval:w \#1 9999 + \__kernel_randint:n \{ 10000 \} \__fp_rand_myriads_loop:w \__fp_rand_myriads_get:w 1 \#1 ; \{ ; \#1 \} }
\end{verbatim}

(End definition for \__fp_rand_myriads:n, \__fp_rand_myriads_loop:w, and \__fp_rand_myriads_get:w.)
### 77.2 Random floating point

First we check that \texttt{random} was called without argument. Then get four blocks of four digits and convert that fixed point number to a floating point number (this correctly sets the exponent). This has a minor bug: if all of the random numbers are zero then the result is correctly \texttt{0} but it raises the \texttt{underflow} flag; it should not do that.

\begin{verbatim}
\cs_new:Npn \__fp_rand_o:Nw ? #1 \@ 
{ \tl_if_empty:nTF {#1} 
  { \exp_after:wN \__fp_rand_o:w 
    \exp:w \exp_end_continue_f:w 
    \__fp_rand_myriads:n { XXXX } { 0000 } { 0000 } ; 0 
  } 
  { \msg_expandable_error:nnnnn 
    { fp } { num-args } { rand() } { 0 } { 0 } 
    \exp_after:wN \c_nan_fp 
  } 
} 
\cs_new:Npn \__fp_rand_o:w ; 
{ \exp_after:wN \__fp_sanitize:Nw 
  \exp_after:wN 0 
  \int_value:w \__fp_int_eval:w \c_zero_int 
  \__fp_fixed_to_float_o:wN }
\end{verbatim}

(End definition for \texttt{\__fp_rand_o:Nw} and \texttt{\__fp_rand_o:w}.)

### 77.3 Random integer

Enforce that there is one argument (then add first argument \texttt{1}) or two arguments. Call \texttt{\__fp_randint_badarg:w} on each; this function inserts \texttt{1 \exp_stop_f:} to end the \texttt{\if_case:w} statement if either the argument is not an integer or if its absolute value is \texttt{\geq 10^{16}}. Also bail out if \texttt{\__fp_compare_back:ww} yields \texttt{1}, meaning that the bounds are not in the right order. Otherwise an auxiliary converts each argument times \texttt{10^{-16}} (hence the shift in exponent) to a 24-digit fixed point number (see \texttt{l3fp-extended}). Then compute the number of choices, \langle \texttt{max} \rangle + 1 - \langle \texttt{min} \rangle. Create a random 24-digit fixed-point number with \texttt{\__fp_randint_myriads:n}, then use a fused multiply-add instruction to multiply the number of choices to that random number and add it to \langle \texttt{min} \rangle. Then truncate to 16 digits (namely select the integer part of \texttt{10^{16}} times the result) before converting back to a floating point number (\texttt{\__fp_sanitize:Nw} takes care of zero). To avoid issues with negative numbers, add \texttt{1} to all fixed point numbers (namely \texttt{10^{16}} to the integers they represent), except of course when it is time to convert back to a float.

\begin{verbatim}
\cs_new:Npn \__fp_randint_o:Nw ? 
{ \__fp_parse_function_one_two:nnw

\exp_after:wN \__fp_fixed_sub:wwn \c__fp_one_fixed_tl }
\__fp_fixed_continue:wn

1182
Evaluate the argument and filter out the case where the lower bound #1 is more than the upper bound #2. Then determine whether the range is narrower than \c__kernel_ran'dint_max_int; #2−#1 may overflow for very large positive #2 and negative #1. If the
range is narrow, call \_kernel\_randint:n \{ \langle \text{choices} \rangle \} \text{ where } \langle \text{choices} \rangle \text{ is the number of possible outcomes. If the range is wide, use somewhat slower code.}

\begin{verbatim}
\cs_new:Npn \int_rand:nn #1#2 {
    \int_eval:n {
        \exp_after:wN \_fp\_randint:ww
        \int_value:w \int_eval:n {#1} \exp_after:wN ;
        \int_value:w \int_eval:n {#2} ;
    }
}
\cs_new:Npn \_fp\_randint:ww #1; #2; {
    \if_int_compare:w #1 > #2 \exp_stop_f:
        \msg_expandable_error:nnnn { kernel } { randint-backward-range } {#1} {#2}
        \_fp\_randint:ww #2; #1;
    \else:
        \if_int_compare:w \_fp\_int_eval:w #2
            \if_int_compare:w \_fp\_int_eval:w #1 > \c_zero_int
                \_kernel\_randint_max_int
                \_fp\_int_eval_end:
                \_kernel\_randint:n
                \_fp\_int_eval:w #2 - #1 + 1 \_fp\_int_eval_end: }
            - 1 + #1
        \else:
            \_kernel\_randint:nn \{#1\} \{#2\}
        \fi:
    \fi:
}
\end{verbatim}

Any $n \in [-2^{31} + 1, 2^{31} - 1]$ is uniquely written as $2^{14}n_1 + n_2$ with $n_1 \in [-2^{17}, 2^{17} - 1]$ and $n_2 \in [0, 2^{14} - 1]$. Calling \_fp\_randint_split_o:Nw \textit{n} \text{ gives } n_1; n_2 \text{ and expands the next token once. We do this for two random numbers and apply } \text{\_fp\_randint-wide AUX} \text{ twice to fully decompose the range } R. One subtlety is that we compute

$R - 2^{31} = \langle \text{max} \rangle - \langle \text{min} \rangle - (2^{31} - 1) \in [-2^{31} + 1, 2^{31} - 1]$ rather than $R$ to avoid overflow.

Then we have \_fp\_randint-wide AUX:w \langle X_1 \rangle; \langle X_0 \rangle; \langle Y_1 \rangle; \langle Y_0 \rangle; \langle R_2 \rangle; \langle R_1 \rangle; \langle R_0 \rangle; .

and we apply the algorithm described earlier.

\begin{verbatim}
\cs_new:Npn \_kernel\_randint:nn #1#2 {
    \exp_after:wN \_fp\_randint\_wide\_aux:w

    \fi:
  \fi:
\endinput

(End definition for \int_rand:n and \__fp_randint:n. This function is documented on page 166.)

End the initial conditional that ensures these commands are only defined in engines that support random numbers.

\endinput

⟨/package⟩
Chapter 78

l3fparray implementation

In analogy to l3intarray it would make sense to have <@@=fparray>, but we need
direct access to \_\_fp_parse:n from l3fp-parse, and a few other (less crucial) internals
of the l3fp family.

78.1 Allocating arrays

There are somewhat more than \((2^{31} - 1)^2\) floating point numbers so we store each floating
point number as three entries in integer arrays. To avoid having to multiply indices by
three or to add 1 etc, a floating point array is just a token list consisting of three tokens:
integer arrays of the same size.

\g__fp_array_int Used to generate unique names for the three integer arrays.
\l__fp_array_loop_int Used to loop in \_\_fp_array_gzero:N.
\fparray_new:Nn \fparray_new:cn \_\_fp_array_new:nNNN

Build a three-token token list, then define all three tokens to be integer arrays of the
same size. No need to initialize the data: the integer arrays start with zeros, and three
zeros denote precisely \c_zero_fp, as we want.

Chapter 79

l3cctab implementation

As LuaTEX offers engine support for category code tables, and this is entirely lacking from the other engines, we need two complementary approaches. (Some future XeLaTeX may add support, at which point the conditionals below would be different.)

79.1 Variables

\g__cctab_stack_seq List of catcode tables saved by nested \cctab_begin:N, to restore catcodes at the matching \cctab_end:. When popped from the \g__cctab_stack_seq the table numbers are stored in \g__cctab_unused_seq for later reuse.

\g__cctab_group_seq A stack to store the group level when a catcode table started.

\g__cctab_allocate_int Integer to keep track of what category code table to allocate. In LuaTEX it is only used in format mode to implement \cctab_new:N. In other engines it is used to make csnames for dynamic tables.

\l__cctab_internal_a_tl Scratch space. For instance, when popping \g__cctab_stack_seq/\g__cctab_unused_seq, consists of the catcode table number (integer denotation) in LuaTEX, or of an intarray variable (as a single token) in other engines.
In LuaTEX we store the \endlinechar associated to each \catcodetable in a property list, unless it is the default value 13.

\prop_new:N \g__cctab_endlinechar_prop

(End definition for \g__cctab_endlinechar_prop.)

### 79.2 Allocating category code tables

The \__cctab_new:N auxiliary allocates a new catcode table but does not attempt to set its value consistently across engines. It is used both in \cctab_new:N, which sets catcodes to \iniTeX values, and in \cctab_begin:N/\cctab_end: for dynamically allocated tables.

First, the LuaTEX case. Creating a new category code table is done like other registers. In ConTeXt, \newcatcodetable does not include the initialisation, so that is added explicitly.

\sys_if_engine_luatex:TF
\cs_new_protected:Npn \cctab_new:N #1
\__kernel_chk_if_free_cs:N #1
\__cctab_new:N #1
\cs_new_protected:Npn \__cctab_gstore:Nnn #1#2#3
{ \intarray_gset:Nnn #1 { \int_eval:n { #2 + 1 } } {#3} }
\cs_new_protected:Npn \cctab_new:N #1
\__kernel_chk_if_free_cs:N #1
\__cctab_new:N #1
\int_step_inline:nn { 256 }
\{ \__cctab_gstore:Nnn #1 {##1} { 12 } \}
\__cctab_gstore:Nnn #1 { 257 } { 13 }
\__cctab_gstore:Nnn #1 { 0 } { 9 }
\__cctab_gstore:Nnn #1 { 13 } { 5 }
\__cctab_gstore:Nnn #1 { 32 } { 10 }
\__cctab_gstore:Nnn #1 { 37 } { 14 }
\int_step_inline:nnn { 65 } { 90 }
\{ \__cctab_gstore:Nnn #1 {##1} { 11 } \}
\__cctab_gstore:Nnn #1 { 92 } { 0 }
\int_step_inline:nnn { 97 } { 122 }
\{ \__cctab_gstore:Nnn #1 {##1} { 11 } \}
\__cctab_gstore:Nnn #1 { 127 } { 15 }

Now the case for other engines. Here, each table is an integer array. Following the LuaTEX pattern, a new table starts with \iniTeX codes. The index base is out-by-one, so we have an internal function to handle that. The \iniTeX \endlinechar is 13.

\sys_if_engine_luatex:TF
\cs_new_protected:Npn \cctab_new:N #1
\__kernel_chk_if_free_cs:N #1
\__cctab_new:N #1
\int_step_inline:nn { 256 }

\__kernel_intarray_gset:Nnn #1 {#1} { 0 }
\int_step_inline:nnn { 65 } { 90 }
\{ \__kernel_intarray_gset:Nnn #1 {##1} { 11 } \}
\__kernel_intarray_gset:Nnn #1 { 92 } { 0 }
\int_step_inline:nnn { 97 } { 122 }
\{ \__kernel_intarray_gset:Nnn #1 {##1} { 11 } \}
\__kernel_intarray_gset:Nnn #1 { 127 } { 15 }
79.3 Saving category code tables

In various functions we need to save the current catcodes (globally) in a table. In LuaTeX, saving the catcodes is a primitives, but the \endlinechar needs more work: to avoid filling \g__cctab_endlinechar_prop with many entries we special-case the default value 13. In other engines we store 256 current catcodes and the \endlinechar in an intarray variable.

\cs_new_protected:Npn \__cctab_gset:n #1
\cs_new_protected:Npn \__cctab_gset:cn #1 #2
\cs_new_protected:Npn \__cctab_gset:Nn #1 #2
\cs_new_protected:Npn \__cctab_gset:cn #1 #2

Category code tables are always global, so only one version of assignments is needed. Simply run the setup in a group and save the result in a category code table #1, provided it is valid. The internal function is defined above depending on the engine.
79.4 Using category code tables

In \LaTeX, we must ensure that the saved tables are read-only. This is done by applying the saved table, then switching immediately to a scratch table. Any later catcode assignment will affect that scratch table rather than the saved one. If we simply switched to the saved tables, then \texttt{\char_set_catcode_other:N} in the example below would change \texttt{\c_document_cctab} and a later use of that table would give the wrong category code to \_.

\begin{verbatim}
\use:n {
  \cctab_begin:N \c_document_cctab
  \char_set_catcode_other:N \_
  \cctab_end:
}\end{verbatim}

We must also make sure that a scratch table is never reused in a nested group: in the following example, the scratch table used by the first \texttt{\cctab_begin:N} would be changed globally by the second one issuing \texttt{\savecatcodetable}, and after \texttt{\group_end:} the wrong category codes (those of \texttt{\c_str_cctab}) would be imposed. Note that the inner \texttt{\cctab_end:} restores the correct catcodes only locally, so the problem really comes up because of the different grouping level. The simplest is to use a scratch table labeled by the \texttt{\currentgrouplevel}. We initialize one of them as an example.

\begin{verbatim}
\use:n {
  \cctab_begin:N \c_document_cctab
  \group_begin:
    \cctab_begin:N \c_str_cctab
  \group_end:
  \cctab_end:
}\end{verbatim}
The public function simply checks the \cctab var exists before using the engine-dependent \cctab_select:N. Skipping these checks would result in low-level engine-dependent errors. First, the LuaTeX case. In other engines, selecting a catcode table is a matter of doing 256 catcode assignments and setting the \endlinechar.

\cctab_select:N \__cctab_select:N

\cs_new_protected:Npn \cctab_select:N \__cctab_select:N

\sys_if_engine_luatex:TF

\int_set:Nn \tex_endlinechar:D

\sys_if_engine_luatex:TF

\g__cctab_next_cctab

\__cctab_begin_aux:

For \cctab_begin:N/\cctab_end: we will need to allocate dynamic tables. This is done here by \__cctab_begin_aux:, which puts a table number (in LuaTeX) or name (in other engines) into \l__cctab_internal_a_tl. In LuaTeX this simply calls \__cctab_new:N and uses the resulting catcodetable number; in other engines we need to give a name to the intarray variable and use that. In LuaTeX, to restore catcodes at \cctab_end: we cannot just set \catcodetable to its value before \cctab_begin:N, because that table may have been altered by other code in the mean time. So we must make sure to save the catcodes in a table we control and restore them at \cctab_end:.

\g__cctab_next_cctab
\__cctab_begin_aux:
\cs_new_protected:Npn \_cctab_begin_aux:
\{
\_cctab_new:N \g__cctab_next_cctab

\seq_gpush:NV \g__cctab_stack_seq \l__cctab_internal_a_tl
\exp_args:NV \_cctab_gset:n \l__cctab_internal_a_tl
\l__cctab_select:N \#1
\}
\}
\cs_generate_variant:Nn \cctab_begin:N { c }

(End definition for \cctab_begin:N. This function is documented on page \pageref{cctab_begin:N}.)

\cctab_end: \cctab_end:
Make sure a \cctab_begin:N was used some time earlier, get in \l__cctab_internal_a_tl the catcode table number/name in which the prevailing catcodes were stored, then restore these catcodes. The dynamic table is now unused hence stored in \g__cctab_unused_seq for recycling by later \cctab_begin:N.

\cs_new_protected:Npn \cctab_end:
\{
\seq_gpop:NNTF \g__cctab_unused_seq \l__cctab_internal_a_tl
\{ \_cctab_stack_seq \l__cctab_internal_a_tl
\seq_gpush:NV \g__cctab_stack_seq \l__cctab_internal_a_tl
\exp_args:Nx \_cctab_chk_group_end:n
\{ \_cctab_nesting_number:N \l__cctab_internal_a_tl \}
\}
\cs_generate_variant:Nn \cctab_end: { c }

1197
(End definition for \texttt{cctab\_end:.} This function is documented on page 263.)

Catcode tables are not allowed to be intermixed with groups, so here we check that they are properly nested regarding \TeX groups. \_\_cctab\_chk\_group\_begin:n stores the current group level in a stack, and locally defines a dummy control sequence \_\_cctab\_\_group \langle \texttt{cctab-level} \rangle _\chk:.

\_\_cctab\_chk\_group\_end:n pops the stack, and compares the returned value with \texttt{\_\_cctab\_\_group\_\langle \texttt{cctab-level} \rangle _\chk:}. If they differ, \texttt{cctab\_end:} is in a different grouping level than the matching \texttt{cctab\_begin:N}. If they are the same, both happened at the same level, however a group might have ended and another started between \texttt{cctab\_begin:N} and \texttt{cctab\_end:}.

\begin{verbatim}
\group\begin:
  \cctab\begin:N \c_document_cctab
\group\end:
\cctab\begin:
\group\end:
\cctab\end:
\group\end:
\end{verbatim}

In this case checking \texttt{\_\_cctab\_\_group\_\langle \texttt{cctab-level} \rangle _\chk:} is not enough, so we locally define \_\_cctab\_\_group\_\langle \texttt{cctab-level} \rangle _\chk:, and then check if it exist in \texttt{cctab\_end:}. If it doesn’t, we know there was a group end where it shouldn’t.

The \texttt{\langle \texttt{cctab-level} \rangle } in the sentinel macro above cannot be replaced by the more convenient \texttt{\_\_cctab\_\_group\_\langle \texttt{cctab-level} \rangle _\chk:} because with the latter we might be tricked. Suppose:

\begin{verbatim}
\group\begin:
  \cctab\begin:N \c_code_cctab % A
\group\end:
\group\begin:
  \cctab\begin:N \c_code_cctab % B
  \cctab\end: % C
  \cctab\end: % D
\group\end:
\end{verbatim}

The line marked with \texttt{A} would start a \texttt{cctab} with a sentinel token named \_\_cctab\_\_group\_\_1\_\chk:, which would disappear at the \texttt{\group\end:} that follows. But \texttt{B} would create the same sentinel token, since both are at the same group level. Line \texttt{C} would end the \texttt{cctab} from line \texttt{B} correctly, but so would line \texttt{D} because line \texttt{B} created the same sentinel token. Using \texttt{\langle \texttt{cctab-level} \rangle } works correctly because it signals that certain \texttt{cctab} level was activated somewhere, but if it doesn’t exist when the \texttt{cctab\_end:} is reached, we had a problem.

Unfortunately these tests only flag the wrong usage at the \texttt{cctab\_end:,} which might be far from the \texttt{cctab\_begin:N}. However it isn’t possible to signal the wrong usage at the \texttt{\group\end:} without using \texttt{\_\_cctab\_\_aftergroup:}, which is unsafe in certain types of groups.

The three cases checked here just raise an error, and no recovery is attempted: usually interleaving groups and catcode tables will work predictably.
\cs_new_protected:Npn \__cctab_chk_group_begin:n #1 
{ 
  \seq_gpush:Nx \g__cctab_group_seq 
  { \int_use:N \tex_currentgrouplevel:D }

79.6 Constant category code tables

\cctab_const:Nn
\cctab_const:cn

Creates a new \langle ctab\ var \rangle then sets it with the current and user-supplied codes.

\cinitex_cctab
\c_other_cctab
\c_str_cctab

Creating category code tables means thinking starting from iniTEX. For all-other and the standard “string” tables that’s easy.

\cs_new_protected:Npn \cinitex_cctab \cctab_const:Nn \c_other_cctab \c_str_cctab
{ \cctab_new:N \cinitex_cctab \cctab_const:Nn \c_other_cctab
 \{ \cctab_select:N \cinitex_cctab \int_set:Nn \tex_endlinechar:D \{1\}
 \int_step_inline:nnn {0} {127} \{
 \char_set_catcode_other:n \{1\} \}
}
To pick up document-level category codes, we need to delay setup to the end of the
format, where that’s possible. Also, as there are a lot of category codes to set, we avoid
using the official interface and store the document codes using internal code. Depending
on whether we are in the hook or not, the catcodes may be code or document, so we
explicitly set up both correctly.

Chapter 80

13unicode implementation

80.1 User functions

Conversion of a codepoint to a character (Unicode engines) or to one or more bytes (8-bit engines) is required. For loading the data, all that is needed is the form which creates strings: these are outside the group as they will also be used when looking up data in the hash table storage at point-of-use. Later, we will also need functions that can generate character tokens for document use: those are defined below, in the data recovery setup.

```latex

This code converts a codepoint into the correct UTF-8 representation. In terms of the algorithm itself, see https://en.wikipedia.org/wiki/UTF-8 for the octet pattern.
Converted to NFD is a potentially-recursive process: the key is to check if we get the input codepoint back again. As far as possible, we use the same path for all engines.
80.2 Data loader

Text operations requires data from the Unicode Consortium. Data read into Unicode engine formats is at best a small part of what we need, so there is a loader here to set up the appropriate data structures.

Where we need data for most or all of the Unicode range, we use the two-stage table approach recommended by the Unicode Consortium and demonstrated in a model implementation in Python in https://www.strchr.com/multi-stage_tables. This approach uses the intarray (fontdimen-based) data type as it is fast for random access and avoids significant hash table usage. In contrast, where only a small subset of code-points are required, storage as macros is preferable. There is also some consideration of the effort needed to load data: see for example the grapheme breaking information, which would be problematic to convert into a two-stage table but which can be used with reasonable performance in a small number of comma lists (at the cost that breaking at higher codepoint Hangul characters will be slightly slow).

Choosing the block size for the blocks in the two-stage approach is non-trivial: depending on the data stored, the optimal size for memory usage will vary. At the same time, for us there is also the question of load-time: larger blocks require longer comma lists as intermediates, so are slower. As this is going to be needed to use the data, we set it up outside of the group for clarity.

Parsing the data files can be the same way for all engines, but where they are stored as character tokens, the construction method depends on whether they are Unicode or 8-bit internally. Parsing is therefore done by common functions, with some data storage using engine-specific auxiliaries.

As only the data needs to remain at the end of this process, everything is set up inside a group. The only thing that is outside is creating a stream: they are global anyway and it is best to force a stream for all engines.
track where we are up to. To avoid burning registers, the latter are stored in macros and are “fake” integers. We also avoid any new functions, keeping as much as possible local.

As we need both positive and negative values, case data requires one two-stage table for each transformation. In contrasts, general Unicode properties could be stored in one table with appropriate combination rules: that is not done at present but is likely to be added over time. Here, all that is needed is additional entries into the comma-list to create the structures.

Notice that in the standard expl3 way we are indexes position not offset: that does mean a little work later.

We need an integer value when matching the current block to those we have already seen, and a way to track codepoints for handling ranges. Again, we avoid using up registers or creating global names.

Parse the main Unicode data file and pull out the NFD and case changing data. The NFD data is stored on using the hash table approach and can yield a predictable number of code points: one or two. We also need the case data, which will be modified further below. To allow for finding ranges, the description of the codepoint needs to be carried forward.

The case data is going to be stored as an offset from the parent character, rather than an absolute value. We therefore deal with that plus the situation where a codepoint has no mapping data in one shot.
To deal with ranges, we track the position of the next codepoint expected. If there is a
gap, we deal with that separately: it could be a range or an unused part of the Unicode
space. As such, we deal with the current codepoint here whether or not there is range to
fill in. Upper- and lowercase data go into the two-stage table, any titlecase exception is
just stored in a macro. The data for the codepoint is added to the current block, and if
that is now complete we move on to save the block. The case exceptions are all stored as
codepoints, with a fixed number of balanced text as we know that there are never more
than three.
Calculated the length of the range and the space remaining in the current block.

Here we want to do three things: add to and possibly complete the current block, add complete blocks quickly, then finish up the range in a final open block. We need to avoid as far as possible avoid dealing with ever single codepoint, so the middle step is optimised.

1212
To allow rapid comparison, each completed block is stored locally as a comma list: once all of the blocks have been created, they are converted into an \texttt{intarray} in one step. The aim here is to check the current block against those we’ve already used, and either match to an existing block or save a new block.

\begin{verbatim}
\cs_set_protected:Npn \__codepoint_save_blocks:nn #1#2
\tl_set_eq:Nc \l__codepoint_matched_block_tl { \l__codepoint_ #1_block_tl }
\int_step_inline:nn { \tl_use:c { \l__codepoint_ #1_block_tl } - 1 }
\tl_if_eq:ccT { \l__codepoint_ #1_block_clist } { \l__codepoint_ #1_block_ ##1_clist }
\tl_set:Nn \l__codepoint_matched_block_tl {##1}
\int_compare:nNnT \tl_use:c { \l__codepoint_ #1_block_tl } = \l__codepoint_matched_block_tl
\clist_set_eq:cc
\tl_use:c { \l__codepoint_ #1_block_clist }
\tl_set:cx \l__codepoint_ #1_block_tl { \int_eval:n { \tl_use:c { \l__codepoint_ #1_block_tl } + 1 } }
\prg_replicate:nn {#2}
\tl_set:cx \l__codepoint_ #1_pos_tl { \int_eval:n { \tl_use:c { \l__codepoint_ #1_pos_tl } + 1 } }
\exp_args:Nc \__kernel_intarray_gset:Nnn
\l__codepoint_matched_block_tl \l__codepoint_matched_block_tl
\clist_clear:c { \l__codepoint_ #1_block_clist }
\end{verbatim}

Close out the final block, rename the first stage table, then combine all of the block comma-lists into one large second-stage table with offsets. As we use an index not an offset, there is a little back-and-forward to do.

\begin{verbatim}
\cs_set_protected:Npn \__codepoint_finalise_blocks:
\clist_map_inline:nn { uppercase , lowercase }
\__codepoint_finalise_blocks:n {##1}
\end{verbatim}

\begin{verbatim}
\cs_set_protected:Npn \__codepoint_finalise_blocks:n #1
\clist_set_eq:cc
\tl_use:c { \l__codepoint_ #1_block_clist }
\tl_set:cx \l__codepoint_ #1_block_tl { \int_eval:n { \tl_use:c { \l__codepoint_ #1_block_tl } + 1 } }
\prg_replicate:nn {#2}
\tl_set:cx \l__codepoint_ #1_pos_tl { \int_eval:n { \tl_use:c { \l__codepoint_ #1_pos_tl } + 1 } }
\exp_args:Nc \__kernel_intarray_gset:Nnn
\l__codepoint_ #1_index_intarray
\tl_use:c { \l__codepoint_ #1_pos_tl } }
\l__codepoint_ #1_block_clist }
\end{verbatim}

Close out the final block, rename the first stage table, then combine all of the block comma-lists into one large second-stage table with offsets. As we use an index not an offset, there is a little back-and-forward to do.
With the setup done, read the main data file: it's easiest to do that as a token list with spaces retained.

\ior_open:Nn \g__codepoint_data_ior { UnicodeData.txt }
\group_begin:
\char_set_catcode_space:n { ' ' }

\}%
\__kernel_codepoint_data:nn
\__codepoint_data:nnn
Recover data from a two-stage table: entirely generic as this applies to all tables (as we use the same block size for all of them). Notice that as we use indices not offsets we have to shuffle out-by-one issues. This function is needed before loading the special casing data, as there we need to be able to check the standard case mappings.
\cs_new:Npn \__kernel_codepoint_data:nnn #1#2#3
{ \exp_args:Nf \__kernel_codepoint_data:nnn #1#2#3#4 ,
\quark_if_recursion_tail_stop:n {#4}

{ #1 + #2 }
{#4}
\exp_args:Nf \__codepoint_finalise_blocks:nnww
{ \int_eval:n { #1 + 1 } } {#2} {#3}
}
\begin{verbatim}
{ \int_eval:n
   { \c__codepoint_block_size_int * 
     \intarray_item:cn { c__codepoint_ #1 _index_intarray }
     { \int_div_truncate:nn {#2} \c__codepoint_block_size_int + 1
       - 1 }
     } \{#2} \{#1} }
\cs_new:Npn \__codepoint_data:nnn #1#2#3
{ \intarray_item:cn { c__codepoint_ #3 _blocks_intarray }
  { #1 + \int_mod:nn {#2} \c__codepoint_block_size_int + 1 } }
\end{verbatim}

(End definition for \_\_kernel_codepoint_data:nn and \_\_codepoint_data:nnn.)

The other data files all use C-style comments so we have to worry about # tokens
(and reading as strings). The set up for case folding is in two parts. For the basic
(core) mappings, folding is the same as lower casing in most positions so only store
the differences. For the more complex foldings, always store the result, splitting up the two
or three code points in the input as required.

\begin{verbatim}
\group_begin:
\ior_open:Nn \g__codepoint_data_ior { CaseFolding.txt }
\cs_set_protected:Npn \__codepoint_data_auxi:w #1 ;~ #2 ;~ #3 ; #4 \q_stop
{ \if:w \tl_head:n { #2 ? } C \reverse_if:N \if_int_compare:w
  \int_eval:n { \_\_kernel_codepoint_data:nn { lowercase } {"#1} + "+#1 
  = "#3 -
  \tl_const:cx
  { c__codepoint_casefold_ \codepoint_str_generate:n {"#1} _tl }
  { "#3} { } { } }
\fi:
  \else:
    \if:w \tl_head:n { #2 ? } F
    \_\_codepoint_data_auxii:w #1 - #3 - \q_stop
  \fi:
\fi:
}\cs_set_protected:Npn \__codepoint_data_auxii:w #1 ~ #2 ~ #3 ~ #4 \q_stop
{ \tl_const:cx { c__codepoint_casefold_ \codepoint_str_generate:n {"#1} _tl }
  { }
}\group_end:
\end{verbatim}

Here, #4 can have have a trailing space, so we tidy up a bit at the cost of speed for these
small number of cases it applies to.

\begin{verbatim}
\cs_set_protected:Npn \_\_codepoint_data_auxii:w #1 - #2 - #3 - #4 \q_stop
{ \tl_const:cx { c__codepoint_casefold_ \codepoint_str_generate:n {"#1} _tl }
  { }
}\end{verbatim}
For upper- and lowercasing special situations, there is a bit more to do as we also have
titlecasing to consider, plus we need to stop part-way through the file.

With the core data files loaded, there is now a need to provide access to this information
for other modules. That is done here such that case folding can also be covered. At this
level, all that needs to be returned is the

1219
Internal scan marks quarks.

Functions to gobble up to a scan mark.

Functions to query recursion scan marks. Slower than a quark test but needed to avoid issues in the outer expansion loop with unterminated \romannumeral primitives.

The idea here is to take a token and ensure that if it's an implicit char, we output the explicit version. Otherwise, the token needs to be unchanged. First, we have to split between control sequences and everything else.
For control sequences, we can check for macros versus other cases using `\if_meaning:w`, then explicitly check for `\chardef` and `\mathchardef`.

For character tokens, we need to filter out the implicit characters from those that are explicit. That’s done here, then if necessary we work out the category code and generate the char. To avoid issues with alignment tabs, that one is done by elimination rather than looking up the code explicitly. The trick with finding the charcode is that the TeX messages are either the ⟨something⟩ character ⟨char⟩ or the ⟨type⟩ ⟨char⟩.

\tex_mathchardef:D \c__text_mathchardef_group_begin_token = '{\%'}'
\end{lstlisting}

1227
After precautions against & tokens, start a simple loop: that of course means that “text”
cannot contain the two recursion quarks. The loop here must be f-type expandable; we
have arbitrary user commands which might be protected and take arguments, and if the
expansion code is used in a typesetting context, that will otherwise explode. (The same
issue applies more clearly to case changing: see the example there.) The outer loop has
to use scan marks as delimiters to protect against unterminated \romannumeral usage
in the input.

The approach to making the code f-type expandable is to use a marker result token and
to shuffle the collected tokens.

The main loop is a standard “tl action”: groups are handled recursively, while spaces are
just passed through. Thus all of the action is in handling N-type tokens.
Before we get into the real work, we have to watch out for problematic implicit characters: spaces and grouping tokens. Converting these to explicit characters later would lead to real issues as they are not \$\text{-}\text{type. A space is the easy case, so it's dealt with first: just insert the explicit token and continue the loop.

}\cs_new:Npx \__text_expand_N_type:N #1

{ \__text_expand_store:o \c_left_brace_str
The first step in dealing with $N$-type tokens is to look for math mode material: that needs to be left alone. The starting function has to be split into two as we need $\text{quark-if_recursion_tail_stop:N}$ first before we can trigger the search. We then look for matching pairs of delimiters, allowing for the case where math mode starts but does not end. Within math mode, we simply pass all the tokens through unchanged, just checking the $N$-type ones against the end marker.
At this stage, either we have a control sequence or a simple character: split and handle. The need to check for non-protected actives arises from handling of legacy input encodings: they need to end up in a representation we can deal with in further processing. The tests for explicit parts of the \LaTeX2ε UTF-8 mechanism cover the case of bookmarks, where definitions change and are no longer protected. The same is true for babel shorthands.
Next we exclude math commands: this is mainly as there might be an `\ensuremath`. The switching command for case needs special handling as it has to work by meaning.

```latex

\يتاXe\’s \protect makes life interesting. Where possible, we simply remove it and replace with the “parent” command; of course, the \protect might be explicit, in which case we need to leave it alone. That includes the case where it’s not even followed by an N-type token. There is also the case of a straight \@protected@testopt to cover.
\cs_new:Npx \_text_expand_cs:N #1
{ \exp_not:N \str_if_eq:nTF {#1} \{ \exp_not:N \protect 
\{ \exp_not:N \_text_expand_protect:w \} }
Deal with encoding-specific commands
\cs_new:Npn \__textexpand_encoding:N #1

  { \exp_after:wN \__textexpand_loop:w \__textexpand_encoding_escape:NN }
  { \__textexpand_replace:N #1 }
}
\cs_new:Npn \__textexpand_encoding_escape:NN #1#2 { \exp_not:n {#1} }

See if there is a dedicated replacement, and if there is, insert it.
\cs_new:Npn \__textexpand_replace:N #1
{
  \bool_lazy_and:nnTF
   { \cs_if_exist_p:c { l__text-expand_ \token_to_str:N #1 _tl } }
   { \bool_lazy_or_p:nn
     { \token_if_cs_p:N #1 }
     { \token_if_active_p:N #1 }
   }
   { \exp_args:Nv \__textexpand_replace:n
     { l__text-expand_ \token_to_str:N #1 _tl }
     { \__textexpand_cs-expand:N #1 }
   }
  { \__textexpand_store:n {#1}
    \__textexpand_loop:w
  }
}
\cs_new:Npn \__textexpand_replace:n #1 { \__textexpand_loop:w #1 }

Finally, expand any macros which can be: this then loops back around to deal with what they produce. The only issue is if the token is \exp_not:n, as that must apply to the following balanced text.
\cs_new:Npn \__textexpand_cs-expand:N #1
{
  \__text_if_expandable:NTF #1
  { \token_if_eq_meaning:NNTF #1 \exp_not:n
    { \__textexpand_unexpanded:w }
    { \exp_after:wN \__textexpand_loop:w #1 }
  }
  { \__textexpand_store:n {#1}
    \__textexpand_loop:w
  }
}

Since \exp_not:n is actually a primitive, it allows a strange syntax and it particular the primitive expands what follows and discards spaces and \scan_stop: until finding a braced argument (the opening brace can be implicit but we will not support this here). Here, we repeatedly f-expand after such an \exp_not:n, and test what follows. If it is a brace group, then we found the intended argument of \exp_not:n. If it is a space, then the next f-expansion will eliminate it. If it is an N-type token then \__text_-_expand_unexpanded:N leaves the token to be expanded if it is expandable, and otherwise removes it, assuming that it is \scan_stop:. This silently hides errors when \exp_not:n
is incorrectly followed by some non-expandable token other than `\scan_stop:`; but this
should be pretty rare, and there is no good error recovery anyways.

\cs_new:Npn \text_titlecase_first:nn #1#2
{ \__text_change_case:nnn { titleonly } {#1} {#2} }

(End definition for \text_lowercase:n and others. These functions are documented on page 268.)

As for the expansion code, the business end of case changing is the handling of \text-N-type tokens. First, we expand the input fully (so the loops here don’t need to worry about awkward look-aheads and the like). Then we split into the different paths.

The code here needs to be \text-f-type expandable to deal with the situation where case changing is applied in running text. There, we might have case changing as a document command and the text containing other non-expandable document commands.
If we use an \texttt{e-} type expansion and wrap each token in \texttt{exp_not:n}, that would explode: the document command grabs \texttt{exp_not:n} as an argument, and things go badly wrong. So we have to wrap the entire result in exactly one \texttt{exp_not:n}, or rather in the kernel version.

\begin{verbatim}
\cs_new:Npn \__text_change_case:nnn #1#2#3
\begin{Verbatim}
\__kernel_exp_not:w \exp_after:wN
\exp:w
\exp_args:Ne \__text_change_case_auxi:nnn
{ \text_expand:n {#3} }
{#1} {#2}
\end{Verbatim}
\end{verbatim}

As for expansion, collect up the tokens for future use.

\begin{verbatim}
\cs_new:Npn \__text_change_case_store:n #1
\begin{Verbatim}
\__text_change_case_store:nw {#1} \__text_change_case_result:n #3
\end{Verbatim}
\end{verbatim}
The main loop is the standard `tl` action type.

For a group, we could worry about whether this contains a character or not. However, that would make life very complex for little gain: exactly what a first character is is rather weakly-defined anyway. So if there is a group, we simply assume that a character has been seen, and for title case we switch to the “rest of the tokens” situation. To avoid having too much testing, we use a two-step process here to allow the titlecase functions to be separate.
The first step of handling $N$-type tokens is to filter out the end-of-loop. That has to be done separately from the first real step as otherwise we pick up the wrong delimiter. The loop here is the same as the expand one, just passing the additional data long. If no close-math token is found then the final clean-up is forced (i.e. there is no assumption of “well-behaved” input in terms of math mode).
Once potential math-mode cases are filtered out the next stage is to test if the token grabbed is a control sequence: the two routes the code may take are then very different.

To deal with a control sequence there is first a need to test if it is on the list which
indicate that case changing should be skipped. That’s done using a loop as for the other special cases. If a hit is found then the argument is grabbed and passed through as-is.

\end{verbatim}
Allow for manually-controlled case switching.

Letter-like commands may still be present: they are set up using a simple lookup approach, so can easily be handled with no loop. If there is no hit, we are at the end of the process: we loop around. Letter-like chars are all available only in upper- and lowercase, so titlecasing maps to the uppercase version.
For upper- and lowercase changes, once we get to this stage there are only a couple of questions remaining: is there a language-specific mapping and is there the special case of a terminal sigma. If not, then we pass to a simple codepoint mapping.

If the current character is an uppercase sigma, a check is made on the next item in the input. If it is N-type and not a control sequence then there is a look-ahead phase: the logic here is simply based on letters or actives (to cover 8-bit engines).
For titlecasing, we need to fully expand the new character to see if it is a letter (or active).

```latex
\cs_new:Npn \__text_change_case_codepoint_title:nnn #1#2#3
\begin{Verbatim}
\cs_if_exist_use:cF \texttt{__text_change_case_title_ #3 :nnnn}
\cs_if_exist_use:cF \texttt{__text_change_case_upper_ #3 :nnnn}
\end{Verbatim}
```

```latex
\cs_new_eq:NN \__text_change_case_codepoint_titleonly:nnn \__text_change_case_codepoint_title:nnn
\cs_new:Npn \__text_change_case_codepoint_titleonly:nn #1#2
\begin{Verbatim}
\cs_if_exist_use:cF \texttt{__text_change_case_title_ #1 :nnn}
\cs_if_exist_use:cF \texttt{__text_change_case_upper_ #1 :nnn}
\end{Verbatim}
```
Avoid high chars with pTeX.

\sys_if_engine_ptex: T
  \cs_new_eq:NN \__text_change_case_codepoint_aux:nnn \__text_change_case_codepoint:nnn
  \cs_gset:Npn \__text_change_case_codepoint:nnn #1#2#3
    \int_compare:nNnTF {#1} = {-1}
      \exp_not:n {#3}
      {\__text_change_case_codepoint_aux:nnn {#1} {#2} {#3}}

\sys_if_engine_ptex: T
  \use:e { \__text_change_case_codepoint_aux:nnnn #1 #2 #3 #4}
    \__text_codepoint_compare:nNnTF {#4} = {#1}
      \exp_not:n {#4}
      {\codepoint_generate:nn {#1}
        \char_value_catcode:n {#2}
        \tl_if_blank:nF {#3}
          \codepoint_generate:nn {#3}
          \char_value_catcode:n {#3}}

We need to ensure that only valid catcode-extraction is attempted. That’s fine with Unicode engines but needs a bit of work with 8-bit ones. The logic is that if the original codepoint was in the ASCII range, we keep the catcode. Otherwise, if the target is in
the ASCII range, we use the standard catcode. If neither are true, we set as 13 on the
grounds that this will be what is used anyway!

```

For Greek uppercasing, we need to know if characters in the Greek range have accents. That means doing a NFD conversion first, then starting a search. As described by the Unicode CLDR, Greek accents need to be found after any \textbackslash U+0308 (diaeresis) and are done in two groups to allow for the canonical ordering. The implementation here follows the data and examples from ICU (https://icu.unicode.org/design/case/greek-upper), although necessarily the implementation is somewhat different. The \textit{ypogegrammeni} is filtered out here as it is not actually in the Greek range, so gets lost if we leave until later.

At this stage we have the first NFD codepoint as \( #3 \). What we need to know is whether after that we have another character, either from the NFD or directly in the input. If not, we store the changed character at this stage.

Now, we check the detail of the next codepoint: again we filter out the not-a-char cases, before checking if it’s an dialettika, accent or diacritic. (The latter do not have the same hiatus behavior as accents.) There is additional work if the codepoint can take a ypogeagrammeni: there, we need to move any ypogeagrammeni to after accents (in case the input is not normalised). The ypogeagrammeni itself is handled separately.

There is one special case in Greek that needs to be picked up based on being an isolated letter. We do that using a test similar to final sigma, but it has to fire off from the space grabber.
Titlecasing retains accents, but to prevent the uppercasing code from kicking in, there has to be an explicit function here.

```

(End definition for \_text_change_case_upper_hy:nnnn and others.)

Simply swaps of characters.

\texttt{\textbackslash cs_new:cpn \{ \_text_change_case_lower_la-x-medieval:nnnn \} #1#2#3#4}
\texttt{\textbackslash cs_new:cpn \{ \_text_change_case_upper_la-x-medieval:nnnn \} #1#2#3#4}
\texttt{\_text_change_case_lower_la-x-medieval:nnnn}
\texttt{\_text_change_case_upper_la-x-medieval:nnnn}
For Lithuanian, the issue to be dealt with is dots over lower case letters: these should be present if there is another accent. The first step is a simple match attempt: look for the three uppercase accented letters which should gain a dot-above char in their lowercase form.

If there was a hit, output the result with the dot-above and move on. Otherwise, look for one of the three letters that can take a combining accent: I, J and I-ogonek.
Again, branch depending on a hit. If there is one, we output the character then need to look for a combining accent: as usual, we need to be aware of the loop situation.
The uppercasing version: first find i/j/i-ogonek, then look for the combining char: drop it if present.

```latex
\cs_new:Npn \__text_change_case_upper_lt:nnnw #1#2#3#4
\exp_args:Ne \__text_change_case_upper_lt_aux:nnnn
{ \int_case:nn { \__text_codepoint_from_chars:Nw #4 } }
```
For Dutch, there is a single look-ahead test for ij when title casing. If the appropriate letters are found, produce IJ and gobble the j/J.

```latex
\cs_new:Npn \__text_change_case_title_nl:nnnn #1#2#3#4
\{\tl_if_single:nTF {#4}

\{ \use:c { \_text_change_case_next_ #1 :nn } {#1} {#2} #3 \}
\}
```

(End definition for \_text_change_cases_upper_lt:nnnn and others.)
The Turkic languages need special treatment for dotted-i and dotless-i. The lower casing rule can be expressed in terms of searching first for either a dotless-I or a dotted-I. In the latter case the mapping is easy, but in the former there is a second stage search.

After a dotless-I there may be a dot-above character. If there is then a dotted-i should be produced, otherwise output a dotless-i. When the combination is found both the dotless-I and the dot-above char have to be removed from the input.
Uppercasing is easier: just one exception with no context.

\q__text_recursion_tail \q__text_recursion_stop
\prg_break_point:Nn \text_map_break: { }

1266
We pull out a few special cases here. Carriage returns case needs a bit of context handling so has an auxiliary. Codepoint U+200D is the zero-width joiner, which has no context to concern us: just don’t break.

A carriage return is a boundary unless it is immediately followed by a line feed, in which case that pair is a boundary.
There are various classes of character, and we deal with them all in the same general way. We need to example the relevant list of codepoints: if we get a hit, then we do whatever the relevant action is. Otherwise we loop, but only if the current codepoint could still match: the loop stops early otherwise and we move forward.

Break before and after.
Keep collecting.

\cs_new:Npn \__text_map_Extend:Nnn #1#2#3
{ \__text_map_loop:Nnw #1 {#2#3} }
\cs_new_eq:NN \__text_map_SpacingMark:Nnn \__text_map_Extend:Nnn

Outputting anything earlier, the combine with what follows. The only exclusions are control characters.

    \__text_map_class_end:nw
    \__text_map_loop:Nnw #1 {#2} #3 }
  }
}
Dealing with end-of-class is done such that we can be flexible.

Hangul needs additional treatment. First we have to deal with the start-of-Hangul position: output what we had up to now, then move the the specialist handler. The idea here is to pick off the different codepoint types one at a time, tracking what else can be considered at each stage until we hit the end of the viable types. Other than that, we just keep building up the Hangul codepoints using a dedicated version of the loop from above.

Chapter 84

\text-purify implementation

As in the other parts of the module, we start off with a standard “action” loop, with expansion applied up-front.

As for expansion, collect up the tokens for future use.
The main loop is a standard “tl action”. Unlike the expansion or case changing, here any groups have to be run inline. Most of the business end is as before in the N-type token processing.

The first part of handling math mode is exactly the same as in the other functions: look for a start-of-math mode token and if found start a new loop tracking the closing token.
Then handle math mode as an argument: same outcomes, different input syntax.

```latex
\cs_new:Npn \__text_purify_math_store:nw #1 \__text_purify_math_result:n #3
\cs_new:Npn \__text_purify_math_end:w #1 \__text_purify_math_result:n #2
\cs_new:Npn \__text_purify_math_stop:Nw #1 \__text_purify_math_result:n #2
\cs_new:Npn \__text_purify_math_loop:NNw #1#2#3 \q__text_recursion_stop
\cs_new:Npn \__text_purify_math_N_type:NNN #1#2#3
\cs_new:Npn \__text_purify_math_group:NNn #1#2#3
\cs_new:Npn \__text_purify_math_space:NNw #1#2#3
\exp_after:wN \cs_new:Npn \exp_after:wN \__text_purify_math_cmd:N #1
\exp_after:wN \__text_purify_math_loop:NNw #1#2#3
\__text_purify_math_store:n \__text_purify_math_result:n \__text_purify_math_end:w \__text_purify_math_stop:Nw \__text_purify_math_loop:NNw \__text_purify_math_cmd:N #1#2
```

```latex
\begin{verbatim}
Then handle math mode as an argument: same outcomes, different input syntax.
\end{verbatim}
```
For \(N\)-type tokens, we first look for a string-context replacement before anything else: this can therefore cover anything. Assuming we don’t find one, check to see if we can expand control sequences: if not, they have to be dropped. We also allow for \LaTeX2\protect: there’s an assumption that we don’t have \protect \{ \oops \} or similar, but that’s also in the expansion code and seems like a reasonable balance.

Handle encoding commands, as detailed for expansion.
Now pre-define a range of standard commands that need dedicated definitions in purified text. First handle font-related stuff: all of this needs to be disabled.

Spaces.
84.2 Accent and letter-like data for purifying text

In contrast to case changing, both 8-bit and Unicode engines need information for text purification to handle accents and letter-like functions: these all need to be removed. However, the results are of course engine-dependent.

For the letter-like commands, life is relatively easy: they are all simply added as standard exceptions. The only oddity is $\text{"\text{SS}"}$, which gets converted to two letters. (At some stage an alternative version can presumably be added to babel or similar.)

}
\__text_loop:Nn
\AA { 00C5 }
Accent handling is a little more complex. Accents may exist as pre-composed codepoints or as independent glyphs. The former are all saved as single token lists, whilst for the latter the combining accent needs to be re-ordered compared to the character it applies to.

\text_declare_purify_equivalent:Nn \SS { SS }
\__text_purify_accent:NN #1#2
\cs_new:Npn \__text_loop:Nn #1#2
\group_begin:
\cs_set_protected:Npn \__text_tmp:n {#2}
\endgroup
\tl_map_inline:Nn \l_text_accents_tl
\text_declare_purify_equivalent:Nn #1 { \__text_purify_accent:NN #1 }
Now we handle the pre-composed accents: the list here is taken from `puenc.def`. All of the precomposed cases take a single letter as their second argument. We do not try to cover the case where an accent is added to a “real” dotless-i or -j, or a æ/Æ. Rather, we assume that if the UTF-8 character is used, it will have the real accent character too.

\cs_new_eq:NN \box_if_exist:c \cs_if_exist:c
\{ TF , T , F , p \}
\end{verbatim}

\section{Measuring and setting box dimensions}
Accessing the height, depth, and width of a \textit{box} register.
\begin{verbatim}
\cs_new_eq:NN \box_ht:N \tex_ht:D
\cs_new_eq:NN \box_dp:N \tex_dp:D
\cs_generate_variant:Nn \box_ht:N { c }
\cs_generate_variant:Nn \box_dp:N { c }
\end{verbatim}
The \texttt{\box_ht:N} and \texttt{\box_dp:N} primitives do not expand but rather are suitable for use after \texttt{\the} or inside dimension expressions. Here we obtain the same behaviour by using \texttt{\__box_dim_eval:n} (basically \texttt{\dimexpr}) rather than \texttt{\dim_eval:n} (basically \texttt{\the \dimexpr}).
Setting the size whilst respecting local scope requires copying; the same issue does not come up when working globally. When debugging, the dimension expression #2 is surrounded by parentheses to catch early termination.

85.4 Using boxes

Using a ⟨box⟩. These are just \TeX primitives with meaningful names.

Move box material in different directions. When debugging, the dimension expression #1 is surrounded by parentheses to catch early termination.
85.5 Box conditionals

The primitives for testing if a ⟨box⟩ is empty/void or which type of box it is.

\if_hbox:N \if_vbox:N \if_box_empty:N
\box_if_horizontal_p:N \box_if_horizontal_p:c \box_if_horizontal:N \box_if_horizontal:c
\box_if_vertical_p:N \box_if_vertical_p:c \box_if_vertical:N \box_if_vertical:c
\box_if_empty_p:N \box_if_empty_p:c \box_if_empty:N \box_if_empty:c

Testing if a ⟨box⟩ is empty/void.

\prg_new_conditional:Npnn \box_if_horizontal:N #1 \prg_return_true: \prg_return_false: \fi:
\prg_new_conditional:Npnn \box_if_vertical:N #1 \prg_return_true: \prg_return_false: \fi:
\prg_generate_conditional_variant:Nnn \box_if_horizontal:N { c } \prg_generate_conditional_variant:Nnn \box_if_vertical:N { c }

(End definition for \box_new:N and others. These functions are documented on page 273.)

85.6 The last box inserted

\box_set_to_last:N \box_set_to_last:c \box_gset_to_last:N \box_gset_to_last:c

Set a box to the previous box.

\cs_new_protected:Npn \box_set_to_last:N \cs_new_protected:Npn \box_gset_to_last:N
\tex_setbox:D \tex_lastbox:D \tex_global:D \tex_setbox:D \tex_lastbox:D \tex_gsetbox:D \tex_global:D \tex_gsetbox:D
\cs_generate_variant:Nn \box_set_to_last:N \cs_generate_variant:Nn \box_gset_to_last:N
\cs_generate_variant:Nn \box_set_to_last:c \cs_generate_variant:Nn \box_gset_to_last:c

(End definition for \box_set_to_last:N and \box_gset_to_last:N. These functions are documented on page 276.)

85.7 Constant boxes

\c_empty_box

A box we never use.

\box_new:N \c_empty_box

(End definition for \c_empty_box. This variable is documented on page 276.)
85.8 Scratch boxes

Scratch boxes.

(End definition for \l_tmpa_box and others. These variables are documented on page 276.)

85.9 Viewing box contents

\TeX’s \showbox is not really that helpful in many cases, and it is also inconsistent with other \TeX\ show functions as it does not actually shows material in the terminal. So we provide a richer set of functionality.

Essentially a wrapper around the internal function, but evaluating the breadth and depth arguments now outside the group.

(End definition for \box_show:N and \box_show:Nnn. These functions are documented on page 277.)

Getting \TeX to write to the log without interruption the run is done by altering the interaction mode. For that, the \e-\TeX extensions are needed.

The internal auxiliary to actually do the output uses a group to deal with breadth and depth values. The use here gives better output appearance. Setting \tracingonline and \errorcontextlines is used to control what appears in the terminal.

(End definition for \box_log:N, \box_log:Nnn, and \__box_log:nNnn. These functions are documented on page 277.)
85.10 Horizontal mode boxes

\hbox:n (The test suite for this command, and others in this file, is m3box002.ltx.)

Put a horizontal box directly into the input stream.

\hbox_set:Nn \hbox_set:cn \hbox_gset:Nn \hbox_gset:cn

Storing material in a horizontal box with a specified width. Again, put the dimension expression in parentheses when debugging.
\hbox_set:Nw Storing material in a horizontal box. This type is useful in environment definitions.

\hbox_set:cnw
\hbox_gset:cnw
\hbox_set_end:
\hbox_gset_end:

Combining the above ideas.

\hbox_set_to_wd:Nnw
\hbox_set_to_wd:cnw
\hbox_gset_to_wd:Nnw
\hbox_gset_to_wd:cnw

Put a horizontal box directly into the input stream.

\hbox_to_wd:nn
\hbox_to_zero:n

(End definition for \hbox_set_to_wd:Nnw and \hbox_gset_to_wd:Nnw. These functions are documented on page 278.)
(End definition for \hbox_to:wd:nn and \hbox_to_zero:n. These functions are documented on page 277.)

\hbox_overlap_center:n Put a zero-sized box with the contents pushed against one side (which makes it stick out on the other) directly into the input stream.

\hbox_overlap_left:n
\hbox_overlap_right:n

(End definition for \hbox_overlap_center:n, \hbox_overlap_left:n, and \hbox_overlap_right:n. These functions are documented on page 278.)

\hbox_unpack:N Unpacking a box and if requested also clear it.
\hbox_unpack:c
\hbox_unpack_drop:N
\hbox_unpack_drop:c

(End definition for \hbox_unpack:N and \hbox_unpack_drop:N. These functions are documented on page 278.)

85.11 Vertical mode boxes

\TeX ends these boxes directly with the internal \texttt{end_graf} routine. This means that there is no \texttt{par} at the end of vertical boxes unless we insert one. Thus all vertical boxes include a \texttt{par} just before closing the color group.

\vbox:n The following test files are used for this code: \texttt{m3box003.lvt}.

\vbox_top:n Put a vertical box directly into the input stream.

\vbox_to_ht:nn
\vbox_to_zero:n
\vbox_to_ht:nn
\vbox_to_zero:n

(End definition for \vbox:n and \vbox_top:n. These functions are documented on page 279.)
Storing material in a vertical box with a natural height.

\begin{verbatim}
\cs_new_protected:Npn \vbox_set:Nn #1#2
\{ \tex_setbox:D #1 \tex_vbox:D
\{ \color_group_begin: #2 \par \color_group_end: \}
\}
\cs_new_protected:Npn \vbox_gset:Nn #1#2
\{ \tex_global:D \tex_setbox:D #1 \tex_vbox:D
\{ \color_group_begin: #2 \par \color_group_end: \}
\}
\cs_generate_variant:Nn \vbox_set:Nn { c }
\cs_generate_variant:Nn \vbox_gset:Nn { c }
\end{verbatim}

(End definition for \vbox_set:Nn and \vbox_gset:Nn. These functions are documented on page 279.)

Storing material in a vertical box with a natural height and reference point at the baseline of the first object in the box.

\begin{verbatim}
\cs_new_protected:Npn \vbox_set_top:Nn #1#2
\{ \tex_setbox:D #1 \tex_vtop:D
\{ \color_group_begin: #2 \par \color_group_end: \}
\}
\cs_new_protected:Npn \vbox_gset_top:Nn #1#2
\{ \tex_global:D \tex_setbox:D #1 \tex_vtop:D
\{ \color_group_begin: #2 \par \color_group_end: \}
\}
\cs_generate_variant:Nn \vbox_set_top:Nn { c }
\cs_generate_variant:Nn \vbox_gset_top:Nn { c }
\end{verbatim}

(End definition for \vbox_set_top:Nn and \vbox_gset_top:Nn. These functions are documented on page 279.)

Storing material in a vertical box with a specified height.

\begin{verbatim}
\cs_new_protected:Npn \vbox_set_to_ht:Nnn #1#2#3
\{ \tex_setbox:D #1 \tex_vbox:D to \__box_dim_eval:n {#2}
\{ \color_group_begin: #3 \par \color_group_end: \}
\}
\cs_new_protected:Npn \vbox_gset_to_ht:Nnn #1#2#3
\{ \tex_global:D \tex_setbox:D #1 \tex_vbox:D to \__box_dim_eval:n {#2}
\{ \color_group_begin: #3 \par \color_group_end: \}
\}
\cs_generate_variant:Nn \vbox_set_to_ht:Nnn { c }
\cs_generate_variant:Nn \vbox_gset_to_ht:Nnn { c }
\end{verbatim}

(End definition for \vbox_set_to_ht:Nnn and \vbox_gset_to_ht:Nnn. These functions are documented on page 279.)
Storing material in a vertical box. This type is useful in environment definitions.

\begin{verbatim}
\cs_new_protected:Npn \vbox_set:Nw #1
\{ \tex_setbox:D #1 \tex_vbox:D \c_group_begin_token \color_group_begin:
\}
\cs_new_protected:Npn \vbox_gset:Nw #1
\{ \tex_global:D \tex_setbox:D #1 \tex_vbox:D \c_group_begin_token \color_group_begin:
\}
\cs_generate_variant:Nn \vbox_set:Nw { c }
\cs_generate_variant:Nn \vbox_gset:Nw { c }
\cs_new_protected:Npn \vbox_set_end:
\{ \par \color_group_end:
\c_group_end_token
\}
\cs_new_eq:NN \vbox_gset_end: \vbox_set_end:
\end{verbatim}

(End definition for \vbox_set:Nw and others. These functions are documented on page 279.)

A combination of the above ideas.

\begin{verbatim}
\cs_new_protected:Npn \vbox_to_ht:Nnw #1#2
\{ \tex_setbox:D \tex_vbox:D to \__box_dim_eval:n {#2} \c_group_begin_token \color_group_begin:
\}
\cs_new_protected:Npn \vbox_gset_to_ht:Nnw #1#2
\{ \tex_global:D \tex_setbox:D \tex_vbox:D to \__box_dim_eval:n {#2} \c_group_begin_token \color_group_begin:
\}
\cs_generate_variant:Nn \vbox_to_ht:Nnw { c }
\cs_generate_variant:Nn \vbox_gset_to_ht:Nnw { c }
\end{verbatim}

(End definition for \vbox_to_ht:Nnw and \vbox_gset_to_ht:Nnw. These functions are documented on page 280.)

Unpacking a box and if requested also clear it.

\begin{verbatim}
\cs_new_eq:NN \vbox_unpack:N \tex_unvcopy:D
\cs_new_eq:NN \vbox_unpack_drop:N \tex_unvbox:D
\cs_generate_variant:Nn \vbox_unpack:N { c }
\cs_generate_variant:Nn \vbox_unpack_drop:N { c }
\end{verbatim}

(End definition for \vbox_unpack:N and \vbox_unpack_drop:N. These functions are documented on page 280.)
Splitting a vertical box in two.

\cs_new_protected:Npn \vbox_set_split_to_ht:NNn #1#2#3
{ \tex_setbox:D #1 \tex_vsplit:D #2 to \__box_dim_eval:n {#3} }
\cs_generate_variant:Nn \vbox_set_split_to_ht:NNn { c , Nc , cc }

\cs_new_protected:Npn \vbox_gset_split_to_ht:NNn #1#2#3
{ \tex_global:D \tex_setbox:D #1 \tex_vsplit:D #2 to \__box_dim_eval:n {#3} }
\cs_generate_variant:Nn \vbox_gset_split_to_ht:NNn { c , Nc , cc }

(End definition for \vbox_set_split_to_ht:NNn and \vbox_gset_split_to_ht:NNn. These functions are documented on page 280.)

85.12 Affine transformations

\l__box_angle_fp
When rotating boxes, the angle itself may be needed by the engine-dependent code. This is done using the fp module so that the value is tidied up properly.

\fp_new:N \l__box_angle_fp
(End definition for \l__box_angle_fp.)

\l__box_cos_fp
\l__box_sin_fp
These are used to hold the calculated sine and cosine values while carrying out a rotation.

\fp_new:N \l__box_cos_fp
\fp_new:N \l__box_sin_fp
(End definition for \l__box_cos_fp and \l__box_sin_fp.)

\l__box_top_dim
\l__box_bottom_dim
\l__box_left_dim
\l__box_right_dim
These are the positions of the four edges of a box before manipulation.

\dim_new:N \l__box_top_dim
\dim_new:N \l__box_bottom_dim
\dim_new:N \l__box_left_dim
\dim_new:N \l__box_right_dim
(End definition for \l__box_top_dim and others.)

\l__box_top_new_dim
\l__box_bottom_new_dim
\l__box_left_new_dim
\l__box_right_new_dim
These are the positions of the four edges of a box after manipulation.

\dim_new:N \l__box_top_new_dim
\dim_new:N \l__box_bottom_new_dim
\dim_new:N \l__box_left_new_dim
\dim_new:N \l__box_right_new_dim
(End definition for \l__box_top_new_dim and others.)

\l__box_internal_box
Scratch space, but also needed by some parts of the driver.

\box_new:N \l__box_internal_box
(End definition for \l__box_internal_box.)
Rotation of a box starts with working out the relevant sine and cosine. The actual
rotation is in an auxiliary to keep the flow slightly clearer

```
\cs_new_protected:Npn \box_rotate:Nn #1#2
\__box_rotate:NnN #1 {#2} \hbox_set:Nn
\cs_generate_variant:Nn \box_rotate:Nn { c }
\cs_new_protected:Npn \box_grotate:Nn #1#2
\__box_rotate:NnN #1 {#2} \hbox_gset:Nn
\cs_generate_variant:Nn \box_grotate:Nn { c }
\cs_new_protected:Npn \__box_rotate:NnN #1#2#3
{ #3 #1
  \fp_set:Nn \l__box_angle_fp {#2}
  \fp_set:Nn \l__box_sin_fp { sind ( \l__box_angle_fp ) }
  \fp_set:Nn \l__box_cos_fp { cosd ( \l__box_angle_fp ) }
  \__box_rotate:N #1 }
\__box_rotate_quadraent_one:
\__box_rotate_quadraent_two:
\__box_rotate_quadraent_three:
\__box_rotate_quadraent_four:
```

The edges of the box are then recorded: the left edge is always at zero. Rotation of the
four edges then takes place: this is most efficiently done on a quadrant by quadrant basis.

```
\cs_new_protected:Npm \__box_rotate:N #1
{ \dim_set:Nn \l__box_top_dim { \box_ht:N #1 }
  \dim_set:Nn \l__box_bottom_dim { -\box_dp:N #1 }
  \dim_set:Nn \l__box_right_dim { \box_wd:N #1 }
  \dim_set:Nn \l__box_left_dim { \box_lx:N #1 }
```

The next step is to work out the $x$ and $y$ coordinates of vertices of the rotated box in
relation to its original coordinates. The box can be visualized with vertices $B$, $C$, $D$ and
$E$ is illustrated (Figure 1). The vertex $O$ is the reference point on the baseline, and in
this implementation is also the centre of rotation. The formulae are, for a point $P$ and
angle $\alpha$:

\[
\begin{align*}
P_x' &= P_x - O_x \\
P_y' &= P_y - O_y \\
P_x'' &= (P_x' \cos(\alpha)) - (P_y' \sin(\alpha)) \\
P_y'' &= (P_x' \sin(\alpha)) + (P_y' \cos(\alpha)) \\
P_x''' &= P_x'' + O_x + L_x \\
P_y''' &= P_y'' + O_y
\end{align*}
\]

Figure 1: Co-ordinates of a box prior to rotation.
The “extra” horizontal translation $L_z$ at the end is calculated so that the leftmost point of the resulting box has $x$-coordinate 0. This is desirable as TeX boxes must have the reference point at the left edge of the box. (As $O$ is always $(0,0)$, this part of the calculation is omitted here.)

```latex
\fp_compare:nNnTF \l__box_sin_fp > \c_zero_fp
{ \fp_compare:nNnTF \l__box_cos_fp > \c_zero_fp
  { \__box_rotate_quadrant_one: }
  { \__box_rotate_quadrant_two: }
}
{ \fp_compare:nNnTF \l__box_cos_fp < \c_zero_fp
  { \__box_rotate_quadrant_three: }
  { \__box_rotate_quadrant_four: }
}
```

The position of the box edges are now known, but the box at this stage be misplaced relative to the current TeX reference point. So the content of the box is moved such that the reference point of the rotated box is in the same place as the original.

```latex
\hbox_set:Nn \l__box_internal_box { \box_use:N #1 }
\hbox_set:Nn \l__box_internal_box
{ \__kernel_kern:n { -\l__box_left_new_dim }
  \hbox:n
  { \__box_backend_rotate:Nn \l__box_internal_box \l__box_angle_fp }
}
```

Tidy up the size of the box so that the material is actually inside the bounding box. The result can then be used to reset the original box.

```latex
\box_set_ht:Nn \l__box_internal_box { \l__box_top_new_dim }
\box_set_dp:Nn \l__box_internal_box { -\l__box_bottom_new_dim }
\box_set_wd:Nn \l__box_internal_box { \l__box_right_new_dim - \l__box_left_new_dim }
\box_use_drop:N \l__box_internal_box
```

These functions take a general point $(#1,#2)$ and rotate its location about the origin, using the previously-set sine and cosine values. Each function gives only one component of the location of the updated point. This is because for rotation of a box each step needs only one value, and so performance is gained by avoiding working out both $x'$ and $y'$ at the same time. Contrast this with the equivalent function in the l3coffins module, where both parts are needed.

```latex
\cs_new_protected:Npn \__box_rotate_xdir:nnN #1#2#3
{ \dim_set:Nn #3
  { \fp_to_dim:n { \l__box_cos_fp * \dim_to_fp:n {#1} }
    - \l__box_sin_fp * \dim_to_fp:n {#2} }
```

1300
Rotation of the edges is done using a different formula for each quadrant. In every case, the top and bottom edges only need the resulting $y$-values, whereas the left and right edges need the $x$-values. Each case is a question of picking out which corner ends up at with the maximum top, bottom, left and right value. Doing this by hand means a lot less calculating and avoids lots of comparisons.

```latex
\begin{align*}
\cs_new_protected:Npn \__box_rotate_ydir:nnN #1#2#3 #4 #5 #6 \\
\cs_new_protected:Npn \__box_rotate_xdir:nnN #1#2#3 #4 #5 #6 \\
\end{align*}
```
\l__box_rotate_ydir:nnN \l__box_left_dim \l__box_top_dim
\l__box_top_new_dim
\l__box_rotate_ydir:nnN \l__box_right_dim \l__box_bottom_dim
\l__box_bottom_new_dim
\l__box_rotate_xdir:nnN \l__box_left_dim \l__box_bottom_dim
\l__box_left_new_dim
\l__box_rotate_xdir:nnN \l__box_right_dim \l__box_top_dim
\l__box_right_new_dim
}

(End definition for \box_rotate:Nn and others. These functions are documented on page 284.)

\l__box_scale_x_fp \l__box_scale_y_fp

Scaling is potentially different in the two axes.
\fp_new:N \l__box_scale_x_fp
\fp_new:N \l__box_scale_y_fp

(End definition for \l__box_scale_x_fp and \l__box_scale_y_fp.)

Resizing a box starts by working out the various dimensions of the existing box.
\cs_new_protected:Npn \box_resize_to_wd_and_ht_plus_dp:Nnn #1#2#3
\hbox_set:Nn
\cs_generate_variant:Nn \box_resize_to_wd_and_ht_plus_dp:Nnn { c }

\cs_generate_variant:Nn \box_gresize_to_wd_and_ht_plus_dp:Nnn { c }
\cs_new_protected:Npn \__box_resize_to_wd_and_ht_plus_dp:NnnN #1#2#3#4
\__box_resize_set_corners:N #1
\__box_resize:N #1
\__box_resize:NNN

\l__box_resize_to_wd_and_ht_plus_dp:Nnn#1#2#3
\hbox_set:Nn
\cs_generate_variant:Nn \box_resize_to_wd_and_ht_plus_dp:Nnn { c }
\cs_new_protected:Npn \box_gresize_to_wd_and_ht_plus_dp:Nnn#1#2#3
\hbox_gset:Nn
\cs_generate_variant:Nn \box_gresize_to_wd_and_ht_plus_dp:Nnn { c }
\cs_new_protected:Npn \__box_resize_to_wd_and_ht_plus_dp:NnnN#1#2#3#4
\{ #4 #1
\__box_resize_set_corners:N #1
\}

The x-scaling and resulting box size is easy enough to work out: the dimension is that
given as #2, and the scale is simply the new width divided by the old one.
\fp_set:Nn \l__box_scale_x_fp
\{ \dim_to_fp:n {#2} / \dim_to_fp:n { \l__box_right_dim } \}

The y-scaling needs both the height and the depth of the current box.
\fp_set:Nn \l__box_scale_y_fp
\{ \dim_to_fp:n { \l__box_right_dim } \}
/ \dim_to_fp:n { \l__box_top_dim - \l__box_bottom_dim }
}

Hand off to the auxiliary which does the rest of the work.
\__box_resize:N #1
\}
\cs_new_protected:Npn \__box_resize_set_corners:N #1
\}
\cs_new_protected:Npn \__box_resize_set_corners:N #1

With at least one real scaling to do, the next phase is to find the new edge co-ordinates.
In the $x$ direction this is relatively easy: just scale the right edge. In the $y$ direction,
both dimensions have to be scaled, and this again needs the absolute scale value. Once
that is all done, the common resize/rescale code can be employed.

Scaling to a (total) height or to a width is a simplified version of the main resizing
operation, with the scale simply copied between the two parts. The internal auxiliary is
called using the scaling value twice, as the sign for both parts is needed (as this allows
the same internal code to be used as for the general case).

(End definition for \texttt{box_resize_to_wd_and_ht_plus_dp:Nnn} and others. These functions are docu-
mented on page 283.)
When scaling a box, setting the scaling itself is easy enough. The new dimensions are also relatively easy to find, allowing only for the need to keep them positive in all cases. Once that is done then after a check for the trivial scaling a hand-off can be made to the common code. The code here is split into two as this allows sharing with the auto-resizing functions.

\begin{verbatim}
\cs_new_protected:Npn \box_scale:Nnn #1#2#3
  { \__box_scale:NnnN #1 {#2} {#3} \hbox_set:Nn }
\cs_generate_variant:Nn \box_scale:Nnn { c }
\cs_new_protected:Npn \box_gscale:Nnn #1#2#3
  { \__box_scale:NnnN #1 {#2} {#3} \hbox_gset:Nn }
\cs_generate_variant:Nn \box_gscale:Nnn { c }
\cs_new_protected:Npn \__box_scale:NnnN #1#2#3#4
  { #4 #1
    \fp_set:Nn \l__box_scale_x_fp {#2}
    \fp_set:Nn \l__box_scale_y_fp {#3}
    \__box_scale:N #1
  }
\cs_new_protected:Npn \__box_scale:N #1
  { \dim_set:Nn \l__box_top_dim { \box_ht:N #1 }
    \dim_set:Nn \l__box_bottom_dim { -\box_dp:N #1 }
    \dim_set:Nn \l__box_right_dim { \box_wd:N #1 }
    \dim_zero:N \l__box_left_dim
    \dim_set:Nn \l__box_top_new_dim { \fp_abs:n { \l__box_scale_y_fp } \l__box_top_dim }
    \dim_set:Nn \l__box_bottom_new_dim { \fp_abs:n { \l__box_scale_y_fp } \l__box_bottom_dim }
    \dim_set:Nn \l__box_right_new_dim { \fp_abs:n { \l__box_scale_x_fp } \l__box_right_dim }
    \__box_resize_common:N #1
  }
\end{verbatim}

Although autosizing a box uses dimensions, it has more in common in implementation with scaling. As such, most of the real work here is done elsewhere.

\begin{verbatim}
\cs_new_protected:Npn \box_autosize_to_wd_and_ht:Nnn #1#2#3
  { \__box_autosize:NnnnN #1 {#2} {#3} \hbox_set:Nn }
\cs_generate_variant:Nn \box_autosize_to_wd_and_ht:Nnn { c }
\cs_new_protected:Npn \box_gautosize_to_wd_and_ht:Nnn #1#2#3
  { \__box_autosize:NnnnN #1 {#2} {#3} \hbox_gset:Nn }
\cs_generate_variant:Nn \box_gautosize_to_wd_and_ht:Nnn { c }
\cs_new_protected:Npn \box_autosize_to_wd_and_ht_plus_dp:Nnn #1#2#3
  { \__box_autosize:NnnnN #1 {#2} {#3} \hbox_set:Nn {\box ht:N 1 + \box dp:N 1} }
\end{verbatim}
\begin{verbatim}
\box_autosize_to_wd_and_ht_plus_dp:Nnn \__box_autosize:Nnn\hbox_set:Nn \cs_generate_variant:Nn \box_autosize_to_wd_and_ht_plus_dp:Nnn \cs_new_protected:Npm \box_gautosize_to_wd_and_ht_plus_dp:Nnn \__box_autosize:Nnn
\hbox_gset:Nn \cs_generate_variant:Nn \box_gautosize_to_wd_and_ht_plus_dp:Nnn \cs_new_protected:Npn \__box_autosize:NnnnN
\__box_resize_common:N
\end{verbatim}

The main resize function places its input into a box which start off with zero width, and includes the handles for engine rescaling.

\begin{verbatim}
\cs_new_protected:Npm \__box_resize_common:N
\__box_backend_scale:Nnn \l__box_scale_x_fp \l__box_scale_y_fp
\fp_compare:nNnTF \l__box_scale_y_fp > \c_zero_fp
\box_set_ht:Nn \l__box_internal_box \l__box_top_new_dim
\box_set_dp:Nn \l__box_internal_box \l__box_bottom_new_dim
\fp_compare:nNnTF \l__box_scale_x_fp < \c_zero_fp
\hbox_to_wd:nn \l__box_right_new_dim
\end{verbatim}

Things are not quite as obvious for the width, as the reference point needs to remain unchanged. For positive scaling factors resizing the box is all that is needed. However, for case of a negative scaling the material must be shifted such that the reference point ends up in the right place.
\{__kernel_kern:n \{l__box_right_new_dim \}
\box_use_drop:N \l__box_internal_box
\text_hss:D
\}
\}
\box_set_wd:Nn \l__box_internal_box \{l__box_right_new_dim \}
\hbox:n
\{__kernel_kern:n \ Opt \}
\box_use_drop:N \l__box_internal_box
\text_hss:D
\}
\}

(End definition for \__box_resize_common:N.)

\textbf{l3coffins Implementation}

\section{Coffins: data structures and general variables}

Scratch variables.

\begin{verbatim}
\newbox{l__coffin_internal_box}
\newdimen{l__coffin_internal_dim}
\newlength{l__coffin_internal_tl}
\end{verbatim}

The “corners” of a coffin define the real content, as opposed to the \TeX\ bounding box. They all start off in the same place, of course.

\begin{verbatim}
\prop_const_from_keyval:Nn \c__coffin_corners_prop { tl = { 0pt } { 0pt } ,
tr = { 0pt } { 0pt } ,
bl = { 0pt } { 0pt } ,
br = { 0pt } { 0pt } ,
}
\end{verbatim}

Pole positions are given for horizontal, vertical and reference-point based values.

\begin{verbatim}
\prop_const_from_keyval:Nn \c__coffin_poles_prop { l = { 0pt } { 0pt } { 0pt } { 1000pt } ,
hc = { 0pt } { 0pt } { 0pt } { 1000pt } ,
r = { 0pt } { 0pt } { 0pt } { 1000pt } ,

b = { 0pt } { 0pt } { 1000pt } { 0pt } ,
vc = { 0pt } { 0pt } { 1000pt } { 0pt } ,
t = { 0pt } { 0pt } { 1000pt } { 0pt } ,
B = { 0pt } { 0pt } { 1000pt } { 0pt } ,

H = { 0pt } { 0pt } { 1000pt } { 0pt } ,
T = { 0pt } { 0pt } { 1000pt } { 0pt } ,
}
\end{verbatim}
\l__coffin_slope_A_fp  Used for calculations of intersections.
\l__coffin_slope_B_fp

\fp_new:N \l__coffin_slope_A_fp
\fp_new:N \l__coffin_slope_B_fp

(End definition for \l__coffin_slope_A_fp and \l__coffin_slope_B_fp.)

\l__coffin_error_bool  For propagating errors so that parts of the code can work around them.

\bool_new:N \l__coffin_error_bool

(End definition for \l__coffin_error_bool.)

\l__coffin_offset_x_dim  The offset between two sets of coffin handles when typesetting. These values are corrected from those requested in an alignment for the positions of the handles.
\l__coffin_offset_y_dim

\dim_new:N \l__coffin_offset_x_dim
\dim_new:N \l__coffin_offset_y_dim

(End definition for \l__coffin_offset_x_dim and \l__coffin_offset_y_dim.)

\l__coffin_pole_a_tl  Needed for finding the intersection of two poles.
\l__coffin_pole_b_tl

\tl_new:N \l__coffin_pole_a_tl
\tl_new:N \l__coffin_pole_b_tl

(End definition for \l__coffin_pole_a_tl and \l__coffin_pole_b_tl.)

\l__coffin_x_dim  For calculating intersections and so forth.
\l__coffin_y_dim
\l__coffin_x_prime_dim
\l__coffin_y_prime_dim

\dim_new:N \l__coffin_x_dim
\dim_new:N \l__coffin_y_dim
\dim_new:N \l__coffin_x_prime_dim
\dim_new:N \l__coffin_y_prime_dim

(End definition for \l__coffin_x_dim and others.)

\__coffin_to_value:N  Coffins are a two-part structure and we rely on the internal nature of box allocation to make everything work. As such, we need an interface to turn coffin identifiers into numbers. For the purposes here, the signature allowed is N despite the nature of the underlying primitive.

\cs_new_eq:NN \__coffin_to_value:N \tex_number:D

(End definition for \__coffin_to_value:N.)

86.2 Basic coffin functions

There are a number of basic functions needed for creating coffins and placing material in them. This all relies on the following data structures.
Several of the higher-level coffin functions would give multiple errors if the coffin does not exist. A cleaner way to handle this is provided here: both the box and the coffin structure are checked.

```
\prg_new_conditional:Npnn \coffin_if_exist:N #1 { p , T , F , TF }
\prg_generate_conditional_variant:Nnn \coffin_if_exist:N { c } { p , T , F , TF }
```

(End definition for \coffin_if_exist:NTF. This function is documented on page 285.)

Several of the higher-level coffin functions would give multiple errors if the coffin does not exist. So a wrapper is provided to deal with this correctly, issuing an error on erroneous use.

```
\cs_new_protected:Npn \__coffin_if_exist:NT #1#2
\prg_generate_conditional_variant:Nnn \coffin_if_exist:N { c } { p , T , F , TF }
```

(End definition for \__coffin_if_exist:NT.)

Clearing coffins means emptying the box and resetting all of the structures.

```
\cs_new_protected:Npm \__coffin_if_exist:N #1#2
\__coffin_if_exist:NT #1
\msg_error:nxn { coffin } { unknown }
\__coffin_reset_structure:N #1
```

(End definition for \__coffin_if_exist:NT.)

```
\cs_new_protected:Npm \coffin_clear:N #1
\cs_generate_variant:Nn \coffin_clear:N { c }
\__coffin_if_exist:NT #1
\box_clear:N #1
\__coffin_reset_structure:N #1
```

(End definition for \coffin_clear:N and \coffin_gclear:N. These functions are documented on page 285.)
Creating a new coffin means making the underlying box and adding the data structures. The \debug_suspend: and \debug_resume: functions prevent \prop_gclear_new:c from writing useless information to the log file.

\cs_new_protected:Npn \coffin_new:N #1
\box_new:N #1
\debug_suspend:
\prop_gclear_new:c { coffin ~ \__coffin_to_value:N #1 ~ corners }
\prop_gclear_new:c { coffin ~ \__coffin_to_value:N #1 ~ poles }
\c__coffin_corners_prop
\prop_gset_eq:cN { coffin ~ \__coffin_to_value:N #1 ~ poles }
\c__coffin_poles_prop
\debug_resume:
}\cs_generate_variant:Nn \coffin_new:N { c }

(End definition for \coffin_new:N. This function is documented on page 285.)

\hcoffin_set:Nn
\hcoffin_set:cn
\hcoffin_gset:Nn
\hcoffin_gset:cn
\__coffin_set_vertical:NnnNN
\__coffin_set_vertical_aux:

Horizontal coffins are relatively easy: set the appropriate box, reset the structures then update the handle positions.

\cs_new_protected:Npn \hcoffin_set:Nn #1#2
\__coffin_if_exist:NT #1
{ \hbox_set:Nn #1
  \color_ensure_current: #2
  \__coffin_update:N #1 }
}\cs_generate_variant:Nn \hcoffin_set:Nn { c }

(End definition for \hcoffin_set:Nn and \hcoffin_gset:Nn. These functions are documented on page 286.)

\vcoffin_set:Nnn
\vcoffin_set:cnn
\vcoffin_gset:Nnn
\vcoffin_gset:cnn
\__coffin_set_vertical:NnnNN
\__coffin_set_vertical_aux:

Setting vertical coffins is more complex. First, the material is typeset with a given width. The default handles and poles are set as for a horizontal coffin, before finding the top baseline using a temporary box. No \color_ensure_current: here as that would add a
whatsit to the start of the vertical box and mess up the location of the T pole (see \TeX
by Topic for discussion of the \vtop primitive, used to do the measuring).

```latex
\cs_new_protected:Npn \vcoffin_set:Nnn #1#2#3
  { \__coffin_set_vertical:NnnNN #1 {#2} {#3} \vbox_set:Nn \__coffin_update:N }

\hcoffin_set_end:
\hcoffin_gset_end:

These are the “begin”/“end” versions of the above: watch the grouping!

\hcoffin_set:Nw
\hcoffin_set:cw
\hcoffin_gset:Nw
\hcoffin_gset:cw
\hcoffin_set_end:
\hcoffin_gset_end:
The same for vertical coffins.

\vcoffin_set:Nnw
\vcoffin_set:cnw
\vcoffin_gset:Nnw
\vcoffin_gset:cnw
\__coffin_set_vertical:NnNNNNw
\vcoffin_set_end:
\vcoffin_gset_end:
Setting two coffins equal is just a wrapper around other functions.

Special coffins: these cannot be set up earlier as they need \texttt{\coffin_new:N}. The empty coffin is set as a box as the full coffin-setting system needs some material which is not yet available. The empty coffin is created entirely by hand: not everything is in place yet.
86.3 Measuring coffins

Coffins are just boxes when it comes to measurement. However, semantically a separate set of functions are required.

\cs_new_eq:NN \coffin_dp:N \box_dp:N
\cs_new_eq:NN \coffin_dp:c \box_dp:c
\cs_new_eq:NN \coffin_ht:N \box_ht:N
\cs_new_eq:NN \coffin_ht:c \box_ht:c
\cs_new_eq:NN \coffin_wd:N \box_wd:N
\cs_new_eq:NN \coffin_wd:c \box_wd:c

(End definition for \coffin_dp:N, \coffin_ht:N, and \coffin_wd:N. These functions are documented on page 288.)

86.4 Coffins: handle and pole management

A simple wrapper around the recovery of a coffin pole, with some error checking and recovery built-in.

\cs_new_protected:Npn \__coffin_get_pole:NnN #1#2#3
\prop_get:cnNF \{ \__coffin_to_value:N #1 \} \{ poles \} #2 #3
\msg_error:nnxx \{ \__coffin \} \{ unknown-pole \}
\prop_set_eq:cN \{ \__coffin_to_value:N \} \{ token_to_str:N \}
\tl_set:Nn \#3 \{ \{ Opt \} \{ Opt \} \{ Opt \} \} #2 #3

(End definition for \__coffin_get_pole:NnN.)

Resetting the structure is a simple copy job.

\cs_new_protected:Npn \__coffin_reset_structure:N \__coffin_greset_structure:N \#1
\prop_set_eq:cN \{ \__coffin_to_value:N \} \{ corners \}
\prop_set_eq:cN \{ \__coffin_to_value:N \} \{ poles \}

The usual scratch space.

\l_tmpa_coffin \l_tmpb_coffin \g_tmpa_coffin \g_tmpb_coffin

(End definition for \l_tmpa_coffin and others. These variables are documented on page 289.)
Setting the pole of a coffin at the user/designer level requires a bit more care. The idea here is to provide a reasonable interface to the system, then to do the setting with full expansion. The three-argument version is used internally to do a direct setting.

\begin{verbatim}
\cs_new_protected:Npn \coffin_set_horizontal_pole:Nnn #1#2#3
\{ \__coffin_set_horizontal_pole:NnnN #1 {#2} {#3} \prop_put:cnx \}

```

(End definition for \_\_coffin_update_corners:N and others.)
### 86.5 Coffins: calculation of pole intersections

The lead off in finding intersections is to recover the two poles and then hand off to the auxiliary for the actual calculation. There may of course not be an intersection, for which an error trap is needed.

```latex
\cs_new_protected:Npn \_coffin_calculate_intersection:Nnn #1#2#3
\{ \_coffin_get_pole:NnN #1 {#2} \l__coffin_pole_a_tl \_coffin_get_pole:NnN #1 {#3} \l__coffin_pole_b_tl \bool_set_false:N \l__coffin_error_bool \exp_last_two_unbraced:Noo \_coffin_calculate_intersection:nnnnnnnn \l__coffin_pole_a_tl \l__coffin_pole_b_tl \bool_if:NT \l__coffin_error_bool \{ \msg_error:nn { coffin } { no-pole-intersection } \dim_zero:N \l__coffin_x_dim \dim_zero:N \l__coffin_y_dim \} \}
```

The two poles passed here each have four values (as dimensions), \((a, b, c, d)\) and \((a', b', c', d')\). These are arguments 1–4 and 5–8, respectively. In both cases \(a\) and \(b\) are the co-ordinates of a point on the pole and \(c\) and \(d\) define the direction of the pole. Finding the intersection depends on the directions of the poles, which are given by \(d/c\) and \(d'/c'\). However, if one of the poles is either horizontal or vertical then one or more of \(c, d, c', \) and \(d'\) are zero and a special case is needed.

```latex
\cs_new_protected:Npn \_coffin_calculate_intersection:nnnnnnnn #1#2#3#4#5#6#7#8
\{ \dim_compare:nNnTF {#3} = \c_zero_dim \dim_set:Nn \l__coffin_x_dim {#1} \dim_compare:nNnTF {#7} = \c_zero_dim \{ \bool_set_true:N \l__coffin_error_bool \} \dim_set:Nn \l__coffin_y_dim \{ \dim_compare:nNnTF {#8} = \c_zero_dim \{ \fp_to_dim:n \{ \dim_to_fp:n {#8} / \dim_to_fp:n {#7} \} \times (\dim_to_fp:n {#1} - \dim_to_fp:n {#5}) \} \}
```

The case where the first pole is vertical. So the \(x\)-component of the interaction is at \(a\). There is then a test on the second pole: if it is also vertical then there is an error.

```latex
\{ \dim_set:Nn \l__coffin_x_dim {#1} \dim_compare:nNnTF {#7} = \c_zero_dim \{ \bool_set_true:N \l__coffin_error_bool \} \}
```

The second pole may still be horizontal, in which case the \(y\)-component of the intersection is \(b'\). If not,

\[ y = \frac{d'}{c'} (a - a') + b' \]

with the \(x\)-component already known to be \(a\).
If the first pole is not vertical then it may be horizontal. If so, then the procedure is essentially the same as that already done but with the $x$- and $y$-components interchanged.

\[
\dim_to_fp:n \{#6\}
\]

\[
\dim_compare:nNnTF {#4} = \c_zero_dim
\]

\[
\dim_set:Nn \l__coffin_y_dim \{#2\}
\]

\[
\dim_compare:nNnTF {#8} = \{ \c_zero_dim \}
\]

\[
{ \bool_set_true:N \l__coffin_error_bool }
\]

Now we deal with the case where the second pole may be vertical, or if not we have

\[x = \frac{c'}{d'} (b - b') + a'
\]

which is again handled by the same auxiliary.

\[
\dim_set:Nn \l__coffin_x_dim
\]

\[
\dim_compare:nNnTF {#7} = \c_zero_dim
\]

\[
\{#5\}
\]

\[
\fp_to_dim:n
\]

\[
{ ( \dim_to_fp:n \{#7\} / \dim_to_fp:n \{#8\} ) }\]

\[
* ( \dim_to_fp:n \{#4\} - \dim_to_fp:n \{#6\} )\]

\[
+ \dim_to_fp:n \{#5\}
\]

\[
\]

The first pole is neither horizontal nor vertical. To avoid even more complexity, we now work out both slopes and pass to an auxiliary.

\[
\use:x
\]

\[
{ \_coffin_calculate_intersection:nnnnn }
\]

\[
\{ \dim_to_fp:n \{#4\} / \dim_to_fp:n \{#3\} \}
\]

\[
\{ \dim_to_fp:n \{#8\} / \dim_to_fp:n \{#7\} \}
\]

\[
{#1} \{#2} \{#5} \{#6\}
\]

Assuming the two poles are not parallel, then the intersection point is found in two steps. First we find the $x$-value with

\[
x = \frac{sa - s'a' - b + b'}{s - s'}
\]

1320
and then finding the \( y \)-value with

\[
y = s(x - a) + b
\]

\[
\text{\cs_set_protected:Npn \texttt{\_coffin_calculate_intersection:n}#1#2#3#4#5#6}
\]

\[
\text{\fp_compare:nNnTF {#1} = {#2}
\}
\]

\[
\text{\bool_set_true:N \texttt{\l\_coffin_error_bool}}
\]

\[
\text{\dim_set:Nn \texttt{\l\_coffin\_x\_dim}}
\]

\[
\dim_set:Nn \texttt{\l\_coffin\_y\_dim}
\]

(End definition for \texttt{\_coffin_calculate_intersection:n}.)

\section{Affine transformations}

\texttt{\l\_coffin\_sin\_fp}

Used for rotations to get the sine and cosine values.

\texttt{\l\_coffin\_cos\_fp}

(End definition for \texttt{\l\_coffin\_sin\_fp} and \texttt{\l\_coffin\_cos\_fp}.)

\texttt{\l\_coffin\_bounding\_prop}

A property list for the bounding box of a coffin. This is only needed during the rotation, so there is just the one.

(End definition for \texttt{\l\_coffin\_bounding\_prop}.)

\texttt{\l\_coffin\_corners\_prop}

Used to avoid needing to track scope for intermediate steps.

\texttt{\l\_coffin\_poles\_prop}

(End definition for \texttt{\l\_coffin\_corners\_prop} and \texttt{\l\_coffin\_poles\_prop}.)
The shift of the bounding box of a coffin from the real content.

These are used to hold maxima for the various corner values: these thus define the minimum size of the bounding box after rotation.

Rotating a coffin requires several steps which can be conveniently run together. The sine and cosine of the angle in degrees are computed. This is then used to set \l__coffin_sin_fp and \l__coffin_cos_fp, which are carried through unchanged for the rest of the procedure.

Use a local copy of the property lists to avoid needing to pass the name and scope around.

The corners and poles of the coffin can now be rotated around the origin. This is best achieved using mapping functions.

The bounding box of the coffin needs to be rotated, and to do this the corners have to be found first. They are then rotated in the same way as the corners of the coffin material itself.

At this stage, there needs to be a calculation to find where the corners of the content and the box itself will end up.
The correction of the box position itself takes place here. The idea is that the bounding box for a coffin is tight up to the content, and has the reference point at the bottom-left. The $x$-direction is handled by moving the content by the difference in the positions of the bounding box and the content left edge. The $y$-direction is dealt with by moving the box down by any depth it has acquired. The internal box is used here to allow for the next step.

\begin{verbatim}
\hbox_set:Nn \l__coffin_internal_box
{ \__kernel_kern:n
  { \l__coffin_bounding_shift_dim - \l__coffin_left_corner_dim }
\box_move_down:nn { \l__coffin_bottom_corner_dim }
  { \box_use:N #1 }
}
\end{verbatim}

If there have been any previous rotations then the size of the bounding box will be bigger than the contents. This can be corrected easily by setting the size of the box to the height and width of the content. As this operation requires setting box dimensions and these transcend grouping, the safe way to do this is to use the internal box and to reset the result into the target box.

\begin{verbatim}
\box_set_ht:Nn \l__coffin_internal_box
{ \l__coffin_top_corner_dim - \l__coffin_bottom_corner_dim }
\box_set_dp:Nn \l__coffin_internal_box { 0pt }
\box_set_wd:Nn \l__coffin_internal_box
{ \l__coffin_right_corner_dim - \l__coffin_left_corner_dim }
\box_use_drop:N \l__coffin_internal_box
\end{verbatim}

The final task is to move the poles and corners such that they are back in alignment with the box reference point.

\begin{verbatim}
\prop_map_inline:Nn \l__coffin_corners_prop
{ \__coffin_shift_corner:Nnnn #1 {##1} ##2 }
\prop_map_inline:Nn \l__coffin_poles_prop
{ \__coffin_shift_pole:Nnnnnn #1 {##1} ##2 }
\end{verbatim}

Update the coffin data.

\begin{verbatim}
#4 { coffin - \__coffin_to_value:N #1 - corners }
\l__coffin_corners_prop
#4 { coffin - \__coffin_to_value:N #1 - poles }
\l__coffin_poles_prop
\end{verbatim}

(End definition for \coffin_rotate:Nn, \coffin_grotate:Nn, and \__coffin_rotate:NNNN. These functions are documented on page 287.)

\_coffin_set_bounding:N

The bounding box corners for a coffin are easy enough to find: this is the same code as for the corners of the material itself, but using a dedicated property list.

\begin{verbatim}
\cs_new_protected:Npn \__coffin_set_bounding:N #1
{ \prop_put:Nnx \l__coffin_bounding_prop { tl }
  { 0pt } { \dim_eval:n { \box_ht:N #1 } } }
\prop_put:Nnx \l__coffin_bounding_prop { tr }
{ \dim_eval:n { \box_wd:N #1 } }
\prop_put:Nnx \l__coffin_bounding_prop { bl }
{ \dim_eval:n { \box_wd:N #1 } }
\prop_put:Nnx \l__coffin_bounding_prop { br }
{ \dim_eval:n { \box_wd:N #1 } }
\end{verbatim}
\_coffin\_rotate\_bounding:nn

Rotating the position of the corner of the coffin is just a case of treating this as a vector from the reference point. The same treatment is used for the corners of the material itself and the bounding box.

\cs_new_protected:Npn \_coffin\_rotate\_bounding:nnn #1#2#3
\{ \_coffin\_rotate\_vector:nnNN \{#2\} \{#3\} \_\_coffin\_x_dim \_\_coffin\_y_dim
\prop_put:Nnx \_\_coffin\_bounding\_prop {#1} \{ \dim_use:N \_\_coffin\_x_dim \} \{ \dim_use:N \_\_coffin\_y_dim \}
\}

(End definition for \_coffin\_rotate\_bounding:nnn.)

\_coffin\_rotate\_corner:Nnnn

Rotating a single pole simply means shifting the co-ordinate of the pole and its direction. The rotation here is about the bottom-left corner of the coffin.

\cs_new_protected:Npn \_coffin\_rotate\_pole:Nnnnnn #1#2#3#4#5#6
\{ \_coffin\_rotate\_vector:nnNN \{#3\} \{#4\} \_\_coffin\_x_dim \_\_coffin\_y_dim
\_\_coffin\_rotate\_vector:nnNN \{#5\} \{#6\}
\_\_coffin\_x\_prime_dim \_\_coffin\_y\_prime_dim
\prop_put:Nnx \_\_coffin\_poles\_prop {#2} \{ \dim_use:N \_\_coffin\_x_dim \} \{ \dim_use:N \_\_coffin\_y_dim \}
\{ \dim_use:N \_\_coffin\_x\_prime_dim \} \{ \dim_use:N \_\_coffin\_y\_prime_dim \}
\}

(End definition for \_coffin\_rotate\_pole:Nnnnnn.)

\_coffin\_rotate\_vector:nnNN

A rotation function, which needs only an input vector (as dimensions) and an output space. The values \_\_coffin\_cos_fp and \_\_coffin\_sin_fp should previously have been set up correctly. Working this way means that the floating point work is kept to a minimum: for any given rotation the sin and cosine values do no change, after all.

\cs_new_protected:Npn \_coffin\_rotate\_vector:nnNN #1#2#3#4
\{ \dim_set:Nn \_\_coffin\_internal_dim { -\box_dp:N #1 } \prop_put:Nnx \_\_coffin\_bounding\_prop { bl }
\{ \dim_eval:n \{ \box_wd:N #1 \} \} \dim_use:N \_\_coffin\_internal_dim
\prop_put:Nnx \_\_coffin\_bounding\_prop { br }
\{ \dim_use:N \_\_coffin\_internal_dim \}
\}

(End definition for \_\_coffin\_set\_bounding:N.)
The idea here is to find the extremities of the content of the coffin. This is done by looking for the smallest values for the bottom and left corners, and the largest values for the top and right corners. The values start at the maximum dimensions so that the case where all are positive or all are negative works out correctly.

The approach to finding the shift for the bounding box is similar to that for the corners. However, there is only one value needed here and a fixed input property list, so things are a bit clearer.
Shifting the corners and poles of a coffin means subtracting the appropriate values from
the \(x\) and \(y\)-components. For the poles, this means that the direction vector is un-
changed.

Resizing a coffin begins by setting up the user-friendly names for the dimensions of the
coffin box. The new sizes are then turned into scale factor. This is the same operation
as takes place for the underlying box, but that operation is grouped and so the same
calculation is done here.
The poles and corners of the coffin are scaled to the appropriate places before actually resizing the underlying box.

Negative \(x\)-scaling values place the poles in the wrong location: this is corrected here.

For scaling, the opposite calculation is done to find the new dimensions for the coffin. Only the total height is needed, as this is the shift required for corners and poles. The
scaling is done the \TeX\ way as this works properly with floating point values without needing to use the \texttt{fp} module.

\begin{verbatim}
\cs_new_protected:Npn \coffin_scale:Nnn #1#2#3
\{ \__coffin_scale:NnnNN #1 {#2} {#3} \box_scale:Nnn \prop_set_eq:cN \}
\cs_generate_variant:Nn \coffin_scale:Nnn { c }
\cs_new_protected:Npn \coffin_gscale:Nnn #1#2#3
\{ \__coffin_scale:NnnNN #1 {#2} {#3} \box_gscale:Nnn \prop_gset_eq:cN \}
\cs_generate_variant:Nn \coffin_gscale:Nnn { c }
\cs_new_protected:Npn \__coffin_scale:NnnNN #1#2#3#4#5
\{
  \fp_set:Nn \l__coffin_scale_x_fp {#2}
  \fp_set:Nn \l__coffin_scale_y_fp {#3}
  \dim_set:Nn \l__coffin_internal_dim { \coffin_ht:N #1 + \coffin_dp:N #1 }
  \dim_set:Nn \l__coffin_scaled_total_height_dim { \fp_abs:n { \l__coffin_scale_y_fp } \l__coffin_internal_dim }
  \dim_set:Nn \l__coffin_scaled_width_dim { \fp_abs:n { \l__coffin_scale_x_fp } \coffin_wd:N #1 }
  \__coffin_resize_common:NnnN #1 \l__coffin_scaled_width_dim \l__coffin_scaled_total_height_dim \m
\}
\end{verbatim}

(End definition for \texttt{\coffin_scale:Nnn}, \texttt{\coffin_gscale:Nnn}, and \texttt{\coffin_scale:NnnNN}. These functions are documented on page 287.)

\texttt{\__coffin_scale_vector:nnNN} This function scales a vector from the origin using the pre-set scale factors in \textsl{x} and \textsl{y}. This is a much less complex operation than rotation, and as a result the code is a lot clearer.

\begin{verbatim}
\cs_new_protected:Npn \__coffin_scale_vector:nnNN #1#2#3#4
\{
  \dim_set:Nn #3 \fp_to_dim:n { \dim_to_fp:n {#1} * \l__coffin_scale_x_fp }
  \dim_set:Nn #4 \fp_to_dim:n { \dim_to_fp:n {#2} * \l__coffin_scale_y_fp }
\}
\end{verbatim}

(End definition for \texttt{\__coffin_scale_vector:nnNN}.)

\texttt{\__coffin_scale_corner:Nnnn} \texttt{\__coffin_scale_pole:Nnnnnn} Scaling both corners and poles is a simple calculation using the preceding vector scaling.

\begin{verbatim}
\cs_new_protected:Npn \__coffin_scale_corner:Nnnn #1#2#3#4
\{ \__coffin_scale_vector:nnNN \l__coffin_x_dim \l__coffin_y_dim \prop_put:Nnx \l__coffin_corners_prop {#2} \dim_use:N \l__coffin_x_dim \dim_use:N \l__coffin_y_dim \}
\cs_new_protected:Npn \__coffin_scale_pole:Nnnnnn #1#2#3#4#5#6
\{ \__coffin_scale_vector:nnNN \l__coffin_x_dim \l__coffin_y_dim \prop_put:Nnx \l__coffin_poles_prop {#2} {#5} {#6} \}
\end{verbatim}

1328
These functions correct for the $x$ displacement that takes place with a negative horizontal scaling.

86.7 Aligning and typesetting of coffins

This command joins two coffins, using a horizontal and vertical pole from each coffin and making an offset between the two. The result is stored as the as a third coffin, which has all of its handles reset to standard values. First, the more basic alignment function is used to get things started.
The coffin structure is reset, and the corners are cleared: only those from the two parent coffins are needed.

\prop_clear:c \coffin ~ \coffin_to_value:N \coffin_aligned_coffin
\c_space_tl corners

The structures of the parent coffins are now transferred to the new coffin, which requires that the appropriate offsets are applied. That then depends on whether any shift was needed.

\dim_compare:nTF \l__coffin_offset_x_dim < \c_zero_dim
\__coffin_offset_poles:Nnn #1 { -\l__coffin_offset_x_dim } { 0pt }
\__coffin_offset_poles:Nnn #4 { 0pt } { \l__coffin_offset_y_dim }
\__coffin_offset_corners:Nnn #1 { -\l__coffin_offset_x_dim } { 0pt }
\__coffin_offset_corners:Nnn #4 { 0pt } { \l__coffin_offset_y_dim }
\__coffin_update_vertical_poles:NNN #1 #4 \coffin_aligned_coffin
#9 #1 \coffin_aligned_coffin

A more simple version of the above, as it simply uses the size of the first coffin for the new one. This means that the work here is rather simplified compared to the above code. The function used when marking a position is hear also as it is similar but without the structure updates.

\cs_new_protected:Npn \coffin_attach:NnnNnnnn #1#2#3#4#5#6#7#8
{ \__coffin_attach:NnnNnnnnN #1 {#2} {#3} #4 {#5} {#6} {#7} {#8}

\cs_generate_variant:Nn \coffin_attach:NnnNnnnn { c , Nnnc , cnnc }

(End definition for \coffin_join:NnnNnnnn , \coffin_gjoin:NnnNnnnn , and \__coffin_join:NnnNnnnnN.
These functions are documented on page 288.)
The internal function aligns the two coffins into a third one, but performs no corrections on the resulting coffin poles. The process begins by finding the points of intersection for the poles for each of the input coffins. Those for the first coffin are worked out after those for the second coffin, as this allows the 'primed' storage area to be used for the second coffin. The 'real' box offsets are then calculated, before using these to re-box the input coffins. The default poles are then set up, but the final result depends on how the bounding box is being handled.
Transferring structures from one coffin to another requires that the positions are updated by the offset between the two coffins. This is done by mapping over the property list of the source coffins, moving as appropriate and saving to the new coffin data structures. The test for a - means that the structures from the parent coffins are uniquely labelled and do not depend on the order of alignment. The payoff for this is that - should not be used in coffin pole or handle names, and that multiple alignments do not result in a whole set of values.

Saving the offset corners of a coffin is very similar, except that there is no need to worry about naming: every corner can be saved here as order is unimportant.
The T and B poles need to be recalculated after alignment. These functions find the larger absolute value for the poles, but this is of course only logical when the poles are horizontal.

\begin{verbatim}
\cs_new_protected:Npn \__coffin_update_vertical_poles:NNN #1#2#3
\{
  \__coffin_get_pole:NnN #3 { #1 -T } \l__coffin_pole_a_tl

\}
\end{verbatim}

(End definition for \_coffin_offset_corners:Nnn and \_coffin_offset_corner:Nnnnn.)
An empty-but-horizontal coffin.

Typesetting a coffin means aligning it with the current position, which is done using a coffin with no content at all. As well as aligning to the empty coffin, there is also a need to leave vertical mode, if necessary.

This property list is used to print coffin handles at suitable positions. The offsets are expressed as multiples of the basic offset value, which therefore acts as a scale-factor.

Marking a single handle is relatively easy. The standard attachment function is used, meaning that there are two calculations for the location. However, this is likely to be okay given the load expected. Contrast with the more optimised version for showing all handles which comes next.

\cs_new_protected:Npn \coffin_mark_handle:Nnnn \#1\#2\#3\#4

Printing the poles starts by removing any duplicates, for which the H poles is used as the definitive version for the baseline and bottom. Two loops are then used to find the combinations of handles for all of these poles. This is done such that poles are removed during the loops to avoid duplication.

```latex
\cs_new_protected:Npn \coffin_display_handles:Nn #1#2
\{ \hcoffin_set:Nn \l__coffin_display_pole_coffin
\color_select:n {#2}
\__coffin_rule:nn { 1pt } { 1pt }
\} \prop_set_eq:Nc \l__coffin_display_poles_prop{ \_coffin_display_handles:aux:nmmnnn (#1) #2}
\__coffin_get_pole:NnN #1 { H } \l__coffin_pole_a_tl
\__coffin_get_pole:NnN #1 { T } \l__coffin_pole_b_tl
\tl_if_eq:NNT \l__coffin_pole_a_tl \l__coffin_pole_b_tl
\{ \prop_remove:Nn \l__coffin_display_poles_prop { T } \} \prop_remove:Nn \l__coffin_display_poles_prop { B } \}
\__coffin_set_eq:NN \l__coffin_display_coffin #1 \prop_map_inline:Nn \l__coffin_display_poles_prop
\{ \prop_remove:Nn \l__coffin_display_poles_prop {##1} \__coffin_display_handles_aux:nmmnnn (###1) #2 \}
\box_use_drop:N \l__coffin_display_coffin
\}
```

For each pole there is a check for an intersection, which here does not give an error if none is found. The successful values are stored and used to align the pole coffin with the main coffin for output. The positions are recovered from the preset list if available.

```latex
\cs_new_protected:Npn \__coffin_display_handles:aux:nmmnnn #1#2#3#4#5#6

\quark_if_no_value:NTF \l__coffin_internal_tl
```

1337
This is a dedicated version of \coffin_attach:Nnnnnnn with a hard-wired first coffin. As the intersection is already known and stored for the display coffin the code simply uses it directly, with no calculation.
For showing the various internal structures attached to a coffin in a way that keeps things relatively readable. If there is no apparent structure then the code complains.

```
\cs_new_protected:Npn \coffin_show_structure:N #1\{ \__coffin_show_structure:NN \msg_term:nnxxxx \box_show:Nnn \}
\cs_generate_variant:Nn \coffin_show_structure:N { c }

Chapter 87

\l3color Implementation

87.1 Basics

The color currently active for foreground (text, etc.) material. This is stored in the form of a color model followed by one or more values. There are four pre-defined models, three of which take numerical values in the range [0, 1]:

- gray (gray) Grayscale color with the (gray) value running from 0 (fully black) to 1 (fully white)
- cmyk (cyan) (magenta) (yellow) (black)
- rgb (red) (green) (blue)

Notice that the value are separated by spaces. There is a fourth pre-defined model using a string value and a numerical one:

- spot (name) (tint) A pre-defined spot color, where the (name) should be a pre-defined string color name and the (tint) should be in the range [0, 1].

Additional models may be created to allow mixing of spot colors. The number of data entries these require will depend on the number of colors to be mixed.

\TeXhackers note: The content of \l__color_current_tl comprises two brace groups, the first containing the color model and the second containing the value(s) applicable in that model.

(End definition for \l__color_current_tl.)

\color_group_begin: \color_group_end: Grouping for color is the same as using the basic \group_begin: and \group_end: functions. However, for semantic reasons, they are renamed here.

(End definition for \color_group_begin: and \color_group_end:. These functions are documented on page 291.)
\color\textbf{ensure.current:} A driver-independent wrapper for setting the foreground color to the current color “now”.

\cs\texttt{new\ protected:}Npn \color\texttt{ensure.current:}
\{ \__color\texttt{select:N} \l__color\texttt{current_tl} \}

(End definition for \color\texttt{ensure.current:}. This function is documented on page 291.)

\s\texttt{color\ stop} Internal scan marks.
\cs\texttt{new:N} \s\texttt{color\ stop}

(End definition for \s\texttt{color\ stop}.)

\__color\texttt{select:N} \__color\texttt{select_math:N} \__color\texttt{select:nn}
Take an internal color specification and pass it to the driver. This code is needed to ensure the current color but will also be used by the higher-level material.

\{ \exp\texttt{after:wN} \__color\texttt{select:nn} \#1 \}
\cs\texttt{new\ protected:}Npn \__color\texttt{select:nn} \#1#2
\{ \use\texttt{c} \{ \__color\texttt{backend\ select:} \#1 :n \} \{#2\} \}

(End definition for \__color\texttt{select:N}, \__color\texttt{select_math:N}, and \__color\texttt{select:nn}.)

\l\texttt{color\ current_tl} The current color, with the model and
\tl\texttt{new:N} \l\texttt{color\ current_tl}
\tl\texttt{set:Nn} \l\texttt{color\ current_tl} \{ \{ \texttt{gray} \} \{ 0 \} \}

(End definition for \l\texttt{color\ current_tl}.)

\textbf{87.2 Predefined color names}

The ability to predefine colors with a name is a key part of this module and means there has to be a method for storing the results. At first sight, it seems natural to follow the usual expl3 model and create a \texttt{color} variable type for the process. That would then allow both local and global colors, constant colors and the like. However, these names need to be accessible in some form at the user level, for selection of colors either simply by name or as part of a more complex expression. This does not require that the full name is exposed but does require that they can be looked up in a predictable way. As such, it is more useful to expose just the color names as part of the interface, with the result that only local color names can be created. (This is also seen for example in key creation in l3keys.) As a result, color names are declarative (no \texttt{new} functions).

Since there is no need to manipulate colors \textit{en masse}, each is stored in a two-part structure: a \texttt{prop} for the colors themselves, and a \texttt{tl} for the default model for each color.
87.3 Setup

\l__color_internal_int
\l__color_internal_tl
\int_new:N \l__color_internal_int
\tl_new:N \l__color_internal_tl

(End definition for \l__color_internal_int and \l__color_internal_tl.)

\s__color_mark
Internal scan marks. \s__color_stop is already defined in l3color-base.
\scan_new:N \s__color_mark

(End definition for \s__color_mark.)

87.4 Utility functions

\color_if_exist_p:n \color_if_exist:nTF
A simple wrapper to avoid needing to have the lookup repeated in too many places. To guard against a color created in a group, we need to test for entries in the prop.
\prg_new_conditional:Npnn \color_if_exist:n #1 { p , T, F, TF }
\prop_if_exist:cTF { l__color_named_ #1 _prop }
\prop_if_empty:cTF { l__color_named_ #1 _prop }
\prg_return_false:
\prg_return_true:
\prg_return_false:
\prg_return_false:

(End definition for \color_if_exist:nTF. This function is documented on page 294.)

\__color_model:N \__color_values:N
Simple abstractions.
\cs_new:Npn \__color_model:N #1 { \exp_after:wN \use_i:nn #1 }
\cs_new:Npn \__color_values:N #1 { \exp_after:wN \use_ii:nn #1 }

(End definition for \__color_model:N and \__color_values:N.)

\__color_extract:nNN \__color_extract:VNN
Recover the values for the standard model for a color.
\cs_new_protected:Npn \__color_extract:nNN #1#2#3
\tl_set_eq:Nc #2 { l__color_named_ #1 _tl }
\prop_get:cVN { l__color_named_ #1 _prop } #2 #3
\cs_generate_variant:Nn \__color_extract:nNN { V }

(End definition for \__color_extract:nNN.)
Model conversion is carried out using standard formulae for base models, as described in the manual for \texttt{xcolor} (see also the \textit{PostScript Language Reference Manual}). For other models direct conversion might not be defined, so we go through the fallback models if necessary.

\begin{verbatim}
\cs_new_protected:Npn \__color_convert:nnN #1#2#3
\cs_generate_variant:Nn \__color_convert:nnN { VV }\cs_generate_variant:Nn \exp_last_unbraced:Nf { c }\cs_new_protected:Npn \__color_convert:nnnN #1#2#3#4
\tl_set:Nx #4
\cs_if_exist_use:cTF { __color_convert_ #1 _ #2 :w }{ #3 \s__color_stop }\cs_if_exist:cTF { __color_convert_ \use:c { c__color_fallback_ #1 _tl } _ #2 :w }{ \use:c { __color_convert_ #1 _ \use:c { c__color_fallback_ #1 _tl } :w } \s__color_stop }\exp_last_unbraced:cf
\__color_convert_ \use:c { c__color_fallback_ #1 _tl } _ #2 :w \s__color_stop \cs_if_exist_use:cTF { __color_convert_ #1 _ #2 :w }{ \exp_last_unbraced:cf
\__color_convert_ \use:c { c__color_fallback_ #1 _tl } _ #2 :w \s__color_stop }\exp_last_unbraced:cf
\__color_convert_ \use:c { c__color_fallback_ #2 _tl } _ #2 :w \s__color_stop \cs_if_exist_use:cTF { __color_convert_ #1 _ #2 :w }{ \exp_last_unbraced:cf
\__color_convert_ \use:c { c__color_fallback_ #1 _tl } _ #2 :w \s__color_stop }\exp_last_unbraced:cf
\__color_convert_ \use:c { c__color_fallback_ #1 _tl } _ \use:c { c__color_fallback_ #2 _tl } :w \s__color_stop \cs_if_exist:cTF { __color_convert_ \use:c { c__color_fallback_ #1 _tl } _ \use:c { c__color_fallback_ #2 _tl } :w }{ \exp_last_unbraced:cf
\__color_convert_ \use:c { c__color_fallback_ #1 _tl } _ \use:c { c__color_fallback_ #2 _tl } :w \s__color_stop }\end{verbatim}

These rather odd values are based on NTSC television: the set are used for the \texttt{cmyk} conversion.

\begin{verbatim}
\cs_new:Npn \__color_convert_rgb_gray:w #1 ~ #2 ~ #3 \s__color_stop{ \fp_eval:n { 0.3 * #1 + 0.59 * #2 + 0.11 * #3 } }
\end{verbatim}
The conversion from rgb to cmyk is the most complex: a two-step procedure which requires black generation and undercolor removal functions. The PostScript reference describes them as device-dependent, but following xcolor we assume they are linear. Moreover, as the likelihood of anyone using a non-unitary matrix here is tiny, we simplify and treat those two concepts as no-ops. To allow code sharing with parsing of cmy values, we have an intermediate function here (\_color_convert_rgb_cmyk:nnn) which actually takes cmy values as input.

The conversion from rgb to cmyk is the most complex: a two-step procedure which requires black generation and undercolor removal functions. (End definition for \_color_convert:nnN and others.)

87.6.6 Color expressions

Working space to store the color data whilst doing calculations: keeping it on the stack is attractive but gets tricky (return is non-trivial).

\tl_new:N \l__color_model_tl
\tl_new:N \l__color_value_tl
\tl_new:N \l__color_next_model_tl
\tl_new:N \l__color_next_value_tl

(End definition for \l__color_model_tl and others.)
The main function for parsing color expressions removes actives but otherwise expands, then starts working through the expression itself. At the end, we apply the payload.

```latex
\cs_new_protected:Npx \__color_parse:nN #1#2
\{ \tl_set:Nx \exp_not:c { l__color_named_. _tl } 
\{ \exp_not:N \__color_model:N \exp_not:N \__color_current_tl } 
\prop_put:NVx \exp_not:c { l__color_named_. _prop } 
\exp_not:c { l__color_named_. _tl } 
\exp_not:N \exp_args:Ne \exp_not:N \__color_parse_aux:nN 
\exp_not:N \tl_to_str:n \tl_to_str:n #2 
\prop_check_model:N #3 \s__color_stop 
\}
```

Before going to all of the effort of parsing an expression, these two precursor functions look for a pre-defined name, either on its own or with a trailing ! (which is the same thing).

```latex
\cs_new_protected:Npn \__color_parse_aux:nN #1#2
\{ \color_if_exist:nTF {#1} 
\{ \__color_parse_set_eq:Nn #2 {#1} \} \__color_check_model:N #2 \}
```

Here, we have to allow for the case where there is a fixed model: that can’t be swept up by generic conversion as we are dealing with a named color.

```latex
\cs_new_protected:Nm \__color_parse_set_eq:Nn #1#2
\{ \tl_if_empty:NTF \__color_fixed_model_tl 
\{ \exp_args:N \__color_parse_set_eq:nN \{ \__color_fixed_model_tl } \} \exp_args:N \__color_parse_set_eq:nN \{ \__color_fixed_model_tl } \#1 \} \#2 \}
```

1346
Once we establish that a full parse is needed, the next job is to get the detail of the first color. That will determine the model we use for the calculation: splitting here makes checking that a bit easier.

This is the loop proper: there can be an open-ended set of colors to parse, separated by ! tokens. There are a few cases to look out for. At the end of the expression and with we find a mix of 100 then we simply skip the next color entirely (we can’t stop the loop as there might be a further valid color to mix in). On the other hand, if we get a mix of 0 then drop everything so far and start again. There is also a trailing white to “read in” if the final explicit data is a mix. Those conditions are separate from actually looping, which is therefore sorted out by checking if we have further data to process: in contrast to xcolor, we don’t allow !! so the test can be simplified.
The “payload” of calculation in the loop first. If the model for the upcoming color is
different from that of the existing (partial) color, convert the model. For gray the two
are flipped round so that the outcome is something with “real” color. We are then in
a position to do the actual calculation itself. The two auxiliaries here give us a way to
break the loop should an invalid name be found.

The gray model needs special handling: the models need to be swapped: we do that
using a dedicated function.
Do the vector arithmetic: mainly a question of shuffling input, along with one pre-calculation to keep down the use of division.

```
\cs_new:Npn \__color_parse_mix:Nnnn #1#2#3#4
{ \exp_args:Nf \__color_parse_mix:nNnn { \fp_eval:n { #4 / 100 } } #1 {#2} {#3} }
\cs_generate_variant:Nn \__color_parse_mix:Nnnn { NVV }
\cs_new:Npn \__color_parse_mix_gray:nw #1#2 \s__color_mark #3 \s__color_stop
{ \fp_eval:n { #2 * #1 + #3 * ( 1 - #1 ) } }
\cs_new:Npn \__color_parse_mix_rgb:nw #1#2 ~ #3 ~ #4 \s__color_mark #5 ~ #6 ~ #7 \s__color_stop
{ \fp_eval:n { #2 * #1 + #5 * ( 1 - #1 ) } \c_space_tl
\fp_eval:n { #3 * #1 + #6 * ( 1 - #1 ) } \c_space_tl
\fp_eval:n { #4 * #1 + #7 * ( 1 - #1 ) } }
\cs_new:Npn \__color_parse_mix_cmyk:nw #1#2 ~ #3 ~ #4 ~ #5 \s__color_mark #6 ~ #7 ~ #8 ~ #9 \s__color_stop
{ \fp_eval:n { #2 * #1 + #6 * ( 1 - #1 ) } \c_space_tl
\fp_eval:n { #3 * #1 + #7 * ( 1 - #1 ) } \c_space_tl
\fp_eval:n { #4 * #1 + #8 * ( 1 - #1 ) } \c_space_tl
\fp_eval:n { #5 * #1 + #9 * ( 1 - #1 ) } }
```

(End definition for \__color_parse:nN and others.)

Turn the input into internal form, also tidying up the number quickly.

```
\cs_new:Npn \__color_parse_model_gray:w #1 \s__color_stop
{ \__color_parse_model:tl \__color_next_value_tl }

\cs_new_protected:Npn \__color_parse_break:w #1 \__color_parse_end: { }
\cs_new_protected:Npn \__color_parse_end: { }
```

Turn the input into internal form, also tidying up the number quickly.

```
\cs_new:Npn \__color_parse_model_gray:w #1 \s__color_stop
{ { gray } { \__color_parse_number:n {#1} } }
\cs_new:Npn \__color_parse_model_rgb:w #1 \s__color_stop
{ { rgb } { \__color_parse_number:n {#1} - \__color_parse_number:n {#2} - \__color_parse_number:n {#3} } }
\cs_new:Npn \__color_parse_model_cmyk:w #1 \s__color_stop
{ }
```

1349
The conversion here is non-trivial but is described at length in the xcolor manual. For ease, we calculate the integer and fractional parts of the hue first, then use them to work out the possible values for r, g and b before putting them in the correct places.
Following the description in the xcolor manual. As we always use rgb, there is no need to find the sixth, we just pass the information straight to the hsb auxiliary defined earlier.

{ \textbackslash fp\_compare:nNnTF \{#1\} < \{ 440 \}

(End definition for \_\_color\_parse\_model\_Gray:w and others.)

\_\_color\_parse\_model\_cmy:w Simply pass data to the conversion functions.
There are three stages to the process here: bring the tH argument into the normal range, divide through to get to hsb and finally convert that to rgb. The final stage can be delegated to the parsing function for hsb, and the conversion from Hsb to hsb is trivial, so the main focus here is the first stage. We use a simple expandable loop to do the work, and we implement the equation given in the xcolor manual (number 85 there) as a simple expression.

We cannot extract data here from that passed by xcolor, so we fall back on a black tint.
87.7 Selecting colors (and color models)

\l_color_fixed_model_tl

For selecting a single fixed model.

\__color_check_model:N
\__color_check_model:nn

Check that the model in use is the one required.

\__color_finalise_current:

A backend-neutral location for “last minute” manipulations before handing off to the backend code. We set the special \color syntax here: this will therefore always be available. The finalisation is separate from the main function so it can also be applied to e.g. page color.

\color_select:n
\color_select:nn
\__color_select_main:Nw
\__color_select_loop:Nw
\__color_select_swap:Nnn
\__color_select:nnN
\__color_select_swap:Nnn

Parse the input expressions then get the backend to actually activate them. The main complexity here is the need to check through multiple models. That is done “locally” here as the approach is subtly different to when different models are being stored.

\color_select:n
\color_select:nn
\__color_parse:nN {#1} \l__color_current_tl
\__color_finalise_current:

(End definition for \l_color_fixed_model_tl. This variable is documented on page 294.)

(End definition for \__color_check_model:N and \__color_check_model:nn.)

(End definition for \__color_finalise_current:.)
If the first color model is the fixed one, or if there is no fixed model, we don’t need most of the data: just set up and apply the backend function.

If a fixed model applies, we need to check each possible value in order. If there is no hit at all, fall back on the generic formula-based interchange.
87.8 Math color

The approach here is the same as for the \texttt{\LaTeX} \texttt{\mathcolor} command, but as we are working at the \texttt{expl3} level we can make some minor changes.

\newcommand*{\l_color_math_active_tl}{Tokens representing active sub/superscripts.}
\newcommand*{\g__color_math_seq}{Not all engines have multiple color stacks, and at the same time we are not expecting breaking within a colored math fragment. So we track the color stack ourselves.}
\newcommand*{\color_math:nn}{The basic set up here is relatively simple: store the current color, parse the new color as-normal, then switch color before inserting the tokens we are asked to change. The tricky part is right at the end, handling the reset.}
\newcommand*{\__color_math:nn}{The complication when changing the color back is due to the fact that the \texttt{\color_math:nn(n)} may be followed by \texttt{^} or \texttt{_} or the hidden superscript (for example \texttt{'}) and its argument may end in a \texttt{\mathop} in which case the sub- and superscripts may be attached as \texttt{limits} instead of after the material. All cases need separate treatment. To avoid repeatedly collecting the same token, we first check for an alignment tab: assuming we don’t have one of those, we can “recycle” \texttt{\l_peek_token} safely. As we have an explicit \texttt{\c_alignment_token}, there needs to be an align-safe group present.

\newcommand*{\__color_math_scan:w}{\newcommand*{\__color_math_scan_auxi}{\newcommand*{\__color_math_scan_auxii}{\newcommand*{\__color_math_scan_end}{}}}}
Dealing with literal _ and ^ is easy, and as we have exactly two cases, we can hard-code this. We use a hard-coded list for limits: these are all primitives. The \use_none:n here also removes the test token so it is left just in the right place.

The one final case to handle is math-active tokens, most obviously ', as these won't be covered earlier.
The tricky part of handling sub and superscripts is that we have to reset color to the one that is on the stack but reset it back to what it was before to allow for cases like

\[
\text{\color{red}}\{ a + \text{\texttt{\sum}} \}_i = 1 \to n \]

Here, TeX constructs a \texttt{vbox} stacking subscript, summation sign, and superscript. So technically the superscript comes first and the \texttt{\sum} that should get colored red is the middle.

The approach here is to set up a brace group immediately after the script token, then to set the color appropriately in that argument. We need an extra group to keep the color contained, and as we need to allow for an explicit closing brace in the source, the inner group also is a brace one rather than \texttt{\group_begin:}-based. At the end of the outer group we need to insert \texttt{\_color_math_scan:w} to continue the search for a second script token.

Notice that here we don’t need to use the math-specific color selector as we can allow the \texttt{\group_insert_after:N} \texttt{\@@_backend_reset:} to operate normally.

Deal with the case where we do not have an explicit brace pair in the source.

87.10 Defining named colors

\l__color_named_tl

Space to store the detail of the named color.

tl_new:N \l__color_named_tl

(End definition for \l__color_named_tl)

\color_set:nn
\__color_set:nnn
\__color_set:nn
\__color_set:nw
\color_set:nn
\__color_set_aux:nnn
\__color_set_loop:nw
\color_set_eq:nn

Defining named colors means working through the model list and saving both the “main” color and any equivalents in other models. Even if there is only one model, we store a prop as well as a tl, as there could be grouping weirdness, etc. When setting using an expression, we need to avoid any fixed model issues, which is done without a group as in \l3keys.

\cs_new_protected:Npn \color_set:nn #1#2
35532 {  
35533 \__color_set:nnn #1#2#3
35534 {  
35535 \tl_clear:N \l__color_fixed_model_tl
When setting an expression-based color, there could be multiple model data available for one or more of the input colors. Where that is true for the first named color in an expression, we re-parse the expression when they are also parameter-based: only cmyk, gray and rgb make any sense here. There is a bit of a performance hit but this should be rare and taking place during set-up.
\begin{verbatim}
\exp_not:N \__color_set_colon:nnw (#2) {#3}
#1 \c_colon_str \c_colon_str \exp_not:N \s__color_stop
\end{verbatim}

\textit{End definition for \texttt{\color_set:nn} and others. These functions are documented on page 294.}

1361
A small set of colors are always defined.

\begin{verbatim}
\color_set:nnn { black } { gray } { 0 }
\color_set:nnn { white } { gray } { 1 }
\color_set:nnn { cyan } { cmyk } { 1 , 0 , 0 , 0 }
\color_set:nnn { magenta } { cmyk } { 0 , 1 , 0 , 0 }
\color_set:nnn { yellow } { cmyk } { 0 , 0 , 1 , 0 }
\color_set:nnn { red } { rgb } { 1 , 0 , 0 }
\color_set:nnn { green } { rgb } { 0 , 1 , 0 }
\color_set:nnn { blue } { rgb } { 0 , 0 , 1 }
\end{verbatim}

A special named color: this is always defined though not fixed in definition.

\begin{verbatim}
\prop_new:c { l__color_named_._prop }
\tl_new:c { l__color_named_._tl }

\__color_model_init:nnx

Separations must have a “real” name, which is pretty easy to find.

\cs_new_protected:Npm \__color_model_separation:n #1
\prop_get:NnTF \l__color_internal_prop { name }
\l__color_internal_tl
\exp_args:NV \__color_model_separation:nn
\l__color_internal_tl {#1}

(End definition for \__color_model_init:nnn)
We have two keys to find at this stage: the alternative space model and linked values.

As each alternative space leads to a different requirement for conversion, and as there are only a small number of choices, we manually split the data and then set up. Notice that mixing tints is really just the same as mixing gray. The white color is special, as it allows tints to be adjusted without an additional color space. To make sure the data is set for that at all group levels, we need to work on a per-level basis. Within the output, only the set-up needs the “real” name of the colorspace: we use a simple tracking number for general usage as this is a clear namespace without issues of escaping chars.
\begin{verbatim}

We now complete the data we require by first finding out how many colorants there are, then moving on to begin constructing the function required to map to the alternative color space.

\cs_new_protected:Npm \__color_model_devicen:nnn #1#2#3
\exp_args:Nx \__color_model_devicen:nnn \l__color_model_devicen {#1} {#2} {#3}
\}
\exp_args:Nx \__color_model_devicen:nnn \l__color_model_devicen:nnn {#1} {#2} {#3}
\}

At this stage, we have checked everything is in place, so we can set up the \TeX and backend data structures. As for separations, it’s not really possible in general to have a fallback, so we simply provide “black” for each element.
For short lists of DeviceN colors, we can use hand-tuned parsing. This lines up with other models, where we allow for up to four components. For larger spaces, rather than limit artificially, we use a somewhat slow approach based on open-ended commas-lists.
To construct the tint transformation, we have to use PostScript. The aim is to have the final tint for each device colorant as

\[ 1 - \prod_{n}(1 - X_n D_{X_n}) \]

where \( X \) is a DeviceN colorant and \( D \) is the amount of device colorant that the DeviceN colorant maps to. At the start of the process, the PostScript stack will contain the
\(X_n\) values, whilst we have the \(D\) values on a per-DeviceN colorant basis. The more convenient approach for us is therefore to take each DeviceN colorant in turn and find the value \(1 - X_n D_{X_n}\), multiplying as we go, and finalise with the subtraction. That contrasts to colorspace: it splits the process up by process color, which works better when you have a fixed list of colorants. (colorspace only supports up to 4 DeviceN colors, and only cmyk as the alternative space.) To set this up, we first need to know the number of values in the target color space: this is easily handled as there are a very small range of possibles. Once we have that information, it’s relatively easy to build the required PostScript using some generic code.

As we always need to split the alternative values into parts, we use a shared auxiliary and only use a minimal difference between code paths. Construction of the tint transformation is as far as possible done using loops, which means there are some inefficiencies for device colors in the DeviceN space: we roll the stack one-at-a-time even if there is a potential shortcut. However, that way there is nothing to special-case. Once this is sorted, we can write the tint transform object, which will remain as the last object until we sort out the final step: the colorant list.
Here we need to set up conversion from the DeviceN space to the alternative at the \TeX level. This also means supplying methods for inter-converting to other parameter-based spaces. Essentially the approach is exactly the same as the PostScript, just expressed in
\TeX{} terms.

Deprecated functions

\pdf_object_new:nn \pdf_object_new:nn \{object\} \{type\}
\pdf_object_new:nn \{object\} \{type\}

Declares \{object\} as a PDF object of \{type\}, which should be one of

- array
- dict
- fstream
- stream

The object may be referenced from this point on, and written later using \pdf_object_-write:nn.

Deprecated in favor of \pdf_object_new:n.

\pdf_object_write:nn \pdf_object_write:nn \{object\} \{content\}
\pdf_object_write:nn \{object\} \{content\}

Writes the \{content\} as content of the \{object\}. Depending on the \{type\} declared for the object, the format required for the \{data\} will vary

array A space-separated list of values

dict Key–value pairs in the form /\{key\} \{value\}

fstream Two brace groups: \{file name\} and \{file content\}

stream Two brace groups: \{attributes (dictionary)\} and \{stream contents\}

Deprecated in favor of \pdf_object_write:nnn.

⟨/package⟩
Chapter 90

\textbf{l3candidates Implementation}

\section{Additions to l3box}

\subsection{Viewing part of a box}

A wrapper around the driver-dependent code.

\begin{verbatim}
\cs_new_protected:Npn \box_clip:N #1 { \hbox_set:Nn #1 { \__box_backend_clip:N #1 } }
\cs_generate_variant:Nn \box_clip:N { c }
\cs_new_protected:Npn \box_gclip:N #1 { \hbox_gset:Nn #1 { \__box_backend_clip:N #1 } }
\cs_generate_variant:Nn \box_gclip:N { c }
\end{verbatim}

(End definition for \texttt{\textbackslash box\_clip:N} and \texttt{\textbackslash box\_gclip:N}. These functions are documented on page 305.)

Trimming from the left- and right-hand edges of the box is easy: kern the appropriate parts off each side.

\begin{verbatim}
\cs_new_protected:Npn \box_set_trim:Nnnnn #1#2#3#4#5 { \__box_set_trim:NnnnnN #1 {#2} {#3} {#4} {#5} \box_set_eq:NN }
\cs_generate_variant:Nn \box_set_trim:Nnnnn { c }
\cs_new_protected:Npn \box_gset_trim:Nnnnn #1#2#3#4#5 { \__box_set_trim:NnnnnN #1 {#2} {#3} {#4} {#5} \box_gset_eq:NN }
\cs_generate_variant:Nn \box_gset_trim:Nnnnn { c }
\cs_new_protected:Npn \__box_set_trim:NnnnnN #1#2#3#4#5#6 { \hbox_set:Nn \l__box_internal_box { \__kernel_kern:n { -#2 } \box_use:N #1 \__kernel_kern:n { -#4 } } }
\end{verbatim}

For the height and depth, there is a need to watch the baseline is respected. Material always has to stay on the correct side, so trimming has to check that there is enough material to trim. First, the bottom edge. If there is enough depth, simply set the depth, or if not move down so the result is zero depth. \texttt{\textbackslash box\_move\_down:n} is used in both
cases so the resulting box always contains a lower primitive. The internal box is used here as it allows safe use of \box_set_dp:Nn.

\dim_compare:nNnTF { \box_dp:N #1 } > {#3}
{
  \hbox_set:Nn \l__box_internal_box
  \box_move_down:nn \c_zero_dim
  \box_use_drop:N \l__box_internal_box
}
\box_set_dp:Nn \l__box_internal_box { \box_dp:N #1 - (#3) }
\box_set_dp:Nn \l__box_internal_box { \box_dp:N #1 - (#3) }
\box_set_dp:Nn \l__box_internal_box { \box_dp:N #1 - (#3) }

Same thing, this time from the top of the box.

\dim_compare:nNnTF { \box_ht:N \l__box_internal_box } > {#5}
{
  \hbox_set:Nn \l__box_internal_box
  \box_move_up:nn \c_zero_dim
  \box_use_drop:N \l__box_internal_box
}
\box_set_ht:Nn \l__box_internal_box { \box_ht:N \l__box_internal_box - (#5) }
\box_set_ht:Nn \l__box_internal_box { \box_ht:N \l__box_internal_box - (#5) }
\box_set_ht:Nn \l__box_internal_box { \box_ht:N \l__box_internal_box - (#5) }

(End definition for \box_set_trim:Nnnn, \box_gset_trim:Nnnn, and __box_set_trim:NnnnnN. These functions are documented on page 305.)

\box_set_viewport:Nnnnn \box_set_viewport:cnmnn \box_gset_viewport:Nnnnn \box_gset_viewport:cnmnn __box_viewport:Nnnnn

The same general logic as for the trim operation, but with absolute dimensions. As a result, there are some things to watch out for in the vertical direction.
{ \hbox_set:Nn \l__box_internal_box
  \__kernel_kern:n { -#2 }
  \box_use:N #1
  \__kernel_kern:n { #4 - \box_wd:N #1 }

{ \box_move_up:nn { - \__box_dim_eval:n {#5} }
  { \box_use_drop:N \l__box_internal_box }
  \box_set_ht:Nn \l__box_internal_box \c_zero_dim
}
\hbox_set:Nn \l__box_internal_box
\box_set_viewport:Nnnnn \box_gset_viewport:Nnnnn \__box_viewport:NnnnN.
These functions are documented on page \textit{305}.

90.2 Additions to \texttt{l3flag}

\langle \@@=\texttt{flag} \rangle
It might be faster to just call the “trap” function in all cases but conceptually the function name suggests we should only run it if the flag is zero in case the “trap” made customizable in the future.

```latex
\flag_raise_if_clear:n
```

```latex
\begin{verbatim}
\cs_new:Npn \flag_raise_if_clear:n #1
\{
  \if_cs_exist:w flag-#1-0 \cs_end:
  \else:
  \cs:w flag-#1 \cs_end: 0 ;
  \fi:
\}
\end{verbatim}
```

(End definition for \flag_raise_if_clear:n. This function is documented on page 306.)

### 90.3 Additions to l3msg

A short-hand used for \int_show:n and similar functions that passes to \tl_show:n the result of applying #1 (a function such as \int_eval:n) to the expression #2. The use of \f-expansion ensures that #1 is expanded in the scope in which the show command is called, rather than in the group created by \io\w_wrap:nnnN. This is only important for expressions involving the \texttt{currentgrouplevel} or \texttt{currentgrouptype}. On the other hand we want the expression to be converted to a string with the usual escape character, hence within the wrapping code.

```latex
\begin{verbatim}
\cs_new_protected:Npn \msg_show_eval:Nn #1#2
\{
  \exp_args:Nf \__msg_show_eval:nnN { #1 {#2} } {#2} \tl_show:n
\}
\cs_new_protected:Npn \msg_log_eval:Nn #1#2
\{
  \exp_args:Nf \__msg_show_eval:nnN { #1 {#2} } {#2} \tl_log:n
\}
\cs_new_protected:Npn \__msg_show_eval:nnN #1#2#3 { #3 { #2 = #1 } }
\end{verbatim}
```

(End definition for \msg_show_eval:Nn, \msg_log_eval:Nn, and \__msg_show_eval:nnN. These functions are documented on page 307.)

Each item in the variable is formatted using one of the following functions. We cannot use \s and so on because these short-hands cannot be used inside the arguments of messages, only when defining the messages.

```latex
\begin{verbatim}
\cs_new:Npx \msg_show_item:n #1
\{
  \iow_newline: > ~ \c_space_tl \exp_not:N \tl_to_str:n { {#1} }
\}
\cs_new:Npx \msg_show_item_unbraced:n #1
\{
  \iow_newline: > \use:nn { ~ } { ~ }
  \exp_not:N \tl_to_str:n { {#1} }
\}
\cs_new:Npx \msg_show_item:nn #1#2
\{
  \io\w_newline: > \use:nn { - } { - }
  \exp_not:N \tl_to_str:n { {#1} }
  \use:nn { - } { - } => \use:nn { - } { - }
  \exp_not:N \tl_to_str:n { {#2} }
\}
\cs_new:Npx \msg_show_item_unbraced:nn #1#2
\{
  \io\w_newline: > \use:nn { - } { - }
  \exp_not:N \tl_to_str:n { {#1} }
  \use:nn { - } { - } => \use:nn { - } { - }
  \exp_not:N \tl_to_str:n { {#2} }
\}
\end{verbatim}
```

1392
90.4 Additions to \texttt{l3prg}

\begin{verbatim}
\bool_set_inverse:N \bool_set_inverse:c \bool_gset_inverse:N \bool_gset_inverse:c
\end{verbatim}

Set to false or true locally or globally.

\begin{verbatim}
\cs_new_protected:Npn \bool_set_inverse:N #1
  { \bool_if:NTF #1 { \bool_set_false:N } { \bool_set_true:N } #1 }
\cs_generate_variant:Nn \bool_set_inverse:N { c }
\cs_new_protected:Npn \bool_gset_inverse:N #1
  { \bool_if:NTF #1 { \bool_gset_false:N } { \bool_gset_true:N } #1 }
\cs_generate_variant:Nn \bool_gset_inverse:N { c }
\end{verbatim}

(End definition for \texttt{bool_set_inverse:N} and \texttt{bool_gset_inverse:N}. These functions are documented on page \pageref{page:307}.)

\begin{verbatim}
\s__bool_mark \s__bool_stop
\end{verbatim}

Internal scan marks.

\begin{verbatim}
\scan_new:N \s__bool_mark \scan_new:N \s__bool_stop
\end{verbatim}

(End definition for \texttt{s__bool_mark} and \texttt{s__bool_stop}.)

\begin{verbatim}
\bool_case_true:n \bool_case_true:n \bool_case_false:n \bool_case_false:n \__bool_case:NnTF \__bool_case_true:w \__bool_case_false:w \__bool_case_end:nw
\end{verbatim}

For boolean cases the overall idea is the same as for \texttt{tl_case:nnTF} as described in \texttt{l3tl}.
90.5 Additions to \texttt{l3prop}

\newcommand{\prop.rand.key.value}{N}
\newcommand{\prop.rand.key.value}{c}
\newcommand{\prop.rand.item}{w}

Contrarily to \texttt{clist}, \texttt{seq} and \texttt{tl}, there is no function to get an item of a \texttt{prop} given an integer between 1 and the number of items, so we write the appropriate code. There is no bounds checking because \texttt{\int.rand:nn} is always within bounds. The initial \texttt{\int-.value:w} is stopped by the first \texttt{\s_.prop} in \texttt{#1}.

\begin{verbatim}
\cs_new:Npn \prop.rand.key.value:N \strut #1 \s_.prop \strut \\
{ \prop_if_empty:NF \strut #1 \s_.prop \strut \\
\exp_after:wN \__prop.rand.item:w \int_value:w \int_rand:nn { 1 } { \prop_count:N \strut #1 } \s_.prop \strut \\

\cs_generate_variant:Nn \prop.rand.key.value:N \strut { c }

\cs_new:Npn \__prop.rand.item:w \strut #1 \s_.prop \strut \\
{ \int_compare:nNnF {#1} > 1 \s_.prop \strut \\
\exp_after:wN \__prop.rand.item:w \int_value:w \int_eval:n { #1 - 1 } \s_.prop \strut
\end{verbatim}

(End definition for \texttt{\prop.rand.key.value:N} and \texttt{\prop.rand.item:w}. This function is documented on page \pageref{prop.rand.key.value:N}.)

90.6 Additions to \texttt{l3seq}

The idea is to first expand both sequences, adding the usual \texttt{? \prg_break:} \texttt{}} \texttt{}} to the end of each one. This is most conveniently done in two steps using an auxiliary function. The mapping then throws away the first tokens of \texttt{#2} and \texttt{#5}, which for items in both sequences are \texttt{\s_.seq} \texttt{\s_.item:n}. The function to be mapped are then be applied to the two entries. When the code hits the end of one of the sequences, the break material stops the entire loop and tidy up. This avoids needing to find the count of the two sequences, or worrying about which is longer.
\cs_new:Npn \seq_mapthread_function:NNN #1#2#3
{ \exp_after:wN \__seq_mapthread_function:wNN #2 \s__seq_stop #1 #3 }
\cs_new:Npn \__seq_mapthread_function:wNN \s__seq #1 \s__seq_stop #2#3
{ \exp_after:wN \__seq_mapthread_function:wNw #2 \s__seq_stop #3
#1 { ? \prg_break: } { } \prg_break_point:
}
\cs_new:Npn \__seq_mapthread_function:wNw \s__seq #1 \s__seq_stop #2
{ \__seq_mapthread_function:Nnnwnn #2 #1 { ? \prg_break: } { } \s__seq_stop
#1 {#3} {#6}
\__seq_mapthread_function:Nnnwnn #1 #4 \a_seq_stop
\cs_generate_variant:Nn \seq_mapthread_function:NNN { Nc , c , cc }

(End definition for \seq_mapthread_function:NNN and others. This function is documented on page 309.)

\cs_new_protected:Npn \seq_set_filter:NNn
{ \__seq_set_filter:NNNn \__kernel_tl_set:Nx }
\cs_new_protected:Npn \seq_gset_filter:NNn
{ \__seq_set_filter:NNNn \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \__seq_set_filter:NNNn #1#2#3#4
{ \__seq_push_item_def:n { \bool_if:nT {#4} { \__seq_wrap_item:n {##1} } } #1 #2 { \s__seq #3 \__seq_item:n }
\__seq_pop_item_def:
}
\cs_generate_variant:NNn \seq_mapthread_function:NNN { Nc , c , cc }

(End definition for \seq_set_filter:NNn, \seq_gset_filter:NNn, and \__seq_set_filter:NNNn. These functions are documented on page 309.)

Set \__seq_item:n then map it using the loop code.

\cs_new_protected:Npn \seq_set_from_inline_x:NNn
{ \__seq_set_from_inline_x:NNnn \__kernel_tl_set:Nx }
\cs_new_protected:Npn \seq_gset_from_inline_x:NNn
{ \__seq_set_from_inline_x:NNnn \__kernel_tl_gset:Nx }
\cs_new_protected:Npn \__seq_set_from_inline_x:NNnn #1#2#3#4
{ \__seq_push_item_def:n { \bool_if:nT {#4} { \__seq_wrap_item:n {##1} } } #1 #2 { #3 } #4
\__seq_pop_item_def:

(End definition for \seq_set_from_inline_x:NNn, \seq_gset_from_inline_x:NNn, and \__seq_set_filter:NNNn. These functions are documented on page 309.)

\seq_set_filter:NNn \seq_gset_filter:NNn \__seq_set_filter:NNNn
\seq_set_from_inline_x:NNn \seq_gset_from_inline_x:NNn \__seq_set_from_inline_x:NNnn

Similar to \seq_map_inline:Nn, without a \prg_break_point: because the user’s code is performed within the evaluation of a boolean expression, and skipping out of that would break horribly. The \__seq_wrap_item:n function inserts the relevant \__seq_item:n without expansion in the input stream, hence in the x-expanding assignment.

\cs_new_protected:Npn \seq_set_from_inline_x:NNnn #1#2#3#4
{ \__seq_push_item_def:n { \exp_not:N \__seq_item:n {#4} } #1 #2 { \s__seq #3 \__seq_item:n }
\__seq_pop_item_def:

1395
Reuse \seq_set_from_inline_x:Nnn.

\__seq_set_from_inline_x:NNnn
\__seq_gset_from_inline_x:NNnn, and \__seq_set_from_inline_x:NNnn. These functions are documented on page 309.

(End definition for \seq_set_from_function:NnN, \seq_gset_from_function:NnN, and \__seq_set_from_inline_x:NNnn.)

\__seq_int_eval:w

Useful to more quickly go through items.

\cs_new_eq:NN \__seq_int_eval:w \tex_numexpr:D

(End definition for \__seq_int_eval:w.)

The conditionals are distinguished from the Nnn versions by the last argument \use_ii:nn vs \use_i:nn.

\cs_new_protected:Npn \seq_set_item:Nnn #1#2#3
{ \__seq_set_item:NnnNN #1 {#2} {#3} \__kernel_tl_set:Nx \use_i:nn }

(End definition for \seq_set_item:Nnn.)

\cs_new_protected:Npn \seq_gset_item:Nnn #1#2#3
{ \__seq_set_item:NnnNN #1 {#2} {#3} \__kernel_tl_gset:Nx \use_ii:nn }

\prg_generate_conditional_variant:Nnn \seq_set_item:Nnn { c } { TF , T , F }
\prg_generate_conditional_variant:Nnn \seq_gset_item:Nnn { c } { TF , T , F }

(End definition for \__seq_set_item:Nnn.)

Save the item to be stored and evaluate the position and the sequence length only once.

Then depending on the sign of the position, check that it is not bigger than the length (in absolute value) nor zero.

(End definition for \__seq_set_item:Nnn.)

1396
If the position is not ok, \_\_seq_set_item_false:nnNNNN calls an error or returns false (depending on the \use_i:nn vs \use_ii:nn argument mentioned above).

\cs_new_protected:Npn \_\_seq_set_item_false:nnNNNN #1#2#3#4#5#6
\begin{verbatim}
  \#6
  \msg_error:nnxxx { seq } { item-too-large }
  \{ \token_to_str:N #3 \} \#2 \#1
  \{ \prg_return_false: \}
\end{verbatim}
\msg_new:nnnn { seq } { item-too-large }
\begin{verbatim}
{ Sequence-'#1'-does-not-have-an-item-#3 }
{ An-attempt-was-made-to-push-or-pop-the-item-at-position-#3-
  of-'#1',-but-this- \int_compare:nTF { #3 = 0 } \{ position-does-not-exist. \}
  \{ sequence-only-has-#2-item \int_compare:nF { #2 = 1 } \{s}. \} }
\end{verbatim}

If the position is ok, \_\_seq_set_item:nNnnNNNN makes the assignment and returns true (in the case of conditionnals). Here #1 is an integer expression (position minus one), it needs to be evaluated. The sequence #5 starts with \s_seq (even if empty), which stops the integer expression and is absorbed by it. The \if_meaning:w test is slightly faster than an integer test (but only works when testing against zero, hence the offset we chose in the position). When we are done skipping items, insert the saved item \l__seq_internal_a_tl. For put functions the last argument of \_\_seq_set_item_end:w is \use_none:nn and it absorbs the item #2 that we are removing: this is only useful for the pop functions.

\cs_new_protected:Npn \_\_seq_set_item:nNnnNNNN #1#2#3#4#5#6#7#8
\begin{verbatim}
  \#7 \#5
  \exp_after:wN \_\_seq_set_item:wn
  \int_value:w \_\_seq_int_eval:w #1 \#5 \s__seq_stop \#6
  \{ \prg_return_true: \}
\end{verbatim}
\cs_new:Npn \_\_seq_set_item:wn #1 \__seq_item:n #2
\begin{verbatim}
  \if_meaning:w 0 #1 \_\_seq_set_item_end:w \fi:
  \exp_not:n \{ \_\_seq_item:n \#2 \}
  \exp_after:wN \_\_seq_set_item:wn
  \int_value:w \_\_seq_int_eval:w #1 - 1 \s__seq
\end{verbatim}
\cs_new:Npn \_\_seq_set_item_end:w #1 \exp_not:n \#2 \#3 \s__seq \#4 \s__seq_stop \#5
\begin{verbatim}
  \#1
  \exp_not:o \l__seq_internal_a_tl
  \exp_not:n \{\#4}
\end{verbatim}
The \texttt{NnN} versions simply call the conditionals, for which we will rely on the internals of \texttt{\seq_set_item:Nnn}. Save in \texttt{\l__seq_internal_b_tl} the token list variable \texttt{#3} in which we will store the item. The \texttt{\_seq_set_item:nnNNNN} auxiliary eventually inserts \texttt{\_a_tl} in place of the item found in the sequence, so we empty that. Instead of the last argument \texttt{\use_i:nn} or \texttt{\use_ii:nn} used for put functions, we introduce \texttt{\_seq_pop_item:nn}, which stores \texttt{\q_no_value} before calling its second argument (\texttt{\prg_return_false:/false:/}) to end the conditional. The item found is passed to \texttt{\_seq_pop_item_aux:w}, which interrupts the \texttt{x}-expanding sequence assignment and stores the item using the assignment function in \texttt{\_seq_internal_b_tl}.

\begin{verbatim}
\cs_new_protected:Npm \seq_pop_item:NnN #1#2#3

{ \if_false: { \fi: }
   \l__seq_internal_b_tl { \if_false: } \fi: \exp_not:N \q_no_value
}
\end{verbatim}

(End definition for \texttt{\seq_set_item:Nnn TF} and others. These functions are documented on page 310.)
90.7 Additions to \texttt{l3sys}

Various different engines, various different ways to extract the data!

```latex
\str_const:Nx \c_sys_engine_version_str
{\str_case:on \c_sys_engine_str
 { \{ pdftex \}
   { \fp_eval:n { round(\int_use:N \tex_pdftexversion:D / 100 , 2) } }
   { \tex_pdftexrevision:D }
 } { \ptex }
 { \cs_if_exist:NT \tex_ptexversion:D
   { \int_use:N \tex_ptexversion:D
     . \int_use:N \tex_ptexminorversion:D
     \tex_ptexrevision:D
   } { luatex }
   { \fp_eval:n { round(\int_use:N \tex_luatexversion:D / 100 , 2) } }
   { \tex_luatexrevision:D }
 } { \uptex }
 { \cs_if_exist:NT \tex_epTeXversion:D
   { \int_use:N \tex_epTeXversion:D
     - \int_use:N \tex_uptexversion:D
     - \int_use:N \tex_uptexrevision:D
   } { xetex }
   { \int_use:N \tex_XeTeXversion:D }
 } { }\}
```

1399
90.8 Additions to \texttt{l3file}

\texttt{\ior_shell_open:Nn} Actually much easier than either the standard open or input versions! When calling \texttt{\_kernel_ior_open:Nn} the file the pipe is added to signal a shell command, but the quotes are not added yet—they are added later by \texttt{\_kernel_file_name_quote:n}.

\begin{verbatim}
\cs_new_protected:Npn \ior_shell_open:Nn #1#2 {
  \sys_if_shell:TF
  { \exp_args:No \_ior_shell_open:nN { \tl_to_str:n {#2} } #1 }
  { \msg_error:nn { ior } { pipe-failed } }
}
\cs_new_protected:Npn \_ior_shell_open:nN #1#2 {
  \tl_if_in:nnTF {#1} { " }
  { \msg_error:nnx { kernel } { quote-in-shell } {#1} }
  { \_kernel_ior_open:Nn #2 { |#1 } }
}\msg_new:nnnn { ior } { pipe-failed }
{ Cannot-run-piped-system-commands. }
\{ \_kernel_ior_open:Nn #2 { |#1 } }
\msg_new:nmmn { ior } { pipe-failed }
{ LaTeX-tried-to-call-a-system-process-but-this-was-not-possible.\ }
\{ Try-the-"--shell-escape"-(or-"--enable-pipes")-option. \}
\end{verbatim}

(End definition for \texttt{\ior_shell_open:Nn} and \texttt{\_ior_shell_open:nN}. This function is documented on page 306.)

90.9 Additions to \texttt{l3tl}

90.9.1 Building a token list

\begin{verbatim}
\tl_build_begin:N \tl_build_end:N \tl_build_last:N\tl
\end{verbatim}

Between \texttt{\tl_build_begin:N \tl var} and \texttt{\tl_build_end:N \tl var}, the \texttt{\tl var} has the structure
\begin{verbatim}
\exp_end: ... \exp_end: \tl_build_last:NNNn \tl \assignment \tl
\end{verbatim}

where \texttt{(right)} is not braced. The “data” it represents is \texttt{(left)} followed by the “data” of \texttt{(next tl)} followed by \texttt{(right)}. The \texttt{(next tl)} is a token list variable whose name is that of \texttt{(tl var)} followed by \texttt{'}$. There are between 0 and 4 \texttt{\exp_end:} to keep track of when \texttt{(left)}
First construct the \textit{(next tl)}: using a prime here conflicts with the usual expl3 convention but we need a name that can be derived from \#1 without any external data such as a counter. Empty that \textit{(next tl)} and setup the structure. The local and global versions only differ by a single function \texttt{\cs_set_nopar:Npx} used for all assignments: this is important because only that function is stored in the \texttt{\tl} and \textit{(next tl)} for subsequent assignments. In principle \texttt{\__tl_build_begin:NNN} could use \texttt{\tl_clear_new:N} to empty \#1 and make sure it is defined, but logging the definition does not seem useful so we just do \#3 \#1 \{} to clear it locally or globally as appropriate.

\begin{verbatim}
\cs_new_protected:Npn \tl_build_begin:N \#1
\{ \__tl_build_begin:NN \cs_set_nopar:Npx \#1 \}
\cs_new_protected:Npn \tl_build_gbegin:N \#1
\{ \__tl_build_begin:NN \cs_gset_nopar:Npx \#1 \}
\cs_new_protected:Npn \__tl_build_begin:NN \#1\#2
\{ \exp_args:Nc \__tl_build_begin:NNN \{ \cs_to_str:N \#2' \} \#2 \#1 \}
\cs_new_protected:Npn \__tl_build_begin:NNN \#1\#2\#3
\{ \#3 \#1 \{ \}
\#3 \#2
\{ \exp_not:n \{ \exp_end: \exp_end: \exp_end: \exp_end: \} \}
\exp_not:n \{ \__tl_build_last:NNn \#3 \#1 \{ \} \}
\}
\end{verbatim}

(End definition for \texttt{\tl_build_begin:N} and others. These functions are documented on page 311.)

The \texttt{begin} and \texttt{gbegin} functions already clear enough to make the token list variable effectively empty. Eventually the \texttt{begin} and \texttt{gbegin} functions should check that \#1' is empty or undefined, while the \texttt{clear} and \texttt{gclear} functions ought to empty \#1'', \#1''', and so on, similar to \texttt{\tl_build_end:N}. This only affects memory usage.

\begin{verbatim}
\cs_new_eq:NN \tl_build_clear:N \tl_build_begin:N
\cs_new_eq:NN \tl_build_gclear:N \tl_build_gbegin:N
\end{verbatim}

(End definition for \texttt{\tl_build_clear:N} and \texttt{\tl_build_gclear:N}. These functions are documented on page 311.)

Similar to \texttt{\tl_put_right:Nn}, but apply \texttt{\exp:w} to \#1. Most of the time this just removes one \texttt{\exp_end:}. When there are none left, \texttt{\__tl_build_last:NNn} is expanded instead. It resets the definition of the \texttt{\tl} by ending the \texttt{\exp_not:n} and the definition early. Then it makes sure the \textit{(next tl)} (its argument \#1) is set-up and starts a new definition. Then \texttt{\__tl_build_put:nn} and \texttt{\__tl_build_put:nw} place the \texttt{\left} part of the original \texttt{\tl} as appropriate for the definition of the \textit{(next tl)} (the \texttt{\right} part is left in the right place without ever becoming a macro argument). We use \texttt{\exp_after:wN} rather than some \texttt{\exp_args:No} to avoid reading arguments that are likely very long token lists. We use \texttt{\cs_set_nopar:Npx} rather than \texttt{\tl_set:Nx} partly for the same reason and partly because the assignments are interrupted by brace tricks, which implies that the assignment does not simply set the token list to an \texttt{x}-expansion of the second argument.

\begin{verbatim}
\cs_new_protected:Npn \tl_build_put_right:Nn \#1\#2
\{ \cs_set_nopar:Npx \#1 \}
\end{verbatim}

1401
See \tl_build_put_right:Nn for all the machinery. We could easily provide \tl_build_put_left_right:Nnn, by just add the \langle right\rangle material after the \langle left\rangle in the x-expanding assignment.
The idea is to expand the ⟨tl var⟩ then the ⟨next tl⟩ and so on, all within an x-expanding assignment, and wrap as appropriate in \exp_not:n. The various ⟨left⟩ parts are left in the assignment as we go, which enables us to expand the ⟨next tl⟩ at the right place. The various ⟨right⟩ parts are eventually picked up in one last \exp_not:n, with a brace trick to wrap all the ⟨right⟩ parts together.

\cs_new_protected:Npn \tl_build_get:NN { \__tl_build_get:NNN \__kernel_tl_set:Nx }
\cs_new_protected:Npn \__tl_build_get:NNN #1 #2 #3 { #1 #3 { \if_false: { \fi: \exp_after:wN \__tl_build_get:w #2 } } }
\cs_new:Npn \__tl_build_get:w #1 \__tl_build_last:NNn #2 #3 #4 { \exp_not:n {#4} \if_meaning:w \c_empty_tl #3 \exp_after:wN \__tl_build_get_end:w \fi: \exp_after:wN \__tl_build_get:w #3 #4 }
\cs_new:Npn \__tl_build_get_end:w #1 #2 #3 { \exp_after:wN \exp_not:n \exp_after:wN \exp_after:wN { \if_false: } \fi: }

Get the data then clear the ⟨next tl⟩ recursively until finding an empty one. It is perhaps wasteful to repeatedly use \cs_to_str:N. The local/global scope is checked by \tl_set:Nx or \tl_gset:Nx.

\cs_new_protected:Npn \tl_build_end:N #1 { \__tl_build_get:NNN \__kernel_tl_set:Nx #1 #1 \exp_args:Nc \__tl_build_end_loop:NNN { \cs_to_str:N #1 } \tl_clear:N }
\cs_new_protected:Npn \__tl_build_end_loop:NN #1 #2 { \if_meaning:w \c_empty_tl #1 \exp_after:wN \__tl_build_end_loop:NN \exp_after:wN { \if_false: } \fi: }
90.9.2 Other additions to \texttt{l3tl}

For the braced version \texttt{\_\_tl\_range\_braced:w} sets up \texttt{\_\_tl\_range\_collect\_braced:w} which stores items one by one in an argument after the semicolon. The unbraced version is almost identical. The version preserving braces and spaces starts by deleting spaces before the argument to avoid collecting them, and sets up \texttt{\_\_tl\_range\_collect:nn} with a first argument of the form \{ \{\texttt{collected}\} \{\texttt{tokens}\} \}, whose head is the collected tokens and whose tail is what remains of the original token list. This form makes it easier to move tokens to the \{\texttt{collected}\} tokens.

\begin{verbatim}
\cs_new:Npn \tl_range_braced:Nnn { \exp_args:No \tl_range_braced:nnn }
\cs_generate_variant:Nn \tl_range_braced:Nnn { c }
\cs_new:Npn \tl_range_braced:nnn { \__tl_range:Nnnn \__tl_range_braced:w }
\cs_new:Npn \tl_range_unbraced:Nnn { \exp_args:No \tl_range_unbraced:nnn }
\cs_generate_variant:Nn \tl_range_unbraced:Nnn { c }
\cs_new:Npn \tl_range_unbraced:nnn { \__tl_range:Nnnn \__tl_range_unbraced:w }
\cs_new:Npn \__tl_range_braced:w #1 ; #2
{ \__tl_range_collect_braced:w #1 ; { } #2 }
\cs_new:Npn \__tl_range_unbraced:w #1 ; #2
{ \__tl_range_collect_unbraced:w #1 ; { } #2 }
\cs_new:Npn \__tl_range_collect_braced:w #1 ; #2#3
{ \if_int_compare:w #1 > \c_one_int
\exp_after:wN \__tl_range_collect_braced:w
\int_value:w \int_eval:n { #1 - 1 } \exp_after:wN ;
\fi: { #2 {#3} } }
\cs_new:Npn \__tl_range_collect_unbraced:w #1 ; #2#3
{ \if_int_compare:w #1 > \c_one_int
\exp_after:wN \__tl_range_collect_unbraced:w
\int_value:w \int_eval:n { #1 - 1 } \exp_after:wN ;
\fi: { #2 #3 } }
\end{verbatim}

(End definition for \texttt{\_\_tl\_range\_braced:Nnn} and others. These functions are documented on page 311.)

90.10 Additions to \texttt{l3token}

\begin{verbatim}
\c_catcode_active_space_tl
\end{verbatim}

\texttt{\_\_tl\_range\_collect\_unbraced:w} While \texttt{\_\_tl\_range\_collect\_unbraced:w} can produce active characters in some engines it cannot in general. It would be possible to simply change the catcode of space but then the code would need to avoid all spaces, making it quite unreadable. Instead we use the primitive \texttt{\_\_tex\_lowercase:D} trick.

\begin{verbatim}
\group_begin:
\char_set_catcode_active:N * \char_set_lccode:nn { ' } { ' \}
\tex_lowercase:D \{ \tl_const:Nn \c_catcode_active_space_tl \{ * \} \}
\group_end:
\end{verbatim}

1404
Most of the work is done by __peek_execute_branches__:..., which calls either __peek_true:w or __peek_false:w according to whether the next token \l_.peek_token matches the search token (stored in \l_.peek_search_token and \l_.peek_search_tl). Here, in the true case we run __peek_collect_true:w, which generally calls __peek_collect:N to store the peeked token into \l_.peek_collect_tl, except in special non-N-type cases (begin-group, end-group, or space), where a frozen token is stored. The true branch calls __peek_execute_branches__:... to fetch more matching tokens. Once there are no more, __peek_false_aux:n closes the safe-align group and runs the user's inline code.

```latex
\begin{verbatim}
\cs_new_protected:Npn \peek_catcode_collect_inline:Nn
\cs_new_protected:Npn \peek_charcode_collect_inline:Nn
\cs_new_protected:Npn \peek_meaning_collect_inline:Nn
\cs_new_protected:Npn \__peek_collect:NNn \__peek_execute_branches_catcode: \\
\cs_new_protected:Npn \__peek_collect:NNn \__peek_execute_branches_charcode: \\
\cs_new_protected:Npn \__peek_collect:NNn \__peek_execute_branches_meaning: \\
\cs_new_protected:Npn \__peek_collect:NNn #1#2#3
{ \group_align_safe_begin: \\
\cs_set_eq:NN \l__peek_search_token #2 \\
\tl_set:Nn \l__peek_search_tl {#2} \\
\tl_clear:N \l__peek_collect_tl \\
\cs_set:Npn \__peek_false:w \exp_args:No \__peek_false_aux:n \l__peek_collect_tl } \\
\cs_set:Npn \__peek_false_aux:n ##1 \\
{ \group_align_safe_end: #3 } \\
\cs_set_eq:NN \__peek_true:w \__peek_collect_true:w \\
\cs_set:Npn \__peek_true_aux:w { \peek_after:Nw #1 } \\
\__peek_true_aux:w \\
\cs_new_protected:Npn \__peek_collect_true:w \\
{ \if_case:w \if_catcode:w \exp_not:N \l_peek_token { 1 \exp_stop_f: \fi: \\
\if_catcode:w \exp_not:N \l_peek_token } 2 \exp_stop_f: \fi: \\
\if_meaning:w \l_peek_token \c_space_token 3 \exp_stop_f: \fi: \\
\exp_after:wN \__peek_collect:N \\
\or: \__peek_collect_remove:nw { \c_group_begin_token } \\
\or: \__peek_collect_remove:nw { \c_group_end_token } \\
\or: \__peek_collect_remove:nw { ~ } } \fi: \\
\end{verbatim}
\end{verbatim}

(End definition for \c_catcode_active_space_tl. This variable is documented on page 312.)

\l_.peek_collect_tl
\tl_new:N \l_.peek_collect_tl

(End definition for \l_.peek_collect_tl.)
(End definition for \peek_catcode_collect_inline:Nn and others. These functions are documented on page 313.)

{/package}
Chapter 91

\textbf{l3deprecation implementation}

91.1 Patching definitions to deprecate

\begin{verbatim}
\__kernel_patch_deprecation:nnNNpn \{\langle date\rangle\} \{\langle replacement\rangle\} \{\langle definition\rangle\} \{\langle function\rangle\} \{\langle parameters\rangle\} \{\langle code\rangle\}
\end{verbatim}

defines the \textit{function} to produce a warning and run its \textit{code}, or to produce an error and not run any \textit{code}, depending on the expl3 date.

- If the expl3 date is less than the \textit{date} (plus 6 months in case \texttt{undo-recent-deprecations} is used) then we define the \textit{function} to produce a warning and run its code. The warning is actually suppressed in two cases:
  - if neither \texttt{undo-recent-deprecations} nor \texttt{enable-debug} are in effect we may be in an end-user’s document so it is suppressed;
  - if the command is expandable then we cannot produce a warning.

- Otherwise, we define the \textit{function} to produce an error.

In both cases we additionally make \texttt{\debug_on:n \{deprecation\}} turn the \textit{function} into an \texttt{outer} error, and \texttt{\debug_off:n \{deprecation\}} restore whatever the behaviour was without \texttt{\debug_on:n \{deprecation\}}.

In later sections we use the l3doc key \texttt{deprecated} with a date equal to that \textit{date} plus 6 months, so that l3doc will complain if we forget to remove the stale \textit{parameters} and \textit{code}.

In the explanations below, \textit{\langle definition\rangle} \textit{\langle function\rangle} \textit{\langle parameters\rangle} \textit{\langle code\rangle} or assignments that only differ in the scope of the \textit{definition} will be called “the standard definition”.

\begin{verbatim}
\end{verbatim}

(The parameter text is grabbed using \#5\#.) The arguments of \texttt{\__kernel_deprecation\_code:nn} are run upon \texttt{\debug_on:n \{deprecation\}} and \texttt{\debug_off:n \{deprecation\}}, respectively. In both scenarios we the \textit{function} may be \texttt{outer} so we undefine it with \texttt{\tex_let:D} before redefining it, with \texttt{\__kernel_deprecation_error:NNn} or with some code added shortly.
In case we want a warning, the \textit{function} is defined to produce such a warning without grabbing any argument, then redefine itself to the standard definition that the \textit{function} should have, with arguments, and call that definition. The x-type expansion and \texttt{\exp_not:n} avoid needing to double the \# which we could not do anyways. We then deal with the code for \texttt{\debug_off:n \{deprecation\}}: presumably someone doing that does not need the warning so we simply do the standard definition.

In case we want neither warning nor error, the \textit{function} is given its standard definition. Here \#1 is \texttt{\cs_new:Npn or \cs_new_protected:Npn} and \#2 is \textit{\texttt{\exp_not:n} avoid needing to double the \#, which we could not do anyways. We then deal with the code for \texttt{\debug_off:n \{deprecation\}}: presumably someone doing that does not need the warning so we simply do the standard definition.

\begin{verbatim}
\cs_new_protected:Npn \__kernel_patch_deprecation:nnNNpn #1#2#3#4#5#6
\cs_new_protected:Npn \__deprecation_patch_aux:nnNNnn {#1} {#2} #3 #4 {#5} {#6}
\cs_new_protected:Npn \__deprecation_patch_aux:Nn #3 { #4 {#5} {#6} }
\end{verbatim}

(End definition for \texttt{\__kernel_patch_deprecation:nnNNpn and others}.)

1408
\__kernel_deprecation_error:Nnn

The \texttt{outer} definition here ensures the command cannot appear in an argument. Use this auxiliary on all commands that have been removed since 2015.

\begin{verbatim}
\cs_new_protected:Npn \__kernel_deprecation_error:Nnn #1#2#3
{\tex_protected:D \tex_outer:D \tex_edef:D #1
 \exp_not:N \msg_expandable_error:nnnn
 { \tl_to_str:n {#3} } { \token_to_str:N #1 } { \tl_to_str:n {#2} }
 \exp_not:N \msg_error:nnxxx
 { \tl_to_str:n {#3} } { \token_to_str:N #1 } { \tl_to_str:n {#2} }
}
\end{verbatim}

(End definition for \__kernel_deprecation_error:Nnn.)

\begin{verbatim}
\msg_new:nnn { deprecation } { deprecated-command }
{ \tl_if_blank:nF {#3} { Use- \tl_trim_spaces:n {#3} -not- } #2-deprecated-on-#1. }
\end{verbatim}

91.2 Removed functions

\__deprecation_old_protected:Nnn \__deprecation_old:Nnn

Short-hands for old commands whose definition does not matter any more as they were removed.

\begin{verbatim}
\cs_new_protected:Npn \__deprecation_old_protected:Nnn #1#2#3
{ \__kernel_patch_deprecation:nnNNpn {#3} {#2} \cs_gset_protected:Npn #1 { } }
