to-be-determined: \LaTeX Package for highlighting places that require more work

Yegor Bugayenko

0.1.1 2021/07/21

This package helps you highlight places in your articles and make sure it looks nice. Install it from CTAN and then use like this:

\documentclass{article}
\usepackage{to-be-determined}
\begin{document}
The budget is \tbd{99.00 USD}.
\end{document}

With this package it’s also possible to highlight larger pieces of text that take a few lines on the page.

If you want to hide the content of what’s inside \tbd, use hide option of the package. They will all be replaced with TBD placeholders.

If you want them to disappear entirely, use the off package option.

More details about this package you find in the yegor256/to-be-determined GitHub repository.
