Creation of title pages is something most authors should not have to do. But reality is not perfect, so a lot of authors have to do it. In 2009 KOMA started the title page project at https://komascript.de/titlepage to collect real title pages and implement them with a well defined interface. In 2021 the project has been moved to https://github.com/komascript/uni-titlepage and renamed.

Now, changing from one title page style to another would be very simple. Nevertheless implementation of a new title page style may be still difficult. But maybe the guys of the title page project would help you. Just ask!

   2.9 Style JT-Aufsaetze ..................20
1 Loading the Package

You may load this package like all the other package, simply using:

\usepackage{uni-titlepage}

This package declares several options for title page manipulation. We will declare all those options in the following. Most of the options are package options as well, but some are style options only. You may use every package option already as optional argument of \usepackage and even of \documentclass. But in most cases it would be better to use them as optional argument of \TitlePageStyle or \maketitle. We show this way below.

2 The Title Page Styles and their Options

\TitlePageStyle Several title page styles are supported. You may select a title page style using:

\TitlePageStyle\{\langle\textit{option}=\langle\textit{value}\rangle,\ldots\}\{\langle\textit{style}\rangle\}.

The available styles are shown at the following sub-sections. Options may be every package option and every style option.

\maketitle After loading a style you may generate title pages using:

\maketitle\{\langle\textit{option}=\langle\textit{value}\rangle,\ldots\}\.

Again, you may use every package option and every style option as optional argument.

\TitleOption Another way to set an option is to use either

\TitleOption\{\langle\textit{option}\rangle\{\langle\textit{value}\rangle\}

or
\TitleOptions{⟨option⟩=⟨value⟩,...}.

You can set every package option an every option of already loaded title page styles.

For every option, that expects a string argument exists a corresponding command with the same name. So you may set, e.g., the title either using \TitleOptions{title={This is the Title}} or \TitleOption{title} {This is the Title} or \maketitle[title={This is the Title}] or \TitlePageStyle[title={This is the Title}] {...} or \title{This is the Title}. The most robust way is to use the command \title instead of the option at one of the other commands! If you use the option you may need to add \protect in front of commands inside the option value!

</table>
### String Option | Styles | Common Meaning
--- | --- | ---
**title** | *every style* | the main title of the document
**titlehead** | DHBW, KOMAScript, Markus-2, Spacer, KIT | page head over the main title of the document
**university** | DHBW, TU-DD, TU-HH, KIT, WWUM | the university where you’ve made or presented your work

Let’s have a look at the already defined title page styles. You should find an example LaTeX file for each of them at the documentation folder. If not, ask your distributor or administrator for those! But you may find the code of all examples in docstrip syntax even at subsection 4.4 starting at page 56. At the shown examples most variable contents was made red.
2.1 Style DHBW

Josef Schmidbauer asked me for a title page usable for bachelor thesis at the “Duale Hochschulen Baden-Württemberg”. This is a only one title page style.

The page (in example titlepage-DHBW.tex) is:

1. main title page with titlehead, mainlogo, title, subject, academicgrade, discipline, place, author, duration, matriculationnumber, course, company, referee, university, and date.

Note: The upper right corner is the logo placeholder. If you’d download the logo from the DHBW homepage http://www.dhbw.de and save it with the name DHBW_d_MOS_195x95_rgb_300.jpg it would be used automatically. The logo file is also available from https://de.wikipedia.org/wiki/Datei:DHBW_d_MOS_195x95_rgb_300.jpg. This original logo has a large white border, so it would be much smaller than the red box at the example. The example file also contains comments for an optional company logo at the upper left corner.
### 2.2 Style KOMAScript

This is a style similar to the title pages of KOMA-Script classes.

The pages (in twoside example `titlepage-KOMAScript.tex`) are:

1. defined by `extratitle`, which is not a package option but a style option. You may set it using `\TitleOption` or `\TitleOptions` after loading the style or with the optional argument of `\maketitle` or `\TitlePageStyle`.
2. empty and only in twoside mode with `extratitle` used.
3. main title page with `titlehead`, `subject`, `title`, `subtitle`, `author`, `date`, `publisher`. You may use `\thanks` at any of these.
4. only in twoside mode defined by `uppertitleback` and `lowertitleback`, which are not package options but style options. You may set them using `\TitleOption` or `\TitleOptions` after loading the style or with the optional argument of `\maketitle` or `\TitlePageStyle`.

5. optional post title with `dedication`.

6. empty and only in twoside mode with `dedication` used.
2.3 Style Markus-1

This is a style similar to the one of the title of the KOMA-Script book.

The pages (in twoside example `titlepage-Markus-1.tex`) are:

1. defined by `publisher`; may be omitted by `publisher={}`.
2. only in twoside mode with `publisher` defined by `author`.
3. main title page with `subject`, `title`, `subtitle`, and `date`. 
4. only in twoside mode defined by \texttt{uppertitleback} and \texttt{lowertitleback}, which are not package options but style options. You may set them using \texttt{\TitleOption} or \texttt{\TitleOptions} after loading the style or with the optional argument of \texttt{\maketitle} or \texttt{\TitlePageStyle}.

5. optional post title with \texttt{dedication}.

6. empty and only in twoside mode with \texttt{dedication} used.
2.4 **Style Markus-2**

This style is not a real live style, but similar styles are often used:

The pages (in twoside example) *titlepage-Markus-2.tex* are:

1. defined by `extratitle`.
2. empty and only in twoside mode with `extratitle` used.
3. main title page with `titlehead` placed at the page head (if this is to high, it might be put outside the page; if it is to deep, it might overwrite parte of the title), `rulewidth` and `rulesep` for the vertical rule (these aren’t package options but style options), `subject`, `title`, `subtitle`, `author`, `date`, and `publisher`. 
4. only in twoside mode defined by `upptitleback` and `lowertitleback`, which are not package options but style options. You may set them using \TitleOption or \TitleOptions after loading the style or with the optional argument of `maketitle` or `TitlePageStyle`.

5. optional post title with `dedication`.

6. empty and only in twoside mode with `dedication` used.
2.5 Style Spacer

This style is a variant of style Markus-2 from subsection 2.4. It was asked by spacer2012 at the original titlepage project on https://komascript.de/titlepage. In difference to Markus-2 the title head will not be placed at the page head but at the body.

The pages (in twoside example titlepage-Spacer.tex) are:

1. defined by extratitle.
2. empty and only in twoside mode with extratitle used.
3. main title page with titlehead placed at the page head, rulewidth and rulesep for the vertical rule (these aren’t package options but style options), subject, title, subtitle, author, date, and publisher.
4. only in twoside mode defined by `uppertitleback` and `lowertitleback`, which are not package options but style options. You may set them using `\TitleOption` or `\TitleOptions` after loading the style or with the optional argument of `\maketitle` or `\TitlePageStyle`.

5. optional post title with `dedication`.

6. empty and only in twoside mode with `dedication` used.
2.6 Style TU-DD

This style is used at the “Technische Universität Dresden”. I was asked for this several years ago. Only one title page is defined!

The page (in example titlepage-TU-DD.tex) is:

1. main title page with university, faculty, chair, professor, title, subject, author, discipline, matriculationnumber, advisor, place, and date.

But there is another variant. If option blackborder was set to true, an black border is put around the page:

The page (in example titlepage-TU-DD.tex with option blackborder) is:

1. main title page with university, faculty, chair, professor, title, subject, author, discipline, matriculationnumber, advisor, place, and date.
2.7 Style TU-HH

This style is used at the “Technische Universität Hamburg-Harburg”. I was asked for this several years ago. Only two title pages are defined!

The pages (in twoside example titlepage-TU-HH.tex) are:

1. main title page with title, subtitle, university, academicgrade, subject, author, place, and date. Some additional text depending on the selected language will be used also.

2. only in twoside mode with referee and oralexaminationdate.

The output of style TU-HH differs, if you use option final, which is a style option, not a package option. You may set it using \TitleOption
or \TitleOptions after loading the style or with the optional argument of \maketitle or \TitlePageStyle.
2.8 Style KIT

This style is used at the “KIT – University of the State of Baden-Württemberg and National Research Center of the Helmholtz Association”. I've made this because of the ugly \LaTeX class and template made by the KIT itself. Only one title page is defined!

The page (in example titlepage-KIT.tex) is:

1. main title page with titlehead, mainlogo, title, subject, author, referee, advisor, university, duration, and homepage. Some additional text depending on the selected language will be used also.

If titlehead is empty or unused left aligned mainlogo will be used. If mainlogo is empty or unused, and if you have a logo file KITLogo_RGB.pdf, this will be used. As an alternative also 2560px-Logo_KIT.svg.png, 2000px-Logo_KIT.svg.png, 1024px-Logo_KIT.svg.png, 800px-Logo_KIT.svg.png, 640px-Logo_KIT.svg.png, or 500px-Logo_KIT.svg.png from https://de.wikipedia.org/wiki/Datei:Logo_KIT.svg would be auto-detected.

Several other elements will be set to defaults too, if they are empty. So you don’t need to set all the elements, that has been set at the example file.
2.9 Style JT-Aufsätze

The style is based on the front cover of “Jan Tschichold: Ausgewählte Aufsätze über Fragen der Gestalt des Buches und der Typographie, Birkhäuser Verlag Basel, 1975, ISBN: 3-7643-1946-1”. I’ve made this, because the book is a major book of classic typography. It seems to be old fashioned and indeed it is. Note, that the front cover of a book an the main title of a book are not the same! Nevertheless, here I’ve made a main title from a front cover. Currently only one title page is defined, but you may also use extratitle, uppertitleback, and lowertitleback.

The page (in example titlepage-JT-Aufsätze.tex) is:

1. main title page with author, title, publisher, rulewidth and rulesep for width of the horizontal rules and the distance between them (these aren’t package options but style options).
2.10 Style JT-Geschichte

The style is based on “Jan Tschichold: Geschichte der Schrift in Bildern; Holbein-Verlag, 1947”. This is another major book of classic typography. It seems to be old fashioned and indeed it is. Currently only one title page is defined, but you may also use extratitle, uppertitleback, and lowertitleback.

The page (in example titlepage-JT-Geschichte.tex) is:

1. main title page with author, title, publisher, place, rulewidth and rulesep for width of the horizontal rules and the distance between them (these aren’t package options but style options).

Note, that the default for titlepagefont prints everything but the title with ad-hoc letterspacing in upper-case letters if \lsstyle is available and without letterspacing but in small capitals otherwise. Changing the default of titlepagefont will also change this automatism.
2.11 Style JT-Typography

The style is based on “Jan Tschichold: The New Typography; University of California Press, Berkley and Los Angeles, California 1995”. This is the English translation of another major book of classic typography. Some things like missing letterspacing at the upper-case title seems to be wrong. Currently only one title page is defined, but you may also use extratile, uppertitleback, and lowertitleback.

The page (in example titlepage-JT-Geschichte.tex) is:

1. main title page with author, title, subtitle, place, date, publisher.
Tobias Südkamp asked me for that title for the Westfälischen Wilhelms-Universität Münster. The professor is more likely the chairman. Female referees should be prefixed by [f]. You can omit the examination date defining an empty \examinationdatename.

The pages (in example tilepage-WWUM.tex) are:

1. cover page with author, title, \the\year
2. the backside of the cover page is empty if it exists
3. main title page with chair, title, subject, academicgrade, science, discipline, faculty
4. main title back side with professor, referee, oralexaminationdate (normally empty)
3 Additional Commands

\NowButAfterBeginDocument Command

\NowButAfterBeginDocument{(code)}

is something like \AtBeginDocument, but if you call it somewhere after \begin{document} argument (code) will be used immediately. This command is used inside some of the title page styles, because you may load them either at the preamble or even after \begin{document}, but some code should not be executed before \begin{document}.

\titlepage  In opposite to the titlepage environment of the standard classes,

\begin{titlepage}[(options)]
...
\end{titlepage}

knows some options. These are pagestyle=(style) and pagenumber=(number). The first one changes the page style of the generated title page to the given (style). If the option is not set, the default empty will be used. The second one sets the logical page number of the generated title page to the given (number) and sets the counter pagenumber to this value. If the option is not used, the value of counter pagenumber will be increased by one and the result is used for the logical page number.

\fullsizetitle  Using

\begin{fullsizetitle}[(options)]
...
\end{fullsizetitle}

is almost the same like above. But fullsizetitle removes the margins from the generated title page. Nevertheless if binding correction (aka binding offset) of package typearea or geometry could be recognized, it will not be removed. Some of the title page styles use this environment instead of titlepage inside \maketitle. With this the margins of the title page do not depend on the type area of the document.

\usetitleelement  Command

\usetitleelement{(element)}

gives the content of the corresponding title (element). Each main (element) defined by the package may be used. Those are currently: advisor, author, chair, company, course, date, dedication, academicgrade, discipline, duration, faculty, homepage, mainlogo, matriculationnumber, oralexaminationdate, place, professor, publisher, referee, subject, subtitle, title, titlehead, and university. Note: student isn’t a main (element), because it’s only an alias for author.
4 Implementation

Note: To generate all files, developers and beta testers should simply use the source from https://github.com/komascript/uni-titlepage and call

\texttt{13build unpack}
\texttt{13build doc}

The resulting documentation will be placed in the main folder. The unpacked style file are in \texttt{build/unpacked}. You can use

\texttt{13build install}

to install them in \texttt{TEXMFHOME}. See the manual of \texttt{13build} for more information.

As an alternative you can use the source distribution from CTAN and run:

\texttt{tex uni-titlepage.dtx}

The documentation is usually part of the source distribution at CTAN. Note, that all the generated \texttt{tex} files are example files. Do not copy them to the run-time files but the documentation folder!

4.1 The Installation Driver ‘uni-titlepage.ins’

First of all we produce \texttt{uni-titlepage.ins}, the installation driver. It starts very common with loading \texttt{docstrip}, preamble declaration and start of generation.

\begin{verbatim}
1 \def\batchfile{uni-titlepage.dtx}
2 \input docstrip.tex
3 \iffontlevel\%

\}%
\endfootnote

4.3 The titlepage Drivers

\begin{footnote}
\DefineFamilyMember[
(DHBW) DHBW%
(KOMAScript) KOMAScript%
(TU-DD) TU-DD%
(TU-HH) TU-HH%
(Markus & 1) Markus-1%
(Markus & 2) Markus-2%
(Spacer) Spacer%
(KIT) KIT%
(JT-Aufsaetze) JT-Aufsaetze%
\endfootnote
Nevertheless some style has their own switches:

\texttt{\textbackslash FamilyBoolKey\{TU-DD\}\{title\}\{blackborder\}}{blackborder}

\texttt{\textbackslash FamilyBoolKey\{TU-HH\}\{title\}\{final\}}{final}

Some styles have some variable rules at the title:

\texttt{\providecommand*{\title@rulewidth}{%}
  \gdef\title@rulewidth{\dimexpr #1\relax}\
  \FamilyKeyStateProcessed}

\texttt{\providecommand*{\title@rulesep}{%}
  \gdef\title@rulesep{\dimexpr #1\relax}\
  \FamilyKeyStateProcessed}

An some has their own terms:

\texttt{\presentationinformationWWUM}
\texttt{\presentationinformationTUHH}
\texttt{\presentationinformationDHBW}
\texttt{\presentationinformationKIT}
While style initialization, something may change:

style KOMAScript redefines some footnote macros:

\renewcommand*{\inittitle}{%}
\let\footnotesize\small
\let\footnoterule\relax
\let\footnote\thanks
\renewcommand*{\thefootnote}{@fnsymbol{\c@footnote}}%
\let\@oldmakefnmark\@makefnmark
\renewcommand*{\@makefnmark}{\rlap\@oldmakefnmark}%

styles DHBW, TU-DD, TU-HH, and KIT sets some variable if not already done
\if\@university\@empty
\university{Dualen Hochschule}%
\fi
\if\@place\@empty
\place{Westfälischen Wilhelms-Universität}%
\fi

("DHBW | TU-DD | TU-HH | KIT | WWUM)

\PackageWarning{uni-titlepage}{Birth place missing.\MessageBreak

# ABSTRACT

Creation of title pages is something most authors should not have to do. But reality is not perfect, so a lot of authors have to do it. In 2009 KOMA started the title page project at https://komascript.de/titlepage to collect real title pages and implement them with a well defined interface. In 2021 the project has been moved to github.com/komascript/uni-titlepage and renamed.

Now, changing from one title page style to another would be very simple. Nevertheless implementation of a new title page style may be still difficult. But maybe the guys of the title page project would help you. Just ask!
# Unpacking and Installation for Developers and Distributors

To unpack and install all files, you can download the source from github and then run:

```
l3build install
```

Afterwards you can build the manual and the PDFs of the examples using:

```
l3build doc
```

As an alternative you can use the CTAN source distribution. This already contains the user manual and the PDFs of the example files. So you only have to run

```
tex uni-titlepage.dtx
```

to generate the package file ‘uni-titlepage.sty’, the title definition files ‘title-*.def’ and the example titlepages ‘titlepage-*.tex’.

Please note, the ‘title-*.def’ files are run-time files. Together with ‘uni-titlepage.sty’ they have to be placed in ‘tex/latex/uni-titlepage’ inside a TDS tree. All files ‘titlepage-*.tex’ and ‘titlepage-*.pdf’ as well as ‘uni-titlepage.pdf’ are part of the documentation and should be placed in ‘doc/latex/uni-titlepage/’ of the TDS tree.

# Unpacking and Installation for Users

Users can use the installation described at [Unpacking and Installation for Developers and Distributors]. However, if your TeX distributor already distributes a ready for installation package, you do not need and should not create files and copy them yourself. Just use the package manager of your TeX distribution to install the package.

# How to Contribute

If you have made a title definition that is not specific for a single project but could be of interest for other users, you can either

- make your own ‘uni-titlepage-FOO’ package with its own manual and [upload it to ctan](https://www.ctan.org/upload),
- contribute in adding it to ‘uni-titlepage’.

The first option has the advantage, that you are free. There won’t be any code reviews by the ‘uni-titlepage’ developers. You don’t need to use the same coding style. There is not need to accept the license of ‘uni-titlepage’ etc. But in this case you have to take care to keep it compatible with future
releases of ‘uni-titlepage’ and it will not be presented in the
‘uni-titlepage’ manual.

The second option has the advantage, that after accepting your code, the
‘uni-titlepage’ developers will try to keep it working even if they change
‘uni-titlepage’. But there are several restrictions to your code, before it
will be accepted. For example, you should always try to use general options,
if possible. *Static text* (not handled by options) should be configurable via
‘\newcaptionname’, ‘\providecaptionname’ and ‘\renewcaptionname’ and should be
available at least in English and German (but if we can, we help in
translating them). The coding style and quality is also a criterion.
