Abstract

This package allows the definition of \verb variants which add \TeX code before and after the verbatim text. When used together with the shortverb package it allows the definition of short verbatim characters which use this variants instead of the normal \verb.

1 Usage

1.1 Defining new variants of \verb

This macros allow the definition of \verb variants. The verbatim content is first processed using \verbmacro which defaults to \verb, then the given \TeX code is added before and afterwards. The three definition macros use \newcommand*, \renewcommand* and \providecommand* internally to define \verbmacro, respectively. Afterwards \verbatimmacro can be used like \verb. The star version of \verbatimmacro will use \verbatimmacro* (default: \verbatim). See the implementation of \qverb in section 3.2 for an example.

1.2 Provided \verb variants

Two \verb variants are provided (i.e. with \provideverbcommand) by default.

\qverb(char)\verb(verbatim material)\verb(char)

This macro adds quote characters around the verbatim material. Two macros are used to insert the quotes: \verbbeginquote and \verbbendquote. They can be redefined by the user if required. If the caquotes package was loaded beforehand the above macros use its macros \openautoquote and \closeautoquote to take advantage of the language dependent quotation marks. See the manual of caquotes for more details.
Using \verb(verbatim material)(char) is equal to \verbbeginquote\verb(verbatim material)(char)\verbendquote, or ‘\verb(verbatim material)(char)’ when the default definition of the quote macros is used.

This macro adds a frame \fbox{} around the verbatim text \verb+$&^_\$ \rightarrow $&^_$. A \TeX{} box is used to store the content first, then the box is framed. The user can define similar command using the following code:

\newverbcommand{\myverb}{\begin{lrbox}{\verbbox}}{\end{lrbox}\mycommand{\usebox{\verbbox}}}

The temporary box \verbbox is only provided inside a \...verbcommand.

1.3 Using \verb variants with short verbatim character

This package also defines a special version of the \MakeShortVerb macro from the shortvrb package. The original command \MakeShortVerb*(\char) changes the meaning of \char so that \char(verbatim material)(char) is a shorter alternative to \verb*(\char)(verbatim material)(char).

The new macro \MakeSpecialShortVerb*(\verb variant)(\char) does the same, but instead of \verb* it uses a \verb variant* which needs to be defined using \newverbcommand. The package shortvrb must be installed in order to make this macro work. It is loaded automatically by newverbs.

The special meaning of \char can be removed using shortvrb’s \DeleteShortVerb, i.e. the same way as for characters defined with the normal \MakeShortVerb. If a character was already made a short verbatim character it must be “deleted” before it can be redefined by \MakeShortVerb or \MakeSpecialShortVerb.

Examples:
\MakeSpecialShortVerb{\qverb}{"} will make " a short, quoting verbatim character: "$^&$" \rightarrow "$^&$".
\DeleteShortVerb{"}\MakeSpecialShortVerb{\fverb}{"} will change it definition to use \fverb: $^&$

This macro is supposed to be used with its \{\code\} argument at the end of user or package macro which want to typeset verbatim material. It will collect everything between the following \char and its next occurrence as verbatim material. An exception is if the following \char is ‘’, then ‘’ is taken as the end \char to simulate a normal argument to increase user friendliness. Afterwards \code is expanded with \{verbatim material\} direct behind it. The macro ensures proper font settings to
typeset the verbatim material. For this, a group is opened before the material is collected and closed directly after the given code is processed. Therefore all changes done by the \texttt{\textbackslash code} are local and the material should be typeset directly. (In special cases when the group is disruptive, \texttt{\textbackslash code} can be a macro which reads both the verbatim material and the \texttt{\textendgroup} as two arguments. However, then special care must be taken to use the correct font and some of the special characters may be active but have lost their definition.) The starred version will make spaces appear as ‘\textbackslash’ instead of displaying them as normal spaces.

\begin{verbatim}
\Collectverb{\textbackslash code}\textbackslash (char)\textbackslash (verbatim material)\textbackslash (char)
\Collectverb*{\textbackslash code}\textbackslash (char)\textbackslash (verbatim material)\textbackslash (char)
\Collectverb{\textbackslash code}\textbackslash (verbatim material)
\Collectverb*{\textbackslash code}\textbackslash (verbatim material)
\end{verbatim}

This macro is supposed to be used with its \texttt{\textbackslash code} argument at the end of user or package macro which want to collect plain verbatim material suitable to be written in auxiliary files or log messages. It will collect everything between the following \texttt{\textbackslash char} and its next occurrence as verbatim material without adjusting the font or defining any characters in a special way (besides being verbatim). The starred version will make spaces appear as ‘\textbackslash’ when typeset but still be written to auxiliary files as normal spaces. An exception is if the following \texttt{\textbackslash char} is ‘{’, then ‘}’ is taken as the end \texttt{\textbackslash char} to simulate a normal argument to increase user friendliness. Afterwards \texttt{\textbackslash code} is expanded with \texttt{\textbackslash (verbatim material)} direct behind it. This macro does not add any group around the code. Should the material be typeset after all a proper font (e.g. \texttt{\textttfamily} or \texttt{\textttfamily MWEfont}) must be enabled manually.

\begin{verbatim}
\collectverbenv{\textbackslash code}
\collectverbenv*{\textbackslash code}
\end{verbatim}

This macro is supposed to be used with its \texttt{\textbackslash code} argument at the end of the begin-code of an user or package environment definition. It then collects the content of the environment as verbatim material and feeds it as an argument to the provided \texttt{\textbackslash code} like \texttt{\collectverb} does (see there for further details which also apply here). This has the following limitations: When used the \texttt{\textbackslash begin} of the environment must end with a line break, i.e. the source line must not include any other material afterwards. If the environment is defined with arguments, which is supported, the line break must be after the arguments. The \texttt{\textbackslash end} of the macro must be at the beginning of an own source code line. If this conditions are not met incorrect results or an error may occur. Currently trailing material on the \texttt{\textbackslash begin} line is simply ignored, but this behaviour might change in future versions.

The starred version will make the spaces inside the environment appear as ‘\textbackslash’.

Example usage:
\begin{verbatim}
\newenvironment{myenv}{\maybesomeothercode\collectverbenv{\mycmd}}{\someendcode}
\end{verbatim}

This macro works like \texttt{\collectverbenv} but collects the environment content as plain verbatim material suitable to be written in auxiliary files or log messages. After collecting the environment the \texttt{\textbackslash code} is expanded with \texttt{\textbackslash (verbatim material)} direct behind it. This macro does not add any group around the
code. Should the material be typeset after all a proper font (e.g. \ttfamily or \newverbsfont) must be enabled manually.

The starred version will make spaces appear as ‘ ’ when typeset but still be written to auxiliary files as normal spaces.

\newverbsfont

Macro which activates the font used by the newverbs package for the verbatim text. This macro can be used manually if verbatim material collected with \Collectverb or \Collectverbenv should be typeset after all.

\verbdef{\macro}{char}{verbatim material}{char}
\verbdef*{\macro}{char}{verbatim material}{char}
\verbdef{\macro}{verbatim material}
\verbdef*{\macro}{verbatim material}

This macro defines the \macro as a robust macro which typesets the verbatim material in the usual verbatim font. For this the material is placed in a brace group with \newverbsfont. If a different font is wanted, this macro can be redefined locally.

If the \macro existed before it will be overwritten silently. If an error should be raced instead use \newcommand{\macro}{} just before the \verbdef.

Note that this macro is also provided by the verbdef package. If that package is loaded as well it definition of this macro is used, independent on the order of loading the two packages.

\Verbdef{\macro}{char}{verbatim material}{char}
\Verbdef*{\macro}{char}{verbatim material}{char}
\Verbdef{\macro}{verbatim material}
\Verbdef*{\macro}{verbatim material}

This macro uses \Collectverb internally to define \macro as the plain verbatim material. This can be used to define macros for special characters, so these can be used in error or warning messages or be written into auxiliary files.

If the \macro existed before it will be overwritten silently. If an error should be raced instead use \newcommand{\macro}{} just before the \Verbdef.

Note that for maximum flexibility the such defined macros are not defined as robust macros. Therefore using them inside sectioning commands they should be protected using \protect to avoid syntax issues in the .aux file due to verbatim characters.

2 Compatibility with other verbatim packages

The compatibility with other verbatim packages is not tested yet. This package relies on the normal internal definition of \verb and \MakeShortVerb. Any package which changes these might break this package. Users which encounter incompatibilities should not hesitate to contact the package author (with details).

Since v1.2 from 2011/02/16 the new verbatim macros and their short versions can be used inside tabularx environments. This package patches an internal macro of tabularx to achieve this compatibility.

3 Implementation
### 3.1 Verb Definition Commands

- \texttt{\newverbcommand}\new@verbcommand
- \texttt{\renewverbcommand}\new@verbcommand
- \texttt{\provideverbcommand}\new@verbcommand

This macro calls the real macro with the to be used definition macro.

\texttt{\newcommand}\new@verbcommand\new@verbcommand\new@verbcommand
\texttt{\renewcommand}\new@verbcommand\renewcommand\new@verbcommand
\texttt{\provideverbcommand}\new@verbcommand\providecommand\new@verbcommand

\texttt{\new@verbcommand}\new@verbcommand\new@verbcommand\new@verbcommand
#1: underlying definition macro
#2: macro to be defined
Checks for optional argument and calls \texttt{\new@verbcommand} accordingly.

\texttt{\def}\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand\new@verbcommand

The trailing code is inserted by patching \texttt{\verb@egroup} which is called by \texttt{\verb} after the verbatim content.
\usepackage{tabularx}

Enables support for the new verbatim macros inside \texttt{tabularx} environments. This environment defines its own almost-verbatim form of \texttt{\verb} which lacks the end-macro we patch above. The following code inserts such an end-macro.

\begin{verbatim}
def \newverbs@tabularxsupport{\%
\begingroup
\def\origa@TX@vb##1{\def\@tempa####1##1{\toks@{####1}\edef\@tempa{\toks@}%%
\expandafter\TX@v\meaning\@tempa\ifnum'={\fi}}\@tempa
\def\origb@TX@vb##1{\def\@tempa####1##1{\toks@{####1}\edef\@tempa{\toks@}%%
\expandafter\TX@v\meaning\@tempa\\\ifnum'={\fi}}\@tempa
\ifcase0%
  \ifx\TX@vb\origa@TX@vb 1\else
  \ifx\TX@vb\origb@TX@vb 1\fi\fi
\relax
\endgroup
\PackageWarning{newverbs}{Couldn't patch 'TX@vb' macro of the 'tabularx' package. Definition unknown.}\
\else
\endgroup
\PackageInfo{newverbs}{Patching 'TX@vb' macro of the 'tabularx' package.}\
\def\TX@vb##1{\def\@tempa####1##1{\toks@{####1}\edef\@tempa{\toks@}%%
\expandafter\TX@v\meaning\@tempa\\\ifnum'={\fi}}\@tempa!%}
\let\newverbs@tabularxsupport\relax
}
\end{verbatim}

The end-macro is initially empty and is set for every call of a new verb macro.

\begin{verbatim}
def \newverbs@txend{\%}
The support is activated either now or at the begin of the document if the \texttt{tabularx} is loaded.
\@ifpackageloaded{tabularx}{%\newverbs@tabularxsupport%\AtBeginDocument{\@ifpackageloaded{tabularx}{%\newverbs@tabularxsupport}{}}}%
\end{verbatim}

Some settings required for all new \texttt{\verb}-like commands. The original end group macro from \texttt{\verb} is saved away. Also the 'temp box a' is provided with a user friendly name.

\begin{verbatim}
def \newverbcommand@settings{\%
\let\verb@orig@egroup\verb@egroup
\let\verbbox\@tempboxa
}\end{verbatim}

3.2 Provided New Verb Commands
\verb
Quoting version of \verb. Places a quote character before and after the verbatim content: "verb".
\provideverbcommand{\qverb}{\qverbbeginquote}{\qverbendquote}

\qverbbeginquote
\qverbendquote
This macros insert the actual quotes. They can be redefined by the user to contain the required quotes. If available the quoting macros of csquotes are used.
\@ifundefined{openinnerquote}{%\def\qverbbeginquote{"}\def\qverbendquote{"}%\}
\def\qverbbeginquote{\openautoquote}\def\qverbendquote{\closeautoquote}

\fverb
A framed version of \verb. Stores the verbatim content first into a box. Then the box content is framed.
\newverbcommand{\fverb}{\setbox\verbbox\hbox{\bgroup\color@setgroup}{\color@endgroup\egroup\fbox{\box\verbbox}}}

3.3 Make Special Short Verbatim Characters
\RequirePackage{shortvrb}
\MakeShortVerb
\@ifstar{\newverbs@MakeShortVerb*}{\newverbs@MakeShortVerb{}}
\def\newverbs@MakeShortVerb#1{%\@ifnextchar[{{\newverbs@@MakeShortVerb{#1}}}{\@MakeSpecialShortVerb{#1}{\verb}}%}

\newverbs@MakeShortVerb#1:#1 star or empty
\@ifnextchar[{{\newverbs@MakeShortVerb#1}}}{\@MakeSpecialShortVerb{#1}{\verb}%}

\@MakeSpecialShortVerb{#1}{\verb}
\newcommand*{\MakeSpecialShortVerb}{% 
\@ifstar {%\@MakeSpecialShortVerb{*}% \@MakeSpecialShortVerb{}}%}

3.4 Collect verbatim argument

\collectverb

Collects verbatim text which can be typeset. Checks for an existing star.
Changes catcodes and ensures that spaces are displayed normally.

```latex
\def\collectverb#1{\%  
  \verb@eol@error  
  \let\do@makeother  
  \dospecials  
  \@vobeyspaces  
  \frenchspacing  
  \@noligs  
  \@@collectverb{#1}  
}\collectverbenv
```

Changes catcodes.

```latex
\def\scollectverb#1{\%  
  \verb@eol@error  
  \let\do@makeother  
  \dospecials  
  \@noligs  
  \@@collectverb{#1}  
}\scollectverb
```

Defines \@@@collectverb to read everything to the next occurrence of \texttt{〈char〉} and feed it to the given \texttt{〈code〉}.

```latex
\def\@@collectverb#1#2{\%  
  \ifnum'#2='\{%  
    \lccode'\~'\}  
  \else  
    \lccode'#2\active  
  \fi  
  \begingroup  
  \ifnum'#2='\{%  
    \lccode'~'\}  
  \else  
    \lccode'~'#2\%  
  \fi  
  \lowercase\endgroup  
  \def\@@collectverb#1\#2\endgroup{#1#1\endgroup}  
  \@@collectverb  
}\@@collectverb
```

Collects verbatim text which can be typeset. Checks for an existing star.
\newcommand{\collectverbenv}{%
  \begingroup
  \verbatim@font
  \@ifstar
    \@scollectverbenv
    \@collectverbenv
  \}
  \@collectverbenv#1:
  Changes catcodes and ensures that spaces are displayed normally.
  \def\@collectverbenv#1{% 
    \newverb@catcodes
